Patient/Family Teaching

- Emphasize the importance of continuing to take this medication, even if feeling well. Instruct patient to take medication at the same time each day. Take missed doses as soon as remembered unless almost time for next dose. Do not double doses.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to change positions slowly to decrease orthostatic hypotension. May cause syncopal episodes, especially within first 24 hr of therapy, with dose increase, and with resumption of therapy after interruption.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to avoid concurrent use of alcohol or OTC medications and herbal products, especially cold preparations, without consulting health care professional, especially cough, cold, or allergy remedies.
- Advise male patient to notify health care professional if priapism or erection of longer than 4 hr occurs; may lead to permanent impotence if not treated.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of follow-up visits to determine effectiveness of therapy.
- **Hypertension:** Instruct patient and family on proper technique for BP monitoring. Advise them to check BP at least weekly and report significant changes.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, and stress management).

Evaluation/Desired Outcomes

- Decrease in BP without appearance of side effects.
- Decrease in urinary symptoms of BPH.

doxercalciferol, See VITAMIN D COMPOUNDS.

HIGH ALERT

DOXOrubicin

(dox-oh-roo-bi-sin)

* Adriamycin, * Caelyx, * Myocet

Classification

Therapeutic: antineoplastics

Pharmacologic: anthracyclines

Indications

Alone or with other modalities in the treatment of various solid tumors including: Breast, Ovarian, Bladder, Bronchogenic carcinoma, Malignant lymphomas and leukemias.

Action

Inhibits DNA and RNA synthesis by forming a complex with DNA; action is cell-cycle S-phase-specific. Also has immunosuppressive properties. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: Administered IV only, resulting in complete bioavailability.

Distribution: Widely distributed; does not cross the blood-brain barrier; extensively bound to tissues.

Metabolism and Excretion: Mostly metabolized by the liver (primarily by CYP2D6 and CYP3A4). Converted by liver to an active compound. Excreted predominantly in the bile, 50% as unchanged drug. Less than 5% eliminated unchanged in the urine.

Half-life: 16.7 hr.

TIME/ACTION PROFILE (effect on blood counts)

ROUTE	ONSET	PEAK	DURATION
IV	10 days	14 days	21–24 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **OB, Lactation:** Pregnancy or lactation.

Use Cautiously in: History of cardiac disease or high cumulative doses of anthracyclines; Depressed bone marrow reserve; Liver impairment (reduce dose if serum bilirubin >1.2 mg/dL); **Pedi, Geri:** Children, geriatric patients, mediastinal radiation, concurrent cyclophosphamide (↑ risk of cardiotoxicity); **Rep:** Patients with childbearing potential.

Adverse Reactions/Side Effects

Resp: recall pneumonitis. **CV:** **CARDIOMYOPATHY**, ECG changes. **GI:** diarrhea, esophagitis, nausea, stomatitis, vomiting. **GU:** red urine. **Derm:** alopecia, photosensitivity. **Endo:** sterility, prepubertal growth failure with temporary gonadal impairment (children

only). **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** phlebitis at IV site, tissue necrosis. **Me-tab:** hyperuricemia. **Misc:** hypersensitivity reactions.

Interactions

Drug-Drug: CYP2D6 inhibitors, CYP3A4 inhibitors, and P-glycoprotein inhibitors may ↑ risk of toxicity; avoid concurrent use. CYP2D6 inducers, CYP3A4 inducers, and P-glycoprotein inducers may ↓ effect and ↑ risk of therapeutic failure; avoid concurrent use. ↑ bone marrow depression with other antineoplastics or radiation therapy. Pediatric patients who have received concurrent doxorubicin and dactinomycin have an ↑ risk of recall pneumonitis at variable times following local radiation therapy. May ↑ skin reactions at previous radiation therapy sites. If paclitaxel is administered first, clearance of doxorubicin is ↓ and the incidence and severity of neutropenia and stomatitis are ↑ (problem is diminished if doxorubicin is administered first). Hematologic toxicity is ↑ and prolonged by concurrent use of cyclosporine; risk of coma and seizures is also ↑. Incidence and severity of neutropenia and thrombocytopenia are ↑ by concurrent progesterone. Phenobarbital may ↑ clearance and decrease effects of doxorubicin. Doxorubicin may ↓ metabolism and ↑ effects of phenytoin. Streptozocin may ↑ the half-life of doxorubicin (dose ↓ of doxorubicin recommended). May ↑ risk of hemorrhagic cystitis from cyclophosphamide. May ↑ risk of hepatotoxicity from mercaptopurine. Cardiac toxicity may be ↑ by radiation therapy or cyclophosphamide. ↑ risk of cardiac toxicity with trastuzumab; avoid concurrent use. If dexrazoxane is administered at initiation of doxorubicin-containing regimens, may ↑ risk of therapeutic failure and tumor progression. May ↓ antibody response to live-virus vaccines and ↑ risk of adverse reactions.

Route/Dosage

Other regimens are used.

IV (Adults): 60–75 mg/m² daily, repeat q 21 days; or 25–30 mg/m² daily for 2–3 days, repeat q 3–4 wk or 20 mg/m²/wk. Total cumulative dose should not exceed 550 mg/m² without monitoring of cardiac function or 400 mg/m² in patients with previous chest radiation or other cardiotoxic chemotherapy.

IV (Children): 30 mg/m²/day for 3 days every 4 wk.

Hepatic Impairment

IV (Adults): Serum bilirubin 1.2–3mg/dL—50% of usual dose; serum bilirubin 3.1–5 mg/dL—25% of usual dose.

Availability (generic available)

Powder for injection: 10 mg/vial, 20 mg/vial, 50 mg/vial, * 150 mg/vial. **Solution for injection:** 2 mg/mL.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

NURSING IMPLICATIONS

Assessment

- Monitor BP, pulse, respiratory rate, and temperature frequently during administration. Report significant changes.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor intake and output ratios, and report occurrence of significant discrepancies. Encourage fluid intake of 2000–3000 mL/day. Allopurinol and alkalization of the urine may be used to decrease serum uric acid levels and to help prevent urate stone formation.
- Severe and protracted nausea and vomiting may occur as early as 1 hr after therapy and may last 24 hr. Administer parenteral antiemetics 30–45 min prior to therapy and routinely around the clock for the next 24 hr as indicated. Monitor amount of emesis and notify physician or other health care professional if emesis exceeds guidelines to prevent dehydration.
- Monitor for development of signs of cardiac toxicity, which may be either acute and transient (ST segment depression, flattened T wave, sinus tachycardia, and extrasystoles) or late onset (usually occurs 1–6 mo after initiation of therapy) and characterized by intractable HF (peripheral edema, dyspnea, rales/crackles, weight gain). Chest x ray, echocardiography, ECGs, and radionuclide angiography may be ordered prior to and periodically during therapy. Cardiotoxicity is more prevalent in children younger than 2 yr and geriatric patients. Dexrazoxane may be used to prevent cardiotoxicity in patients receiving cumulative doses of >300 mg/m².
- Assess injection site frequently for redness, irritation, or inflammation during and for up to 2 hr after completion of infusion. Doxorubicin is a vesicant but may infiltrate painlessly even if blood returns on aspiration of infusion needle. Severe tissue damage may occur if doxorubicin extravasates. If extravasation occurs, stop infusion immediately, restart, and complete dose in another vein. Local infiltration of antidote is not recommended. If extravasation is suspected, intermittent application of ice to site for 15 min. 4 times daily for 3 days may be useful. Because of the progressive nature of extravasation reactions, close observation and plastic surgery consultation are recommended. Blistering, ulceration and/or persistent pain are indications for wide excision surgery, followed by split-thickness skin grafting. May use dexrazoxane to treat extravasation. Administer first infusion of dexrazoxane as soon as possible

within 6 hr of extravasation. Remove ice packs for at least 15 min prior to and during dexrazoxane administration. Recommended dose of dexrazoxane for day 1 is 1000 mg/m² (up to 2000 mg); the dose for day 2 is 1000 mg/m² (up to 2000 mg); the dose for day 3 is 500 mg/m² (up to 1000 mg). Dexrazoxane is administered as an IV infusion over 1–2 hr. If swelling, redness, and/or pain persists beyond 48 hr, immediate consultation for possible debridement is indicated.

- Assess oral mucosa frequently for development of stomatitis. Increased dosing interval and/or decreased dosing is recommended if lesions are painful or interfere with nutrition.
- **Lab Test Considerations:** Monitor CBC and differential prior to and periodically during therapy. WBC nadir occurs 10–14 days after administration, and recovery usually occurs by the 21st day. Thrombocytopenia and anemia may also occur. Increased dosing interval and/or decreased dose is recommended if ANC is <1000 cells/mm³ and/or platelet count is $<50,000$ cells/mm³.
- Monitor renal (BUN and creatinine) and hepatic (AST, ALT, LDH, and serum bilirubin) function prior to and periodically during therapy. Dose reduction is required for bilirubin >1.2 mg/dL or serum creatinine >3 mg/dL.
- May cause ↑ serum and urine uric acid concentrations.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)

Decreased cardiac output (Adverse Reactions)

Implementation

- **High Alert:** Fatalities have occurred with incorrect administration of chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings.
- **High Alert:** Do not confuse doxorubicin hydrochloride with doxorubicin hydrochloride liposome (Doxil) or with daunorubicin hydrochloride (Cerubidine) or with idarubicin. Clarify orders that do not include generic and brand names.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard IV equipment in specially designated containers.
- Aluminum needles may be used to administer doxorubicin but should not be used during storage, because prolonged contact results in discoloration of solution and formation of a dark precipitate. Solution is red.

IV Administration

- **IV Push:** **Diluent:** Dilute each 10 mg with 5 mL of 0.9% NaCl (nonbacteriostatic) for injection. Shake

to dissolve completely. Do not add to IV solution. Reconstituted medication is stable for 24 hr at room temperature and 48 hr if refrigerated. Protect from sunlight. **Concentration:** 2 mg/mL. **Rate:** Administer each dose over 3–5 min through Y-site of a free-flowing infusion of 0.9% NaCl or D5W. Facial flushing and erythema along involved vein frequently occur when administration is too rapid.

- **Intermittent Infusion:** Has also been mixed in 100–250 mL of 0.9% NaCl. **Rate:** Infuse over 30–60 min.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, amifostine, amikacin, anidulafungin, argatroban, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, chlorpromazine, ciprofloxacin, cisplatin, cladribine, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, flucanazole, fludarabine, gemcitabine, gentamicin, granisetron, haloperidol, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin calcium, levorphanol, lidocaine, linezolid, lorazepam, mannitol, mechlorethamine, melphalan, meperidine, mesna, methotrexate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, morphine, moxifloxacin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, pamidronate, pancuronium, phenylephrine, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, ranitidine, sargramostim, sodium acetate, sufentanil, tacrolimus, teniposide, theophylline, thiotepa, tige-cycline, tirofiban, tobramycin, topotecan, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** acyclovir, allopurinol, aminophylline, amiodarone, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, azithromycin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, diazepam, digoxin, ertapenem, foscarnet, fosphenytoin, ganciclovir, magnesium sulfate, meropenem, methohexital, pantoprazole, pemetrexed, pentamidine, pentobarbital, phenobarbital, phenytoin, piperacil-

lin/tazobactam, potassium phosphates, propofol, rituximab, sodium phosphates, thiopental, trimethoprim/sufamethoxazole, voriconazole.

Patient/Family Teaching

- Instruct patient to notify health care professional promptly if fever; sore throat; signs of infection; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDs, because these may precipitate gastric bleeding.
- Instruct patient to report pain at injection site immediately.
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to use sponge brush, rinse mouth with water after eating and drinking, and confer with health care professional if mouth pain interferes with eating. Pain may require treatment with opioid analgesics. The risk of developing stomatitis is greatest 5–10 days after a dose; the usual duration is 3–7 days.
- **Instruct patient to notify health care professional immediately if irregular heartbeat, shortness of breath, swelling of lower extremities, or skin irritation (swelling, pain, or redness of feet or hands) occurs.**
- Discuss the possibility of hair loss with patient. Explore methods of coping. Regrowth usually occurs 2–3 mo after discontinuation of therapy.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Inform patient that medication may cause urine to appear red for 1–2 days.
- Instruct patient to notify health care professional if skin irritation occurs at site of previous radiation therapy.
- Advise family and/or caregivers to take precautions (i.e., latex gloves) in handling body fluids for at least 5 days post-treatment.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, or herbal products.
- Inform patient that doxorubicin may increase risk of developing secondary cancers.
- **Rep:** Advise patient that this medication may have teratogenic effects. Contraception should be used during and for at least 4 mo after therapy is concluded. Inform patient before initiating therapy that this medication may cause irreversible gonadal suppression.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in size or spread of malignancies in solid tumors.
- Improvement of hematologic status in leukemias.

HIGH ALERT

DOXOrubicin, liposomal

(dox-oh-roo-bi-sin lye-poe-sohm-al)

Doxil

Classification

Therapeutic: antineoplastics

Pharmacologic: anthracyclines

Indications

AIDS-related Kaposi's sarcoma (KS) in patients who cannot tolerate or fail conventional therapy. Ovarian cancer that has progressed or recurred after platinum-based chemotherapy. Multiple myeloma with bortezomib in patients who have not previously received bortezomib and have received at least one prior therapy.

Action

Inhibits DNA and RNA synthesis by forming a complex with DNA; action is cell-cycle S-phase-specific. Also has immunosuppressive properties. Encapsulation in a liposome increases uptake by tumors, prolongs action, and may decrease some toxicity. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: Administered IV only, resulting in complete bioavailability.

Distribution: Widely distributed; does not cross the blood-brain barrier; extensively bound to tissues (\uparrow concentrations delivered to KS lesions due to liposomal carrier).

Metabolism and Excretion: Mostly metabolized by the liver with conversion to an active compound. Excreted mostly in bile, 50% as unchanged drug. $<5\%$ eliminated unchanged in the urine.

Half-life: 55 hr.

TIME/ACTION PROFILE (effect on blood counts)

ROUTE	ONSET	PEAK	DURATION
IV	10 days	14 days	21–24 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; OB, Lactation: Fetal harm may occur.

Use Cautiously in: Pre-existing cardiac disease or \uparrow cumulative doses of anthracyclines; Depressed bone marrow reserve; Liver impairment (dose \downarrow required if

serum bilirubin >1.2 m g/dL); Geri, Pedi: Children, geriatric patients, prior mediastinal radiation, concurrent cyclophosphamide (\uparrow risk of cardiotoxicity); OB: Patients with child-bearing potential.

Adverse Reactions/Side Effects

CNS: weakness. **CV:** CARDIOMYOPATHY. **GI:** nausea, diarrhea, \uparrow alkaline phosphatase, moniliasis, ORAL MALIGNANCY, stomatitis, vomiting. **Derm:** hand-foot syndrome, alopecia. **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** injection site reactions.

Misc: ANAPHYLACTOID ALLERGIC REACTIONS, acute infusion-related reactions, fever.

Interactions

Drug-Drug: \uparrow bone marrow depression with other antineoplastics or radiation therapy. Pediatric patients who have received concurrent doxorubicin and dactinomycin have \uparrow risk of recall pneumonitis following local radiation therapy. May \uparrow skin reactions at previous radiation therapy sites. If paclitaxel is administered first, clearance of doxorubicin is \downarrow and incidence and severity of neutropenia and stomatitis are \uparrow (problem is less if doxorubicin is administered first). Hematologic toxicity is \uparrow by concurrent use of cyclosporine; risk of coma and seizures is also \uparrow . Incidence and severity of neutropenia and thrombocytopenia are \uparrow by concurrent progesterone. Phenobarbital may \uparrow clearance and \downarrow effects of doxorubicin. Doxorubicin may \downarrow metabolism and \uparrow effects of phenytoin. Streptozocin may \uparrow the half-life of doxorubicin (dose reduction of doxorubicin recommended). May \uparrow risk of hemorrhagic cystitis from cyclophosphamide or hepatitis from mercaptopurine. Cardiac toxicity may be \uparrow by radiation therapy or cyclophosphamide. May \downarrow antibody response to live-virus vaccines and \uparrow risk of adverse reactions.

Route/Dosage

AIDS-Related KS

IV (Adults): 20 mg/m² every 3 wk until disease progression or unacceptable toxicity.

Ovarian Cancer

IV (Adults): 50 mg/m² every 4 wk until disease progression or unacceptable toxicity.

Multiple Myeloma

IV (Adults): 30 mg/m² on day 4 (after bortezomib) of each 21-day cycle for 8 cycles or until disease progression or unacceptable toxicity.

Availability (generic available)

Liposomal dispersion for injection: 2 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor BP, pulse, respiratory rate, and temperature frequently during administration. Report significant changes.

- Monitor for acute infusion-related reactions consisting of flushing, shortness of breath, facial swelling, headache, chills, chest pain, back pain, chest or throat tightness, fever, tachycardia, pruritus, rash, cyanosis, syncope, bronchospasm, asthma, apnea, and hypotension. Reactions usually resolve over 1 day and are usually limited to first dose. Slowing infusion rate may minimize this reaction. Reaction is thought to be due to liposome.
 - **Observe for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing).** Discontinue doxorubicin liposome and notify health care professional immediately if these problems occur. **Keep epinephrine, an antihistamine, and resuscitation equipment close by in case of an anaphylactic reaction.**
 - Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
 - Monitor intake and output ratios, and report occurrence of significant discrepancies. Encourage fluid intake of 2000–3000 mL/day. Allopurinol and alkalization of the urine may be used to decrease serum uric acid levels and to help prevent urate stone formation.
 - Severe and protracted nausea and vomiting may occur as early as 1 hr after therapy and may last 24 hr. Administer parenteral antiemetics 30–45 min prior to therapy and routinely around the clock for the next 24 hr as indicated. Monitor amount of emesis and notify health care professional if emesis exceeds guidelines to prevent dehydration.
 - **Assess left ventricular cardiac function (MUGA or echocardiogram) prior to initiation of therapy, during treatment to detect acute changes, and after treatment to detect delayed cardiotoxicity.** Monitor for development of signs of cardiac toxicity, which may be either acute and transient (ST segment depression, flattened T wave, sinus tachycardia, and extrasystoles) or late onset (usually occurs 1–6 mo after initiation of therapy) and characterized by intractable HF (peripheral edema, dyspnea, rales/crackles, weight gain); occurs more frequently in patients receiving a cumulative dose of ≥ 550 mg/m². Cardiotoxicity is more prevalent in children younger than 2 yr and geriatric patients. Dexrazoxane may be used to prevent cardiotoxicity in patients receiving cumulative doses of >300 g/m².
 - Assess injection site frequently for redness, irritation, or inflammation. Doxorubicin liposome is an irritant but may infiltrate painlessly even if blood re-
- turns on aspiration of infusion needle. Severe tissue damage may occur if doxorubicin liposome extravasates. If extravasation occurs, stop infusion immediately, restart, and complete dose in another vein. If possible, withdraw 3–5 mL of blood to remove doxorubicin liposome. Apply ice to site for 15 min. 4 times daily for 3 days. Local infiltration of antidote is not recommended. Delineate the infiltrated area on patient's skin with a felt-tip marker. Elevate for 48 hr above heart level using a sling or stockinette dressing with an observation window cut in the dressing. Avoid pressure or friction. Do not rub the area. Observe for signs of increased erythema, pain, or skin necrosis. If increased symptoms occur, consult a plastic surgeon. After 48 hr, encourage patient to use extremity normally to promote full range of motion.
- Assess oral mucosa frequently for development of stomatitis. Increased dosing interval and/or decreased dose is recommended if lesions are painful or interfere with nutrition.
 - Continue to assess oral mucosa regularly during and for at least 6 yr for ulceration or any discomfort; may indicate secondary oral cancer. *For Grade 1: Painless ulcers, erythema, or mild soreness*, If no previous Grade 3 or 4 toxicity: no dose adjustment. If previous Grade 3 or 4 toxicity: delay up to 2 wks then ↓ dose by 25%. *For Grade 2: Painful erythema, edema, or ulcers, but can eat*, Delay dosing up to 2 wks or until resolved to Grade 0-1. Discontinue therapy if no resolution after 2 wks. If resolved to Grade 0-1 within 2 weeks: if no previous Grade 3 or 4 stomatitis: resume therapy at previous dose. If previous Grade 3 or 4 toxicity: ↓ dose by 25%. *For Grade 3: Painful erythema, edema, or ulcers, and cannot eat*, Delay dosing up to 2 wks or until resolved to Grade 0-1. ↓ dose by 25% and return to original dose interval. If no resolution after 2 wks, discontinue therapy. *For Grade 4: Requires parenteral or enteral support*, Delay dosing up to 2 wks or until resolved to Grade 0-1. ↓ dose by 25% and return to original dose interval. If no resolution after 2 wks, discontinue therapy.
 - Monitor for skin toxicity with prolonged use; hand-foot syndrome (HFS) usually occurs after 6 wk of treatment and consists of swelling, pain, and erythema of the hands and feet. This may progress to desquamation but usually regresses after 2 wk. In severe cases, modification and delay of future doses of doxorubicin liposome may be necessary. *For Grade 1: Mild erythema, swelling, or desquamation not interfering with daily activities*, if no previous Grade 3 or 4 HFS: no dose adjustment. If previous Grade 3 or 4 HFS: delay dose up to 2 wks, then ↓ dose by 25%. *For Grade 2: Erythema, desquamation, or swelling interfering with, but not pre-*

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

cluding normal physical activities; small blisters or ulcerations less than 2 cm in diameter, delay dosing up to 2 wks or until resolved to Grade 0-1. Discontinue therapy if no resolution after 2 wks. If resolved to Grade 0-1 within 2 wks: if no previous Grade 3 or 4 HFS: continue treatment at previous dose. If previous Grade 3 or 4 toxicity: ↓ dose by 25%. For Grade 3: Blistering, ulceration, or swelling interfering with walking or normal daily activities; cannot wear regular clothing. Delay dosing up to 2 wks or until resolved to Grade 0-1, then ↓ dose by 25%. Discontinue therapy if no resolution after 2 wks. For Grade 4: Diffuse or local process causing infectious complications, or a bed ridden state or hospitalization, Delay dosing up to 2 wks or until resolved to Grade 0-1, then ↓ dose by 25%. Discontinue therapy if no resolution after 2 wks.

- **Lab Test Considerations:** Monitor CBC and differential prior to and periodically during therapy. The WBC nadir occurs 10–14 days after administration, and recovery usually occurs by the 21st day. Thrombocytopenia and anemia may also occur. ↑ dosing interval and/or ↓ dose is recommended if ANC is <1000 cells/mm³ and/or platelet count is $<50,000$ cells/mm³. If ANC 1500 – 1900 cells/mm³ and platelets 75,000–150,000 cells/mm³ (Grade 1), resume treatment with no dose reduction. If ANC 1000 – <1500 cells/mm³ and platelets 50,000 – $<75,000$ cells/mm³ (Grade 2), wait until ANC >1500 and platelets $>75,000$; then redose with no dose reduction. If ANC 500 – 999 cells/mm³ and platelets 25,000 – $<50,000$ cells/mm³ (Grade 3), wait until ANC >1500 and platelets $>75,000$; then redose with no dose reduction. If ANC <500 and platelets $<25,000$ cells/mm³ (Grade 4), wait until ANC >1500 and platelets $>75,000$, then redose at 25% dose reduction or continue full dose with prophylactic granulocyte growth factor.
- **Recommended modifications of doxorubicin liposomal when administered with bortezomib.** If fever $\geq 38^{\circ}\text{C}$ and ANC $<1,000/\text{mm}^3$, withhold dose for this cycle if before Day 4; ↓ dose by 25%, if after Day 4 of previous cycle. If on any day of drug administration after Day 1 of each cycle: Platelet count $<25,000/\text{mm}^3$ or Hemoglobin <8 g/dL or ANC $<500/\text{mm}^3$, withhold dose for this cycle if before Day 4; ↓ dose by 25%, if after Day 4 of previous cycle AND if bortezomib is reduced for hematologic toxicity. If Grade 3 or 4 non-hematologic drug related toxicity, do not dose until recovered to Grade <2 , then ↓ dose by 25%.
- Monitor renal (BUN and creatinine) and hepatic (AST, ALT, LDH, and serum bilirubin) function prior to and periodically during therapy. Dose reduction is required for bilirubin >1.2 m g/dL or serum creatinine >3 m g/dL.
- May cause ↑ serum and urine uric acid concentrations.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)

Decreased cardiac output (Adverse Reactions)

Implementation

- **High Alert:** Fatalities have occurred with incorrect administration of chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings.
- **High Alert:** Do not confuse doxorubicin hydrochloride liposome (Doxil) with doxorubicin hydrochloride or with daunorubicin hydrochloride (Cerubidine). Do not confuse Doxil with Paxil. Clarify orders that do not include generic and brand names.
- Prepare solution in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard IV equipment in specially designated containers.
- Aluminum needles may be used to administer doxorubicin but should not be used during storage, because prolonged contact results in discoloration of solution and formation of a dark precipitate. Solution is red.
- Do not increase dose if reduction is made due to toxicity.

IV Administration

- **Intermittent Infusion:** **Diluent:** Dilute dose, up to 90 mg, in 250 mL and doses >90 m g in 500 mL of D5W. Do not dilute with other diluents or diluents containing a bacteriostatic agent. Solution is not clear, but a translucent red liposomal dispersion. Do not use in-line filters. Refrigerate diluted solutions and administer within 24 hr of dilution. **Rate:** Initial rate of infusion should be 1 mg/min to minimize risk of infusion reactions. If no reactions occur, increase rate to complete administration within 1 hr. Do not administer as a bolus or undiluted solution. Rapid infusion may increase infusion-related reactions.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposomal, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, butorphanol, calcium gluconate, carboplatin, caspofungin, ceftazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisraccium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, daptomycin, dexamethasone sodium phosphate, dexmedetomidine, dexrazoxane, digoxin, diphenhydramine, dobutamine, dopamine, droperidol, enalaprilat, ephedrine, epinephrine, epifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fluoroura-

cil, foscarnet, fosphenytoin, furosemide, ganciclovir, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrocortisone sodium succinate, hydromorphone, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, meropenem, mesna, methotrexate, methylglucate, methylprednisolone, metoprolol, metronidazole, midazolam, milrinone, moxifloxacin, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, pentamidine, pentazocine, pentobarbital, phenobarbital, phenylephrine, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, propranolol, quinupristin/dalfopristin, ranitidine, remifentanyl, rituximab, rocuronium, sodium acetate, sodium phosphates, succinylcholine, sufentanil, tacrolimus, thiopental, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** amiodarone, amphotericin B colloidal, buprenorphine, calcium chloride, ceftazidime, dantrolene, diazepam, diltiazem, docetaxel, dolasetron, gemcitabine, hydralazine, hydroxyzine, mannitol, metoclopramide, mitoxantrone, morphine, paclitaxel, phenytoin, piperacillin/tazobactam, promethazine, sodium bicarbonate, theophylline.

Patient/Family Teaching

- Instruct patient to notify health care professional promptly if fever; sore throat; signs of infection; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDs; may precipitate gastric bleeding.
- Instruct patient to report pain at injection site immediately.
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to use sponge brush, rinse mouth with water after eating and drinking, and confer with health care professional if mouth pain interferes with eating. Pain may require treatment with opioid analgesics. The risk of developing stomatitis is greatest 5–10 days after a dose; the usual duration is 3–7 days.

- **Instruct patient to notify health care professional immediately if irregular heartbeat, shortness of breath, swelling of lower extremities, or skin irritation (swelling, pain, or redness of feet or hands) occurs.**
- Discuss the possibility of hair loss with patient. Explore methods of coping. Regrowth usually occurs 2–3 mo after discontinuation of therapy.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Inform patient that medication may cause urine to appear red for 1–2 days.
- Instruct patient to notify health care professional if skin irritation occurs at site of previous radiation therapy.
- Advise family and/or caregivers to take precautions (i.e., latex gloves) in handling body fluids for at least 5 days post-treatment.
- **Rep:** Advise patient that this medication may have teratogenic effects. Contraception should be used during and for at least 6 mo after therapy is concluded. Inform patient before initiating therapy that this medication may cause irreversible gonadal suppression. In females, may cause infertility, amenorrhea, and premature menopause. In men, may result in oligospermia, azoospermia, and permanent loss of fertility. Some sperm counts have returned to normal several years after therapy ended. Advise female patient to avoid breast feeding during therapy.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in size or spread of malignancies.
- Arrested progression of KS in patients with HIV infection.

doxycycline, See TETRACYCLINES.

doxylamine/pyridoxine
(dox-il-a-meen peer-ih-dox-een)
Diclegis,  Diclectin

Classification

Therapeutic: antiemetics

Pharmacologic: antihistamines, vitamin B₆ analogues

Indications

Treatment of nausea and vomiting during pregnancy that has not responded to conservative management.

Action

Combination of an antihistamine and a vitamin B₆ analog. Mechanism not known. **Therapeutic Effects:** Decreased nausea and vomiting associated with pregnancy.

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Pharmacokinetics

Absorption: Well absorbed following oral administration. Food delays/decreases absorption.

Distribution: Doxylamine probably enters breast milk.

Metabolism and Excretion: Doxylamine is mostly metabolized by the liver, inactive metabolites are renally excreted. Pyridoxine is a pro-drug, converted to its active metabolite by the liver.

Half-life: *Doxylamine*— 12.5 hr; *pyridoxine*— 0.4–0.5 hr.

TIME/ACTION PROFILE (anti-emetic effect)

ROUTE	ONSET	PEAK	DURATION
PO	unk	unk	8–24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to doxylamine or pyridoxine; Concurrent use of MAOIs; **Lactation:** Doxylamine probably enters breast milk and may cause irritability, excitement, or sedation in infants; breast feeding should be avoided.

Use Cautiously in: Asthma; ↑ intraocular pressure or narrow angle glaucoma; Stenosing peptic ulcer or pyloroduodenal obstruction; Urinary bladder-neck obstruction; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: drowsiness.

Interactions

Drug-Drug: ↑ risk of CNS depression with other CNS depressants including alcohol, other antihistamines, opioid analgesics, and sedative/hypnotics. Concurrent use of MAOIs ↑ intensity/duration of adverse CNS (anticholinergic) reactions.

Route/Dosage

PO (Adults): *Day 1*— 2 tablets (doxylamine 10 mg/pyridoxine 10 mg) at bedtime, if symptoms are controlled continue this regimen; *Day 2, if symptoms persist into afternoon on day 2*— 2 tablets at bedtime on day 2 and then 1 tablet in the morning on day 3 and 2 tablets in the evening, if symptoms are controlled, continue this regimen; *Day 4, if symptoms persist*— 1 tablet in the morning, 1 tablet mid-afternoon and 2 tablets at bedtime (not to exceed four tablets daily).

Availability (generic available)

Delayed-release tablets: doxylamine 10 mg/pyridoxine 10 mg.

NURSING IMPLICATIONS

Assessment

- Assess for frequency and amount of emesis daily during therapy. Reassess need for medication as pregnancy progresses.
- Monitor hydration status to prevent dehydration.

Potential Nursing Diagnoses

Nausea (Indications)

Risk for injury (Adverse Reactions)

Implementation

- **PO:** Administer on an empty stomach with a full glass of water; food delays onset of medication. Swallow tablets whole; do not crush, break, or chew.

Patient/Family Teaching

- Instruct patient to take as directed.
- May cause drowsiness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to avoid alcohol and CNS depressants, including sedatives, tranquilizers, antihistamines, opioids, and some cough and cold medications with doxylamine pyridoxine.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise female patient to avoid breast feeding during therapy.

Evaluation/Desired Outcomes

- Decrease in frequency of nausea and vomiting during pregnancy.

dronedarone (droe-ned-a-rone)

Multaq

Classification

Therapeutic: antiarrhythmics

Pharmacologic: benzofurans

Indications

Reduces the risk of hospitalization for atrial fibrillation (AF) in patients in sinus rhythm with a history of paroxysmal or persistent AF.

Action

Has several antiarrhythmic properties; prolongs PR and QTc intervals. **Therapeutic Effects:** Suppression of AF/AFL.

Pharmacokinetics

Absorption: Poor bioavailability (4%) due to extensive first-pass hepatic metabolism (4%); food ↑ bioavailability (15%).

Distribution: Unknown.

Protein Binding: >98%.

Metabolism and Excretion: Undergoes extensive first-pass hepatic metabolism; mostly by the CYP3A enzyme system. 6% excreted in urine as metabolites, 84% was excreted in feces as metabolites. Minimal elimination as unchanged drug.

Half-life: 13–19 hr.

TIME/ACTION PROFILE (antiarrhythmic effect)

ROUTE	ONSET	PEAK	DURATION
PO	unknown†	3–6 hr‡	12 hr

† Steady state blood levels are attained at 4–8 days.

‡ Peak levels after individual doses.

Contraindications/Precautions

Contraindicated in: Class IV heart failure or Class II–III heart failure with recent decompensation requiring hospitalization; Permanent AF; Second- or third-degree atrioventricular (AV) block or sick sinus syndrome (unless a pacemaker is present); Heart rate <50 bpm; Concurrent use of strong CYP3A inhibitors or drugs/herbal products that prolong the QT interval; liver or lung toxicity related to previous amiodarone use; QTc interval \geq 500 msec; PR interval $>$ 280 msec; Concurrent use of Class I or III antiarrhythmics including amiodarone, flecainide, propafenone, quinidine, disopyramide, dofetilide, and sotalol; must be discontinued prior to treatment; Severe hepatic impairment; **OB:** May cause fetal harm; **Lactation:** Avoid use.

Use Cautiously in: New/worsening heart failure; Hypokalemia or hypomagnesemia (may \uparrow risk of arrhythmias); Mild or moderate hepatic impairment; **Rep:** Women of reproductive potential (use effective contraception); **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: weakness. **CV:** HF, QTc prolongation. **GI:** HEPATOTOXICITY, abdominal pain, diarrhea, nausea, taste abnormality, vomiting. **Resp:** PNEUMONITIS, PULMONARY FIBROSIS. **GU:** ACUTE RENAL FAILURE, renal impairment.

Derm: photosensitivity. **Misc:** ANGIOEDEMA.

Interactions

Drug-Drug: Dronedaron is metabolized by CYP3A and is a moderate inhibitor of CYP3A and CYP2D6 enzyme systems; interactions may occur with other drugs that are substrates for or are metabolized by these systems. Dronedaron also inhibits P-gp, which can result in \uparrow absorption of certain drugs. Concurrent use of **strong CYP3A inhibitors** including ketoconazole, itraconazole, voriconazole, cyclosporine, clarithromycin, nefazodone, and ritonavir or **drugs that prolong the QT interval** including phenothiazine antipsychotics, tricyclic antidepressants, and other **Class I and III antiarrhythmics** \uparrow risk of serious adverse cardiovascular reactions; concurrent use contraindicated. Concurrent use of CYP3A4 inducers including rifampin, phenobarbital, carbamazepine, or phenytoin \downarrow blood levels and effectiveness and should be avoided. \uparrow **digoxin** levels and the risk of toxicity (discontinue or \downarrow dose of digoxin by 50% before treatment and monitor carefully). May \uparrow **dabiga-**

tran and **warfarin** levels and the risk of bleeding. Avoid concurrent use of other **antiarrhythmics**, including **amiodarone**, **flecainide**, **propafenone**, **quinidine**, **disopyramide**, **dofetilide**, and **sotalol** due to \uparrow risk of adverse cardiovascular reactions; discontinue prior to dronedaron therapy (concurrent use is contraindicated). Concurrent use of **diltiazem**, **verapamil**, **digoxin**, or **beta-blockers** \uparrow risk of bradycardia (initiate at lower dose and \uparrow only after ECG evaluation). May also \uparrow levels and effects of **tricyclic antidepressants**, and **selective serotonin reuptake inhibitors (SSRIs)**. May \uparrow levels and risk of toxicity of some **HMG-CoA reductase inhibitors (statins)**; do not exceed simvastatin dose of 10 mg/day. Concurrent use with **CYP 3A substrates** including **seriolimus** and **tacrolimus** may \uparrow risk of serious adverse reactions; monitor and adjust dosage carefully.

Drug-Natural Products: **St. John's wort** \downarrow blood levels and may \downarrow effectiveness; avoid concurrent use.

Drug-Food: **Grapefruit juice** may \uparrow levels and the risk of toxicity; avoid concurrent ingestion.

Route/Dosage

PO (Adults): 400 mg twice daily.

Availability

Tablets: 400 mg.

NURSING IMPLICATIONS

Assessment

- **Assess** for signs and symptoms of atrial fibrillation or atrial flutter (palpitations, abnormal ECG) periodically during therapy. If atrial fibrillation occurs, cardiovert or discontinue dronedaron; increases risk of stroke, hospitalization for HF, and death.
- Monitor ECG periodically and at least every 3 mo during therapy. If QTc \geq 500 ms or PR interval $>$ 280 ms, discontinue therapy.
- **Assess** for signs and symptoms of hepatic injury (anorexia, nausea, vomiting, fever, malaise, fatigue, right upper quadrant pain, jaundice, dark urine, or itching) during therapy. If hepatic injury is suspected, discontinue therapy and test serum enzymes (AST, ALT), alkaline phosphatase, and serum bilirubin to determine liver injury. If liver injury occurs, begin treatment. Do not restart therapy without another explanation for liver injury.
- **Assess** for signs of pulmonary toxicity (dyspnea, nonproductive cough) periodically during therapy. If pulmonary toxicity occurs, discontinue therapy.
- **Lab Test Considerations:** Monitor serum hepatic enzymes periodically, especially during first 6 mo of therapy.
- Monitor serum potassium and magnesium levels during therapy and maintain within normal range. May cause hypokalemia and hypomagnesemia.

* = Canadian drug name. † = Genetic implication. ‡ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Monitor serum creatinine levels periodically during therapy. Serum creatinine levels ↑ by about 0.1 mg/dL following initiation of therapy with a rapid onset and plateau after 7 days; reversible with discontinuation. If ↑ and plateau occurs, use increased value as new baseline.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)

Implementation

- Patient should be on concurrent antithrombotic therapy.
- **PO:** Administer twice daily with morning and evening meals.

Patient/Family Teaching

- Instruct patient to take dronedarone as directed. Do not stop taking dronedarone, even if feeling better, without consulting health care professional. If a dose is missed, omit and take next dose at regularly scheduled time; do not double dose. Advise patient to read *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- Advise patient to avoid grapefruit juice during therapy; may increase drug levels.
- Advise patient to notify health care professional if signs and symptoms of HF (weight gain, dependent edema, increasing shortness of breath), hepatic injury, or pulmonary toxicity occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort.
- May be teratogenic. Caution female patients of reproductive potential to use effective contraception during therapy and to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Reduction in hospitalization of patients with paroxysmal or persistent atrial fibrillation or atrial flutter.

REMS

dulaglutide (doo-la-gloo-tide)

Trulicity

Classification

Therapeutic: antidiabetics

Pharmacologic: glucagon-like peptide-1 (GLP-1) receptor agonists

Indications

Adjunct treatment to diet and exercise in the management of adults with type 2 diabetes mellitus; not recommended as first line therapy, as a substitute for insulin, in patients with type 1 diabetes, or for ketoacidosis.

Action

Acts as an acylated human Glucagon-Like Peptide-1 (GLP-1, an incretin) receptor agonist; increases intracellular cyclic AMP (cAMP) leading to insulin release when glucose is elevated, which then subsides as blood glucose decreases toward euglycemia. Also decreases glucagon secretion and delays gastric emptying. **Therapeutic Effects:** Improved glycemic control.

Pharmacokinetics

Absorption: 0.75 mg dose—65% absorbed following subcutaneous administration; 1.5 mg dose—47% absorbed following subcutaneous administration.

Distribution: Unknown.

Metabolism and Excretion: Degraded by protein catabolic processes.

Half-life: 5 days.

TIME/ACTION PROFILE (↓ in HbA_{1c})

ROUTE	ONSET	PEAK	DURATION
subcut	within 4 wk	13 wk	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Personal or family history of medullary thyroid carcinoma; Multiple Endocrine Neoplasia syndrome type 2; History of pancreatitis; Type 1 diabetes; Diabetic ketoacidosis; Severe gastrointestinal disease (including severe gastroparesis).

Use Cautiously in: History of angioedema to another GLP-1 receptor agonist; Hepatic/renal impairment; **OB:** Use only if potential benefit justifies potential risk to fetus; **Lactation:** Use only if potential benefit of breast feeding justified potential risk to infant; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: fatigue. **Derm:** pruritis, rash. **Endo:** **THYROID C-CELL TUMORS.** **GI:** PANCREATITIS, abdominal pain, nausea, vomiting, constipation, ↓ appetite, diarrhea, dyspepsia. **GU:** acute renal failure. **Local:** hypersensitivity reactions including ANAPHYLAXIS AND ANGIOEDEMA, injection site reactions.

Interactions

Drug-Drug: Concurrent use with insulin or agents that increase insulin secretion including sulfonylureas may ↑ the risk of serious hypoglycemia, use cautiously and consider dose ↓ of insulin or agents increasing insulin secretion. May alter absorption of concomitantly administered oral medications due to delayed gastric emptying.

Route/Dosage

Subcut (Adults): 0.75 mg once weekly; may ↑ to 1.5 mg once weekly to obtain glycemic control.

Availability

Solution for subcutaneous injection: 0.75 mg/0.5 mL single-dose pen, 0.75 mg/0.5 mL single-dose prefill-

led syringe, 1.5 mg/0.5 mL single-use pen, 1.5 mg/0.5 mL single-dose prefilled syringe.

NURSING IMPLICATIONS

Assessment

- Observe patient taking concurrent insulin for signs and symptoms of hypoglycemic reactions (sweating, hunger, weakness, dizziness, tremor, tachycardia, anxiety, headache, blurred vision, slurred speech, irritability).
- **If thyroid nodules or elevated serum calcitonin are noted, patient should be referred to an endocrinologist.**
- **Monitor for pancreatitis (persistent severe abdominal pain, sometimes radiating to the back, with or without vomiting). If pancreatitis is suspected, discontinue dulaglutide; if confirmed, do not restart dulaglutide.**
- **Lab Test Considerations:** Monitor serum HbA_{1c} periodically during therapy to evaluate effectiveness.
- May ↑ lipase and pancreatic amylase.

Potential Nursing Diagnoses

Imbalanced nutrition: more than body requirements (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- **Subcut:** Administer once weekly at any time of the day, without regard to food. Day of wk may be changed as long as at least 72 hr before next dose. Inject into abdomen, thigh, or upper arm. Solution should be clear and colorless; do not administer solutions that are discolored or contain particulate matter.

Patient/Family Teaching

- Instruct patient on use of pen and to take dulaglutide as directed. Follow manufacturer's instructions for pen use. Pen should never be shared between patients, even if needle is changed. Store pen in refrigerator; do not freeze. After initial use, pen may be stored at room temperature up to 14 days. Advise patient to read the *Patient Medication Guide* before starting dulaglutide and with each Rx refill in case of changes.
- Take missed dose as soon as remembered as long as 3 days (72 hr) until next scheduled dose. If less than 3 days until next scheduled dose, skip and take next scheduled dose.
- Inform patient that nausea is the most common side effect, but usually decreases over time.
- Advise patient taking insulin and dulaglutide to never mix insulin and dulaglutide together. Give as 2 sepa-

rate injections. Both injections may be given in the same body area, but should not be given right next to each other.

- Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long-term.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water and notify health care professional.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hypoglycemic or hyperglycemic episodes.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness, and health care professional should be notified if significant changes occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- **Advise patient to notify discontinue dulaglutide and health care professional immediately if signs of pancreatitis (nausea, vomiting, abdominal pain) or hypersensitivity (swelling of face, lips, tongue or throat, problems breathing or swallowing, severe rash or itching, fainting or feeling dizzy, very rapid heartbeat) occur.**
- **Inform patient of risk of benign and malignant thyroid C-cell tumors. Advise patient to notify health care professional if symptoms of thyroid tumors (lump in neck, hoarseness, trouble swallowing, shortness of breath) or if signs of allergic reaction (swelling of face, lips, tongue, or throat; fainting or feeling dizzy; very rapid heartbeat; problems breathing or swallowing; severe rash or itching) occur.**
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to carry a form of sugar (sugar packets, candy) and identification describing disease process and medication regimen at all times.
- Insulin is the preferred method of controlling blood glucose during pregnancy. Counsel female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of routine follow-up exams.

Evaluation/Desired Outcomes

- Improved glycemic control.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

DULoxetine (do-lox-e-teen)

Cymbalta

Classification

Therapeutic: antidepressants

Pharmacologic: selective serotonin/norepinephrine reuptake inhibitors

Indications

Major depressive disorder. Diabetic peripheral neuropathic pain. Generalized anxiety disorder. Fibromyalgia. Chronic musculoskeletal pain (including chronic lower back pain and chronic pain from osteoarthritis).

Unlabeled Use: Stress urinary incontinence.

Action

Inhibits serotonin and norepinephrine reuptake in the CNS. Both antidepressant and pain inhibition are centrally mediated. **Therapeutic Effects:** Decreased depressive symptomatology. Decreased neuropathic pain. Decreased symptoms of anxiety. Decreased pain.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Unknown.

Protein Binding: Highly (> 90%) protein-bound.

Metabolism and Excretion: Mostly metabolized, primarily by the CYP2D6 and CYP1A2 enzyme pathways; \approx the CYP2D6 enzyme system exhibits genetic polymorphism; \sim 7% of population may be poor metabolizers (PMs) and may have significantly \uparrow duloxetine concentrations and an \uparrow risk of adverse effects.

Half-life: 12 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	6 hr	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of MAO inhibitors or MAO-like drugs (linezolid or methylene blue); Severe renal impairment (CCr <30 mL/min); Chronic hepatic impairment or substantial alcohol use (\uparrow risk of hepatitis); **Lactation:** May enter breast milk; discontinue or bottle-feed.

Use Cautiously in: History of suicide attempt or ideation; History of mania (may activate mania/hypomania); Concurrent use of other centrally acting drugs (\uparrow risk of adverse reactions); History of seizure disorder; Diabetes (may worsen glycemic control); Angle-closure glaucoma; **OB:** Use during 3rd trimester may result in neonatal serotonin syndrome requiring prolonged hospitalization, respiratory and nutritional support; **Pedi:** May \uparrow risk of suicide attempt/ideation especially during dose early treatment or dose adjustment; risk may be greater in children or adolescents; **Geri:** \uparrow risk of orthostatic hypotension and falls.

Adverse Reactions/Side Effects

CNS: NEUROLEPTIC MALIGNANT SYNDROME, SEIZURES, SUICIDAL THOUGHTS, fatigue, drowsiness, insomnia, activation of mania, dizziness, fainting, falls, nightmares.

EENT: blurred vision, \uparrow intraocular pressure. **CV:** \uparrow BP, orthostatic hypotension. **GI:** HEPATOTOXICITY, PANCREATITIS, \downarrow appetite, constipation, dry mouth, nausea, diarrhea, \downarrow liver enzymes, gastritis, vomiting. **F and E:** hyponatremia. **GU:** dysuria, abnormal orgasm, erectile dysfunction, \downarrow libido, urinary retention. **Derm:** ERYTHEMA MULTIFORME, STEVENS-JOHNSON SYNDROME, \uparrow sweating, pruritus, rash. **Neuro:** tremor. **Misc:** SEROTONIN SYNDROME.

Interactions

Drug-Drug: Concurrent use with MAO inhibitors may result in serious potentially fatal reactions (Do not use within 14 days of discontinuing MAOI. Wait at least 5 days after stopping duloxetine to start MAOI). Concurrent use with MAO-inhibitor-like drugs, such as linezolid or methylene blue may \uparrow risk of serotonin syndrome; concurrent use contraindicated; do not start therapy in patients receiving linezolid or methylene blue; if linezolid or methylene blue need to be started in a patient receiving duloxetine, immediately discontinue duloxetine and monitor for signs/symptoms of serotonin syndrome for 5 days or until 24 hr after last dose of linezolid or methylene blue, whichever comes first (may resume duloxetine therapy 24 hr after last dose of linezolid or methylene blue). \uparrow risk of hepatotoxicity with alcohol use disorder/alcohol abuse. Drugs that affect serotonergic neurotransmitter systems, including tricyclic antidepressants, SSRIs, fentanyl, bupropion, tramadol, amphetamines, and triptans \uparrow risk of serotonin syndrome. Drugs that inhibit CYP1A2, including fluvoxamine and some fluoroquinolones, \uparrow levels of duloxetine and should be avoided. Drugs that inhibit CYP2D6, including paroxetine, fluoxetine, and quinidine \uparrow levels of duloxetine and may increase the risk of adverse reactions. Duloxetine also inhibits CYP2D6 and may \uparrow levels of drugs metabolized by CYP2D6, including tricyclic antidepressants, phenothiazines, and class Ic antiarrhythmics (propafenone and flecainide); concurrent use should be undertaken with caution. \uparrow risk of serious arrhythmias with thioridazine; avoid concurrent use. \uparrow risk of bleeding with aspirin, NSAIDs, or warfarin.

Drug-Natural Products: Use with St. John's wort \uparrow serotonin syndrome.

Route/Dosage**Major Depressive Disorder**

PO (Adults): 40–60 mg/day (as 20 mg or 30 mg twice daily or as 60 mg once daily) as initial therapy, then 60 mg once daily as maintenance therapy.

Generalized Anxiety Disorder

PO (Adults ≥65 yr): 30 mg once daily for 2 wk; may then consider ↑ to 60 mg once daily, then may ↑ by 30 mg once daily to maintenance dose of 60–120 mg once daily.

PO (Adults <65 yr): 30–60 mg once daily as initial therapy (if initiated on 30 mg once daily, should titrate to 60 mg once daily after 1 wk), then may ↑ by 30 mg once daily to maintenance dose of 60–120 mg once daily.

PO (Children 7–17 yr): 30 mg once daily for 2 wk; may then consider ↑ to 60 mg once daily; recommended maintenance dose = 30–60 mg once daily (not to exceed 120 mg once daily).

Diabetic Peripheral Neuropathic Pain

PO (Adults): 60 mg once daily.

Fibromyalgia

PO (Adults): 30 mg once daily for 1 wk, then ↑ to 60 mg once daily.

Chronic Musculoskeletal Pain

PO (Adults): 60 mg once daily (may also be started on 30 mg once daily and ↑ to 60 mg once daily after 1 wk).

Availability (generic available)

Capsules: 20 mg, 30 mg, 40 mg, 60 mg. **Cost:** 20 mg \$437.15/60, 30 mg \$473.58/60, 60 mg \$478.64/60.

NURSING IMPLICATIONS

Assessment

- Assess for sexual dysfunction (erectile dysfunction; decreased libido).
- Monitor BP before and periodically during therapy. Sustained hypertension may be dose related; decrease dose or discontinue therapy if this occurs.
- Monitor appetite and nutritional intake. Weigh weekly. Report continued weight loss. Adjust diet as tolerated to support nutritional status.
- Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression, especially in early therapy or during dose changes. Risk may be increased in children, adolescents, and adults ≤24 yr. Restrict amount of drug available to patient.
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyperreflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general

malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.

- **Depression:** Assess mental status (orientation, mood, and behavior). Inform health care professional if patient demonstrates significant increase in anxiety, nervousness, or insomnia.
- **Pain and Fibromyalgia:** Assess intensity, quality, and location of pain periodically during therapy. May require several wk for effects to be seen.
- **Lab Test Considerations:** May cause ↑ ALT, AST, bilirubin, CPK, and alkaline phosphatase.
- May cause hyponatremia.
- Monitor blood sugar and hemoglobin A1c. May cause slight ↑ in blood glucose.

Potential Nursing Diagnoses

Ineffective coping (Indications)

Risk for suicide (Adverse Reactions)

Chronic pain (Indications)

Implementation

- Do not confuse duloxetine with fluoxetine or paroxetine. Do not confuse Cymbalta with Symbyax.
- **PO:** May be administered without regard to meals. Capsules should be swallowed whole. Do not crush, chew, or open and sprinkle contents on food or liquids; may affect enteric coating.

Patient/Family Teaching

- Instruct patient to take duloxetine as directed at the same time each day. Take missed doses as soon as possible unless time for next dose. Do not stop abruptly; may cause dizziness, headache, nausea, diarrhea, paresthesia, irritability, vomiting, insomnia, anxiety, hyperhidrosis, and fatigue; must be decreased gradually.
- Encourage patient and family to be alert for emergence of anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, mania, worsening of depression and suicidal ideation, especially during early antidepressant therapy. If these symptoms occur, notify health care professional.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to make position changes slowly to minimize orthostatic hypotension and falls, especially in elderly patients and those taking anti-hypertensive medications.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Instruct patient to notify health care professional if signs of serotonin syndrome (mental status changes: agitation, hallucinations, coma; autonomic instabil-

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

ity: tachycardia, labile BP, hyperthermia; neuromuscular aberrations: hyperreflexia, incoordination; and/or gastrointestinal symptoms: nausea, vomiting, diarrhea), liver damage (pruritus, dark urine, jaundice, right upper quadrant tenderness, unexplained “flu-like” symptoms) or rash occur.

- Advise patient to avoid taking alcohol during duloxetine therapy.
- Instruct patient to notify health care professional if pregnancy is planned or suspected or if breast feeding. Encourage any patient exposed to duloxetine during pregnancy to register with the Cymbalta Pregnancy Registry at 1-866-814-6975 or www.cymbaltapregnancyregistry.com.

Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings. Need for therapy should be periodically reassessed. Patients may notice improvement within 1–4 wk, but should be advised to continue therapy as directed. Therapy is usually continued for several mo.
- Decrease in neuropathic pain associated with diabetic peripheral neuropathy.
- Decrease in chronic musculoskeletal pain and pain and soreness associated with fibromyalgia.
- Decrease in anxiety.

dutasteride (doo-tas-te-ride)

Avodart

Classification

Therapeutic: benign prostatic hyperplasia (BPH) agents
Pharmacologic: androgen inhibitors

Indications

Management of the symptoms of benign prostatic hyperplasia (BPH) in men with an enlarged prostate gland (alone or with tamsulosin).

Action

Inhibits the enzyme 5-alpha-reductase, which is responsible for converting testosterone to its potent metabolite 5-alpha-dihydrotestosterone in the prostate gland and other tissues. 5-Alpha-dihydrotestosterone is partly responsible for prostatic hyperplasia. **Therapeutic Effects:** Reduced prostate size with associated decrease in urinary symptoms.

Pharmacokinetics

Absorption: Well absorbed (60%) following oral administration; also absorbed through skin.

Distribution: 11.5% of serum concentration partitions into semen.

Protein Binding: 99% bound to albumin; 96.6% bound to alpha-1 glycoprotein.

Metabolism and Excretion: Mostly metabolized by the liver via the CYP3A4 metabolic pathway; metabolites are excreted in feces.

Half-life: 5 wk.

TIME/ACTION PROFILE (reduction in dihydrotestosterone levels†)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–2 wk	unknown

†Symptoms may only improve over 3–12 mo.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with other 5-alpha-reductase inhibitors may occur; Women; **Pedi:** Children.

Use Cautiously in: Hepatic impairment.

Adverse Reactions/Side Effects

CNS: depressed mood. **GU:** **PROSTATE CANCER** (high-grade), ↓ libido, ejaculation disorders, erectile dysfunction, testicular pain, testicular swelling. **Endo:** gynecomastia. **Derm:** rash, urticaria. **Misc:** **ALLERGIC REACTIONS, ANGIOEDEMA.**

Interactions

Drug-Drug: Blood levels and effects may be ↑ by ritonavir, ketoconazole, verapamil, diltiazem, cimetidine, ciprofloxacin, or other CYP3A4 enzyme inhibitors.

Route/Dosage

PO (Adults): 0.5 mg once daily (with or without tamsulosin).

Availability (generic available)

Soft gelatin capsules: 0.5 mg. **In combination with:** tamsulosin (Jalyn); see Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess patient for symptoms of prostatic hyperplasia (urinary hesitancy, feeling of incomplete bladder emptying, interruption of urinary stream, impairment of size and force of urinary stream, terminal urinary dribbling, straining to start flow, dysuria, urgency) before and periodically during therapy.
- Digital rectal examinations should be performed before and periodically during therapy for BPH.
- **Lab Test Considerations:** Serum prostate-specific antigen (PSA) concentrations, used to screen for prostate cancer, decrease by about 20% within the 1st mo of therapy and stabilize at about 50% of the pretreatment level within 6 mo. New baseline PSA concentrations should be established at 3 and 6 mo of therapy and evaluated periodically during therapy. Any increase in PSA during dutasteride therapy may be a sign of prostate cancer and should be evaluated, even those within normal limits. Isolated PSA values from men taking dutasteride for 3 mo or more should be doubled for comparison in untreated men.

Potential Nursing Diagnoses

Impaired urinary elimination (Indications)

Implementation

- **PO:** Administer once daily with or without meals. Do not break, crush, or chew capsule.

Patient/Family Teaching

- Instruct patient to take dutasteride at the same time each day as directed, even if symptoms improve or are unchanged. Take missed doses as soon as remembered later in the day or omit dose. Do not make up by taking double doses the next day.
- Caution patient that sharing of dutasteride may be dangerous.
- Inform patient that the volume of ejaculate may be decreased during therapy but that this will not interfere with normal sexual function.
- Advise patient to avoid donating blood for at least 6 mo after last dose of dutasteride to prevent a preg-

nant female from receiving dutasteride through a blood transfusion.

- Inform patient of potential increase risk in high-grade prostate cancer.
- Caution patient that dutasteride poses a potential risk to a male fetus. Women who are pregnant or may become pregnant should avoid exposure to semen of a partner taking dutasteride and should not handle dutasteride because of the potential for absorption.
- Emphasize the importance of periodic follow-up exams to determine whether a clinical response has occurred.

Evaluation/Desired Outcomes

- Decrease in urinary symptoms of BPH.

* = Canadian drug name. ~~⊗~~ = Genetic implication. ~~⊗~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

econazole, See ANTIFUNGALS (TOPICAL).

edaravone (e-dar-a-vone)

Radicava

Classification

Therapeutic: agents amyotrophic lateral sclerosis

Indications

Amyotrophic lateral sclerosis (ALS).

Action

Unknown. **Therapeutic Effects:** Improved functional ability.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Protein Binding: 92%.

Metabolism and Excretion: Metabolized via sulfation and glucuronidation into inactive metabolites. Primarily eliminated in urine (1% as unchanged drug).

Half-life: 4.5–6 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1 hr	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Sulfite allergy.

Use Cautiously in: **OB:** Safety not established; **Lactation:** Consider benefits of breast feeding against possible risk to infant; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: headache. **Derm:** contusion, dermatitis, eczema, fungal infection (tinea). **GU:** glycosuria.

Neuro: gait abnormality. **Misc:** **HYPERSENSITIVITY REACTIONS** (including anaphylaxis).

Interactions

Drug-Drug: None known.

Route/Dosage

IV (Adults): 60 mg once daily for 14 day, followed by a drug-free period of 14 days. Each subsequent cycle should consist of 60 mg once daily for 10 days out of 14 days, followed by a drug-free period of 14 days.

Availability

Premixed infusion: 30 mg/100 mL.

NURSING IMPLICATIONS

Assessment

- Assess respiratory and functional status prior to and periodically during therapy.
- Monitor for signs and symptoms of hypersensitivity reactions or sulfite allergic reactions (redness, wheals, erythema multiforme, urticaria, decreased blood pressure, dyspnea) with each infusion. If reaction occurs, discontinue therapy and treat with standard care.

Potential Nursing Diagnoses

Activity intolerance

Ineffective breathing pattern (Indications)

Implementation

- Intermittent Infusion:** Do not use if oxygen indicator has turned blue or purple before opening package. Use within 24 hrs of opening overwrap. Solution is clear and colorless; do not administer solutions that are discolored or contain particulate matter. **Rate:** Infuse as 2 consecutive infusion bags over 60 min at 1 mg/min.
- Y-Site Incompatibility:** Do not mix with other medications.

Patient/Family Teaching

- Explain purpose of medication to patient.
- Instruct patient to notify health care professional immediately if signs and symptoms of hypersensitivity or allergic reactions occur.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Improved functional ability.

edoxaban (e-dox-a-ban)

✳ Lixiana, Savaysa

Classification

Therapeutic: anticoagulants

Pharmacologic: factor Xa inhibitors

Indications

Reduction of stroke/systemic embolization (SE) risk associated with nonvalvular atrial fibrillation (NVAf).

Action

Selective inhibitor of factor Xa. Does not inhibit platelet aggregation directly, but does inhibit thrombin-induced platelet aggregation. Decreases thrombin generation and thrombus development. **Therapeutic Effects:** Decreased thrombotic events associated with atrial fibrillation including stroke and systemic embolization. Treatment of deep vein thrombosis (DVT) and pulmo-

✳ = Canadian drug name.  = Genetic implication. ~~Stroke~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

nary embolism (PE) after 5–10 days of parenteral anti-coagulant.

Pharmacokinetics

Absorption: 62% absorbed following oral administration.

Distribution: Unknown.

Metabolism and Excretion: Minimal metabolism, one metabolite is pharmacologically active. Excreted mostly unchanged in urine.

Half-life: 10–14 hr.

TIME/ACTION PROFILE (anticoagulant effect)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–2 hr	24 hr

Contraindications/Precautions

Contraindicated in: Active bleeding; CCr >95 mL/min (↓ effectiveness); Concurrent use of other anticoagulants or rifampin; Presence of mechanical heart valves or severe mitral stenosis; Moderate to severe hepatic impairment; **Lactation:** Discontinue edoxaban or discontinue breast feeding.

Use Cautiously in: Elective/planned invasive/surgical procedures (discontinue at least 24 hr prior to ↓ risk of bleeding); Premature discontinuation (↑ risk of ischemic events); Neuroaxial anesthesia/spinal puncture (↑ risk of spinal/epidural hematoma and potential paralysis); Renal impairment (dose reduction required for CCr 15–50 mL/min); Deteriorating or improving renal function (may require dose change); Body weight ≤60 kg (requires lower dose); **OB:** Use during pregnancy only if potential benefit outweighs potential risk to fetus; **Pedi:** Safe and effective use in children has not been established.

Adverse Reactions/Side Effects

GI: abnormal liver function tests. **Hemat:** BLEEDING, anemia.

Interactions

Drug-Drug: ↑ risk of bleeding with other anticoagulants, aspirin, clopidogrel, ticagrelor, prasugrel, fibrinolytics, NSAIDs, SNRIs, or SSRIs. Rifampin may ↓ blood levels and effectiveness and is contraindicated. Concurrent use of **P-gp inhibitors** including azithromycin, clarithromycin, erythromycin, itraconazole (oral), ketoconazole (oral), quinidine, or verapamil ↑ blood levels and the risk of bleeding (lower dose required).

Route/Dosage

Treatment of NVAF

PO (Adults): 60 mg once daily.

Renal Impairment

PO (Adults): CCr 15–50 mL/min—30 mg once daily.

Treatment of DVT/PE

PO (Adults >60 kg): 60 mg once daily.

PO (Adults ≤60 kg or certain concurrent P-gp inhibitors): 30 mg once daily.

Renal Impairment

PO (Adults CCr 15–50 mL/min): 30 mg once daily.

Availability

Tablets: 15 mg, 30 mg, 60 mg.

NURSING IMPLICATIONS

Assessment

- Monitor for bleeding. Discontinue edoxaban if active pathological bleeding occurs. Concomitant drugs (aspirin, other antiplatelet agents, other antithrombotic agents, fibrinolytic therapy, chronic use of NSAIDs) may increase risk of bleeding. Anticoagulant effects of edoxaban persist for about 24 hr after last dose; there is no established way to reverse anticoagulant effects. Anticoagulant effects cannot be reliably monitored with standard laboratory tests. No reversal agent is available; protamine sulfate, vitamin K, and tranexamic acid do not reverse anticoagulant activity. May consider prothrombin complex concentrates (PCC), or other procoagulant reversal agents such as activated prothrombin complex concentrate (APCC) or recombinant factor VIIa (r-FVIIa). If PCC is used, monitoring anticoagulation effect of edoxaban using clotting test (PT, INR, or aPTT) or anti-FXa activity is not useful. Hemodialysis does not significantly contribute to edoxaban clearance.
 - Monitor frequently for signs and symptoms of neurological impairment (numbness or weakness of legs, bowel, or bladder dysfunction, back pain, tingling, muscle weakness); if noted, urgent treatment is required. Intrathecal or epidural catheters should not be removed earlier than 12 hr after last dose of edoxaban. Next dose of edoxaban should not be given less than 2 hr after removal of catheter.
 - **Lab Test Considerations:** Assess creatinine clearance (CrCl) using Cockcroft-Gault equation (Cockcroft-Gault CrCl = $(140 - \text{age}) \times (\text{weight in kg}) \times (0.85 \text{ if female}) / (72 \times \text{creatinine in mg/dL})$) before starting therapy.
- ### Potential Nursing Diagnoses
- Risk for injury (Adverse Reactions)
- ### Implementation
- Discontinue edoxaban at least 24 hr prior to invasive or surgical procedures; may increase risk of bleeding. Edoxaban may be restarted as soon as adequate hemostasis is established; time to onset of pharmacodynamic effect is 1–2 hr.
 - **PO: Nonvalvular Atrial Fibrillation:** Administer 60 mg once daily without regard to food. Do not use in patients with CrCl >95 mL/min. If CrCl 15 to 50 mL/min, decrease dose to 30 mg once daily.

- **Deep Vein Thrombosis and Pulmonary Embolism:** Administer 60 mg once daily without regard to food, following 5 to 10 days of parenteral anticoagulant therapy. If CrCl 15 to 50 mL/min, patient weighs ≤ 60 kg, or patient taking concurrent verapamil, quinidine, azithromycin, clarithromycin, erythromycin, oral itraconazole, or oral ketoconazole, decrease dose to 30 mg once daily.
- **If transitioning from warfarin or other vitamin K antagonists to edoxaban,** discontinue warfarin and start edoxaban when INR ≤ 2.5 . **If transitioning from oral anticoagulants other than warfarin or other Vitamin K antagonists to edoxaban,** discontinue current oral anticoagulant and start edoxaban at time of next scheduled dose of other oral anticoagulant. **If transitioning from low molecular weight heparin (LMWH) to edoxaban,** discontinue LMWH and start edoxaban at time of next scheduled administration of LMWH. **If transitioning from unfractionated heparin to edoxaban,** discontinue infusion and start edoxaban 4 hr later.
- **If transitioning from edoxaban to warfarin, Oral Option:** For patients taking 60 mg of edoxaban, reduce dose to 30 mg and begin warfarin concomitantly. For patients taking 30 mg edoxaban, reduce dose to 15 mg and begin warfarin concomitantly. Measure INR at least weekly and just prior to daily dose of edoxaban to minimize influence of edoxaban on INR measurements. Once stable INR ≥ 2.0 achieved, discontinue edoxaban and continue warfarin. **Parenteral Option:** Discontinue edoxaban and administer a parenteral anticoagulant and warfarin at time of next scheduled edoxaban dose. Once stable INR ≥ 2.0 achieved, discontinue parenteral anticoagulant and continue warfarin. **If transitioning from edoxaban to non-Vitamin-K Dependent Oral anticoagulant,** discontinue edoxaban and start other oral anticoagulant at time of next dose of edoxaban. **If transitioning from edoxaban to parenteral anticoagulant,** discontinue edoxaban and start parenteral anticoagulant at time of next dose of edoxaban.

Patient/Family Teaching

- Instruct patient to take edoxaban as directed. Take missed doses as soon as remembered on same day. Return to regular schedule next day. Do not double doses in one day. Do not discontinue without consulting health care professional; stopping may increase risk of stroke.
- **Caution patient that they may bleed more easily, longer, or bruise more easily during therapy. Advise patient to notify health care professional immediately if bleeding or a fall, especially with head injury, occurs.**
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products

being taken and to consult with health care professional before taking other medications, especially other aspirin or NSAIDs.

- Advise patient to notify health care professional of therapy before surgery, medical, or dental procedures are scheduled.
- Advise female patient to notify health care professional if pregnancy is planned or suspected. Avoid breast feeding during therapy.

Evaluation/Desired Outcomes

- Decreased thrombotic events (stroke and systemic embolization) associated with atrial fibrillation.
- Treatment of deep vein thrombosis (DVT) and pulmonary embolism (PE).

efavirenz (e-fav-e-renz)

Sustiva

Classification

Therapeutic: antiretrovirals

Pharmacologic: non-nucleoside reverse transcriptase inhibitors

Indications

HIV infection (in combination with one or more other antiretroviral agents).

Action

Inhibits HIV reverse transcriptase, which results in disruption of DNA synthesis. **Therapeutic Effects:** Slowed progression of HIV infection and decreased occurrence of sequelae. Increases CD4 cell counts and decreases viral load.

Pharmacokinetics

Absorption: 50% absorbed when ingested following a high-fat meal.

Distribution: 99.5–99.75% bound to plasma proteins; enters CSF.

Metabolism and Excretion: Mostly metabolized by the liver.

Half-life: Following single dose—52–76 hr. Following multiple doses—40–55 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	3–5 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Moderate to severe hepatic impairment.

Use Cautiously in: History of mental illness or substance abuse (\uparrow risk of psychiatric symptomatology); Mild hepatic impairment; History of seizure disorders (\uparrow risk of seizures); **OB:** Use in pregnancy only if other

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

options have been exhausted; birth defects have been reported; **Lactation:** Breast feeding not recommended for HIV-infected mothers; efavirenz passes into breast milk; **Pedi:** Children <3 mo (safety not established); ↑ incidence of rash; **Geri:** Cautious initial dosing due to ↑ incidence of renal or cardiac dysfunction.

Adverse Reactions/Side Effects

CNS: **SUICIDAL THOUGHTS/BEHAVIORS**, abnormal dreams, catatonia, delusions, depression, dizziness, drowsiness, fatigue, headache, impaired concentration, insomnia, nervousness, psychoses. **CV:** **QT INTERVAL PROLONGATION**. **GI:** **HEPATOTOXICITY**, nausea, abdominal pain, anorexia, diarrhea, dyspepsia, flatulence. **GU:** hematuria, renal calculi. **Derm:** rash, sweating, pruritus. **Endo:** hypercholesterolemia, hypertriglyceridemia. **Neuro:** hypoesthesia. **Misc:** fat redistribution, immune reconstitution syndrome.

Interactions

Drug-Drug: Induces (stimulates) the hepatic cytochrome P450 3A4 enzyme system and would be expected to influence the effects of other drugs that are metabolized by this system; efavirenz itself is also metabolized by this system. ↑ risk of CNS depression with other **CNS depressants**, including **alcohol, antidepressants, antihistamines, and opioid analgesics**. May ↓ the effectiveness of **progestin-containing hormonal contraceptives** (e.g., etonogestrel, norelgestromin, levonorgestrel). Use with **voriconazole** significantly ↓ voriconazole levels and ↑ efavirenz levels; avoid concurrent use with standard doses of voriconazole; if used together, ↑ dose of voriconazole to 400 mg every 12 hr and ↓ dose of efavirenz to 300 mg daily. May ↓ **posaconazole** levels; avoid concurrent use. May ↓ **itraconazole** levels; use alternative antifungal agent. May ↓ **ketoconazole** levels. May ↓ **indinavir** levels; ↑ dose of indinavir dose. May ↓ **fosamprenavir** levels; ↑ dose of ritonavir when given with fosamprenavir/ritonavir once daily. May ↓ **atazanavir** levels; dosage adjustments may be needed in treatment-naïve patients; avoid concurrent use in treatment-experienced patients. May ↓ **lopinavir** levels; ↑ dose of lopinavir/ritonavir; avoid concurrent use of lopinavir/ritonavir once daily. May ↑ **ritonavir** levels; monitor liver function tests. May ↓ **saquinavir** and **raltegravir** levels. ↓ **maraviroc** levels; ↑ maraviroc dose. May alter the effects of **warfarin**. May ↓ levels of **cyclosporine, tacrolimus, and sirolimus**. May ↓ levels of **bupropion** and **sertraline**. **Rifampin** may ↓ levels; ↑ dose of efavirenz. Concurrent use with other **NNRTIs** including **etravirine, nevirapine, rilpivirine, and delavirdine** may lead to ↓ effectiveness and should be avoided. May ↓ levels of **raltegravir**. May ↓ levels of **simeprevir**; avoid concurrent use. Concurrent use with **carbamazepine** may ↓ levels of carbamazepine and efavirenz; use alternative anticonvulsant agent. Concurrent use with **phenytoin** or **phenobarbital** may ↓ levels of phenytoin, carbamazepine, and efavirenz. May ↓ levels of **clarithromycin**; consider using azithromy-

cin. May ↓ levels of **rifabutin**; ↑ daily dose of rifabutin by 50%. May ↓ levels of **calcium channel blockers, atorvastatin, pravastatin, simvastatin, methadone, and artemether/lumefantrine**. May ↓ levels of **progestin-containing contraceptives** and **etonogestrel**; use reliable method of barrier contraception in addition to hormonal contraceptive agent. Concurrent use with other **QT interval prolonging medications** may ↑ risk of QT interval prolongation or torsade de pointes.

Drug-Food: Ingestion following a **high-fat meal** ↑ absorption by 50%.

Route/Dosage

PO (Adults and Children ≥40 kg): 600 mg once daily; *Concurrent rifampin therapy (in patients >50 kg)*—800 mg once daily.

PO (Children ≥3 mo and 32.5–39.9 kg): 400 mg once daily.

PO (Children ≥3 mo and 25–32.4 kg): 350 mg once daily.

PO (Children ≥3 mo and 20–24.9 kg): 300 mg once daily.

PO (Children ≥3 mo and 15–19.9 kg): 250 mg once daily.

PO (Children ≥3 mo and 7.5–14.9 kg): 200 mg once daily.

PO (Children ≥3 mo and 5–7.4 kg): 150 mg once daily.

PO (Children ≥3 mo and 3.5–4.9 kg): 100 mg once daily.

Availability (generic available)

Capsules: 50 mg, 200 mg. **Tablets:** 600 mg. **In combination with:** emtricitabine and tenofovir (Atripla) (See Appendix B).

NURSING IMPLICATIONS

Assessment

- Assess for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.
- Assess for rash, especially during 1st mo of therapy. Onset is usually within 2 wk and resolves with continued therapy within 1 mo. May range from mild maculopapular with erythema and pruritus to exfoliative dermatitis and Stevens-Johnson syndrome. Occurs more often and may be more severe in children. If rash is severe or accompanied by blistering, desquamation, mucosal involvement, or fever, therapy must be discontinued immediately. Efavirenz may be reinstated concurrently with antihistamines or corticosteroids in patients discontinuing due to rash.
- Assess patient for CNS and psychiatric symptoms (dizziness, impaired concentration, somnolence, abnormal dreams, insomnia, suicidal thoughts and behaviors) during therapy. Symptoms usually begin during 1st or 2nd day of therapy and resolve after

2–4 wk. Administration at bedtime may minimize symptoms. Concurrent use with alcohol or psychoactive agents may cause additive CNS symptoms.

- **Lab Test Considerations:** Monitor viral load and CD4 cell count regularly during therapy.
- **Monitor liver function tests in patients with a history of hepatitis B or C or underlying liver disease.** May cause ↑ serum AST, ALT, and GGT concentrations. If moderate to severe liver function test abnormalities occur, efavirenz doses should be held until levels return to normal. Discontinue if liver function abnormalities recur when therapy is resumed.
- May cause ↑ in total cholesterol and serum triglyceride levels.
- Obtain a pregnancy test prior to starting therapy. May cause fetal harm if administered during first trimester of pregnancy.
- May cause false-positive urine cannabinoid results.

Potential Nursing Diagnoses

Risk for infection (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** Administer on an empty stomach, preferably at bedtime to minimize nervous system side effects. Avoid taking with a high-fat meal. Do not break tablets.
- Capsule may be opened and contents sprinkled on a small amount (1 to 2 tsp) of food for children at least 3 mo old and weighing at least 3.5 kg and adults who cannot swallow capsules or tablets. Open capsule carefully; avoid spillage or dispersion of contents into the air. *For infants receiving capsule sprinkle-infant formula mixture*, gently mix entire capsule contents into 2 tsp (10 mL) of reconstituted room temperature infant formula in a medicine cup, then draw up mixture into a 10 mL oral dosing syringe for administration. Use of infant formula for mixing should only be considered for those young infants who cannot consume solid foods. *For patients able to tolerate solid foods*, mix entire capsule contents gently with soft food (applesauce, grape jelly, yogurt). After administration of mixture, add a small amount (2 tsp) of food or formula to empty mixing container, stir to disperse any remaining efavirenz residue, and administer to patient. Administer mixture within 30 minutes of mixing. Avoid food for 2 hr after administration.

Patient/Family Teaching

- Emphasize the importance of taking efavirenz as directed. It must always be used in combination with other antiretroviral drugs. Do not take more than prescribed amount, and do not stop taking without consulting health care professional. Take missed doses as soon as remembered; do not double doses.

Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.

- Instruct patient that efavirenz should not be shared with others.
- May cause dizziness, impaired concentration, or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- **Instruct patient to notify health care professional immediately if rash or suicidal thoughts or behaviors occur.**
- Inform patient that efavirenz does not cure AIDS or prevent associated or opportunistic infections. Efavirenz does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom and to avoid sharing needles or donating blood to prevent spreading the AIDS virus to others. Advise patient that the long-term effects of efavirenz are unknown at this time.
- Inform patient that redistribution and accumulation of body fat may occur, causing central obesity, dorsocervical fat enlargement (buffalo hump), peripheral wasting, breast enlargement, and cushingoid appearance. The cause and long-term effects are not known.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- **Rep:** Advise patients taking oral contraceptives to use a nonhormonal method of birth control during efavirenz therapy and for at least 12 wk following discontinuation and to notify health care professional if they become pregnant while taking efavirenz. Encourage patients who become pregnant during therapy to join the registry by calling 1-800-258-4263.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and increase in CD4 cell counts.

elbasvir/grazoprevir
(elb-as-vir/graz-oh-pre-vir)
Zepatier

Classification

Therapeutic: antivirals
Pharmacologic: NS5A inhibitors, protease inhibitors

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Indications

⚠ Chronic hepatitis C virus (HCV) genotypes 1 or 4 infection (with or without ribavirin).

Action

Elbasvir—inhibits the HCV NS5A protein, resulting in inhibition of viral replication; *Grazoprevir*—inhibits the HCV NS3/4A protease, resulting in inhibition of viral replication. **Therapeutic Effects:** Decreased levels of HCV with sustained virologic response and lessened sequelae of chronic HCV infection.

Pharmacokinetics

Elbasvir

Absorption: Well absorbed following oral administration.

Distribution: Extensively distributed to tissues.

Protein Binding: >99.9%.

Metabolism and Excretion: Partially metabolized by CYP3A4. >90% excreted in feces and <1% eliminated in urine.

Half-life: 24 hr.

Grazoprevir

Absorption: Well absorbed following oral administration.

Distribution: Extensively distributed to tissues.

Protein Binding: >98.8%.

Metabolism and Excretion: Partially metabolized by CYP3A4. >90% excreted in feces and <1% eliminated in urine.

Half-life: 31 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
elbasvir (PO)	unknown	3 hr	24 hr
grazoprevir (PO)	unknown	2 hr	24 hr

Contraindications/Precautions

Contraindicated in: Moderate or severe hepatic impairment (Child-Pugh B or C); Concurrent use of organic anion transporting polypeptides 1B1/3 (OATP1B1/3) inhibitors, strong CYP3A inducers, or efavirenz; Situations when ribavirin is contraindicated (when ribavirin required); **OB:** Pregnant women or men whose partners are pregnant (when ribavirin is required); **Lactation:** Discontinue sofosbuvir/velpatasvir or discontinue breast feeding (when ribavirin required).

Use Cautiously in: Patients who are female or of Asian ancestry (↑ risk of liver enzyme elevation); Patients awaiting liver transplantation or liver transplant recipients (safety and effectiveness not established); Receiving immunosuppressant or chemotherapy medications (↑ risk of hepatitis B virus reactivation); **OB:** Safety not established (when ribavirin not required); **Lactation:** Weigh benefits of breast feeding against possible adverse effects (when ribavirin not required);

Geri: ↑ risk of liver enzyme elevation in elderly patients;

Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects

Without ribavirin

CNS: headache, insomnia. **GI:** abdominal pain, diarrhea, ↑ liver enzymes, nausea. **Misc:** fatigue, hepatitis B virus reactivation.

With ribavirin

CNS: depression, headache, irritability. **Derm:** pruritus, rash. **GI:** abdominal pain, hyperbilirubinemia, ↑ liver enzymes. **Hemat:** anemia. **MS:** arthralgia.

Resp: dyspnea. **Misc:** fatigue, hepatitis B virus reactivation.

Interactions

Drug-Drug: **OATP1B1/3 inhibitors**, including **atazanavir**, **cyclosporine**, **darunavir**, **lopinavir**, **saqueinavir**, or **tipranavir** may ↑ levels/toxicity of grazoprevir; concurrent use contraindicated. **Strong CYP3A inducers**, including **phenytoin**, **carbamazepine**, or **rifampin** may ↓ levels/effectiveness of elbasvir and grazoprevir; concurrent use contraindicated. **Efavirenz** may ↓ levels/effectiveness of elbasvir and grazoprevir; concurrent use contraindicated. **Moderate CYP3A inducers**, including **nafcillin**, **bosentan**, **etravirine**, and **modafanil** may ↓ levels/effectiveness of elbasvir and grazoprevir; concurrent use not recommended. **Strong CYP3A inhibitors**, including **ketoconazole** and **cobicistat-containing regimens** may ↑ levels/toxicity of elbasvir and grazoprevir; concurrent use not recommended. May ↑ levels/toxicity of **tacrolimus**; frequent monitoring of tacrolimus whole blood concentrations recommended. May ↑ levels/toxicity of **atorvastatin**, **fluvastatin**, **lovastatin**, **rosuvastatin**, and **simvastatin**; rosuvastatin dose should not exceed 10 mg/day; atorvastatin dose should not exceed 20 mg/day; use lowest possible dose of fluvastatin, lovastatin, and simvastatin and monitor closely for myopathy.

Drug-Natural Products: **St. John's wort** may ↓ levels/effectiveness of elbasvir and grazoprevir; concurrent use contraindicated.

Route/Dosage

Patients with HCV genotype 1a infection should be tested for the presence of virus with NS5A resistance-associated polymorphisms prior to initiation of therapy to determine the most appropriate dosage regimen and duration of therapy

PO (Adults): *Genotype 1a: Treatment-naïve or Peg-interferon/ribavirin-experienced without baseline NS5A polymorphisms*—1 tablet once daily for 12 wk; *Genotype 1a: Treatment-naïve or Peg-interferon/ribavirin-experienced with baseline NS5A polymorphisms*—1 tablet once daily for 16 wk in combination with ribavirin; *Genotype 1b: Treatment-naïve or Peg-*

interferon/ribavirin-experienced—1 tablet once daily for 12 wk; *Genotype 1a or 1b: Peg-interferon/ribavirin/HCV NS3/4A protease inhibitor-experienced*—1 tablet once daily for 12 wk in combination with ribavirin; *Genotype 4: Treatment-naïve*—1 tablet once daily for 12 wk; *Genotype 4: Peg-interferon/ribavirin-experienced*—1 tablet once daily for 16 wk in combination with ribavirin.

Availability

Tablets: elbasvir 50 mg/grazoprevir 100 mg.

NURSING IMPLICATIONS

Assessment

- Monitor for signs and symptoms of hepatitis B reactivation or hepatitis (jaundice, dark urine, light colored stools, fatigue, weakness, loss of appetite, nausea, vomiting, stomach pain) during therapy.
- **Lab Test Considerations:** Measure hepatitis B surface antigen (HBsAg) and hepatitis core antibody (anti-HBc) in all patients before starting hepatitis C virus therapy. May cause hepatitis B virus reactivation. Monitor for clinical and laboratory signs of hepatitis flare (↑ AST, ALT, bilirubin, liver failure, death) or HBV reactivation (rapid ↑ in serum HBV DNA level) during HCV treatment and post-treatment follow-up.
- Test all patients for current or prior hepatitis B virus (HBV) infection by measuring hepatitis B surface antigen (HBsAg) and hepatitis B core antibody (anti-HBc) before starting therapy. Monitor for HBV reactivation during and following therapy. ❌ Test patient with HCV genotype 1a infection for presence of virus with NS5A resistance-associated polymorphisms prior to starting therapy with Zepatier™ to determine dose regimen and duration.
- Monitor liver function tests (AST, ALT, bilirubin, alkaline phosphatase) prior to, at treatment wk 8, at treatment wk 12 if patient receiving 16 wk therapy, and as clinically indicated during therapy. If persistently ALT ↑ >10 times upper limit of normal, consider discontinuing elbasvir/grazoprevir. Discontinue therapy if ↑ ALT and signs and symptoms of liver inflammation or ↑ conjugated bilirubin, alkaline phosphatase, or INR.

Potential Nursing Diagnoses

Risk for infection (Indications)

Implementation

- **PO:** Administer one tablet daily without regard to food.

Patient/Family Teaching

- Instruct patient to take Zepatier™ as directed. Keep tablet in blister pack until ready to take dose. Do not skip or miss doses or stop medication without consulting health care professional. Advise patient to read *Patient Information* before starting and with each Rx refill in case of changes.

- Advise patient to notify health care professional promptly if signs and symptoms of liver inflammation (fatigue, weakness, lack of appetite, nausea and vomiting, jaundice, discolored feces) occur.
- Advise patient to notify health care professional if they have a history of HBV. May cause reactivation.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's Wort.
- **Rep:** Advise all patients to notify health care professional if pregnancy is planned or suspected or if breast feeding. Advise male and female patients who take Zepatier™ with ribavirin to use effective contraception during and for 6 mo after therapy is completed. Notify health care professional immediately if pregnancy is suspected.

Evaluation/Desired Outcomes

- Decreased levels of HCV with sustained virologic response and lessened sequelae of chronic HCV infection.

elvitegravir/cobicistat/emtricitabine/tenofovir
(el-vi-teg-ra vir/koe-bik-i-stat/em-tri-sye-ti-been/te-noe-fo-veer)
Stribild

Classification

Therapeutic: antiretrovirals
Pharmacologic: integrase strand transfer inhibitors (INSTI), enzyme inhibitors, nucleoside reverse transcriptase inhibitors

Indications

Management of HIV infection, a complete regimen for treatment-naïve adults or in adults who are virologically suppressed (HIV—1 RNA <50 copies/mL) on a stable regimen for ≥6 mo with no history of treatment failure and no known substitutions associated with resistance to the individual components of this medication.

Action

Elvitegravir—An integrase strand transfer inhibitor that inhibits an enzyme necessary for viral replication. *Cobicistat*—A pharmacokinetic enhancer (inhibits CYP3A and CYP2D6) enhancing systemic exposure to elvitegravir. *Emtricitabine*—Phosphorylated intracellularly where it inhibits HIV reverse transcriptase, resulting in viral DNA chain termination. *Tenofovir*—Phosphorylated intracellularly where it inhibits HIV reverse transcriptase resulting in disruption of DNA synthesis. **Therapeutic Effects:** Slowed progression of HIV infection and decreased occurrence of sequelae.

★ = Canadian drug name. ❌ = Genetic implication. ~~Strikethrough~~ = Discontinued.
*CAPITALS indicates life-threatening; underlines indicate most frequent.

Pharmacokinetics**elvitegravir****Absorption:** Absorption follows oral administration.**Distribution:** Unknown.**Protein Binding:** 98–99%.**Metabolism and Excretion:** Metabolized by CYP3A, 94.5% eliminated in feces, 6.7% in urine.**Half-life:** 12.9 hr.**cobicistat****Absorption:** Absorption follows oral administration.**Distribution:** Unknown.**Protein Binding:** 97–98%.**Metabolism and Excretion:** Metabolized by CYP3A and to a small extent by CYP2D6, 86.2 eliminated in feces, 8.2% in urine.**Half-life:** 3.5 hr.**emtricitabine****Absorption:** Rapidly and extensively absorbed; 93% bioavailable.**Distribution:** Unknown.**Metabolism and Excretion:** Some metabolism, 86% renally excreted, 14% fecal excretion.**Half-life:** 10 hr.**tenofovir****Absorption:** Tenofovir disoproxil fumarate is a prodrug, which is split into tenofovir, the active component.**Distribution:** Absorption is enhanced by food.**Metabolism and Excretion:** 70–80% excreted unchanged in urine by glomerular filtration and active tubular secretion.**Half-life:** Unknown.**TIME/ACTION PROFILE**

ROUTE	ONSET	PEAK	DURATION
elvitegravir PO	unknown	4 hr	24 hr
cobicistat PO	unknown	3 hr	24 hr
emtricitabine PO	rapid	1–2 hr	24 hr
tenofovir PO	unknown	2 hr	24 hr

Contraindications/Precautions

Contraindicated in: Severe hepatic impairment; Concurrent administration of other drugs that depend mainly on CYP3A for metabolism and whose blood levels, when ↑, are associated with serious/life-threatening adverse reactions; Concurrent administration of other drugs that induce the CYP3A enzyme system which may ↓ blood levels/effectiveness and promote development of viral resistance; Should not be used concurrently with other antiretrovirals that contain cobicistat, elvitegravir, emtricitabine, tenofovir, lamivudine, adefovir, or ritonavir; Renal impairment (do not initiate if CCr < 70 mL/min, discontinue if CCr < 50 mL/min); **Lactation:** HIV-infected women should not breast feed due to risk of viral transmission.

Use Cautiously in: Female patients or obese patients (may be at ↑ risk for lactic acidosis/hepatic steatosis); **Geriatric:** Elderly may be more sensitive to drug effects; consider age-related ↓ in renal, hepatic, and cardiovascular function; concurrent disease states and medications; **OB:** Use during pregnancy only if potential benefits justify fetal risks; **Pediatric:** Children < 12 yr (safety and effectiveness not established).

Exercise Extreme Caution in: Hepatitis B (may cause severe acute exacerbation).

Adverse Reactions/Side Effects

CNS: abnormal dreams, dizziness, headache, insomnia, drowsiness. **GU:** ACUTE RENAL FAILURE/EANCONI SYNDROME, ↑ serum creatinine, proteinuria. **GI:** LACTIC ACIDOSIS/HEPATOMEGALY WITH STEATOSIS, POST-TREATMENT ACUTE EXACERBATION OF HEPATITIS B, diarrhea, nausea.

Derm: rash, hyperpigmentation. **F and E:** hypophosphatemia. **Metab:** ↑ lipids. **MS:** bone pain, ↓ bone mineral density, muscle pain, osteomalacia. **Misc:** immune reconstitution syndrome.

Interactions

Drug-Drug: May alter blood levels and effects of other drugs metabolized by the CYP3A or CYP2D6 enzyme systems. Other drugs that induce the CYP3A system can alter blood levels and effects. **Concurrent administration of other drugs that depend mainly on CYP3A for metabolism and whose blood levels, when ↑, are associated with serious/life-threatening adverse reactions including alfuzosin, dihydroergotamine, ergotamine, lovastatin, oral midazolam, methyl-ergonovine, lurasidone, pimozone, sildenafil (when used for pulmonary hypertension), simvastatin, and triazolam; concurrent use contraindicated. Carbamazepine, phenobarbital, phenytoin, or rifampin may significantly ↓ levels/effectiveness of cobicistat and elvitegravir and ↑ risk of resistance; concurrent use contraindicated.** Nephrotoxic agents, including NSAIDs ↑ risk of nephrotoxicity; avoid concurrent use. Drugs that induce CYP3A will ↓ levels/effectiveness of elvitegravir and cobicistat. Drugs that inhibit CYP3A will also ↑ levels/effectiveness of cobicistat. **Acyclovir, cidofovir, ganciclovir, valacyclovir, and valganciclovir** may ↓ renal elimination of emtricitabine and tenofovir, ↑ levels and effects. **Antacids, including aluminum and magnesium hydroxide,** may ↓ levels and effectiveness of elvitegravir (separate administration by at least 2 hr). ↑ blood levels and risk of toxicity from **amiodarone, digoxin, disopyramide, flecainide, systemic lidocaine, mexiletine, propafenone or quinidine;** careful monitoring recommended. May alter effects of **warfarin.** Concurrent use with **clarithromycin** can result in altered levels of clarithromycin and/or cobicistat (for patients with CCr 50–60 mL/min ↓ dose of clarithromycin by 50%), levels of cobicistat may be ↑. **Oxcarbazepine** may ↓ levels/effectiveness of cobicistat and elvitegravir; consider using alternative anticonvulsant. May ↑ levels of **clonazepam** and

ethosuximide (clinical monitoring recommended). ↑ levels and risk of adverse effects with **SSRIs**, **tricyclic antidepressants**, and **trazodone** (careful titration and monitoring recommended). ↑ levels of **itraconazole**, **ketoconazole**, and **voriconazole** (maximum daily dose of ketoconazole or itraconazole should not exceed 300 mg, voriconazole with extreme caution). These **azole antifungals** may also ↑ levels of cobicistat and elvitegravir. ↑ levels and risk of toxicity from colchicine (concurrent use is contraindicated in patients with renal or hepatic impairment), *gout flares*—0.6 mg followed by 0.3 mg 1 hr later, do not repeat for at least three days; *prophylaxis of gout flares*—0.3 mg once daily if original regimen was 0.6 mg twice daily, 0.3 mg every other day if original regimen was 0.6 mg daily; *treatment of familial Mediterranean fever*—not to exceed 0.6 mg daily, may be given as 0.3 mg twice daily. Concurrent use with **rifabutin** or **rifapentine** may significantly ↓ levels/effectiveness of cobicistat and elvitegravir and may foster resistance, concurrent use is not recommended. May ↑ levels and effects of **beta blockers** including **metoprolol** and **timolol**; careful monitoring is recommended, ↓ dose of beta blocker if necessary. May ↑ levels and effects of **calcium channel blockers** including **amlodipine**, **diltiazem**, **felodipine**, **nifedipine**, **nifedipine**, and **verapamil**; careful monitoring is recommended. Concurrent use of **corticosteroids that induce CYP3A**, including **budesonide**, **dexamethasone**, **methylprednisolone**, **prednisone**, or inhaled **betamethasone**, **ciclesonide**, **fluticasone**, **mometasone**, and **triamcinolone**, may ↓ levels/effectiveness and ↑ risk of resistance to elvitegravir (consider use of other corticosteroids, such as beclomethasone or prednisolone). Concurrent use of **corticosteroids that are metabolized by CYP3A** including **budesonide**, **dexamethasone**, **methylprednisolone**, **prednisone**, or inhaled **betamethasone**, **ciclesonide**, **fluticasone**, **mometasone**, and **triamcinolone** may ↑ risk of Cushing's disease and adrenal suppression (consider use of other corticosteroids, such as beclomethasone or prednisolone). ↑ levels and effects of **bosentan** (initiate bosentan at 62.5 mg daily or every other day if already receiving elvitegravir/cobicistat/emtricitabine/tenofovir for at least 10 days, if already receiving bosentan discontinue at least 36 hr prior to starting elvitegravir/cobicistat/emtricitabine/tenofovir; after 10 days, bosentan may be restarted at 62.5 mg daily or every other day). ↑ levels and risk of adverse effect with **atorvastatin** (initiate atorvastatin at lowest dose and titrate cautiously). ↑ levels of **norgestimate** and ↓ levels of **ethinyl estradiol** (due to unpredictable effects, non-hormonal contraception should be considered). ↑ levels and effects of **immunosuppressants** including **cyclosporine**, **sirolimus**, and **tacrolimus**, careful monitoring recommended. ↑

levels and risk of adverse cardiovascular reactions with **salmeterol**, concurrent use is not recommended. ↑ blood levels and effects of **neuroleptics** including **perphenazine**, **risperidone**, and **thioridazine**, neuroleptic dose may need to ↓. May ↑ levels of **quetiapine**; if taking quetiapine when initiating therapy, consider alternative antiretroviral therapy or ↓ quetiapine dose to 1/2 of the original dose and monitor for adverse effects. ↑ levels and risk of serious cardiovascular adverse effects from **PDE5 inhibitors** including **sildenafil**, **tadalafil**, and **varденаfil** (for *pulmonary hypertension*—sildenafil is contraindicated; in patients who have received elvitegravir/cobicistat/emtricitabine/tenofovir for at least 7 days, tadalafil may be started at 20 mg/day and carefully titrated if necessary to 40 mg/day; in patients already receiving tadalafil, discontinue for at least 24 hr before initiating elvitegravir/cobicistat/emtricitabine/tenofovir; after 7 days, resume at 20 mg/day and titrate as necessary to 40 mg/day; for *erectile dysfunction*—sildenafil dose should not exceed 25 mg in 48 hr, vardenafil dose should not exceed 2.5 mg in 72 hr, and tadalafil dose should not exceed 10 mg in 72 hr). ↑ levels and risk of sedation with **sedative/hypnotics** including **midazolam**, **clorazepate**, **diazepam**, **estazolam**, **flurazepam**, **buspirone**, and **zolpidem**; concurrent use with oral midazolam is contraindicated, dose reduction of parenteral midazolam should be considered, clinical monitoring and dose reduction if necessary is recommended for others. **Ledipasvir/sofosbuvir** may ↑ tenofovir levels.

Drug-Natural Products: **St. John's wort** may significantly ↓ levels/effectiveness of cobicistat and elvitegravir and ↑ risk of resistance; concurrent use contraindicated.

Route/Dosage

PO (Adults and Children ≥12 yr and ≥35 kg): One tablet once daily.

Availability

Tablets: elvitegravir 150 mg/cobicistat 150 mg/emtricitabine 200 mg/tenofovir 300 mg.

NURSING IMPLICATIONS

Assessment

- Assess for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.
- Monitor bone mineral density in patients who have a history of pathologic bone fracture or are at risk for osteoporosis or bone loss. Consider calcium and vitamin D supplementation.
- **Lab Test Considerations:** Monitor viral load and CD4 cell count regularly during therapy.
- Assess for hepatitis B virus (HBV). *Stribild* is not approved for administration in patients with HIV and HBV.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.
 *CAPITALS indicates life-threatening; underlines indicate most frequent.

- Determine serum phosphorous before initiating and periodically during therapy.
- Monitor liver function tests before and periodically during therapy, especially in patients with underlying liver disease or marked ↑ transaminase. May cause ↑ serum creatinine, AST, ALT, total bilirubin, total cholesterol, LDL, amylase, and triglycerides. **Lactic acidosis may occur with hepatic toxicity causing hepatic steatosis; may be fatal, especially in women.**
- Calculate serum creatinine, creatinine clearance (CCr), urine glucose, and urine protein prior to and periodically during therapy. CCr should be >70 mL/min before starting therapy. Monitor CCr, urine glucose, and urine protein in all patients periodically during therapy and serum phosphorous in patients at risk for renal impairment. Assess patients with persistent or worsening bone pain, pain in extremities, fractures and/or muscular pain or weakness for proximal renal tubulopathy; evaluate renal function promptly.

Potential Nursing Diagnoses

Risk for infection (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** Administer once daily with food.

Patient/Family Teaching

- Emphasize the importance of taking *Stribild* as directed, at the same time each day. Do not take more than prescribed amount and do not stop taking without consulting health care professional. Take missed doses with a meal if remembered unless almost time for next dose; do not double doses. Advise patient to read *Patient Information* prior to starting therapy and with each Rx refill in case of changes.
- Advise patient to take antacids 2 hr before or 4 hr after and H₂ antagonists 12 hr before or 4 hr after *Stribild*.
- Instruct patient that *Stribild* should not be shared with others.
- Inform patient that *Stribild* does not cure AIDS or prevent associated or opportunistic infections. Rilpivirine does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom and to avoid sharing needles or donating blood to prevent spreading the AIDS virus to others. Advise patient that the long-term effects of *Stribild* are unknown at this time.
- **Advise patient to notify health care professional immediately if symptoms of lactic acidosis (nausea, vomiting, unusual or unexpected stomach discomfort, and weakness) occur.**
- **Immune reconstitution syndrome may trigger opportunistic infections or autoimmune disorders. Notify health care professional if symptoms occur.**
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.

- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort.
- **Rep:** Advise patients to notify health care professional if pregnancy is planned or suspected. Advise patient to avoid breast feeding during *Stribild* therapy. Encourage women who become pregnant during *Stribild* therapy to enroll in Antiviral Pregnancy Registry by calling 1-800-258-4263.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and increase in CD4 cell counts.

elvitegravir/cobicistat/emtricitabine/tenofovir alafenamide

(el-vi-teg-ra-vir/koe-bik-i-stat/em-trye-sye-ta-been/ten-of-oh-vir-al-a-fen-a-mide)

Genvoya

Classification

Therapeutic: antiretrovirals

Pharmacologic: integrase strand transfer inhibitors (INSTI), enzyme inhibitors, nucleoside reverse transcriptase inhibitors

Indications

Management of HIV infection in treatment-naïve adults. Management of HIV infection in patients with HIV-1 RNA <50 copies/mL (to replace their current antiretroviral regimen) who are on a stable antiretroviral regimen for ≥6 mo, have no history of treatment failure, and have no known substitutions associated with resistance to the individual medications in the combination product.

Action

Elvitegravir—An integrase strand transfer inhibitor that inhibits an enzyme necessary for viral replication. *Cobicistat*—A pharmacokinetic enhancer (inhibits CYP3A and CYP2D6) that increases systemic exposure to elvitegravir. *Emtricitabine*—Phosphorylated intracellularly where it inhibits HIV reverse transcriptase, resulting in viral DNA chain termination. *Tenofovir alafenamide*—Phosphorylated intracellularly where it inhibits HIV reverse transcriptase resulting in disruption of DNA synthesis. When compared to tenofovir disoproxil fumarate, tenofovir alafenamide is associated with fewer episodes of renal impairment and reductions in bone mineral density. **Therapeutic Effects:**

Slowed progression of HIV infection and decreased occurrence of sequelae.

Pharmacokinetics

elvitegravir

Absorption: Absorption follows oral administration.

Distribution: Unknown.

Protein Binding: 98–99%.

Metabolism and Excretion: Metabolized by CYP3A; 94.5% eliminated in feces, 6.7% in urine.

Half-life: 12.9 hr.

cobicistat

Absorption: Absorption follows oral administration.

Distribution: Unknown.

Protein Binding: 97–98%.

Metabolism and Excretion: Metabolized by CYP3A and to a small extent by CYP2D6; 86.2% eliminated in feces, 8.2% in urine.

Half-life: 3.5 hr.

emtricitabine

Absorption: Rapidly and extensively absorbed; 93% bioavailable.

Distribution: Unknown.

Metabolism and Excretion: Some metabolism; 86% eliminated in urine, 14% in feces.

Half-life: 10 hr.

tenofovir alafenamide

Absorption: Tenofovir alafenamide is a prodrug, which is hydrolyzed into tenofovir, the active component; absorption enhanced by high-fat meals.

Distribution: Unknown.

Metabolism and Excretion: Tenofovir is phosphorylated to tenofovir diphosphate (active metabolite); 32% excreted in feces, <1% in urine.

Half-life: 0.51 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
elvitegravir PO	unknown	4 hr	24 hr
cobicistat PO	unknown	3 hr	24 hr
emtricitabine PO	rapid	1–2 hr	24 hr
tenofovir alafenamide PO	unknown	0.5 hr	24 hr

Contraindications/Precautions

Contraindicated in: Severe hepatic impairment; Concurrent use of drugs that depend mainly on CYP3A for metabolism and whose blood levels, when ↑, are associated with serious/life-threatening adverse reactions; Concurrent use of drugs that induce the CYP3A enzyme system which may ↓ blood levels/effectiveness and promote development of viral resistance; Should not be

used concurrently with other antiretrovirals that contain cobicistat, elvitegravir, emtricitabine, tenofovir disoproxil fumarate, lamivudine, adefovir, or ritonavir; Severe renal impairment (CCr <30 mL/min); Severe hepatic impairment; **Lactation:** HIV-infected women should not breast feed due to risk of viral transmission.

Use Cautiously in: Female patients or obese patients (may be at ↑ risk for lactic acidosis/hepatic steatosis); Chronic hepatitis B virus infection (may exacerbate following discontinuation); Moderate renal impairment (CCr = 30–50 mL/min); Concurrent use of nephrotoxic drugs (↑ risk of renal impairment); **Geriatric:** Elderly may be more sensitive to drug effects; consider age-related ↓ in renal, hepatic, and cardiovascular function; concurrent disease states and medications; **OB:** Use during pregnancy only if potential benefits justify fetal risks; **Pediatric:** Children <12 yr (safety and effectiveness not established).

Exercise Extreme Caution in: Hepatitis B (may cause severe acute exacerbation).

Adverse Reactions/Side Effects

CNS: headache. **F and E:** hypophosphatemia. **GI:** LACTIC ACIDOSIS/HEPATOMEGALY WITH STEATOSIS, POST-TREATMENT ACUTE EXACERBATION OF HEPATITIS B, nausea, diarrhea. **GU:** proteinuria, renal impairment. **Metabolic:** ↑ lipids. **Misc:** fatigue, immune reconstitution syndrome.

Interactions

Drug-Drug: May alter blood levels and effects of other drugs metabolized by the CYP3A or CYP2D6 enzyme systems. Other drugs that induce the CYP3A system can alter blood levels and effects. May ↑ levels and potentially cause serious/life-threatening adverse reactions of drugs that depend mainly on CYP3A for metabolism including **alfuzosin, dihydroergotamine, ergotamine, lovastatin, methylergonovine, lurasidone, pimozone, sildenafil** (when used for pulmonary hypertension), **simvastatin, and triazolam**; concurrent use contraindicated. **Carbamazepine, phenobarbital, phenytoin, or rifampin** may significantly ↓ levels/effectiveness of cobicistat, elvitegravir, and tenofovir alafenamide and ↑ risk of resistance; concurrent use contraindicated. Nephrotoxic agents, including **NSAIDs and aminoglycosides** may ↑ risk of nephrotoxicity; avoid concurrent use. Drugs that induce CYP3A will ↓ levels/effectiveness of elvitegravir, cobicistat, and tenofovir alafenamide. Drugs that inhibit CYP3A will ↑ levels/toxicity of cobicistat. **Acyclovir, cidofovir, ganciclovir, valacyclovir, and valganciclovir** may ↓ renal elimination and ↑ levels/toxicity of emtricitabine and tenofovir alafenamide.

Antacids, including **aluminum hydroxide** and **magnesium hydroxide**, may ↓ levels/effectiveness of elvitegravir; separate administration by ≥2 hr. May ↑ levels/toxicity of **amiodarone, digoxin, disopyramide,**

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.
 *CAPITALS indicates life-threatening; underlines indicate most frequent.

flecainide, lidocaine, mexiletine, propafenone and **quinidine**; careful monitoring recommended. May alter effects of **warfarin**; careful monitoring of INR recommended. Concurrent use with **clarithromycin** may ↑ levels/toxicity of clarithromycin and/or cobicistat (for patients with CCr 50–60 mL/min, ↓ dose of clarithromycin by 50%). May ↑ levels/toxicity of **ethosuximide**; clinical monitoring recommended. **Oxcarbazepine** may ↓ levels/effectiveness of cobicistat, elvitegravir, and tenofovir alafenamide; consider using alternative anticonvulsant. May ↑ levels/toxicity of **SSRIs** (except sertraline), **tricyclic antidepressants**, and **trazodone**; careful titration and monitoring recommended. Concurrent use with **itraconazole, ketoconazole, or voriconazole** may ↑ levels/toxicity of itraconazole, ketoconazole, voriconazole, elvitegravir, and cobicistat; (max dose of ketoconazole or itraconazole = 300 mg/day; assess risk vs. benefit before using voriconazole). May ↑ levels/toxicity of colchicine; concurrent use contraindicated in renal or hepatic impairment; *Dosing adjustment for gout flares*—0.6 mg, then 0.3 mg 1 hr later, do not repeat for ≥3 days; *Dosing adjustment for gout flare prophylaxis*—0.3 mg once daily if original regimen was 0.6 mg twice daily, 0.3 mg every other day if original regimen was 0.6 mg once daily; *Dosing adjustment for treatment of familial Mediterranean fever*—not to exceed 0.6 mg daily, may be given as 0.3 mg twice daily. **Rifabutin** or **rifapentine** may ↓ levels/effectiveness of cobicistat, elvitegravir, and tenofovir alafenamide and may foster resistance; concurrent use not recommended. May ↑ levels/toxicity of **beta blockers**; careful monitoring recommended; ↓ dose of beta blocker if necessary. May ↑ levels/toxicity of **calcium channel blockers** including **amlodipine, diltiazem, felodipine, nifedipine, nifedipine, and verapamil**; careful monitoring recommended. Concurrent use of **corticosteroids that induce CYP3A**, including **budesonide, dexamethasone, methylprednisolone, prednisone**, or inhaled **betamethasone, ciclesonide, fluticasone, mometasone, and triamcinolone**, may ↓ levels/effectiveness and ↑ risk of resistance to elvitegravir (consider use of other corticosteroids, such as beclomethasone or prednisolone). Concurrent use of **corticosteroids that are metabolized by CYP3A** including **budesonide, dexamethasone, methylprednisolone, prednisone**, or inhaled **betamethasone, ciclesonide, fluticasone, mometasone, and triamcinolone** may ↑ risk of Cushing's disease and adrenal suppression (consider use of other corticosteroids, such as beclomethasone or prednisolone). May ↑ levels/toxicity of **bosentan**; initiate bosentan at 62.5 mg once daily or every other day if already receiving elvitegravir/cobicistat/emtricitabine/tenofovir alafenamide for ≥10 days; if already receiving bosentan, discontinue bosentan ≥36 hr prior to starting elvitegravir/cobicistat/emtricitabine/tenofovir alafenamide; after 10 days, bosentan may be restarted at 62.5 mg once daily or every other day. May ↑ levels/toxicity of **atorvastatin**;

initiate atorvastatin at lowest dose and titrate cautiously. May ↑ levels/toxicity of **norgestimate** and ↓ levels of **ethinyl estradiol**; due to unpredictable effects, non-hormonal contraceptive methods should be considered. May ↑ levels/toxicity of **immunosuppressants**, including **cyclosporine, sirolimus, and tacrolimus**; careful monitoring recommended. **Cyclosporine** may ↑ levels/toxicity of cobicistat and elvitegravir; careful monitoring recommended. May ↑ levels/toxicity of **butorphanol** and ↓ levels of **naloxone**; carefully monitor for sedation and altered cognitive effects. May ↑ levels of and risk of adverse cardiovascular effects with **salmeterol**, concurrent use not recommended. ↑ levels/toxicity of **neuroleptics**, including **perphenazine, risperidone, and thioridazine**, may need to ↓ dose of neuroleptic. May ↑ levels of **quetiapine**; if taking quetiapine when initiating therapy, consider alternative antiretroviral therapy or ↓ quetiapine dose to 1/2 of the original dose and monitor for adverse effects. May ↑ levels/toxicity of **PDE5 inhibitors**, including **sildenafil, tadalafil, and vardenafil**; *Dosing adjustment for pulmonary hypertension*—sildenafil is contraindicated; in patients who have received elvitegravir/cobicistat/emtricitabine/tenofovir alafenamide for ≥7 days, start tadalafil at 20 mg once daily and carefully titrate if tolerating to 40 mg once daily; in patients already receiving tadalafil, discontinue tadalafil for ≥24 hr before initiating elvitegravir/cobicistat/emtricitabine/tenofovir alafenamide; after ≥1 wk, resume tadalafil at 20 mg once daily and titrate if tolerating to 40 mg once daily; *Dosing adjustment for erectile dysfunction*—sildenafil dose should not exceed 25 mg in 48 hr, vardenafil dose should not exceed 2.5 mg in 72 hr, and tadalafil dose should not exceed 10 mg in 72 hr. ↑ levels/toxicity of **sedative/hypnotics**, including **midazolam** (parenteral), **diazepam, buspirone, and zolpidem**; consider dose ↓ of parenteral midazolam; clinical monitoring and dose ↓, if necessary, is recommended for other sedative/hypnotics.

Drug-Natural Products: **St. John's wort** may significantly ↓ levels/effectiveness of cobicistat and elvitegravir and ↑ risk of resistance; concurrent use contraindicated.

Route/Dosage

PO (Adults and Children ≥12 yr and ≥35 kg): 1 tablet once daily.

Availability

Tablets: elvitegravir 150 mg/cobicistat 150 mg/emtricitabine 200 mg/tenofovir alafenamide 10 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.
- **Lab Test Considerations:** Monitor viral load and CD4 count before and routinely during therapy to determine response.

- Monitor liver function tests and hepatitis B virus levels throughout and following therapy. If therapy is discontinued, may cause severe exacerbation of hepatitis B. May cause ↑ LDL cholesterol, total cholesterol, and triglyceride concentrations. **Lactic acidosis may occur with hepatic toxicity causing hepatic steatosis; may be fatal, especially in women. Discontinue therapy if symptoms occur.**
- Calculate serum creatinine, creatinine clearance, urine glucose, and urine protein prior to and periodically during therapy and when clinically indicated. In patients at risk of renal dysfunction, assess creatinine clearance, serum phosphorus, urine glucose, and urine protein prior to and periodically during therapy.
- Monitor serum phosphate periodically during therapy in patients at risk for renal impairment. May cause hypophosphatemia in patients with renal impairment.
- May cause hyperglycemia and glucosuria.

Potential Nursing Diagnoses

Risk for infection (Indications)

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- Test patient for hepatitis B prior to starting therapy. *Genvoya*[™] may cause exacerbations of hepatitis B with liver decompensation and liver failure. Monitor hepatic function closely for at least several mo in patients infected with both HIV and HBV who discontinue this medication.
- **PO:** Administer once daily with food.
- Administer antacids at least 2 hr before or after medication.

Patient/Family Teaching

- Instruct patient on the importance of taking medication as directed, even if feeling better. Do not take more than prescribed amount and do not stop taking without consulting health care professional. Discontinuing therapy may lead to severe exacerbations. Take missed doses as soon as remembered unless almost time for next dose; do not double doses. Advise patient to read *Patient Information* prior to starting therapy and with each Rx refill in case of changes. Caution patient not to share or trade *Genvoya*[™] with others.
- Inform patient of importance of hepatitis B testing before starting antiretroviral therapy.
- Advise patients if antacids containing aluminum, magnesium hydroxide, or calcium carbonate, take at least 2 hrs before or after *Genvoya*[™].
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care profes-

sional before taking any new medications, especially St. John's wort.

- Advise patient to notify health care professional immediately if symptoms of lactic acidosis (nausea, vomiting, unusual or unexpected stomach discomfort, unusual muscle pain, difficulty breathing, feeling cold, especially in arms and legs, dizziness, fast or irregular heartbeat, and weakness or tiredness) liver problems (yellow skin or whites of eyes, dark urine, light colored stools, loss of appetite, nausea, stomach pain) or signs of Immune Reconstitution Syndrome (signs and symptoms of an infection or inflammation) occur.
- Inform patient that *Genvoya*[™] does not cure AIDS and does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom and avoid sharing needles or donating blood to prevent spreading HIV to others.
- **Rep:** Advise patient to notify health care professional if pregnancy is planned or suspected. Encourage pregnant women to enroll in the Antiretroviral Pregnancy Registry by calling 1-800-258-4263. Advise female patient to avoid breast feeding during therapy.

Evaluation/Desired Outcomes

- Slowed progression of HIV infection and decreased occurrence of sequelae.

empagliflozin

(em-pag-gli-floe-zin)

Jardiance

Classification

Therapeutic: antidiabetics

Pharmacologic: sodium-glucose co-transporter 2 (SGLT2) inhibitors

Indications

Adjunct to diet and exercise in the management of type 2 diabetes. To reduce risk of cardiovascular death in patients with type 2 diabetes and established cardiovascular disease.

Action

Inhibits proximal renal tubular sodium-glucose co-transporter 2 (SGLT2) which determines reabsorption of glucose from the tubular lumen. Inhibits reabsorption of glucose, lowers renal threshold for glucose and increases excretion of glucose in urine. **Therapeutic Effects:** Improved glycemic control. Reduced death due to cardiovascular causes.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Distribution: Enters red blood cells, remainder of distribution unknown.

Metabolism and Excretion: Minimally metabolized; excreted in feces (41.2% mostly as unchanged drug) and urine (54.4% half as unchanged drug, half as metabolites).

Half-life: 12.4 hr.

TIME/ACTION PROFILE (↓ in A1c)

ROUTE	ONSET	PEAK	DURATION
PO	within 6 wk	12 wk	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Severe renal impairment (eGFR <30 mL/min/1.73 m²/end-stage renal disease/dialysis); Type 1 diabetes; Diabetic ketoacidosis; **Lactation:** Avoid use, discontinue breast feeding or discontinue empagliflozin.

Use Cautiously in: Moderate renal impairment (eGFR 30–<45 mL/min/1.73 m²); use not recommended; Hypotension (correct prior to treatment, especially in renal impairment, age >65 yr, or concurrent use of loop diuretics, ACE inhibitors, or ARBs); History of bladder cancer; History of pancreatitis, pancreatic surgery, reduced caloric intake due to illness or surgery, or alcohol abuse (↑ risk of ketoacidosis); Hypovolemia, chronic kidney disease, HF (↑ risk of acute kidney injury); **OB:** Use only if potential maternal benefit justifies potential fetal risk; **Pedi:** Safety and effectiveness not established; **Ger:** ↑ risk of adverse reactions related to ↓ intravascular volume.

Adverse Reactions/Side Effects

CV: hypotension, volume depletion. **GU:** **UROSEPSIS**, acute kidney injury, genital mycotic infections, ↑ urination, urinary tract infection (including pyelonephritis), renal impairment. **Endo:** hypoglycemia (↑ with other medications). **F and E:** **KETOACIDOSIS**, hyperphosphatemia. **Metab:** hyperlipidemia.

Interactions

Drug-Drug: ↑ risk of hypotension with **anti-hypertensives** or **diuretics**. ↑ risk of hypoglycemia with other **antidiabetics** (dose adjustments may be required). ↑ risk of acute kidney injury with **diuretics**, **ACE inhibitors**, **angiotensin receptor blockers**, or **NSAIDs**.

Route/Dosage

PO (Adults): 10 mg once daily, may be ↑ to 25 mg once daily.

Availability

Tablets: 10 mg, 25 mg. **In combination with:** linagliptin (Glyxambi), metformin (Synjardy). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Observe patient for signs and symptoms of hypoglycemic reactions (sweating, hunger, weakness, dizziness, confusion, headache, tremor, tachycardia, irritability, drowsiness).

ness, confusion, headache, tremor, tachycardia, irritability, drowsiness).

- Monitor for signs and symptoms of volume depletion (dizziness, feeling faint, weakness, orthostatic hypotension) after initiating therapy, especially in elderly patients and patients with renal impairment, low systolic BP, or on diuretics.
- Monitor for signs and symptoms of urinary tract infection during therapy. Treat promptly.
- Assess for ketoacidosis in patients presenting with signs and symptoms of dehydration and metabolic acidosis (nausea, vomiting, abdominal pain, malaise, shortness of breath), regardless of blood glucose level. Discontinue empagliflozin and treat promptly (insulin, fluid and caloric replacement) if suspected. Consider risk factors for ketoacidosis (pancreatic insulin deficiency, caloric restriction, alcohol abuse) before starting empagliflozin.
- **Lab Test Considerations:** Monitor hemoglobin A1C prior to and periodically during therapy.
- May ↑ serum creatinine and ↓ eGFR. Monitor renal function prior to starting and periodically during therapy. Do not begin therapy if eGFR <45 mL/min/1.73 m². Discontinue therapy if eGFR is persistently <45 mL/min/1.73 m².
- May cause ↑ serum phosphate levels. Monitor electrolytes periodically during therapy.
- May cause ↑ LDL-C. Monitor serum lipid levels periodically during therapy.
- May cause ↑ hematocrit.

Potential Nursing Diagnoses

Imbalanced nutrition: more than body requirements (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- Correct volume depletion prior to beginning therapy with empagliflozin.
- **PO:** Administer once daily in the morning with or without food.

Patient/Family Teaching

- Instruct patient to take empagliflozin as directed. Take missed doses as soon as remembered, unless it is almost time for next dose; do not double doses. Advise patient to read the *Medication Guide* before starting and with each Rx refill in case of changes.
- Explain to patient that empagliflozin helps control hyperglycemia but does not cure diabetes. Therapy is usually long term.
- Instruct patient not to share this medication with others, even if they have the same symptoms; it may harm them.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hyperglycemic or hypoglycemic episodes.

- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water, and notify health care professional.
- Instruct patient in proper testing of blood glucose and urine ketones. Inform patient that empagliflozin will cause a positive test result when testing for urine glucose. Monitor closely during periods of stress or illness and health care professional notified if significant changes occur.
- Advise patient to notify health care professional if signs and symptoms of hypotension occur and to maintain adequate hydration as dehydration may increase risk of hypotension.
- Inform patient that empagliflozin may cause mycotic (yeast) infections. Women may have signs and symptoms of a vaginal yeast infection (vaginal odor, white or yellow vaginal discharge [may be lumpy or look like cottage cheese], vaginal itching). Men may have signs and symptoms of a yeast infection of the penis (redness, itching or swelling of penis; rash on penis; foul smelling discharge from penis; pain in skin around penis). Advise patient to notify health care professional if yeast infection occurs.
- Advise patient to notify health care professional if signs and symptoms of urinary tract infection (burning feeling when passing urine, cloudy urine, pain in pelvis or back) occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially other oral hypoglycemic medications.
- Advise patient to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy.
- Encourage patient to follow up with routine lab tests for blood glucose and renal function.

Evaluation/Desired Outcomes

- Improved hemoglobin A1C and glycemic control in adults with Type 2 diabetes.

emtricitabine
(em-tri-si-ti-been)
Emtriva

Classification

Therapeutic: antiretrovirals
Pharmacologic: nucleoside reverse transcriptase inhibitors

Indications

HIV infection (with other antiretrovirals).

Action

Phosphorylated intracellularly where it inhibits HIV reverse transcriptase, resulting in viral DNA chain termination. **Therapeutic Effects:** Slowed progression of HIV infection and decreased occurrence of sequelae. Increases CD4 cell counts and decreases viral load.

Pharmacokinetics

Absorption: Rapidly and extensively absorbed; 93% bioavailable.

Distribution: Unknown.

Metabolism and Excretion: Some metabolism, 86% renally excreted, 14% fecal excretion.

Half-life: 10 hr.

TIME/ACTION PROFILE (blood levels†)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1–2 hr	24 hr

†Normal renal function.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of antiretroviral combination products containing emtricitabine or lamivudine-containing products; **Lactation:** Breast feeding not recommended in HIV-infected patients.

Use Cautiously in: Hepatitis B infection (may exacerbate following discontinuation); Renal impairment; **OB:** Use only if clearly needed; **Geri:** May be at ↑ risk for adverse effects.

Adverse Reactions/Side Effects

CNS: dizziness, headache, insomnia, weakness, depression, nightmares. **GI:** abdominal pain, diarrhea, nausea, **SEVERE HEPATOMEGALY WITH STEATOSIS**, dyspepsia, vomiting. **Derm:** rash, skin discoloration. **F and E:** **LACTIC ACIDOSIS**. **MS:** arthralgia, myalgia. **Neuro:** neuropathy, paresthesia. **Resp:** cough, rhinitis. **Misc:** immune reconstitution syndrome.

Interactions

Drug-Drug: None noted.

Route/Dosage

PO (Adults ≥18 yr): 200 mg once daily.

Renal Impairment

PO (Adults ≥18 yr): *CCr* 30–49 mL/min—200 mg every 48 hr; *CCr* 15–29 mL/min—200 mg every 72 hr; *CCr* <15 mL/min—200 mg every 96 hr.

Availability

Capsules: 200 mg. **Oral solution (cotton candy flavor):** 10 mg/mL. **In combination with:** efavirenz and tenofovir (Atripla); tenofovir (Truvada); rilpivirine and tenofovir (Complera); elvitegravir, cobicistat, and tenofovir (Stribild). See Appendix B.

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

NURSING IMPLICATIONS

Assessment

- Assess patient for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.
- **May cause lactic acidosis and severe hepatomegaly with steatosis.** These events are more likely to occur if patients are female, obese, or receiving nucleoside analogue medications for extended periods of time. Monitor patient for signs (increased serum lactate levels, elevated liver enzymes, liver enlargement on palpation). Therapy should be suspended if clinical or laboratory signs occur.
- Test patients for chronic hepatitis B virus (HBV) before initiating therapy. Emtricitabine is not indicated for treatment of HBV. Exacerbations of HBV have occurred upon discontinuation of emtricitabine.
- **Lab Test Considerations:** Monitor viral load and CD4 cell count regularly during therapy.
- **May cause ↑ AST, ALT, bilirubin, creatine kinase, serum amylase, serum lipase, and triglycerides.** May cause ↑ or ↓ serum glucose. May cause ↓ neutrophil count.

Potential Nursing Diagnoses

Risk for infection (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** May be administered with or without food.

Patient/Family Teaching

- Emphasize the importance of taking emtricitabine as directed. It must always be used in combination with other antiretroviral drugs. Do not take more than prescribed amount and do not stop taking without consulting health care professional. Take missed doses as soon as remembered, but not if almost time for next dose; do not double doses.
- Instruct patient that emtricitabine should not be shared with others.
- Inform patient that emtricitabine does not cure AIDS or prevent associated or opportunistic infections. Emtricitabine does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom and to avoid sharing needles or donating blood to prevent spreading the AIDS virus to others. Advise patient that the long-term effects of emtricitabine are unknown at this time.
- **Instruct patient to notify health care professional immediately if symptoms of lactic acidosis (tiredness or weakness, unusual muscle pain, trouble breathing, stomach pain with nausea and vomiting, cold especially in arms or legs, dizziness, fast or irregular heartbeat) or if signs of hepatotoxicity (yellow skin or whites of eyes, dark urine, light colored stools, lack of appetite for several days or longer, nausea, abdominal pain) occur.** These symptoms may occur more frequently in patients that are fe-

male, obese, or have been taking medications like emtricitabine for a long time.

- Advise patient to notify health care professional if signs and symptoms of Immune Reconstitution Syndrome (signs and symptoms of an infection) occur.
- Advise patient to notify health care professional if she plans or suspects pregnancy or is breast feeding.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and increase in CD4 cell counts.

emtricitabine/rilpivirine/tenofovir disoproxil fumarate

(em-tri-sye-ti-been/ril-pi-vir-een/te-noe-fo-veer)

Complera

Classification

Therapeutic: antiretrovirals

Pharmacologic: nucleoside reverse transcriptase inhibitors, non-nucleoside reverse transcriptase inhibitors

Indications

Management of HIV infection in treatment-naïve patients with HIV-1 RNA <100,000 copies/mL at the start of therapy (for use as a complete regimen). Management of HIV infection in patients on a stable antiretroviral regimen with HIV-1 RNA <50 copies/mL (to replace their current antiretroviral regimen).

Action

Emtricitabine—Phosphorylated intracellularly where it inhibits HIV reverse transcriptase, resulting in viral DNA chain termination. **Rilpivirine**—Inhibits HIV-replication by noncompetitively inhibiting HIV reverse transcriptase. **Tenofovir**—Phosphorylated intracellularly where it inhibits HIV reverse transcriptase resulting in disruption of DNA synthesis. **Therapeutic Effects:** Slowed progression of HIV infection and decreased occurrence of sequelae.

Pharmacokinetics

emtricitabine

Absorption: Rapidly and extensively absorbed; 93% bioavailable.

Distribution: Unknown.

Metabolism and Excretion: Some metabolism, 86% renally excreted, 14% fecal excretion.

Half-life: 10 hr.

rilpivirine

Absorption: Well absorbed following oral administration.

Distribution: Unknown.

Protein Binding: 99.7%.

Metabolism and Excretion: Mostly metabolized by the liver (CYP3A enzyme system); 25% excreted in feces unchanged, <1% excreted unchanged in urine.

Half-life: 50 hr.

tenofovir

Absorption: Tenofovir disoproxil fumarate is a prodrug, which is split into tenofovir, the active component.

Distribution: Absorption is enhanced by food.

Metabolism and Excretion: 70–80% excreted unchanged in urine by glomerular filtration and active tubular secretion.

Half-life: Unknown.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
emtricitabine PO	rapid	1–2 hr	24 hr
rilpivirine PO	unknown	4–5 hr	24 hr
tenofovir PO	unknown	2 hr*	24 hr

* When taken with food.

Contraindications/Precautions

Contraindicated in: Drugs that may significantly ↓ rilpivirine levels (may ↓ virologic response, ↑ risk of resistance and cross-resistance); Concurrent use of other antiretrovirals; Concurrent use of carbamazepine, oxcarbazepine, phenobarbital, phenytoin, rifampin, rifapentine, proton pump inhibitors, dexamethasone (>1 dose), or St. John's wort; Concurrent use of other products containing emtricitabine, rilpivirine (unless dose adjustment needed with rifabutin), tenofovir, lamivudine, or adefovir; CCr <50 mL/min; **Lactation:** HIV-infected patients should not breast feed.

Use Cautiously in: History of suicidal ideation or depression; History of pathologic fractures/osteoporosis/bone loss; **OB:** Use during pregnancy only if potential benefit justifies potential fetal risk; **Pedi:** Children <12 yr (safety and effectiveness not established).

Adverse Reactions/Side Effects

Combination.

GI: HEPATOTOXICITY. **GU:** renal impairment. **MS:** ↓ bone density. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS). **Misc:** POST-TREATMENT ACUTE EXACERBATION OF HEPATITIS B, immune reconstitution syndrome.

rilpivirine

CNS: SUICIDAL THOUGHTS, depression, insomnia, headache.

emtricitabine/tenofovir

CNS: abnormal dreams, depression, dizziness, fatigue, headache, insomnia. **F and E:** hypophosphatemia.

GI: LACTIC ACIDOSIS/HEPATOMEGLY WITH STEATOSIS, diarrhea, nausea. **Derm:** rash. **GU:** ACUTE RENAL FAILURE/PANCONI SYNDROME. **MS:** bone pain, ↓ bone mineral density, muscle pain, osteomalacia.

Interactions

Drug-Drug: May ↑ risk of nephrotoxicity with other nephrotoxic drugs; avoid if possible. **Strong CYP3A4 inducers,** including carbamazepine, oxcarbazepine, phenobarbital, phenytoin, dexamethasone (more than a single dose), rifabutin, rifampin, and rifapentine may ↓ levels and effectiveness; concurrent use contraindicated. **Proton pump inhibitors** including esomeprazole, lansoprazole, omeprazole, pantoprazole, and rabeprazole ↑ gastric pH and may ↓ blood levels and effectiveness; concurrent use contraindicated. **Antacids** including aluminum hydroxide, magnesium hydroxide, and calcium carbonate ↑ gastric pH and may ↓ blood levels; administer at least 2 hr before or 4 hr after. Blood levels and effectiveness may be ↓ by H₂-receptor antagonists including cimetidine, famotidine, nizatidine, and ranitidine; administer 12 hr after or 4 hr before. Nephrotoxic agents, including NSAIDs ↑ risk of nephrotoxicity; avoid concurrent use. Concurrent use of other drugs that ↑ risk of torsade de pointes may ↑ risk of serious arrhythmias. May alter requirements for methadone maintenance. Blood levels and risk of adverse effects may be ↑ by clarithromycin, and erythromycin; consider azithromycin as an alternative. **Ledipasvir/sofosbuvir** and **sofosbuvir/velpatasvir** may ↑ tenofovir levels.

Drug-Natural Products: St. John's wort may ↓ blood levels and effectiveness; concurrent use contraindicated.

Route/Dosage

Route/Dosage

PO (Adults and Children ≥12 yr and ≥35 kg): 1 tablet once daily. *Concurrent rifabutin therapy*—Give an additional 25 mg of rilpivirine once daily.

Availability

Tablets: emtricitabine 200 mg/rilpivirine 25 mg/tenofovir disoproxil fumarate 300 mg.

NURSING IMPLICATIONS**Assessment**

- Assess for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.
- Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Monitor bone mineral density in patients who have a history of pathologic bone fracture or are at risk for osteoporosis or bone loss. Calcium and vitamin D supplementation may be beneficial for all patients.
- **Monitor for signs or symptoms of severe skin or hypersensitivity reactions (severe rash or rash accompanied by fever, blisters, mucosal involvement, conjunctivitis, facial edema, angioedema, hepatitis or eosinophilia).** Discontinue *Complera* immediately if signs develop.
- **Lab Test Considerations:** Monitor viral load and CD4 cell count regularly during therapy.
- Assess for hepatitis B virus (HBV). *Complera* is not approved for administration in patients with HIV and HBV.
- Monitor liver function tests before and periodically during therapy, especially in patients with underlying liver disease or marked ↑ transaminase. May cause ↑ serum creatinine, AST, ALT, total bilirubin, total cholesterol, LDL, and triglycerides. **May cause lactic acidosis and severe hepatomegaly with steatosis.** These events are more likely to occur if patients are female, obese, or receiving nucleoside analogue medications for extended periods of time. Monitor patient for signs (increased serum lactate levels, elevated liver enzymes, liver enlargement on palpation). Therapy should be suspended if clinical or laboratory signs occur.
- Calculate creatinine clearance (CCr), urine glucose, and urine protein prior to therapy. CCr should be >70 mL/min before starting therapy. Monitor CCr, urine glucose, and urine protein in all patients periodically during therapy and serum phosphorous in patients at risk for renal impairment. Assess patients with persistent or worsening bone pain, pain in extremities, fractures and/or muscular pain or weakness for proximal renal tubulopathy; evaluate renal function promptly.
- Instruct patient that *Complera* should not be shared with others.
- Inform patient that *Complera* does not cure AIDS or prevent associated or opportunistic infections. Rilpivirine does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom and to avoid sharing needles or donating blood to prevent spreading the AIDS virus to others. Advise patient that the long-term effects of *Complera* are unknown at this time.
- Advise patient to notify health care professional immediately if symptoms of lactic acidosis (nausea, vomiting, unusual or unexpected stomach discomfort, and weakness) occur.
- Inform patients and families of risk of suicidal thoughts and behavior and advise that behavioral changes, emergency or worsening signs and symptoms of depression, unusual changes in mood, or emergence of suicidal thoughts, behavior, or thoughts of self-harm should be reported to health care professional immediately.
- Immune reconstitution syndrome may trigger opportunistic infections or autoimmune disorders. Notify health care professional if symptoms occur.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort.
- **Rep:** Advise patients to notify health care professional if pregnancy is planned or suspected. Advise patient to avoid breast feeding during *Complera* therapy. Encourage women who become pregnant during *Complera* therapy to enroll in Antiviral Pregnancy Registry by calling 1-800-258-4263.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Potential Nursing Diagnoses

Risk for infection (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** Administer once daily with food.

Patient/Family Teaching

- Emphasize the importance of taking *Complera* as directed, at the same time each day. Do not take more than prescribed amount and do not stop taking without consulting health care professional. Take missed doses with a meal if remembered <12 hr from the time it is usually taken, then return to regular schedule. If more than 12 hr from time dose is usually taken, omit dose and resume dosing schedule; do not double doses. Advise patient to read *Patient Information* prior to starting therapy and with each Rx refill in case of changes.
- Advise patient to take antacids 2 hr before or 4 hr after and H₂-antagonists 12 hr before or 4 hr after *Complera*.

Evaluation/Desired Outcomes

- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and increase in CD4 cell counts.

enalapril/enalaprilat. See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.

enasidinib (en-a-sid-a-nib)

Idhifa

Classification

Therapeutic: antineoplastics

Pharmacologic: IDH2 inhibitors

Indications

⚠ Relapsed or refractory acute myeloid leukemia (AML) with an isocitrate dehydrogenase-2 (IDH2) mutation.

Action

Inhibits the IDH2 enzyme, especially the mutant variants, R140Q, R172S, and R172K. Inhibiting these mutant enzymes results in decreased 2-hydroxyglutarate levels with subsequent induction of myeloid differentiation. Overall effect in patients with AML is a reduction in blast cells and an increased proportion of mature myeloid cells. **Therapeutic Effects:** Promotion of complete remission and reduction in need for transfusions.

Pharmacokinetics

Absorption: 57% absorbed following oral administration.

Distribution: 55.8 L.

Protein Binding: 98.5%.

Metabolism and Excretion: Metabolized by numerous CYP450 isoenzymes (CYP1A2, CYP2B6, CYP2C8, CYP2C9, CYP2C19, CYP2D6, and CYP3A4) to an active metabolite (AGI-16903). Also metabolized by multiple UDP-glucuronosyltransferase (UGTs). AGI-16903 is also metabolized by multiple CYP450 isoenzymes and UGTs. 89% eliminated in feces (34% as unchanged drug); 11% eliminated in urine (<1% as unchanged drug).

Half-life: 137 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	4 hr	unknown

Contraindications/Precautions

Contraindicated in: **OB:** May cause fetal harm;

Lactation: Avoid breast feeding.

Use Cautiously in: **Rep:** Women of reproductive potential and men with female partners of reproductive potential; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

F and E: hypocalcemia, hypokalemia, hypophosphatemia. **GI:** ↓ appetite, diarrhea, dysgeusia, ↑ bilirubin, nausea, vomiting. **GU:** ↓ fertility. **Hemat:** DIFFERENTIATION SYNDROME, leukocytosis. **Misc:** tumor lysis syndrome.

Interactions

Drug-Drug: None reported.

Route/Dosage

PO (Adults): 100 mg once daily for at least 6 mo and then continue until disease progression or unacceptable toxicity.

Availability

Tablets: 50 mg, 100 mg.

NURSING IMPLICATIONS**Assessment**

- Assess for signs and symptoms of differentiation syndrome (fever, dyspnea, acute respiratory distress, pulmonary infiltrates, pleural or pericardial effusions, rapid weight gain or peripheral edema, lymphadenopathy, bone pain, hepatic, renal, or multi-organ dysfunction). *If syndrome is suspected, start corticosteroid therapy and hemodynamic monitoring until symptom resolution. If severe pulmonary symptoms requiring intubation or ventilator support, and/or renal dysfunction persist >48 hours after initiation of corticosteroids, interrupt therapy. Resume enasidinib when signs and symptoms improve to ≤Grade 2.*
- **Lab Test Considerations:** Verify negative pregnancy test prior to starting therapy.
- Monitor CBC and blood chemistries for leukocytosis and tumor lysis syndrome prior to starting therapy and monitor at least every 2 wk for at least first 3 mos during therapy. *If noninfectious leukocytosis (WBC >30 × 10⁹/L), treat with hydroxyurea, using institutional protocol. If leukocytosis is not improved with hydroxyurea, interrupt therapy and resume at 100 mg daily when <WBC 30 × 10⁹/L.*
- Monitor serum bilirubin periodically during therapy. *If ↑ >3 × ULN sustained for ≥2 wk without ↑ ALT or AST or other hepatic disorders, decrease enasidinib dose to 50 mg/day. If bilirubin resolves to <2 × ULN, resume to 100 mg/day dose.*

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- **PO:** Administer once daily without regard for food.

Patient/Family Teaching

- Instruct patient to take enasidinib as directed at same time each day. If dose is missed, not taken at usual time, or vomited, take dose as soon as possible on same day. Then return to routine schedule.
- Advise patient to notify health care professional if signs and symptoms of differentiation syndrome (fever, cough or difficulty breathing, bone pain, rapid weight gain, swelling of their arms or legs) occur.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

May occur within first 10 days through 5 mo of therapy.

- Inform patient of risk of tumor lysis syndrome and advise of need to maintain fluid intake and frequent blood chemistry monitoring.
- Advise patient to notify health care professional if signs and symptoms of GI adverse reactions (diarrhea, nausea, vomiting, decreased appetite, changes in sense of taste) or elevated bilirubin (changes to color of skin or whites of eyes) occur.
- **Rep:** May be teratogenic. Advise female and male patients of reproductive potential to use effective contraception during and for at least 1 mo after last dose of ensidininib. Advise female patient not to breast feed during therapy and for at least 1 mo after last dose. Inform patients that ensidininib may impair fertility in male and female patients.

Evaluation/Desired Outcomes

- Promotion of complete remission and reduction in need for transfusions. Minimum therapy is 6 mo to allow time for clinical response.

enoxaparin, See HEPARINS (LOW MOLECULAR WEIGHT).

entacapone (en-tak-a-pone)

Comtan

Classification

Therapeutic: antiparkinson agents

Pharmacologic: catechol-*O*-methyltransferase inhibitors

Indications

With levodopa/carbidopa to treat idiopathic Parkinson's disease when signs and symptoms of end-of-dose "wearing-off" (so-called fluctuating patients) occur.

Action

Acts as a selective and reversible inhibitor of the enzyme catechol *O*-methyltransferase (COMT). Inhibition of this enzyme prevents the breakdown of levodopa, increasing availability to the CNS. **Therapeutic Effects:** Prolongs duration of response to levodopa with end-of-dose motor fluctuations. Decreased signs and symptoms of Parkinson's disease.

Pharmacokinetics

Absorption: 35% absorbed following oral administration; absorption is rapid.

Distribution: Unknown.

Protein Binding: 98%.

Metabolism and Excretion: Minimal amounts excreted unchanged; highly metabolized followed by biliary excretion.

Half-life: *Initial phase*—0.4–0.7 hr; *second phase*—2.4 hr.

TIME/ACTION PROFILE (inhibition of COMT)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	up to 8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent nonselective MAO inhibitor therapy; Psychotic disorder.

Use Cautiously in: Hepatic impairment; Concurrent use of drugs that are metabolized by COMT; **OB, Lactation:** Safety not established; **Pedi:** No identified use in children.

Adverse Reactions/Side Effects

CNS: **NEUROLEPTIC MALIGNANT SYNDROME**, agitation, aggressive behavior, confusion, delirium, disorientation, dizziness, hallucinations, paranoid ideation, syncope, urges (gambling, sexual). **Resp:** pulmonary infiltrates, pleural effusion, pleural thickening. **CV:** hypotension. **Derm:** melanoma. **GI:** abdominal pain, colitis, diarrhea, nausea (during initiation), retroperitoneal fibrosis. **GU:** brownish-orange discoloration of urine. **MS:** **RHABDOMYOLYSIS**, dyskinesia. **Neuro:** dyskinesia.

Interactions

Drug-Drug: Concurrent use with selective MAO inhibitors is not recommended; both agents inhibit the metabolic pathways of catecholamines. Concurrent use of drugs that are metabolized by COMT such as **isoproterenol, epinephrine, norepinephrine, dopamine, dobutamine, and methyldopa** may ↑ risk of tachycardia, ↑ BP, and arrhythmias. **Probenecid, cholestyramine, erythromycin, rifampin, ampicillin, and chloramphenicol** may interfere with biliary elimination of entacapone; use concurrently with caution.

Route/Dosage

PO (Adults): 200 mg with each dose of levodopa/carbidopa up to a maximum of 8 times daily.

Availability (generic available)

Tablets: 200 mg. **In combination with:** levodopa/carbidopa (Stalevo), see Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess parkinsonian and extrapyramidal symptoms (restlessness or desire to keep moving, rigidity, tremors, pill rolling, mask-like face, shuffling gait, muscle spasms, twisting motions, difficulty speaking or swallowing, loss of balance control) prior to and during therapy. Dyskinesia may increase with therapy.
- Monitor patient for development of diarrhea. Usually occurs within 4 to 12 wk of start of therapy, but may occur as early as the first wk and as late as mo after initiation of therapy.
- Monitor patient for signs and symptoms of neuroleptic malignant syndrome (elevated temperature, muscular rigidity, altered consciousness, elevated CPK). Symptoms have been associated with rapid dose re-

duction or withdrawal of other dopaminergic drugs. Withdrawal should be gradual.

Potential Nursing Diagnoses

Impaired physical mobility (Indications)
Risk for injury (Indications)

Implementation

- **PO:** Always administer entecavir with levodopa/carbidopa. Entecavir has no antiparkinsonism effects of its own.

Patient/Family Teaching

- Encourage patient to take entecavir as directed. Take missed doses as soon as possible, up to 2 hr before the next dose. Taper gradually when discontinuing or a withdrawal reaction may occur.
- May cause dizziness or hallucinations. Advise patient to avoid driving or other activities that require alertness until response to the drug is known.
- Inform patient that nausea may occur, especially at initiation of therapy and diarrhea. Advise patient with diarrhea to drink fluids to maintain adequate hydration and monitor for weight loss. If diarrhea is prolonged, may resolve with discontinuation. Therapy may cause change in urine color to brownish or orange.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient to notify health care professional if suspicious or unusual skin changes, agitation, aggression, delirium, hallucinations, or new or increased gambling, sexual, or other intense urges occur.
- Instruct patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- Emphasize the importance of routine follow-up exams.

Evaluation/Desired Outcomes

- Decreased signs and symptoms of Parkinson's disease.

entecavir (en-tek-aveer)

Baraclude

Classification

Therapeutic: antivirals

Pharmacologic: nucleoside analogues

Indications

Chronic hepatitis B infection with evidence of active viral replication and either persistent elevations in AST or ALT or histologically active disease.

Action

Phosphorylated intracellularly to active form which acts as an analogue of guanosine, interfering with viral DNA

synthesis. **Therapeutic Effects:** Decreased hepatic damage due to chronic hepatitis B infection.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Extensive tissue distribution.

Metabolism and Excretion: 62–73% excreted unchanged by kidneys.

Half-life: Plasma—128–149 hr; intracellular—15 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	0.5–1 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **Lactation:** Potential for serious adverse effects in infant.

Use Cautiously in: Renal impairment (dose ↓ recommended if $CCr < 50$ mL/min; Liver transplant recipients (careful monitoring of renal function recommended); Patients coinfecting with HIV (unless receiving highly active antiretroviral therapy; at ↑ risk for resistance); **OB:** Use only if clearly needed, considering benefits and risks; **Pedi:** Children <2 yr (safety not established); **Ger:** ↑ risk of toxicity due to age-related ↓ in renal function.

Adverse Reactions/Side Effects

CNS: dizziness, fatigue, headache. **GI:** HEPATOMEGALY (WITH STEATOSIS), dyspepsia, nausea. **F and E:** LACTIC ACIDOSIS. **Derm:** alopecia, rash.

Interactions

Drug-Drug: Concurrent use of drugs which may impair renal function may ↑ blood levels and risk of toxicity.

Route/Dosage

PO (Adults and Children >16 yr): *Compensated liver disease*—0.5 mg once daily (1 mg once daily if history of lamivudine or telbivudine resistance); *Decompensated liver disease*—1 mg once daily.

Renal Impairment

PO (Adults and Children >16 yr): *CCr 30–<50 mL/min*—0.25 mg once daily or 0.5 mg q 48 hr (0.5 mg once daily or 1 mg q 48 hr if history of lamivudine resistance) *CCr 10–<30 mL/min*—0.15 mg once daily or 0.5 mg q 72 hr (0.3 mg once daily or 1 mg q 72 hr if history of lamivudine resistance); *CCr <10 mL/min*—0.05 mg once daily or 0.5 mg q 7 days (0.1 mg once daily or 1 mg q 7 days if history of lamivudine resistance).

PO (Children 2–<16 yr and 10–11 kg): 0.15 mg once daily (0.3 mg once daily if history of lamivudine resistance).

★ = Canadian drug name. † = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; _____ indicate most frequent.

PO (Children 2–<16 yr and >11–14 kg): 0.2 mg once daily (0.4 mg once daily if history of lamivudine resistance).

PO (Children 2–<16 yr and >14–17 kg): 0.25 mg once daily (0.5 mg once daily if history of lamivudine resistance).

PO (Children 2–<16 yr and >17–20 kg): 0.3 mg once daily (0.6 mg once daily if history of lamivudine resistance).

PO (Children 2–<16 yr and >20–23 kg): 0.35 mg once daily (0.7 mg once daily if history of lamivudine resistance).

PO (Children 2–<16 yr and >23–26 kg): 0.4 mg once daily (0.8 mg once daily if history of lamivudine resistance).

PO (Children 2–<16 yr and >26–30 kg): 0.45 mg once daily (0.9 mg once daily if history of lamivudine resistance).

PO (Children 2–<16 yr and >30 kg): 0.5 mg once daily (1 mg once daily if history of lamivudine resistance).

Availability (generic available)

Tablets: 0.5 mg, 1 mg. **Oral solution (orange flavor):** 0.05 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor signs of hepatitis (jaundice, fatigue, anorexia, pruritus) during and for several mo following discontinuation of therapy. Exacerbations may occur when therapy is discontinued.
- May cause lactic acidosis and severe hepatomegaly with steatosis. Monitor patient for signs (↑ serum lactate levels, elevated liver enzymes, liver enlargement on palpation). Suspend therapy if clinical or laboratory signs occur.
- **Lab Test Considerations:** Monitor liver function closely during and for several mo following discontinuation of therapy. May cause ↑ AST, ALT, bilirubin, amylase, lipase, creatinine, and serum glucose. May cause ↓ serum albumin.

Potential Nursing Diagnoses

Risk for infection (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** Administer on an empty stomach at least 2 hr before or after a meal. Use oral solution for dose <0.5 mg and children up to 30 kg. Children >30 kg can use oral solution or tablet. Oral solution is ready to use and should not be diluted or mixed with water or any other liquid. Hold spoon in a vertical position and fill gradually to mark corresponding to the prescribed dose. Rinse dosing spoon with water after each daily dose. Store in outer carton at room temperature. After opening, solution can be used until expiration date on bottle.

Patient/Family Teaching

- Instruct patient to read the *Patient Information* with each refill and to take entecavir as directed. Take missed doses as soon as possible unless almost time for next dose. Do not run out of entecavir; get more when supply runs low. Do not double doses. Emphasize the importance of compliance with full course of therapy, not taking more than the prescribed amount, and not discontinuing without consulting health care professional. Inform patient that hepatitis exacerbation may occur upon discontinuation of therapy. Caution patient not to share medication with others.
- Inform patient that entecavir does not cure HBV disease, but may lower the amount of HBV in the body, lower the ability of HBV to multiply and infect new liver cells, and may improve the condition of the liver. Entecavir does not reduce the risk of transmission of HBV to others through sexual contact or blood contamination. Caution patient to use a condom during sexual contact and avoid sharing needles or donating blood to prevent spreading HBV to others.
- Advise patient to notify health care professional promptly if signs of lactic acidosis (weakness or tiredness; unusual muscle pain; trouble breathing; stomach pain with nausea and vomiting; feeling cold, especially in arms or legs; dizziness, fast or irregular heartbeat) or hepatotoxicity (jaundice, dark urine, light-colored bowel movements, anorexia, nausea, lower stomach pain) occur.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Discuss the possibility of hair loss with patient. Explore methods of coping.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of regular follow-up exams and blood tests to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Decreased hepatic damage due to chronic hepatitis B infection.

enzalutamide
(en-za-loo-ta-mide)
Xtandi

Classification

Therapeutic: antineoplastics

Pharmacologic: androgen receptor inhibitors

Indications

Management of metastatic castration-resistant prostate cancer.

Action

Acts as an androgen receptor inhibitor, preventing the binding of androgen; also inhibits androgen nuclear translocation and DNA interaction. Decreases proliferation and induces cell death of prostate cancer cells.

Therapeutic Effect: Decreased growth and spread of prostate cancer.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Unknown.

Protein Binding: Enzalutamide—97–98%; *N-desmethylenzalutamide*—95%.

Metabolism and Excretion: Extensively metabolized by the liver (CYP2C8 and CYP3A4 enzyme systems); one metabolite (*N-desmethylenzalutamide*) has antineoplastic activity. Metabolites are primarily renally excreted, only minimal amounts as unchanged drug.

Half-life: Enzalutamide—5.8 days; *N-desmethylenzalutamide*—7.8–8.6 days.

TIME/ACTION PROFILE (improved survival)

ROUTE	ONSET	PEAK	DURATION
PO	3 mo	unknown	unknown

Contraindications/Precautions

Contraindicated in: **OB: Rep:** Pregnancy (may cause fetal harm) or women of reproductive potential.

Use Cautiously in: History of seizures, underlying brain pathology, cerebrovascular accident, transient ischemic attack (within 12 mo), brain metastases or brain arteriovenous malformation (may ↑ risk of seizures); **Geri:** May be more sensitive to drug effects; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: **POSTERIOR REVERSIBLE ENCEPHALOPATHY SYNDROME (PRES)**, **SEIZURES**, **SPINAL CORD COMPRESSION/CAUDA EQUINA SYNDROME**, headache, weakness, anxiety, dizziness, hallucinations, insomnia, mental impairment disorders. **EENT:** epistaxis. **CV:** peripheral edema, hypertension. **GI:** diarrhea. **GU:** hematuria, urinary frequency. **Derm:** hot flush, dry skin, pruritus. **MS:** arthralgia, musculoskeletal pain, muscular stiffness, muscular weakness. **Neuro:** hypoesthesia, paresthesia.

Interactions

Drug-Drug: **Strong CYP2C8 inhibitors**, including **gemfibrozil**, may ↑ levels and risk of toxicity; avoid concurrent use (if concurrent administration necessary, ↓ enzalutamide dose). **Strong CYP3A4 induc-**

ers, including **carbamazepine**, **phenobarbital**, **phenytoin**, **rifabutin**, **rifampin**, and **rifapentine** may ↓ levels and response; avoid concurrent use (if concurrent administration necessary, ↑ enzalutamide dose). May ↓ levels of **CYP3A4**, **CYP2C9**, and **CYP2C19 substrates** that have narrow therapeutic indexes including **cyclosporine**, **fantanyl**, **phenytoin**, **sirolimus**, **tacrolimus**, and **warfarin**; avoid concurrent use. **Drugs that ↓ seizure threshold** may ↑ risk of seizures.

Drug-Natural Products: **St. John's wort** may ↓ levels and response; avoid concurrent use (if concurrent administration necessary, ↑ enzalutamide dose).

Route/Dosage

PO (Adults): 160 mg (four 40-mg capsules) once daily; if ≥Grade 3 toxicity or intolerable adverse reactions occur, discontinue for 1 wk and resume at the same or lower dose (80 or 120 mg). **Concurrent use of strong CYP2C8 inhibitors**—80 mg once daily; **Concurrent use of strong CYP3A4 inducers**—240 mg once daily.

Availability

Capsules: 40 mg.

NURSING IMPLICATIONS

Assessment

- **Monitor for seizures.** Implement seizure precautions. If a seizure occurs during therapy, permanently discontinue enzalutamide therapy.
- **Monitor for signs and symptoms of PRES (seizure, headache, lethargy, confusion, blindness, other visual and neurological disturbances, hypertension) during therapy.** Diagnosis is made with MRI. Discontinue enzalutamide in patients who develop PRES.
- **Lab Test Considerations:** May cause hematuria.

Potential Nursing Diagnoses

Activity intolerance

Implementation

- **PO:** Administer 4 capsules once daily without regard to food. Swallow capsules whole; do not open, dissolve, or chew.
- If ≥Grade 3 toxicity or intolerable side effects occur, withhold dose for 1 wk or until symptoms improve to <Grade 2, then resume at same or reduced dose (120 mg or 80 mg).

Patient/Family Teaching

- Instruct patient to take enzalutamide as directed at the same time each day. Take missed doses as soon as remembered within the same day. If a whole day is missed, omit dose and take next day's scheduled dose; do not double doses. Advise patient not to interrupt, modify dose, or stop taking enzalutamide

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

without consulting health care professional. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.

- **May cause seizures, dizziness, mental impairment, paresthesia, hypoesthesia, falls, and hallucinations. Caution patient to avoid driving and other activities requiring alertness until response to medication is known. Notify health care professional immediately if loss of consciousness, seizure, or signs and symptoms of PRES occur.**
- Inform patient of common side effects associated with enzalutamide: asthenia/fatigue, back pain, diarrhea, arthralgia, hot flush, peripheral edema, musculoskeletal pain, headache, upper and lower respiratory infection, muscular weakness, dizziness, insomnia, spinal cord compression, cauda equina syndrome, hematuria, paresthesia, anxiety, and hypertension. Notify health care professional if falls or problems thinking clearly, or if side effects are bothersome.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, or herbal products.
- **Rep:** Caution patients that enzalutamide is teratogenic. Advise patient to avoid pregnancy and breast feeding during and for 3 mo following completion of therapy. Male patients should use a condom if having sex with a pregnant woman, and a condom and another effective method of birth control should be used if having sex with a woman of reproductive potential.

Evaluation/Desired Outcomes

- Decreased growth and spread of prostate cancer.

HIGH ALERT

EPINEPHrine (ep-i-nef-rin)

Adrenaclick, Adrenalin, **✳** Allerject,

✳ Anapen, **✳** Anapen Junior,

AsthmaNefrin, Auvi-Q, EpiPen,

✳ S-2 (racepinephrine), **Twin-Ject**

Classification

Therapeutic: antiasthmatics, bronchodilators, vasopressors

Pharmacologic: adrenergics

See Appendix C for ophthalmic use

Indications

Subcut, IM, IV: Management of severe allergic reactions. **IV, Intracardiac, Intratracheal, Intraosseous (part of advanced cardiac life support [ACLS] and pediatric advanced life support [PALS] guidelines):** Management of cardiac arrest (unlabeled). **Subcut, IM:** Management of reversible

airway disease due to asthma or COPD (unlabeled).

Inhaln: Management of upper airway obstruction and croup (racemic epinephrine). **Local/Spinal:** Adjunct in the localization/prolongation of anesthesia.

Action

Results in the accumulation of cyclic adenosine monophosphate (cAMP) at beta-adrenergic receptors. Affects both beta₁ (cardiac)-adrenergic receptors and beta₂ (pulmonary)-adrenergic receptor sites. Produces bronchodilation. Also has alpha-adrenergic agonist properties, which result in vasoconstriction. Inhibits the release of mediators of immediate hypersensitivity reactions from mast cells. **Therapeutic Effects:** Bronchodilation. Maintenance of heart rate and BP. Localization/prolongation of local/spinal anesthetic.

Pharmacokinetics

Absorption: Well absorbed following subcut administration; some absorption may occur following repeated inhalation of large doses.

Distribution: Does not cross the blood-brain barrier; crosses the placenta and enters breast milk.

Metabolism and Excretion: Action is rapidly terminated by metabolism and uptake by nerve endings.

Half-life: Unknown.

TIME/ACTION PROFILE (bronchodilation)

ROUTE	ONSET	PEAK	DURATION
Inhaln	1 min	unknown	1–3 hr
Subcut	5–10 min	20 min	<1–4 hr
IM	6–12 min	unknown	<1–4 hr
IV	rapid	20 min	20–30 min

Contraindications/Precautions

Contraindicated in: Hypersensitivity to adrenergic amines; Some products may contain bisulfites and should be avoided in patients with known hypersensitivity or intolerance.

Use Cautiously in: Cardiac disease (angina, tachycardia, MI); Hypertension; Hyperthyroidism; Parkinson's disease; Pheochromocytoma; Diabetes; Cerebral arteriosclerosis; Glaucoma (except for ophthalmic use); Excessive use may lead to tolerance and paradoxical bronchospasm (inhaler); **OB:** Use only if potential maternal benefit outweighs potential risks to fetus; **Lactation:** High intravenous doses of epinephrine might ↓ milk production or letdown. Low-dose epidural, topical, inhaled, or ophthalmic epinephrine are unlikely to interfere with breast feeding (NIH); **Geri:** More susceptible to adverse reactions; may require ↓ dose.

Adverse Reactions/Side Effects

CNS: nervousness, restlessness, tremor, headache, insomnia. **Resp:** PARADOXICAL BRONCHOSPASM (EXCESSIVE USE OF INHALERS). **CV:** angina, arrhythmias, hypertension, tachycardia. **Derm:** skin and soft tissue infections (including necrotizing fasciitis and myonecrosis). **GI:** nausea, vomiting. **Endo:** hyperglycemia.

Interactions

Drug-Drug: Concurrent use with other **adrenergic agents** will have additive adrenergic side effects. Use with **MAO inhibitors** may lead to hypertensive crisis. **Beta blockers** may negate therapeutic effect. **Tri-cyclic antidepressants** enhance pressor response to epinephrine.

Drug-Natural Products: Use with caffeine-containing herbs (**cola nut, guarana, mate, tea, coffee**) ↑ stimulant effect.

Route/Dosage

Subcut, IM (Adults and Children ≥30 kg): *Severe anaphylaxis*—0.3–0.5 mg (single dose not to exceed 0.5 mg); may repeat every 10–15 min as needed.

Subcut (Children <30 kg): *Severe anaphylaxis*—0.01 mg/kg (not to exceed 0.3 mg/dose); may repeat every 10–15 min as needed.

IV (Adults): *Severe anaphylaxis*—0.1–0.25 mg every 5–15 min; may be followed by 1–4 mcg/min continuous infusion; *cardiopulmonary resuscitation (ACLS guidelines)*—1 mg every 3–5 min; *bradycardia (ACLS guidelines)*—2–10 mcg/min).

IV (Children): *Severe anaphylaxis*—0.1 mg (less in younger children); may be followed by 0.1 mcg/kg/min continuous infusion (may be ↑ up to 1.5 mcg/kg/min); *symptomatic bradycardia/pulseless arrest (PALS guidelines)*—0.01 mg/kg, may be repeated every 3–5 min, higher doses (up to 0.1–0.2 mg/kg) may be considered; may also be given by the intraosseous route. May also be given by the endotracheal route in doses of 0.1–0.2 mg/kg diluted to a volume of 3–5 mL with normal saline followed by several positive pressure ventilations.

Inhaln (Adults): *Inhalation solution*—1 inhalation of 1% solution; may be repeated after 1–2 min; additional doses may be given every 3 hr; *racinephrine*—Via hand nebulizer, 2–3 inhalations of 2.25% solution; may repeat in 5 min with 2–3 more inhalations, up to 4–6 times daily.

Inhaln (Children >1 mo): 0.25–0.5 mL of 2.25% racemic epinephrine solution diluted in 3 mL normal saline.

IV, Intratracheal (Neonates): 0.01–0.03 mg/kg every 3–5 min as needed.

Intracardiac (Adults): 0.3–0.5 mg.

Endotracheal (Adults): *Cardiopulmonary resuscitation (ACLS guidelines)*—2–2.5 mg.

Topical (Adults and Children ≥6 yr): *Nasal decongestant*—Apply 1% solution as drops, spray, or with a swab.

Intraspinal (Adults and Children): 0.2–0.4 mL of 1:1000 solution.

With Local Anesthetics (Adults and Children): Use 1:200,000 solution with local anesthetic.

Availability (generic available)

Inhalation solution (racinephrine): * 2.25%.

Intranasal solution: 1 mg/mL (1:1000). **Solution for injection:** 0.1 mg/mL (1:10,000), 1 mg/mL (1:1000). **Autoinjector (Auvi-Q, EpiPen):** 0.15 mg/0.15 mL (1:1000), 0.15 mg/0.3 mL (1:2000), 0.3 mg/0.3 mL (1:1000).

NURSING IMPLICATIONS

Assessment

- **Bronchodilator:** Assess lung sounds, respiratory pattern, pulse, and BP before administration and during peak of medication. Note amount, color, and character of sputum produced, and notify health care professional of abnormal findings.
- Monitor pulmonary function tests before and periodically during therapy.
- **Observe for paradoxical bronchospasm (wheezing).** If condition occurs, withhold medication and notify health care professional immediately.
- Observe patient for drug tolerance and rebound bronchospasm. Patients requiring more than 3 inhalation treatments in 24 hr should be under close supervision. If minimal or no relief is seen after 3–5 inhalation treatments within 6–12 hr, further treatment with aerosol alone is not recommended.
- Assess for hypersensitivity reaction (rash; urticaria; swelling of the face, lips, or eyelids). If condition occurs, withhold medication and notify health care professional immediately.
- **Vasopressor:** Monitor BP, pulse, ECG, and respiratory rate frequently during IV administration. Continuous ECG, hemodynamic parameters, and urine output should be monitored continuously during IV administration.
- Monitor for chest pain, arrhythmias, heart rate >110 bpm, and hypertension. Consult physician for parameters of pulse, BP, and ECG changes for adjusting dose or discontinuing medication.
- **Shock:** Assess volume status. Correct hypovolemia prior to administering epinephrine IV.
- **Nasal Decongestant:** Assess patient for nasal and sinus congestion prior to and periodically during therapy.
- **Lab Test Considerations:** May cause transient ↓ in serum potassium concentrations with nebulization or at higher than recommended doses.
- May cause an ↑ in blood glucose and serum lactic acid concentrations.
- **Toxicity and Overdose:** Symptoms of overdose include persistent agitation, chest pain or discomfort, decreased BP, dizziness, hyperglycemia, hypokalemia, seizures, tachyarrhythmias, persistent trembling, and vomiting.
- Treatment includes discontinuing adrenergic bronchodilator and other beta-adrenergic agonists and

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

symptomatic, supportive therapy. Cardioselective beta blockers are used cautiously because they may induce bronchospasm.

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)

Ineffective tissue perfusion (Indications)

Implementation

- Do not confuse epinephrine with ephedrine.
- **High Alert:** Patient harm or fatalities have occurred from medication errors with epinephrine. Epinephrine is available in various concentrations, strengths, and percentages and used for different purposes. Packaging labels may be easily confused or products incorrectly diluted. Dilutions should be prepared by a pharmacist. IV doses should be expressed in milligrams not ampules, concentration, or volume. Prior to administration, have second practitioner independently check original order, dose calculations, concentration, route of administration, and infusion pump settings.
- Medication should be administered promptly at the onset of bronchospasm.
- Use a tuberculin syringe with a 26-gauge ½-in. needle for subcut injection to ensure that correct amount of medication is administered.
- Tolerance may develop with prolonged or excessive use. Effectiveness may be restored by discontinuing for a few days and then readministering.
- Do not use solutions that are pinkish or brownish or that contain a precipitate.
- For anaphylactic shock, volume replacement should be administered concurrently with epinephrine. Antihistamines and corticosteroids may be used in conjunction with epinephrine.
- **IM, Subcut:** Administer into anterolateral thigh, through clothing if necessary for anaphylaxis. Hold child's leg firmly to limit movement during injection to prevent lacerations, bent needles, and broken/embedded needles. Avoid injecting into gluteal muscle; may not be effective for anaphylaxis and may cause infection. Medication can cause irritation of tissue. Rotate injection sites to prevent tissue necrosis. Massage injection sites well after administration to enhance absorption and to decrease local vasoconstriction. Avoid IM administration in gluteal muscle.

IV Administration

- **IV Push:** **Diluent:** The 1:10,000 solution can be administered undiluted. Dilute 1 mg (1 mL) of a 1:1000 solution in 9 mL of 0.9% NaCl to prepare a 1:10,000 solution. **Concentration:** 0.1 mg/mL (1:10,000). **Rate:** Administer each 1 mg (10 mL) of a 1:10,000 solution over at least 1 min; more rapid administration may be used during cardiac resuscitation. Follow each dose with 20 mL IV saline flush.
- **Continuous Infusion:** **Diluent:** Dilute 1 mg (1 mL) of a 1:1000 solution in 250 mL of D5W or 0.9%

NaCl. Protect from light. Infusion stable for 24 hr.

Concentration: 4 mcg/mL. **Rate:** See Route/Dose section. Titrate to response (BP, heart rate, respiratory rate).

- **Y-Site Compatibility:** alfentanil, amikacin, amino-caproic acid, amiodarone, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, atropine, azithromycin, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, daunorubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin, doxorubicin liposomal, doxycycline, enalaprilat, ephedrine, epirubicin, epoetin alfa, eptifibatid, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, folic acid, foscarnet, fosphenytoin, furosemide, gencitabine, gentamicin, glycopyrrrolate, granisetron, heparin, hetastarch, hydrocortisone sodium succinate, hydromorphone, ibuprofen, idarubicin, ifosfamide, imipenem/cilastatin, irinotecan, isoproterenol, ketamine, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethylamine, meperidine, mesna, methotrexate, methylglucate, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, multiple vitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nocardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, papaverine, pantoprazole, pemetrexed, penicillin G, pentamidine, pentazocine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, ranitidine, remifentanyl, rocuronium, sodium acetate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, vitamin B complex with C, voriconazole, warfarin, zoledronic acid.
- **Y-Site Incompatibility:** acyclovir, alemtuzumab, aminophylline, amphotericin B colloidal, carmustine, dacarbazine, dantrolene, diazepam, fluorouracil, fosphenytoin, ganciclovir, indomethacin, micafungin, pentobarbital, phenobarbital, phenytoin,

sodium bicarbonate, thiopental, trimethoprim/sulfamethoxazole.

- **Inhaln:** When using epinephrine inhalation solution, 10 drops of 1% base solution should be placed in the reservoir of the nebulizer.
- The 2.25% inhalation solution of racepinephrine must be diluted for use in the combination nebulizer/respirator.
- Allow 1–2 min to elapse between inhalations of epinephrine inhalation solution to make certain the second inhalation is necessary.
- When epinephrine is used concurrently with corticosteroid or ipratropium inhalations, administer bronchodilator first and other medications 5 min apart to prevent toxicity from inhaled fluorocarbon propellants.
- **Endotracheal:** Epinephrine can be injected directly into the bronchial tree via the endotracheal tube if the patient has been intubated. Perform 5 rapid insufflations; forcefully administer 10 mL containing 2–2.5 mg epinephrine (1 mg/mL) directly into tube; follow with 5 quick insufflations.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed. If on a scheduled dosing regimen, take a missed dose as soon as possible; space remaining doses at regular intervals. Do not double doses. Caution patient not to exceed recommended dose; may cause adverse effects, paradoxical bronchospasm, or loss of effectiveness of medication.
- Instruct patient to contact health care professional immediately if shortness of breath is not relieved by medication or is accompanied by diaphoresis, dizziness, palpitations, or chest pain.
- Advise patient to consult health care professional before taking any OTC medications or alcoholic beverages concurrently with this therapy. Caution patient also to avoid smoking and other respiratory irritants.
- **Inhaln:** Review correct administration technique (aerosolization, IPPB) with patient.
- Do not spray inhaler near eyes.
- Advise patients to use bronchodilator first if using other inhalation medications, and allow 5 min to elapse before administering other inhalant medications, unless otherwise directed.
- Advise patient to rinse mouth with water after each inhalation dose to minimize dry mouth.
- Advise patient to maintain adequate fluid intake (2000–3000 mL/day) to help liquefy tenacious secretions.
- Advise patient to consult health care professional if respiratory symptoms are not relieved or worsen after treatment or if chest pain, headache, severe dizziness, palpitations, nervousness, or weakness occurs.

- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- **Autoinjector:** Instruct patients using auto-injector for anaphylactic reactions to remove gray safety cap, placing black tip on thigh at right angle to leg. Press hard into thigh until auto-injector functions, hold in place for 10 seconds, remove, and discard properly. Massage injected area for 10 sec. **Pedi:** Teach parents or caregivers signs and symptoms of anaphylaxis, how to use auto-injector safely, and to get the child to a hospital as soon as possible. Instruct parents or caregivers to teach child how to manage his or her allergy, how to self-inject, and what to do in an emergency. For children too young to self-inject and who will be separated from parent, tell parents to always discuss allergy and use of auto-injector with responsible adult.

Evaluation/Desired Outcomes

- Prevention or relief of bronchospasm.
- Increase in ease of breathing.
- Prevention of bronchospasm or reduction of frequency of acute asthma attacks in patients with chronic asthma.
- Prevention of exercise-induced asthma.
- Reversal of signs and symptoms of anaphylaxis.
- Increase in cardiac rate and output, when used in cardiac resuscitation.
- Increase in BP, when used as a vasopressor.
- Localization of local anesthetic.
- Decrease in sinus and nasal congestion.

HIGH ALERT

epiRUBicin (ep-i-roo-bi-sin)

Ellence,  Pharmorubicin PFS

Classification

Therapeutic: antineoplastics

Pharmacologic: anthracyclines

Indications

A component of adjuvant therapy for evidence of axillary tumor involvement following resection of primary breast cancer.

Action

Inhibits DNA and RNA synthesis by forming a complex with DNA. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Rapidly and widely distributed; concentrates in RBCs.

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Metabolism and Excretion: Extensively and rapidly metabolized by the liver and other tissues.

Half-life: 35 hr.

TIME/ACTION PROFILE (effect on WBCs)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	10–14 days	21 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity to epirubicin, other anthracyclines, or related compounds; Baseline neutrophil count <1500 cells/mm³; Heart failure; Recent MI; Severe arrhythmias; Previous treatment with anthracyclines up to the maximum cumulative dose; Severe hepatic impairment; Concurrent cimetidine therapy; **OB, Lactation:** Significant risk for fetal or infant harm.

Use Cautiously in: Cardiovascular disease, prior or concomitant radiation therapy to mediastinal or pericardial area, previous therapy with anthracyclines, or concomitant use of cardiotoxic drugs (\uparrow risk of cardiotoxicity); Severe renal impairment (serum creatinine >5 mg/dL); consider \downarrow dose; Hepatic impairment (dose \downarrow recommended for bilirubin >1.2 mg/dL or AST >2.2 – 4 times upper limit of normal); Depressed bone marrow reserve; **Rep:** Women of reproductive potential; **Pedi:** Safety not established; \uparrow risk of acute cardiotoxicity and chronic HF; **Geri:** \uparrow risk of toxicity in females ≥ 70 yr.

Adverse Reactions/Side Effects

CNS: lethargy. **CV:** **CARDIOTOXICITY** (dose-related), bradycardia, heart block, thromboembolism, ventricular tachycardia. **GI:** nausea, vomiting, anorexia, diarrhea, mucositis. **Derm:** alopecia, flushing, itching, photosensitivity, radiation-recall reaction, rash, skin/nail hyperpigmentation. **Endo:** gonadal suppression.

Hemat: **LEUKOPENIA**, anemia, thrombocytopenia, treatment-related leukemia/myelodysplastic syndromes.

Local: injection site reactions, phlebitis at IV site, tissue necrosis. **Metab:** hot flashes, hyperuricemia.

Misc: **ANAPHYLAXIS, INFECTION.**

Interactions

Drug-Drug: **Cimetidine** \uparrow blood levels and risk of serious toxicity; avoid concurrent use. Additive hematologic and gastrointestinal toxicity with other **antineoplastics** or **radiation therapy**. Use with other cardiotoxic drugs may \uparrow risk of cardiotoxicity; avoid concurrent use. May \downarrow antibody response to **live-virus vaccines** and \uparrow risk of adverse reactions. **Trastuzumab** may \uparrow risk of cardiotoxicity.

Route/Dosage

IV (Adults): 100–120 mg/m² repeated in 3–4 wk cycles (total dose may be given on day 1 or split and given in equally divided doses on day 1 and day 8 of each cycle) (combination regimens may employ concurrent 5-fluorouracil and cyclophosphamide).

Hepatic Impairment

IV (Adults): **Bilirubin** 1.2–3 mg/dL or AST 2–4 times upper limit of normal—use 50% of recommended starting dose; **bilirubin** >3 mg/dL or AST >4 times upper limit of normal—use 25% of recommended starting dose.

Availability (generic available)

Solution for injection (red): 2 mg/mL.

NURSING IMPLICATIONS

Assessment

- **Monitor for bone marrow depression.** Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- **Severe nausea and vomiting may occur.** Administer parenteral antiemetic agents 30–45 min prior to therapy and routinely around the clock for next 24 hr as indicated. Monitor amount of emesis and notify health care professional if emesis exceeds guidelines to prevent dehydration.
- **Measure cardiac function, using ECG and a multi-gated radionuclide angiography (MUGA) scan or an ECHO, prior to therapy.** Perform repeated evaluations of left ventricular ejection fraction during therapy. Monitor for development of signs of cardiac toxicity, which may occur early (ST-T wave changes, sinus tachycardia, and extrasystoles) or late (may occur mo to yr after termination of therapy). Delayed cardiac toxicity is characterized by cardiomyopathy, tachycardia, peripheral edema, dyspnea, rales/crackles, weight gain, hepatomegaly, ascites, pleural effusion. Toxicity is usually dependent on cumulative dose.
- **Assess injection site frequently for redness, irritation, or inflammation.** Burning or stinging during infusion may indicate infiltration and infusion should be discontinued and restarted in another vein. Epirubicin is a vesicant but may infiltrate painlessly even if blood returns on aspiration of infusion needle. Severe tissue damage may occur if epirubicin extravasates. If extravasation occurs, stop infusion immediately, restart, and complete dose in another vein.
- **Assess oral mucosa frequently for development of stomatitis (pain, burning, erythema, ulcerations, bleeding, infection).** Increased dosing interval and/or decreased dosing is recommended if lesions are painful or interfere with nutrition.
- **Lab Test Considerations:** Monitor CBC and differential before and during each cycle of therapy. Epirubicin should not be administered to patients with a baseline neutrophil count <1500 cells/mm³. The WBC nadir occurs 10–14 days after administra-

tion, and recovery usually occurs by the 21st day. Severe thrombocytopenia and anemia may also occur.

- Monitor renal (BUN and creatinine) and hepatic (AST, ALT, LDH, and serum bilirubin) function prior to and periodically during therapy. Dose reduction is required for bilirubin >1.2 mg/dL, AST 2–4 times the upper limit of normal, or serum creatinine >5 mg/dL.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)
Decreased cardiac output (Adverse Reactions)

Implementation

- **High Alert:** Fatalities have occurred with incorrect administration of chemotherapeutic agents. Before administering, clarify ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations and infusion pump settings. Epirubicin should be administered only under the supervision of a physician experienced in the use of cancer chemotherapeutic agents.
- **High Alert:** Do not confuse epirubicin with eribulin.
- Prepare solution in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard IV equipment in specially designated containers.
- Administer prophylactic anti-infective therapy with trimethoprim/sulfamethoxazole or a fluoroquinolone and antiemetic therapy prior to administration of epirubicin.
- Do not administer subcut or IM.

IV Administration

- **Intermittent Infusion:** **Diluent:** Administer undiluted. Solution is clear red. Use epirubicin within 24 hr of penetration of rubber stopper. Discard unused solution. **Concentration:** 2 mg/mL. **Rate:** Administer initial dose of 100–120 mg/m² over 15–20 min through free-flowing infusion of 0.9% NaCl or D5W. Lower doses may be infused for shorter periods, but not less than over 3 min. Do not administer via IV push. Facial flushing and erythema along involved vein frequently occur when administration is too rapid. Venous sclerosis may result from injection into a small vein or repeated injections into the same vein. Avoid veins over joints or in extremities with compromised venous or lymphatic drainage.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, amifostine, amikacin, aminocaproic acid, anidulafungin, argatroban, atracurium, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, caspofungin, ceftazidime, cefotaxime, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclospor-

ine, dacarbazine, daptomycin, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxacurium, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, erythromycin, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, gemcitabine, gemtamicin, granisetron, haloperidol, halorcortisone, hydromorphone, ifosfamide, imipenem cilastatin, insulin, isoproterenol, labetalol, levofloxacin, levorphanol, lidocaine, linezolid, lorazepam, mannitol, meperidine, mesna, methotrexate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, morphine, moxifloxacin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, pamidronate, pancuronium, pentamidine, pentazocine, phenylephrine, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, quinapristin/dalfopristin, ranitidine, remifentanyl, rocuronium, sodium acetate, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiopeta, tirofiban, tobramycin, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, allopurinol, aminophylline, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, azithromycin, cefepime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, dexamethasone, diazepam, ertapenem, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, heparin, hydrocortisone, ketorolac, leucovorin, magnesium sulfate, meropenem, methylprednisolone, nafcillin, pantoprazole, pemetrexed, pentobarbital, phenobarbital, phenytoin, piperacillin/tazobactam, potassium phosphates, sodium bicarbonate, sodium phosphates, thiopental, tigecycline, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Instruct patient to notify health care professional promptly if fever; sore throat; signs of infection; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Patient should be cautioned not to drink alcoholic beverages or take medication containing aspirin or NSAIDs, because these may precipitate gastric bleeding.
- Instruct patient to report pain at injection site immediately.
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

use sponge brush, rinse mouth with water after eating and drinking, and confer with health care professional if mouth pain interferes with eating. Pain may require treatment with opioid analgesics. Patients usually recover by the third wk of therapy.

- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to avoid concurrent use of alcohol or OTC medications and herbal products, especially cold preparations, without consulting health care professional, especially cimetidine.
- Instruct patient to notify health care professional immediately if vomiting, dehydration, fever, evidence of infection, symptoms of HF, or pain at injection site occurs. Patients should be informed of the risk of irreversible cardiac damage and treatment-related leukemia.
- Discuss the possibility of hair loss with patient. Explore methods of coping. Regrowth usually occurs 2–3 mo after discontinuation of therapy.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Inform patient that medication may cause urine to appear red for 1–2 days.
- Instruct patient to notify health care professional if skin irritation occurs at site of previous radiation therapy. May cause hyperpigmentation of the skin and nails. Advise patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- **Rep:** Advise patient that this medication may have teratogenic effects. Contraception should be used during and for at least 4 mo after therapy is concluded. Inform patient before initiating therapy that this medication may cause irreversible gonadal suppression.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in size or spread of malignancies in patients with axillary node tumor involvement following resection of primary breast cancer.

eplerenone (e-ple-re-none)

Inspira

Classification

Therapeutic: antihypertensives

Pharmacologic: aldosterone antagonists

Indications

Hypertension (alone, or with other agents). LV systolic dysfunction and evidence of HF post-MI.

Action

Blocks the effects of aldosterone by attaching to mineralocorticoid receptors. **Therapeutic Effects:** Lowering of BP. Improves survival in patients with evidence of HF post-MI.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Unknown.

Metabolism and Excretion: Mostly metabolized by the liver (CYP3A enzyme system); <5% excreted unchanged by the kidneys.

Half-life: 4–6 hr.

TIME/ACTION PROFILE (antihypertensive effect)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	4 wk	unknown

Contraindications/Precautions

Contraindicated in: Serum potassium >5.5 mEq/L; Type 2 diabetes with microalbuminuria (for patients with HTN; ↑ risk of hyperkalemia); Serum creatinine >2 mg/dL in males or >1.8 mg/dL in females (for patients with HTN); CCr ≤30 mL/min (for all patients); CCr <50 mL/min (for patients with HTN); Concurrent use of potassium supplements or potassium-sparing diuretics (for patients with HTN); Concurrent use of strong inhibitors of the CYP3A4 enzyme system (ketoconazole, itraconazole, nefazodone, clarithromycin, ritonavir, or nelfinavir); **Lactation:** Lactation.

Use Cautiously in: Moderate hepatic impairment; **Ger:** ↑ risk of hyperkalemia due to age-related ↓ in renal function; **OB:** Use only if clearly needed; **Pedi:** Safety not established.

Adverse Reactions/Side Effects

CNS: dizziness, fatigue. **GI:** abnormal liver function tests, abdominal pain, diarrhea. **GU:** albuminuria.

Endo: abnormal vaginal bleeding, gynecomastia. **F and E:** **HYPERKALEMIA.** **Metab:** hypercholesterolemia, hypertriglyceridemia. **Misc:** flu-like symptoms.

Interactions

Drug-Drug: Concurrent use of strong CYP3A inhibitors, including ketoconazole, itraconazole, nefazodone, clarithromycin, ritonavir, or nelfinavir significantly ↑ effects of eplerenone; concurrent use contraindicated. Concurrent use of moderate CYP3A inhibitors, including erythromycin, saquinavir, fluconazole, or verapamil may ↑ levels; ↓ dose of eplerenone. NSAIDs may ↓ antihypertensive effects. Concurrent use of ACE inhibitors or Angiotensin II receptor blockers may ↑ risk of hyperkalemia.

Route/Dosage

Hypertension

PO (Adults): 50 mg daily initially; may be ↑ to 50 mg twice daily; *Patients receiving concurrent moderate CYP3A4 inhibitors (erythromycin, saquinavir, verapamil, fluconazole)* — 25 mg once daily initially; may be ↑ to 25 mg twice daily.

HF Post-MI

PO (Adults): 25 mg daily initially; ↑ in 4 wk to 50 mg daily; *Patients receiving concurrent moderate CYP3A4 inhibitors (erythromycin, saquinavir, verapamil, fluconazole)*—Do not exceed 25 mg daily.

Availability (generic available)

Tablets: 25 mg, 50 mg.

NURSING IMPLICATIONS**Assessment**

- Monitor BP periodically during therapy.
- Monitor prescription refills to determine adherence.
- **Lab Test Considerations:** May cause hyperkalemia. Monitor serum potassium levels prior to starting therapy, within the first wk, at 1 mo following start of therapy or dose adjustment, and periodically thereafter. Monitor serum potassium and serum creatinine in 3–7 days in patients who start taking a moderate CYP3A4 inhibitor.
- May cause ↓ serum sodium and ↑ serum triglyceride, cholesterol, ALT, GGT, creatinine, and uric acid levels.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- **Do not confuse Inupra with Spiriva.**
- **PO:** Administer once daily. May be increased to twice daily if response is inadequate.

Patient/Family Teaching

- Instruct patient to take medication as directed at the same time each day, even if feeling well.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, discontinuation of smoking, moderation of alcohol consumption, regular exercise, stress management). Medication controls, but does not cure, hypertension.
- Instruct patient and family on correct technique for monitoring BP. Advise them to monitor BP at least weekly, and notify health care professional of significant changes.
- Inform patient not to use potassium supplements, salt substitutes containing potassium, or other Rx, OTC, or herbal products without consulting health care professional.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional if dizziness, diarrhea, vomiting, rapid or irregular heartbeat, lower extremity edema, or difficulty breathing occur.
- Advise patient to inform health care professional of treatment regimen prior to treatment or surgery.

- Advise patient to notify health care professional if pregnancy is planned or suspected. Advise patient to avoid breast feeding during therapy.
- Emphasize the importance of follow-up exams to check serum potassium.

Evaluation/Desired Outcomes

- Decrease in BP without appearance of side effects.
- Improvement in survival in patients with evidence of HF post-MI.

epoetin (e-poe-e-tin)

Epogen, ✳Eprex, Procrit

Classification

Therapeutic: antianemics

Pharmacologic: hormones, erythropoiesis stimulating agents (ESA)

Indications

Anemia associated with chronic kidney disease (CKD). Anemia secondary to zidovudine (AZT) therapy in HIV-infected patients. Anemia from chemotherapy in patients with nonmyeloid malignancies when there is ≥2 additional mo of planned chemotherapy. Reduction of need for allogeneic red blood cell transfusions in patients undergoing elective, noncardiac, nonvascular surgery.

Action

Stimulates erythropoiesis (production of red blood cells). **Therapeutic Effects:** Maintains and may elevate RBCs, decreasing the need for transfusions.

Pharmacokinetics

Absorption: Well absorbed after subcut administration.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: *Children and Adults*—4–13 hr; *Neonates*—11–17 hr.

TIME/ACTION PROFILE (increase in RBCs)

ROUTE	ONSET†	PEAK	DURATION
IV, Subcut	7–10 days	within 2 mo	2 wk‡

†Increase in reticulocytes.

‡After discontinuation.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to albumin or mammalian cell-derived products; Uncontrolled hypertension; Patients with erythropoietin levels >200 m-Units/mL; Patients with cancer receiving hormonal agents, biologic products, or radiotherapy, unless also receiving concomitant myelosuppressive chemotherapy; Patients receiving chemotherapy when anticipated

✳ = Canadian drug name. ⚡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

outcome is cure; Patients with cancer receiving myelosuppressive chemotherapy in whom the anemia can be managed by transfusion; Patients who require immediate correction of anemia when RBC transfusions can be used instead; Patients scheduled for surgery who are willing to donate autologous blood; Patients undergoing cardiac or vascular surgery; Neutropenia in newborns.

Use Cautiously in: History of seizures or stroke; Cardiovascular disease; History of porphyria; **OB:** Evidence of fetal harm in animal studies—use only if potential benefit outweighs potential risk to fetus; **OB, Lactation:** Little published information, however, erythropoietin alfa is a normal constituent of breast milk; **Pedi:** Multidose vials contain benzyl alcohol, which can cause potentially fatal gasping syndrome in neonates.

Adverse Reactions/Side Effects

CNS: SEIZURES, headache. **CV:** HF, MI, STROKE, THROMBOEMBOLIC EVENTS (especially with hemoglobin >11 g/dL), hypertension. **Derm:** transient rashes. **Endo:** restored fertility, resumption of menses. **Misc:** ↑ mortality and ↑ tumor growth (with hemoglobin \geq 12 g/dL).

Interactions

Drug-Drug: May ↑ requirement for heparin anticoagulation during hemodialysis.

Route/Dosage

Anemia of CKD

(Do not initiate if hemoglobin \geq 10 g/dL).

Subcut, IV (Adults): 50–100 units/kg 3 times weekly initially; use lowest dose sufficient to ↓ the need for red blood cell transfusions (do not exceed hemoglobin of 11 g/dL [patients on dialysis] or 10 g/dL [patients not on dialysis]); if Hgb ↑ by >1.0 g/dL in 2 wk, ↓ dose by 25%; if Hgb ↑ by <1.0 g/dL after 4 wk of therapy (with adequate iron stores), ↑ dose by 25%; do not ↑ dose more frequently than q 4 wk.

Subcut, IV (Children 1 mo–16 yr): 50 units/kg 3 times weekly initially; use lowest dose sufficient to ↓ the need for red blood cell transfusions (do not exceed hemoglobin of 11 g/dL [patients on dialysis] or 10 g/dL [patients not on dialysis]); if Hgb ↑ by >1.0 g/dL in 2 wk, ↓ dose by 25%; if Hgb ↑ by <1.0 g/dL after 4 wk of therapy (with adequate iron stores), ↑ dose by 25%; do not ↑ dose more frequently than q 4 wk.

Anemia Secondary to AZT Therapy

Subcut, IV (Adults): 100 units/kg 3 times weekly for 8 wk; if inadequate response, may ↑ by 50–100 units/kg every 4–8 wk (max: 300 units/kg 3 times weekly).

Subcut, IV (Children 8 mo–17 yr): 50–400 units/kg 2–3 times weekly.

Anemia from Chemotherapy

(Use only for chemotherapy-related anemia and discontinue when chemotherapy course is completed; do not initiate if hemoglobin \geq 10 g/dL).

Subcut (Adults): 150 units/kg 3 times weekly or 40,000 units weekly; adjust dose to maintain lowest he-

moglobin level sufficient to avoid blood transfusions (do not exceed hemoglobin of 12 g/dL); if Hgb ↑ by >1.0 g/dL in 2 wk or reaches a level needed to avoid red blood cell transfusions, ↓ dose by 25%; if Hgb ↑ by <1.0 g/dL (and remains <10 g/dL) after initial 4 wk of therapy (with adequate iron stores), ↑ dose to 300 units/kg 3 times weekly or 60,000 units weekly.

IV (Children 5–18 yr): 600 units/kg weekly; adjust dose to maintain lowest hemoglobin level sufficient to avoid blood transfusions (do not exceed hemoglobin of 12 g/dL); if Hgb ↑ by >1.0 g/dL in 2 wk or reaches a level needed to avoid red blood cell transfusions, ↓ dose by 25%; if Hgb ↑ by <1.0 g/dL (and remains <10 g/dL) after initial 4 wk of therapy (with adequate iron stores), ↑ dose to 900 units/kg (maximum = 60,000 units) weekly.

Surgery

Subcut (Adults): 300 units/kg/day for 10 days before surgery, day of surgery, and 4 days after or 600 units/kg 21, 14, and 7 days before surgery and on day of surgery.

Availability

Solution for injection: 2,000 units/mL, 3,000 units/mL, 4,000 units/mL, 10,000 units/mL, 20,000 units/mL, 40,000 units/mL.

NURSING IMPLICATIONS

Assessment

- Monitor BP before and during therapy. Inform health care professional if severe hypertension is present or if BP begins to increase. Additional antihypertensive therapy may be required during initiation of therapy.
- Monitor for symptoms of anemia (fatigue, dyspnea, pallor).
- Monitor dialysis shunts (thrill and bruit) and status of artificial kidney during hemodialysis. Heparin dose may need to be increased to prevent clotting. Monitor patients with underlying vascular disease for impaired circulation.
- **Lab Test Considerations:** May cause ↑ in WBCs and platelets. May ↓ bleeding times.
- Monitor serum ferritin, transferrin, and iron levels to assess need for concurrent iron therapy. Transferrin saturation should be at least 20% and ferritin should be at least 100 ng/mL.
- **Anemia of Chronic Kidney Disease:** Monitor hematocrit before and twice weekly during initial therapy, for 2–6 wk after a change in dose, and regularly after target range (30–36%) has been reached and maintenance dose is determined. Monitor other hematopoietic parameters (CBC with differential and platelet count) before and periodically during therapy. If hemoglobin ↑ and approached 11 g/dL or ↑ by more than 1 g/dL in a 2-wk period, ↓ dose by 25% and monitor hemoglobin twice weekly for 2–6 wk. If ↑ in hemoglobin continues and exceeds 11 g/

dL, dose should be withheld until hemoglobin begins to ↓; epoetin is then reinitiated at a dose 25% lower than previous dose. If hemoglobin ↑ by <1 g/dL over 4 wk (and iron stores are adequate), ↑ dose by 25%; monitor hemoglobin twice weekly for 2–6 wk; further dose ↑ may be made at 4-wk intervals until desired response attained. If no response after 12 wk of escalation, further dose ↑ is unlikely to improve response and may increase risks. Use lowest dose that will maintain Hgb level sufficient to reduce need for transfusions.

- Monitor renal function studies and electrolytes closely; resulting increased sense of well-being may lead to decreased compliance with other therapies for renal failure. Increases in BUN, creatinine, uric acid, phosphorus, and potassium may occur.
- **Anemia Secondary to Zidovudine Therapy:** Before initiating therapy, determine serum erythropoietin level before transfusion. Patients receiving zidovudine with endogenous serum erythropoietin levels >500 mUnits/mL may not respond to therapy. Monitor hemoglobin weekly during dose adjustment. If response does not reduce transfusion requirements or increase hemoglobin effectively after 8 wk of therapy, dose may be ↑ by 50–100 units/kg 3 times weekly. Evaluate response and adjust dose by 50–100 units/kg every 4–8 wk thereafter. If a satisfactory response is not obtained with a dose of 300 units/kg 3 times weekly, it is unlikely that a higher dose will produce a response. Once the desired response is attained, maintenance dose is titrated based on variations of zidovudine dose and concurrent infections. If hemoglobin exceeds 12 g/dL, discontinue dose until hemoglobin drops to <11 g/dL, then ↓ dose by 25%.
- **Anemia from Chemotherapy:** Monitor hemoglobin weekly until stable. Do not initiate if hemoglobin ≥10 g/dL. Patients with lower baseline serum erythropoietin levels may respond more rapidly; not recommended if levels >200 mUnits/mL. If hemoglobin exceeds 12 g/dL, withhold dose until hemoglobin approaches level where transfusions may be required and then reinitiate at a dose 25% lower than previous dose. If hemoglobin ↑ by >1.0 g/dL in any 2-wk period, ↓ dose by 25%. For 3 times weekly dosing regimens, if response is not adequate (no ↓ in transfusion requirements or no ↑ in hemoglobin) after 8 wk of therapy, dose may be ↑ up to 300 units/kg 3 times weekly. If no response is obtained to this dose, it is unlikely that higher doses will produce a response. For weekly dosing regimens, if response is not adequate (no ↑ in hemoglobin by ≥1 g/dL after 4 wk in absence of RBC transfusion), ↑ dose to 60,000 units weekly (adults) or 900 units/kg (max: 60,000 units) (children).

- **Surgery:** Determine that hemoglobin is >10 to ≤13 g/dL before therapy. Epoetin has been used for 10 days before surgery, on the day of surgery, and for 4 days post surgery. Implement prophylaxis of deep venous thrombosis during surgical use.

Potential Nursing Diagnoses

Activity intolerance (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

IV Administration

- Transfusions are still required for severe symptomatic anemia. Supplemental iron should be initiated with epoetin and continued throughout therapy.
- **Institute seizure precautions in patients who experience greater than a 4-point increase in hematocrit in a 2-wk period or exhibit any change in neurologic status. Risk of seizures is greatest during the first 90 days of therapy.**
- Do not shake vial; inactivation of medication may occur. Solution is clear and colorless; do not administer solutions that are discolored, cloudy, or contain a precipitate. Discard vial immediately after withdrawing dose from single-use 1-mL vial. Refrigerate multidose 2-mL vial; stable for 21 days after initial entry.
- **Subcut:** This route is often used for patients not requiring dialysis.
- May be admixed in syringe immediately before administration with 0.9% NaCl with benzyl alcohol 0.9% in a 1:1 ratio to prevent injection site discomfort.
- **IV Push:** **Diluent:** Administer undiluted or dilute with an equal amount of 0.9% NaCl. **Concentration:** 1000–40,000 units/mL. **Rate:** May be administered as direct injection or bolus over 1–3 minutes into IV tubing or via venous line at end of dialysis session.
- **Y-Site Compatibility:** alfentanil, amikacin, aminophylline, ascorbic acid, atracurium, atropine, azathioprine, aztreonam, benzotropine, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, clindamycin, cyanocobalamin, cyclosporine, dexamethasone, digoxin, diphenhydramine, dobutamine, dopamine, doxycycline, enalaprilat, ephedrine, epinephrine, erythromycin, esmolol, famotidine, fentanyl, fluconazole, folic acid, furosemide, ganciclovir, gentamicin, glycopyrrolate, heparin, hydrocortisone, imipenem-cilastatin, indomethacin, insulin, isoproterenol, ketorolac, labetalol, lidocaine, magnesium sulfate, mannitol, meperidine, methyldopate, methylprednisolone, metoclopramide, metoprolol, morphine, multivita-

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

mins, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxacillin, oxytocin, penicillin G, pentazocine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, potassium chloride, procainamide, promethazine, propranolol, protamine, pyridoxine, ranitidine, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, theophylline, tobramycin, vasopressin, verapamil.

- **Y-Site Incompatibility:** amphotericin B colloidal, chlorpromazine, dantrolene, diazepam, haloperidol, midazolam, pentamidine, phenytoin, prochlorperazine, trimethoprim/sulfamethoxazole, vancomycin.

Patient/Family Teaching

- Advise patient to read the *Medication Guide* prior to initiating therapy and with each Rx refill in case of changes. Patient must sign the patient-health care provider acknowledgment form before each course of therapy.
- Explain rationale for concurrent iron therapy (increased red blood cell production requires iron).
- **Discuss ways of preventing self-injury in patients at risk for seizures. Driving and activities requiring continuous alertness should be avoided.**
- Inform patient that use of epoetin may result in shortened overall survival and/or ↓ time to tumor progression.
- **Advise patient to notify health care professional immediately if signs of blood clots (chest pain, trouble breathing or shortness of breath; pain in the legs, with or without swelling; a cool or pale arm or leg; sudden confusion; trouble speaking or trouble understanding others' speech; sudden numbness or weakness in the face, arm, or leg, especially on one side of the body; sudden trouble seeing; sudden trouble walking, dizziness, loss of balance or coordination; loss of consciousness or fainting; hemodialysis vascular access stops working) occur.**
- Advise patient to inform health care professional of medication prior to treatment or surgery.
- **Rep:** Discuss possible return of menses and fertility in women of child-bearing age. Patient should discuss contraceptive options with health care professional.
- **Anemia of Chronic Renal Failure:** Stress importance of compliance with dietary restrictions, medications, and dialysis. Foods high in iron and low in potassium include liver, pork, veal, beef, mustard and turnip greens, peas, eggs, broccoli, kale, blackberries, strawberries, apple juice, watermelon, oatmeal, and enriched bread. Epoetin will result in increased sense of well-being, but it does not cure underlying disease.
- **Home Care Issues:** Home dialysis patients determined to be able to safely and effectively administer epoetin should be taught proper dosage, administration technique, and disposal of equipment. *Information for Home Dialysis Patients* should be provided to patient along with medication.

Evaluation/Desired Outcomes

- Increase in hematocrit to 30–36% with improvement in symptoms of anemia in patients with chronic renal failure.
- Increase in hematocrit in anemia secondary to zidovudine therapy.
- Increase in hematocrit in patients with anemia resulting from chemotherapy.
- Reduction of need for transfusions after surgery.

eprosartan, See ANGIOTENSIN II RECEPTOR ANTAGONISTS.

HIGH ALERT

eptifibatide (ep-ti-fib-a-tide)
Integrilin

Classification

Therapeutic: antiplatelet agents
Pharmacologic: glycoprotein IIb/IIIa inhibitors

Indications

Acute coronary syndrome (unstable angina/non-Q-wave MI), including patients who will be managed medically and those who will undergo percutaneous coronary intervention (PCI) that may consist of percutaneous transluminal angioplasty (PTA) or atherectomy. Treatment of patients undergoing PCI. Usually used concurrently with aspirin and heparin.

Action

Decreases platelet aggregation by reversibly antagonizing the binding of fibrinogen to the glycoprotein IIb/IIIa binding site on platelet surfaces. **Therapeutic Effects:** Inhibition of platelet aggregation resulting in decreased incidence of new MI, death, or refractory ischemia, reducing the need for repeat urgent cardiac intervention.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: 50% excreted by the kidneys.

Half-life: 2.5 hr.

TIME/ACTION PROFILE (effects on platelet function)

ROUTE	ONSET	PEAK	DURATION
IV	immediate	following bolus	brief†

†Inhibition is reversible following cessation of infusion.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Active internal bleeding or history of bleeding within previous 30

days; Severe uncontrolled hypertension (systolic BP >200 mm Hg and/or diastolic BP >110 mm Hg); Major surgical procedure within 6 wk; History of hemorrhagic stroke or other stroke within 30 days; Concurrent use of other glycoprotein IIb/IIIa receptor antagonists; Platelet count <100,000/mm³; Severe renal insufficiency (serum creatinine \geq 4 mg/dL) or dependency on renal dialysis.

Use Cautiously in: **Geriatric:** ↑ risk of bleeding; Renal insufficiency (↓ infusion rate if CCR <50 mL/min); **OB, Pediatric:** Pregnancy, lactation, or children (safety not established; use in pregnancy only if clearly needed).

Adverse Reactions/Side Effects

Noted for patients receiving heparin and aspirin in addition to eptifibatide.

CV: hypotension. **Hematologic:** BLEEDING (including GI and intracranial bleeding, hematuria, and hematomas), thrombocytopenia.

Interactions

Drug-Drug: ↑ risk of bleeding with other drugs that affect hemostasis (heparins, warfarin, NSAIDs, thrombolytic agents, abiximab, dipyridamol, clopidogrel, some cephalosporins, valproates).

Drug-Natural Products: ↑ bleeding risk with arnica, chamomile, clove, dong quai, feverfew, garlic, ginger, ginkgo, and *Panax ginseng*.

Route/Dosage

Acute Coronary Syndrome

IV (Adults \leq 121 kg): 180 mcg/kg as a bolus dose, followed by 2 mcg/kg/min until hospital discharge or surgical intervention (up to 72 hr).

Percutaneous Coronary Intervention

IV (Adults): 180 mcg/kg as a bolus dose, immediately before PCI, followed by 2 mcg/kg/min infusion; a second bolus of 180 mcg/kg is given 10 min after first bolus; infusion should continue for 18–24 or hospital discharge (minimum of 12 hr).

Renal Impairment

(Adults CCR <50 mL/min): 180 mcg/kg bolus followed by 1 mcg/kg/min infusion; second bolus of 180 mcg/kg is given 10 min after first bolus for patients undergoing PCI.

Availability (generic available)

Solution for injection: 20 mg/10 mL, 75 mg/100 mL, 200 mg/100 mL.

NURSING IMPLICATIONS

Assessment

- Assess for bleeding. Most common sites are arterial access site for cardiac catheterization or GI or GU tract. Arterial and venous punctures, IM injections, and use of urinary catheters, nasotracheal intuba-

tion, and NG tubes should be minimized. Noncompressible sites for IV access should be avoided. If bleeding cannot be controlled with pressure, discontinue eptifibatide and heparin immediately.

- Lab Test Considerations:** Prior to eptifibatide therapy, assess hemoglobin or hematocrit, platelet count, serum creatinine, and PT/aPTT. Activated clotting time (ACT) should also be measured in patients undergoing PCI.
- Maintain the aPTT between 50 and 70 sec unless PCI is to be performed. Maintain ACT between 300 and 350 sec during PCI.
- Arterial sheath should not be removed unless aPTT <45 sec.
- If platelet count decreases to <100,000 and is confirmed, eptifibatide and heparin should be discontinued and condition monitored and treated.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)

Implementation

- High Alert:** Accidental overdose of antiplatelet medications has resulted in patient harm or death from internal hemorrhage or intracranial bleeding. Have second practitioner independently check original order, dose calculations, and infusion pump settings.
- Most patients receive heparin and aspirin concurrently with eptifibatide.
- After PCI, femoral artery sheath may be removed during eptifibatide treatment only after heparin has been discontinued and its effects mostly reversed.
- Do not administer solutions that are discolored or contain particulate matter. Discard unused portion.

IV Administration

- IV Push:** **High Alert:** **Diluent:** Withdraw appropriate loading dose from bolus vial (20 mg/10-mL vial) into a syringe. Administer undiluted. **Concentration:** 2 mg/mL. **Rate:** Administer over 1–2 min.
- Continuous Infusion:** **Diluent:** Administer undiluted directly from the 100-mL vial via an infusion pump. **Concentration:** 0.75 mg/mL or 2 mg/mL (depends on vial used). **Rate:** Based on patient's weight (see Route/Dosage section).
- Y-Site Compatibility:** alemtuzumab, alfentanil, alteplase, amikacin, amiodarone, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, atracurium, atropine, azithromycin, aztreonam, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, cefepime, cefotaxime, cefotetan, ceftazidime, ceftriaxone, cefuroxime, ciprofloxacin, cisatracurium, clindamycin, cyclosporine, daptomycin,

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

dexamethasone, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, dolasetron, dopamine, doxorubicin liposomal, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, ertapenem, erythromycin, esmolol, famotidine, fentanyl, fluconazole, foscarnet, fosphenytoin, ganciclovir, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, hydromorphone, imipenem/cilastatin, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem, methylprednisolone, metoclopramide, metoprolol, micafungin, midazolam, milrinone, morphine, nalbuphine, naloxone, nifedipine, nitroglycerin, nitroprusside, octreotide, ondansetron, oxytocin, palonosetron, pancuronium, pemetrexed, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, ranitidine, remifentanyl, rocuronium, sodium bicarbonate, sodium phosphates, succinylcholine, sufentanil, teniposide, theophylline, tigecycline, tirofiban, tobramycin, vancomycin, vecuronium, verapamil, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, amphotericin B colloid, chlorpromazine, diazepam, furosemide, methohexital, mycophenolate, pentamidine, phenytoin, thiopental.

Patient/Family Teaching

- Inform patient of the purpose of epifibatide.
- **Instruct patient to notify health care professional immediately if any bleeding is noted.**

Evaluation/Desired Outcomes

- Inhibition of platelet aggregation, resulting in decreased incidence of new MI, death, or refractory ischemia with the need for repeat urgent cardiac intervention.

ergocalciferol, See VITAMIN D COMPOUNDS.

erlotinib (er-lo-ti-nib)

Tarceva

Classification

Therapeutic: antineoplastics

Pharmacologic: enzyme inhibitors

Indications

☒ Treatment of metastatic non–small-cell lung cancer (NSCLC) that has epidermal growth factor exon 19 deletions or exon 21 substitution mutations in patients who are receiving first-line, maintenance or second or greater line treatment after progression following ≥ 1 previous chemotherapy regimen. First-line therapy for

locally advanced, surgically unresectable, or metastatic pancreatic cancer (with gemcitabine).

Action

☒ Inhibits the enzyme tyrosine kinase, which is associated with human epidermal growth factor receptor (EGFR); blocks growth stimulation signals in cancer cells. **Therapeutic Effects:** Decreased spread of lung or pancreatic cancer with increased survival.

Pharmacokinetics

Absorption: 60% absorbed; bioavailability \uparrow to 100% with food.

Distribution: Unknown.

Protein Binding: 93% protein bound.

Metabolism and Excretion: Mostly metabolized by the liver (CYP3A4 enzyme system).

Half-life: 36 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Oral	unknown	4 hr	24 hr

Contraindications/Precautions

Contraindicated in: **OB:** May cause fetal harm;

Lactation: Avoid breast feeding.

Use Cautiously in: Hepatic impairment; Previous chemotherapy/radiation, pre-existing lung disease, metastatic lung disease (may \uparrow risk of interstitial lung disease); **Rep:** Women of reproductive potential; **Pedi:** Safety not established.

Adverse Reactions/Side Effects

CNS: CEREBROVASCULAR ACCIDENT (pancreatic cancer patients), fatigue. **CV:** MYOCARDIAL INFARCTION/ISCHEMIA (pancreatic cancer patients). **EENT:** abnormal eyelash growth, conjunctivitis, corneal perforation, corneal ulceration, keratitis, \downarrow tear production. **Resp:** INTERSTITIAL LUNG DISEASE, dyspnea, cough. **GI:** HEPATOTOXICITY, GI PERFORATION, diarrhea, abdominal pain, anorexia, nausea, stomatitis, vomiting, \uparrow liver enzymes. **Derm:** BULLOUS AND EXFOLIATIVE SKIN DISORDERS, rash, dry skin, pruritus. **GU:** RENAL FAILURE. **Hemat:** microangiopathic hemolytic anemia with thrombocytopenia (pancreatic cancer patients).

Interactions

Drug-Drug: Strong CYP3A4 inhibitors, including atazanavir, clarithromycin, indinavir, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, saquinavir, or voriconazole \uparrow levels and the risk of toxicity; consider alternative therapy or \downarrow erlotinib dose. Strong CYP3A4 inducers, including rifampin, rifabutin, rifapentine, phenytoin, carbamazepine, or phenobarbital \downarrow levels and may \downarrow response; consider alternative therapy or \uparrow erlotinib dose. CYP1A2 inhibitors, including ciprofloxacin, may \uparrow levels and the risk of toxicity; consider \downarrow erlotinib dose if used with CYP3A4 inhibitor. **Smoking** may \downarrow levels and may \downarrow response; avoid smoking during

therapy or consider ↑ erlotinib dose if smoking continues. **Moderate CYP1A2 inducers**, including **teriflunomide**, **rifampin**, or **phenytoin**; avoid concurrent use or ↑ erlotinib dose. May ↓ **midazolam** levels. May ↑ risk of bleeding with **warfarin**. ↓ levels with **proton pump inhibitors**, **H₂ blockers**, and **antacids**; avoid concurrent use with **proton pump inhibitors**; take 10 hr after **H₂ antagonist** and ≥2 hr before next dose of **H₂ antagonist**; separate from **antacid** by several hours.

Drug-Natural Products: **St. John's wort** may ↓ levels and may ↓ response; alternative therapy or ↑ dose should be considered.

Drug-Food: **Grapefruit juice** or **grapefruit**, a strong CYP3A4 inhibitor, ↑ levels and the risk of toxicity; consider dose ↓.

Route/Dosage

PO (Adults): *NSCLC*—150 mg daily taken at least 1 hr before or 2 hr after food; *Pancreatic cancer*—100 mg daily taken at least 1 hr before or 2 hr after food. *Concurrent use of strong CYP3A4 inhibitor or concurrent use of CYP3A4 and CYP1A2 inhibitor (e.g., ciprofloxacin)*—Consider ↓ dose in 50–mg increments (avoid concomitant use, if possible); *Concurrent use of strong CYP3A4 inducer*—consider ↑ dose by 50 mg every 2 wk (max dose = 450 mg/day) (avoid concomitant use, if possible); *Concurrent cigarette smoking or concurrent use of moderate CYP1A2 inducer*—↑ dose by 50 mg every 2 wk (max dose = 300 mg/day); immediately ↓ dose to recommended initial dose for indication upon smoking cessation.

Availability (generic available)

Tablets: 25 mg, 100 mg, 150 mg.

NURSING IMPLICATIONS

Assessment

- Assess respiratory status prior to and periodically during therapy. If dyspnea, cough, or fever occur, discontinue erlotinib, assess for interstitial lung disease, and institute treatment as needed.
- Assess for diarrhea. Usually responds to loperamide but may require dose reduction or discontinuation of therapy if unresponsive to therapy or patient becomes dehydrated.
- Assess skin throughout therapy. If bullous, blistering, and exfoliative skin conditions, including Stevens-Johnson syndrome/toxic epidermal necrolysis, occur, interrupt or discontinue treatment. Skin rash may require treatment with corticosteroids or anti-infectives with anti-inflammatory properties; acne treatments may aggravate dry skin and erythema.
- Assess eyes periodically during therapy. Discontinue erlotinib if corneal ulceration occurs. Withhold erlotinib if Grade 3 or 4 keratitis, or Grade 2 lasting >2

wks, or if acute or worsening eye pain or disorders occur.

- Assess for GI pain. Patients receiving concomitant antiangiogenic agents, corticosteroids, NSAIDs, and/or taxane-based chemotherapy, or who have prior history of peptic ulceration or diverticular disease, are at increased risk for GI perforation. Permanently discontinue erlotinib in patients who develop gastrointestinal perforation.
- **Lab Test Considerations:**  Test patients for epidermal growth factor receptor (EGFR) exon 19 deletions or exon 21 (L858R) substitution mutations in plasma or tumor specimens prior to starting therapy; presence is required for therapy.
- Monitor liver function tests (AST, ALT, bilirubin, alkaline phosphatase) periodically during therapy. Consider dose reduction or discontinuation of therapy if severe changes in liver function (doubling or tripling of transaminase levels in patients with pre-existing hepatic impairment or total bilirubin ≥3 times upper limit of normal and/or transaminases ≥5 times upper limit of normal in patients without pre-existing hepatic impairment) occur.
- Monitor renal function and electrolytes in patients at risk for dehydration. Withhold therapy if dehydration or Grade 3 or 4 renal toxicity occurs.
- Monitor INR regularly in patients taking warfarin. May cause ↑ INR.

Potential Nursing Diagnoses

Ineffective breathing pattern (Side Effects)

Implementation

- **PO:** Administer at least 1 hr before or 2 hr after food.

Patient/Family Teaching

- Instruct patient to take erlotinib as directed.
- Advise patient to notify health care professional if severe or persistent diarrhea, nausea, anorexia, vomiting, onset or worsening of skin rash, unexplained dyspnea or cough, eye irritation, or signs and symptoms of a cerebrovascular accident (sudden weakness; paralysis [an inability to move] or numbness of the face, arms, or legs, especially on one side of the body; confusion; trouble speaking or understanding speech; trouble seeing in one or both eyes; problems breathing; dizziness, trouble walking, loss of balance or coordination, unexplained falls; loss of consciousness; sudden and severe headache) occur.
- Instruct patient to avoid proton pump inhibitors and if antacids are necessary, separate antacids and erlotinib dose by several hours. If therapy with H₂ antagonists is required, take erlotinib 10 hrs after H₂ antagonist and at least 2 hrs before next dose of H₂ antagonist.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products

* = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

being taken and consult health care professional before taking any new medications.

- Advise patient to wear sunscreen and protective clothing to decrease skin reactions.
- Instruct patient to discontinue smoking during therapy; smoking decreases blood levels of erlotinib.
- **Rep:** Caution patient to use highly effective contraceptive during and for at least 1 mo after completion of therapy and to avoid breast feeding during and for at least 2 wks following last dose. Advise female patients to notify health care professional if pregnancy is planned or suspected.

Evaluation/Desired Outcomes

- Decrease in spread of non–small-cell lung or pancreatic cancer with increased survival.

ertapenem (er-ta-pen-em) INVanz

Classification

Therapeutic: anti-infectives

Pharmacologic: carbapenems

Indications

Moderate to severe: complicated intra-abdominal infections, complicated skin and skin structure infections, community acquired pneumonia, complicated urinary tract infections (including pyelonephritis), acute pelvic infections including postpartum endomyometritis, septic abortion, and postsurgical gynecologic infections. Prophylaxis of surgical site infection following elective colorectal surgery.

Action

Binds to bacterial cell wall, resulting in cell death. Ertapenem resists the actions of many enzymes that degrade most other penicillins and penicillin-like anti-infectives.

Therapeutic Effects: Bactericidal action against susceptible bacteria. **Spectrum:** Active against the following aerobic gram-positive organisms: *Staphylococcus aureus* (methicillin-susceptible strains only), *Staphylococcus epidermidis*, *Streptococcus agalactiae*, *S. pneumoniae* (penicillin-susceptible strains only), and *S. pyogenes*. Also active against the following gram-negative aerobic organisms: *Escherichia coli*, *Haemophilus influenzae* (beta-lactamase negative strains), *Klebsiella pneumoniae*, *Moraxella catarrhalis*, and *Providencia rettgeri*. Addition anaerobic spectrum includes *Bacteroides fragilis*, *B. distasonis*, *B. ovatus*, *B. thetaotamicon*, *B. uniformis*, *B. vulgatus*, *Clostridium clostriforme*, *Eubacterium lentum*, *Peptostreptococcus*, *Porphyromonas asaccharolytica*, and *Prevotella bivia*.

Pharmacokinetics

Absorption: 90% after IM administration; IV administration results in complete bioavailability.

Distribution: Enters breast milk.

Metabolism and Excretion: Mostly excreted by the kidneys.

Half-life: 1.8 hr (↑ in renal impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IM	rapid	2 hr	24 hr
IV	rapid	end of infusion	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity may occur with penicillins, cephalosporins, and other carbapenems; Hypersensitivity to lidocaine (may be used as a diluent for IM administration).

Use Cautiously in: History of multiple hypersensitivity reactions; Seizure disorders; Renal impairment; **OB:** Use in pregnancy only if clearly needed; **Lactation:** Not expected to cause adverse effects in breast-fed infants (NIH); **Pedi:** Safety not established; **Geri:** ↑ sensitivity due to age-related ↓ in renal function.

Adverse Reactions/Side Effects

CNS: SEIZURES, headache. **GI:** CLOSTRIDIUM DIFFICILE-ASSOCIATED DIARRHEA (CDAD), diarrhea, nausea, vomiting. **GU:** vaginitis. **Local:** phlebitis at IV site, pain at IM site. **Misc:** hypersensitivity reaction including ANAPHYLAXIS.

Interactions

Drug-Drug: Probenecid ↓ excretion and ↑ levels. May ↓ serum valproate levels (↑ risk of seizures).

Route/Dosage

IV, IM (Adults and Children ≥13 yrs): 1 g once daily for up to 14 days (IV) or 7 days (IM).

IV, IM (Children 3 mo–12 yrs): 15 mg/kg twice daily (not to exceed 1 g/day) for up to 14 days (IV) or 7 days (IM).

Renal Impairment

IM, IV (Adults): $CCr \leq 30 \text{ mL/min/1.73 m}^2$ —500 mg once daily.

Availability

Powder for injection: 1 g/vial.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.
- Obtain a history before initiating therapy to determine previous use of and reactions to penicillins, cephalosporins, or carbapenems. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.

- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify the physician immediately if these occur. Have epinephrine, an antihistamine, and resuscitative equipment close by in the event of an anaphylactic reaction.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of *Clostridium difficile*-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- **Lab Test Considerations:** May cause ↑ AST, ALT, serum alkaline phosphatase levels.
- May cause ↑ platelet and eosinophil counts.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)

Implementation

- **IM:** Reconstitute 1-g vial with 3.2 mL of 1% lidocaine without epinephrine. Shake well to form solution. Immediately withdraw contents and inject deep into large muscle mass. Use reconstituted solution within 1 hr.

IV Administration

- **Intermittent Infusion:** **Diluent:** Reconstitute 1-g vial with 10 mL of sterile water for injection or 0.9% NaCl and shake well. Further dilute in 50 mL of 0.9% NaCl. Administer within 6 hr of reconstitution. **Rate:** Infuse over 30 min.
- **Y-Site Compatibility:** acyclovir, alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, argatroban, arsenic trioxide, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, chloramphenicol, ciprofloxacin, cisatracurium, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, docetaxel, dopamine, doxacurium, doxycycline, enalaprilat, ephedrine, epinephrine, eptifibatide, erythromycin, esmolol, etoposide phosphate, famotidine, fenoldopam, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrocortisone, hydromorphone, ifosfamide, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, mesna, metaraminol, methotrexate, methylprednisolone, metoclopramide, metro-

nidazole, milrinone, mitomycin, morphine, moxifloxacin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxaliplatin, oxytocin, paclitaxel, pamidronate, pancuronium, pantoprazole, pemetrexed, pentobarbital, phenobarbital, phenolamine, phenylephrine, potassium acetate, potassium chloride, potassium phosphates, procainamide, propranolol, ranitidine, remifentanyl, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, telavancin, teniposide, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** alemtuzumab, allopurinol, amiodarone, amphotericin B colloidal, anidulafungin, caspofungin, dantrolene, daunorubicin hydrochloride, diazepam, dobutamine, doxorubicin hydrochloride, droperidol, epirubicin, hydralazine, hydroxyzine, idarubicin, midazolam, mitoxantrone, nicardipine, ondansetron, pentamidine, phenytoin, prochlorperazine, promethazine, quinupristin/dalfopristin, thiopental, topotecan, verapamil.

Patient/Family Teaching

- Advise patient to report the signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools) and allergy.
- **Caution patient to notify health care professional if fever and diarrhea occur, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional. May occur up to several wk after discontinuation of medication. Consult health care professional before treating with antidiarrheals.**

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

erythromycin (topical)

Akne-Mycin, Erygel

Classification

Therapeutic: anti-infectives

Pharmacologic: macrolides

†See Appendix C for ophthalmic use

Indications

IV, PO: Infections caused by susceptible organisms including: Upper and lower respiratory tract infections, Otitis media (with sulfonamides), Skin and skin structure infections, Pertussis, Diphtheria, Erythrasma, Intestinal amebiasis, Pelvic inflammatory disease, Non-gonococcal urethritis, Syphilis, Legionnaires' disease, Rheumatic fever. Useful when penicillin is the most appropriate drug but cannot be used because of hypersensitivity, including: Streptococcal infections, Treatment of syphilis or gonorrhea. **Topical:** Treatment of acne.

Action

Suppresses protein synthesis at the level of the 50S bacterial ribosome. **Therapeutic Effects:** Bacteriostatic action against susceptible bacteria. **Spectrum:** Active against many gram-positive cocci, including: Streptococci, Staphylococci. Gram-positive bacilli, including: *Clostridium*, *Corynebacterium*. Several gram-negative pathogens, notably: *Neisseria*, *Legionella pneumophila*. *Mycoplasma* and *Chlamydia* are also usually susceptible.

Pharmacokinetics

Absorption: Variable absorption from the duodenum after oral administration (dependent on salt form). Absorption of enteric-coated products is delayed. Minimal absorption may follow topical or ophthalmic use.

Distribution: Widely distributed. Minimal CNS penetration. Crosses placenta; enters breast milk.

Protein Binding: 70–80%.

Metabolism and Excretion: Partially metabolized by the liver, excreted mainly unchanged in the bile; small amounts excreted unchanged in the urine.

Half-life: Neonates: 2.1 hr; Adults: 1.4–2 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	1 hr	1–4 hr	6–12 hr
IV	rapid	end of infusion	6–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of pimozide, ergotamine, dihydroergotamine, procainamide, quinidine, dofetilide, amiodarone, or sotalol; Long QT syndrome; Hypokalemia; Hypomagnesemia; Heart rate <50 bpm; Known alcohol intolerance (most topicals); Tartrazine sensitivity (some products

contain tartrazine—FDC yellow dye #5); Products containing benzyl alcohol should be avoided in neonates.

Use Cautiously in: Liver/renal disease; **OB:** May be used in pregnancy to treat chlamydial infections or syphilis; Myasthenia gravis (may worsen symptoms); **Geri:** ↑ risk of ototoxicity if parenteral dose >4 g/day, ↑ risk of QTc interval prolongation.

Adverse Reactions/Side Effects

CNS: seizures (rare). **EENT:** ototoxicity. **CV:** **TORSADE DE POINTES**, **VENTRICULAR ARRHYTHMIAS**, QT interval prolongation. **GI:** **CLOSTRIDIUM DIFFICILE-ASSOCIATED DIARRHEA (CDAD)**, nausea, vomiting, abdominal pain, cramping, diarrhea, hepatitis, infantile hypertrophic pyloric stenosis, pancreatitis (rare). **GU:** interstitial nephritis. **Derm:** rash. **Local:** phlebitis at IV site. **Misc:** allergic reactions, superinfection.

Interactions

Drug-Drug: Concurrent use with **pimozide** may ↑ levels and the risk for serious arrhythmias (concurrent use contraindicated); similar effects may occur with **diltiazem**, **verapamil**, **ketoconazole**, **itraconazole**, **nefazodone**, and **protease inhibitors**; avoid concurrent use. May ↑ levels of **ergotamine** and **dihydroergotamine** and risk for acute ergot toxicity; concurrent use contraindicated. Concurrent use with **amiodarone**, **dofetilide**, or **sotalol** may ↑ risk of torsades de pointe; avoid concurrent use. May ↑ **verapamil** levels and the risk for hypotension, bradycardia, and lactic acidosis. ↑ blood levels and effects of **sildenafil**, **tadalafil**, and **ildenafil**; use lower doses. Concurrent **rifabutin** or **rifampin** may ↓ effect of erythromycin and ↑ risk of adverse GI reactions. ↑ levels and risk of toxicity from **alfentanil**, **alprazolam**, **bromocriptine**, **carbamazepine**, **cyclosporine**, **cilostazol**, **diazepam**, **disopyramide**, **ergot alkaloids**, **felodipine**, **methylprednisolone**, **midazolam**, **quinidine**, **rifabutin**, **tacrolimus**, **triazolam**, or **vinblastine**. May ↑ levels of **lovastatin** and **simvastatin** and ↑ the risk of myopathy/rhabdomyolysis. May ↑ serum **digoxin** levels. **Theophylline** may ↓ blood levels. May ↑ **colchicine** levels and the risk for toxicity; use lower starting and maximum dose of colchicine. May ↑ **theophylline** levels and the risk for toxicity; ↓ theophylline dose. May ↑ **warfarin** levels and the risk for bleeding.

Route/Dosage

250 mg of erythromycin base or stearate = 400 mg of erythromycin ethylsuccinate.

Most Infections

PO (Adults): *Base, stearate*—250 mg q 6 hr, or 333 mg q 8 hr, or 500 mg q 12 hr. *Ethylsuccinate*—400 mg q 6 hr or 800 mg q 12 hr.

PO (Children >1 mo): *Base and ethylsuccinate*—30–50 mg/kg/day divided q 6–8 hr (maximum 2 g/day as base or 3.2 g/day as ethylsuccinate). *Stearate*—30–50 mg/kg/day divided q 6 hr (maximum 2 g/day).

PO (Neonates): *Ethylsuccinate*—20–50 mg/kg/day divided q 6–12 hr.

IV (Adults): 250–500 mg (up to 1 g) q 6 hr.

IV (Children >1 mo): 15–50 mg/kg/day divided q 6 hr, maximum 4 g/day.

Acne

Topical (Adults and Children >12 yr): 2% ointment, gel, solution, or pledgets twice daily.

Availability (generic available)

Erythromycin Base

Enteric-coated tablets: 250 mg, 333 mg, 500 mg.

Tablets with polymer-coated particles: 333 mg, 500 mg. **Delayed-release capsules:** 250 mg.

Erythromycin Ethylsuccinate

Tablets: 400 mg, *600 mg. **Oral suspension (fruit flavor, cherry):** 200 mg/5 mL. **Oral suspension (orange, banana flavors):** 400 mg/5 mL.

Erythromycin Lactobionate

Powder for injection: 500 mg, 1 g.

Erythromycin Stearate

Film-coated tablets: 250 mg, *500 mg.

Topical Preparations

Ointment: 2%. **Gel:** 2%. **Solution:** 2%. **Pledgets:**

2%. **In combination with:** benzoyl peroxide (Benzamycin). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- **Monitor bowel function.** **Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of Clostridium difficile-associated diarrhea (CDAD).** May begin up to several wk following cessation of therapy.
- **Lab Test Considerations:** Monitor liver function tests periodically on patients receiving high-dose, long-term therapy.
- May cause ↑ serum bilirubin, AST, ALT, and alkaline phosphatase concentrations.
- May cause false ↑ of urinary catecholamines.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)

Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** Administer around the clock. *Erythromycin film-coated tablets (base and stearate)* are ab-

sorbed better on an empty stomach, at least 1 hr before or 2 hr after meals; may be taken with food if GI irritation occurs. *Enteric-coated erythromycin (base)* may be taken without regard to meals. *Erythromycin ethylsuccinate* is best absorbed when taken with meals. Take each dose with a full glass of water.

- Use calibrated measuring device for liquid preparations. Shake well before using.
- Do not crush or chew delayed-release capsules or tablets; swallow whole. *Erythromycin base delayed-release capsules* may be opened and sprinkled on applesauce, jelly, or ice cream immediately before ingestion. Entire contents of the capsule should be taken.

IV Administration

- **IV:** Add 10 mL of sterile water for injection without preservatives to 250- or 500-mg vials and 20 mL to 1-g vial. Solution is stable for 7 days after reconstitution if refrigerated.
- **Intermittent Infusion:** **Diluent:** Dilute in 0.9% NaCl or D5W. **Concentration:** 1–5 mg/mL. **Rate:** Administer slowly over 20–60 min to avoid phlebitis. Assess for pain along vein; slow rate if pain occurs; apply ice and notify health care professional if unable to relieve pain.
- **Continuous Infusion:** May also be administered as an infusion over 4 hr. **Diluent:** 0.9% NaCl, D5W, or LR. **Concentration:** 1 g/L.

Erythromycin Lactobionate

- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, amikacin, aminocaproic acid, aminophylline, amiodarone, anidulafungin, argatroban, atropine, azathioprine, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, cefotaxime, ceftriaxone, cefuroxime, chlorpromazine, cisplatin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin, doxorubicin liposomal, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, epifibatide, ertapenem, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, gemcitabine, gentamicin, glycopyrrolate, granisetron, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, labetalol, leucovorin, levofloxacin, lidocaine, lorazepam, mannitol, mechlorethamine, meperidine, mesna, methotrexate, methylodopate,

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pentamidine, pentazocine, perphenazine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, ranitidine, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, vitamin B complex with C, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, ascorbic acid, aztreonam, cefazolin, cefepime, cefotetan, cefoxitin, dantrolene, diazepam, diazoxide, doxycycline, furosemide, ganciclovir, indomethacin, ketorolac, metamizolol, nitroprusside, pemetrexed, pentobarbital, phenytoin, trimethoprim/sulfamethoxazole.
- **Topical:** Cleanse area before application. Wear gloves during application.

Patient/Family Teaching

- Instruct patient to take medication around the clock and to finish the drug completely as directed, even if feeling better. Take missed doses as soon as remembered, with remaining doses evenly spaced throughout day. Advise patient that sharing of this medication may be dangerous.
- May cause nausea, vomiting, diarrhea, or stomach cramps; notify health care professional if these effects persist or if severe abdominal pain, yellow discoloration of the skin or eyes, darkened urine, pale stools, or unusual tiredness develops. May cause infantile hypertrophic pyloric stenosis in infants; notify health care professional if vomiting and irritability occur.
- **Caution patient to notify health care professional if fever and diarrhea occur, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional. May occur up to several wk after discontinuation of medication.**
- Advise patient to report signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools).
- Instruct patient to notify health care professional if symptoms do not improve.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.
- Improvement of acne lesions.

escitalopram (ess-sit-al-o-pram)

★ Ciprexal, ★ Ciprexal Meltz, Lexapro

Classification

Therapeutic: antidepressants

Pharmacologic: selective serotonin reuptake inhibitors (SSRIs)

Indications

Major depressive disorder. Generalized anxiety disorder (GAD). **Unlabeled Use:** Panic disorder. Obsessive-compulsive disorder (OCD). Post-traumatic stress disorder (PTSD). Social anxiety disorder (social phobia). Premenstrual dysphoric disorder (PMDD).

Action

Selectively inhibits the reuptake of serotonin in the CNS.

Therapeutic Effects: Antidepressant action.

Pharmacokinetics

Absorption: 80% absorbed following oral administration.

Distribution: Enters breast milk.

Metabolism and Excretion: Mostly metabolized by the liver (primarily CYP3A4 and CYP2C19 isoenzymes); 7% excreted unchanged by kidneys.

Half-life: ↑ in elderly and patients with hepatic impairment.

TIME/ACTION PROFILE (antidepressant effect)

ROUTE	ONSET	PEAK	DURATION
PO	within 1–4 wk	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent pimozide; Concurrent use of MAO inhibitors or MAO-like drugs (linezolid or methylene blue); Concurrent use of citalopram; Angle-closure glaucoma.

Use Cautiously in: History of mania (may activate mania/hypomania); History of seizures; Patients at risk for suicide; Hepatic impairment (dose ↓ recommended); Severe renal impairment; **OB:** Neonates exposed to SSRIs in the 3rd trimester may develop drug discontinuation syndrome manifested by respiratory distress, feeding difficulty, and irritability; **Lactation:** May cause adverse effects in infant; consider risk/benefit; **Pedi:** May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; safety not established in children <12 yr; **Ger:** ↓ doses recommended due to ↓ drug clearance in older patients.

Adverse Reactions/Side Effects

CNS: **NEUROLEPTIC MALIGNANT SYNDROME, SUICIDAL THOUGHTS, insomnia, dizziness, drowsiness, fatigue.**

GI: **diarrhea, nausea, abdominal pain, constipation, dry mouth, indigestion.** **GU:** **anorgasmia, ↓ libido, ejaculatory delay, erectile dysfunction.** **Derm:** **sweating.** **Endo:** **syndrome on inappropriate secretion of antidiuretic hormone (SIADH).** **F and E:** **hyponatremia.** **Metab:** **SEROTONIN SYNDROME, ↑ appetite.**

Interactions

Drug-Drug: May cause serious, potentially fatal reactions when used with **MAO inhibitors**; allow at least 14 days between escitalopram and **MAO inhibitors**. Concurrent use with **MAO-inhibitor-like drugs**, such as **linezolid** or **methylene blue** may ↑ risk of serotonin syndrome; concurrent use contraindicated; do not start therapy in patients receiving **linezolid** or **methylene blue**; if **linezolid** or **methylene blue** need to be started in a patient receiving escitalopram, immediately discontinue escitalopram and monitor for signs/symptoms of serotonin syndrome for 2 wk or until 24 hr after last dose of linezolid or methylene blue, whichever comes first (may resume escitalopram therapy 24 hr after last dose of linezolid or methylene blue). Concurrent use with **pimozide** may result in prolongation of the QTc interval and is contraindicated. Use cautiously with other **centrally acting drugs** (including **alcohol, antihistamines, opioid analgesics, and sedative/hypnotics**; concurrent use with **alcohol** is not recommended). Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants, SNRIs, fentanyl, buspirone, tramadol, amphetamines, and triptans** ↑ risk of serotonin syndrome. **Cimetidine** may ↑ levels. Serotonergic effects may be ↑ by **lithium** (concurrent use should be carefully monitored). **Carbamazepine** may ↓ levels. May ↑ levels of **metoprolol**. Use cautiously with **tricyclic antidepressants** due to unpredictable effects on serotonin and norepinephrine reuptake. ↑ risk of bleeding with **aspirin, NSAIDs, clopidogrel, or warfarin**.

Drug-Natural Products: ↑ risk of serotonin syndrome with **St. John's wort** and **SAME**.

Route/Dosage

PO (Adults): *Depression and GAD*—10 mg once daily, may be ↑ to 20 mg once daily after 1 wk.

Hepatic Impairment

PO (Adults): 10 mg once daily.

PO (Geriatric Patients): 10 mg once daily.

PO (Children ≥12 yr): *Depression*—10 mg once daily, may be ↑ to 20 mg once daily after 3 wk.

Availability (generic available)

Tablets: 5 mg, 10 mg, 20 mg. **Cost:** *Generic*—5 mg \$13.16/100, 10 mg \$13.87/100, 20 mg \$18.01/100.

Orally disintegrating tablets: * 10 mg, * 20 mg.

Oral solution (peppermint flavor): 1 mg/mL. **Cost:**

Generic—\$190.20/240 mL.

NURSING IMPLICATIONS

Assessment

- Monitor mood changes and level of anxiety during therapy.
- Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yr. After starting therapy, children, adolescents, and young adults should be seen by health care professional at least weekly for 4 wk, every 3 wk for next 4 wk, and on advice of health care professional thereafter.
- Assess for sexual dysfunction (erectile dysfunction; decreased libido).
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyperreflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).

Potential Nursing Diagnoses

Ineffective coping (Indications)

Risk for injury (Side Effects)

Sexual dysfunction (Side Effects)

Implementation

- Do not confuse Lexapro with Loxitane (loxapine).
- Do not administer escitalopram and citalopram concomitantly. Taper to avoid potential withdrawal reactions. Reduce dose by 50% for 3 days, then again by 50% for 3 days, then discontinue.
- **PO:** Administer as a single dose in the morning or evening without regard to meals.

Patient/Family Teaching

- Instruct patient to take escitalopram as directed. Take missed doses on the same day as soon as remembered and consult health care professional. Resume regular dosing schedule next day. Do not double doses. Do not stop abruptly; should be discontinued gradually. Instruct patient to read *Medication Guide* before starting and with each Rx refill in case of changes.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient, family, and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide, new or worse depression or anxiety, agi-

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

tation or restlessness, panic attacks, insomnia, new or worse irritability, aggressiveness, acting on dangerous impulses, mania, or other changes in mood or behavior or if rash or symptoms of serotonin syndrome occur.

- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any other Rx, OTC, or herbal products, especially St. John's Wort, alcohol or other CNS depressants.
- Instruct female patients to notify health care professional if pregnancy is planned or suspected or if they plan to breast feed. If used during pregnancy, should be tapered during 3rd trimester to avoid neonatal serotonin syndrome.
- Emphasize importance of follow-up exams to monitor progress.

Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings. May require 1–4 wk of therapy to obtain antidepressant effects. Full antidepressant effects occur in 4–6 wk.
- Decrease in anxiety.

HIGH ALERT

esmolol (es-moe-lol)

Brevibloc

Classification

Therapeutic: antiarrhythmics (class II)

Pharmacologic: beta blockers

Indications

Management of sinus tachycardia and supraventricular arrhythmias.

Action

Blocks stimulation of beta₁ (myocardial)-adrenergic receptors. Does not usually affect beta₂ (pulmonary, vascular, or uterine)-receptor sites. **Therapeutic Effects:** Decreased heart rate. Decreased AV conduction.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Rapidly and widely distributed.

Metabolism and Excretion: Metabolized by enzymes in RBCs and liver.

Half-life: 9 min.

TIME/ACTION PROFILE (antiarrhythmic effect)

ROUTE	ONSET	PEAK	DURATION
IV	within minutes	unknown	1–20 min

Contraindications/Precautions

Contraindicated in: Uncompensated HF; Pulmonary edema; Cardiogenic shock; Bradycardia or heart block; Known alcohol intolerance.

Use Cautiously in: **Geri:** ↑ sensitivity to the effects of beta blockers; Thyrotoxicosis (may mask symptoms); Diabetes mellitus (may mask symptoms of hypoglycemia); Patients with a history of severe allergic reactions (intensity of reactions may be ↑); **OB, Lactation, PEDI:** Safety not established; neonatal bradycardia, hypotension, hypoglycemia, and respiratory depression may occur rarely.

Adverse Reactions/Side Effects

CNS: fatigue, agitation, confusion, dizziness, drowsiness, weakness. **CV:** hypotension, peripheral ischemia. **GI:** nausea, vomiting. **Derm:** sweating. **Local:** injection site reactions.

Interactions

Drug-Drug: General anesthesia, IV phenytoin, and verapamil may cause additive myocardial depression. Additive bradycardia may occur with digoxin. Additive hypotension may occur with other anti-hypertensives, acute ingestion of alcohol, or nitrates. Concurrent use with amphetamine, cocaine, ephedrine, epinephrine, norepinephrine, phenylephrine, or pseudoephedrine may result in unopposed alpha-adrenergic stimulation (excessive hypotension, bradycardia). Concurrent thyroid hormone administration may ↓ effectiveness. May alter the effectiveness of insulins or oral hypoglycemic agents (dose adjustments may be necessary). May ↓ effectiveness of theophylline. May ↓ beneficial beta cardiovascular effects of dopamine or dobutamine. Use cautiously within 14 days of MAO-inhibitor therapy (may result in hypertension).

Route/Dosage

IV (Adults): *Antiarrhythmic*—500-mcg/kg loading dose over 1 min initially, followed by 50-mcg/kg/min infusion for 4 min; if no response within 5 min, give 2nd loading dose of 500 mcg/kg over 1 min, then ↑ infusion to 100 mcg/kg/min for 4 min. If no response, repeat loading dose of 500 mcg/kg over 1 min and ↑ infusion rate by 50-mcg/kg/min increments (not to exceed 200 mcg/kg/min for 48 hr). As therapeutic end point is achieved, eliminate loading doses and decrease dose increments to 25 mcg/kg/min. *Intraoperative anti-hypertensive/antiarrhythmic*—250–500-mcg/kg loading dose over 1 min initially, followed by 50-mcg/kg/min infusion for 4 min; if no response within 5 min, give 2nd loading dose of 250–500 mcg/kg over 1 min, then ↑ infusion to 100 mcg/kg/min for 4 min. If no response, repeat loading dose of 250–500 mcg/kg over 1 min and ↑ infusion rate by 50-mcg/kg/min increments (not to exceed 200 mcg/kg/min for 48 hr).

IV (Children): *Antiarrhythmic*—50 mcg/kg/min, may be ↑ every 10 min up to 300 mcg/kg/min.

Availability (generic available)

Solution for injection (for use as loading dose): 10 mg/mL. **Premixed infusion:** 2000 mg/100 mL, 2500 mg/250 mL.

NURSING IMPLICATIONS

Assessment

- Monitor BP, ECG, and pulse frequently during dose adjustment period and periodically during therapy. The risk of hypotension is greatest within the first 30 min of initiating esmolol infusion.
- Monitor intake and output ratios and daily weights. Assess routinely for signs and symptoms of HF (dyspnea, rales/crackles, weight gain, peripheral edema, jugular venous distention).
- Assess infusion site frequently throughout therapy. Concentrations >10 mg/mL may cause redness, swelling, skin discoloration, and burning at the injection site. Do not use butterfly needles for administration. If venous irritation occurs, stop the infusion and resume at another site.
- **Toxicity and Overdose:** Monitor patients receiving esmolol for signs of overdose (bradycardia, severe dizziness or fainting, severe drowsiness, dyspnea, bluish fingernails or palms, seizures).
- IV glucagon and symptomatic care are used in the treatment of esmolol overdose. Because of the short action of esmolol, discontinuation of therapy may relieve acute toxicity.

Potential Nursing Diagnoses

Decreased cardiac output (Side Effects)

Implementation

- **High Alert:** IV vasoactive medications are inherently dangerous. Esmolol is available in different concentrations; fatalities have occurred when loading dose vial is confused with concentrated solution for injection, which contains 2500 mg in 10 mL (250 mg/mL) and must be diluted. Before administering, have second practitioner independently check original order, dose calculations, and infusion pump settings.
- **High Alert:** Do not confuse Brevibloc (esmolol) with Brevital (methohexital). If both are available as floor stock, store in separate areas.
- To convert to other antiarrhythmics following esmolol administration, administer the 1st dose of the antiarrhythmic agent and decrease the esmolol dose by 50% after 30 min. If an adequate response is maintained for 1 hr following the 2nd dose of the antiarrhythmic agent, discontinue esmolol.

IV Administration

- **IV Push:** **Diluent:** The 10-mg/mL and 20-mg/mL vials should be used for the loading dose. These vials are already diluted. No further dilution is needed. **Concentration:** Avoid concentrations >10 mg/mL. **Rate:** Administer over 1 min.
- **Continuous Infusion:** **Diluent:** Premixed infusions are already diluted and ready to use. Solution is clear, colorless to light yellow. **Concentration:**

10 mg/mL. **Rate:** Based on patient's weight (see Route/Dosage section). Titration of dose is based on desired heart rate or undesired decrease in BP. Esmolol infusions should not be abruptly discontinued; the infusion rate should be tapered.

- **Y-Site Compatibility:** alfentanil, amikacin, aminophylline, amiodarone, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, ceftazidime, cefotaxime, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chlorpromazine, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporin, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxycycline, enalaprilat, ephedrine, epinephrine, epoetin alfa, eptifibatid, ertapenem, erythromycin, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin (regular), isoproterenol, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, mesna, methotrexate, methylodopate, methoclopramide, metoprolol, metronidazole, micafungin, midazolam, mitoxantrone, morphine, moxifloxacin, multivitamins, mycophenolate, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, pentazocine, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procaïnamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, ranitidine, remifentanyl, rocuronium, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** acyclovir, amphotericin B colloidal, amphotericin B lipid complex, azathioprine, cefotetan, dantrolene, dexamethasone, diazepam, diazoxide, furosemide, ganciclovir, indomethacin, ketorolac, milrinone, mitomycin, oxacillin, pantoprazole, pentobarbital, phenobarbital, warfarin.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Patient/Family Teaching

- May cause drowsiness. Caution patients receiving esomeprazole to call for assistance during ambulation or transfer.
- Advise patients to change positions slowly to minimize orthostatic hypotension.
- Patients with diabetes should closely monitor blood glucose, especially if weakness, malaise, irritability, or fatigue occurs. Medication does not block dizziness or sweating as signs of hypoglycemia.

Evaluation/Desired Outcomes

- Control of arrhythmias without appearance of detrimental side effects.

esomeprazole (es-oh-mep-ra-zole) NexIUM, NexIUM 24hr

Classification

Therapeutic: antiulcer agents

Pharmacologic: proton-pump inhibitors

Indications

PO, IV: GERD/erosive esophagitis (IV therapy should only be used if PO therapy is not possible/appropriate).

IV: Reduction in risk of rebleeding following therapeutic endoscopy for acute bleeding gastric or duodenal ulcers. **PO:** Hypersecretory conditions, including Zollinger-Ellison syndrome. **PO:** With amoxicillin and clarithromycin to eradicate *Helicobacter pylori* in duodenal ulcer disease or history of duodenal ulcer disease.

PO: Decrease risk of gastric ulcer during continuous NSAID therapy. **OTC:** Heartburn occurring \geq twice/wk.

Action

Binds to an enzyme on gastric parietal cells in the presence of acidic gastric pH, preventing the final transport of hydrogen ions into the gastric lumen. **Therapeutic**

Effects: Diminished accumulation of acid in the gastric lumen with lessened gastroesophageal reflux. Healing of duodenal ulcers. Decreased incidence of gastric ulcer during continuous NSAID therapy.

Pharmacokinetics

Absorption: 90% absorbed following oral administration; food \downarrow absorption.

Distribution: Unknown.

Protein Binding: 97%.

Metabolism and Excretion: Extensively metabolized by the liver (cytochrome P450 [CYP450] system, primarily CYP2C19 isoenzyme, but also the CYP3A4 isoenzyme) (the CYP2C19 enzyme system exhibits genetic polymorphism; 15–20% of Asian patients and 3–5% of Caucasian and Black patients may be poor metabolizers and may have significantly \uparrow esomeprazole concentrations and an \uparrow risk of adverse effects); <1% excreted unchanged in urine.

Half-life: *Children 1–11 yrs:* 0.42–0.88 hr; *Adults:* 1.0–1.5 hr.

TIME/ACTION PROFILE (blood levels*)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1.6 hr	24 hr
IV	rapid	end of infusion	24 hr

*Resolution of symptoms takes 5–8 days.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to esomeprazole or related drugs (benzimidazoles); Hypersensitivity.

Use Cautiously in: Severe hepatic impairment; Patients using high-doses for >1 year (\uparrow risk of hip, wrist, or spine fractures); Patients using therapy for >3 yr (\uparrow risk of vitamin B₁₂ deficiency); **OB, Lactation:** Use only if potential benefit outweighs potential risk.

Adverse Reactions/Side Effects

CNS: headache. **Derm:** cutaneous lupus erythematosus. **GI:** CLOSTRIDIUM DIFFICILE-ASSOCIATED DIARRHEA (CDAD), abdominal pain, constipation, diarrhea, dry mouth, flatulence, nausea. **F and E:** hypomagnesemia (especially if treatment duration \geq 3 mo). **GU:** acute interstitial nephritis. **Hemat:** vitamin B₁₂ deficiency. **MS:** bone fracture. **Misc:** systemic lupus erythematosus.

Interactions

Drug-Drug: May \downarrow levels of atazanavir and nelfinavir; avoid concurrent use with either of these antiretrovirals. May \uparrow levels and risk of toxicity of saquinavir (may need to \downarrow dose of saquinavir). May \downarrow absorption of drugs requiring acid pH, including ketoconazole, itraconazole, ampicillin esters, iron salts, erlotinib, and mycophenolate mofetil. May \uparrow levels of digoxin and methotrexate. May \uparrow risk of bleeding with warfarin (monitor INR and PT). **Voriconazole** may \uparrow levels. May \downarrow the antiplatelet effects of clopidogrel; avoid concurrent use. May \uparrow levels of cilostazol; consider \downarrow dose of cilostazol from 100 mg twice daily to 50 mg twice daily. **Rifampin** may \downarrow levels and may \downarrow response (avoid concurrent use). Hypomagnesemia \uparrow risk of digoxin toxicity. May \uparrow levels of tacrolimus and methotrexate.

Drug-Natural Products: St. John's wort may \downarrow levels and may \downarrow response (avoid concurrent use).

Route/Dosage

Gastroesophageal Reflux Disease

PO (Adults): *Healing of erosive esophagitis*—20 mg or 40 mg once daily for 4–8 wk; *Maintenance of healing of erosive esophagitis*—20 mg once daily; *Symptomatic GERD*—20 mg once daily for 4 wk (additional 4 wk may be considered for nonresponders); *Heartburn*—20 mg once daily for 2 wk.

PO (Children 12–17 yr): *Short-term treatment of GERD*—20–40 mg once daily for up to 8 wk.

PO (Children 1–11 yr): *Short-term treatment of GERD*—10 mg once daily for up to 8 wk; *Healing of*

erosive esophagitis— <20 kg: 10 mg once daily for 8 wk; ≥20 kg: 10–20 mg once daily for 8 wk.

PO (Infants and Children 1 mo–<1 yr): >7.5–12 kg—10 mg once daily for up to 6 wk; >5–7.5 kg—5 mg once daily for up to 6 wk; 3–5 kg—2.5 mg once daily for up to 6 wk.

IV (Adults): 20 or 40 mg once daily.

IV (Children 1–17 yr): <55 kg—10 mg once daily; ≥55 kg—20 mg once daily.

IV (Children 1 mo–<1 yr): 0.5 mg/kg once daily.

Hepatic Impairment

PO, IV (Adults): *Severe hepatic impairment*—Dose should not exceed 20 mg/day.

Reduction of Risk of Rebleeding of Gastric or Duodenal Ulcers After Therapeutic Endoscopy

IV (Adults): 80 mg over 30 min, then 8 mg/hr continuous infusion for 71.5 hr.

Hepatic Impairment

IV (Adults): *Mild-to-moderate hepatic impairment*—Do not exceed continuous infusion rate of 6 mg/hr; *Severe hepatic impairment*—Do not exceed continuous infusion rate of 4 mg/hr.

H. pylori Eradication to Reduce the Risk of Duodenal Ulcer Recurrence (Triple Therapy)

PO (Adults): 40 mg once daily for 10 days with amoxicillin 1000 mg twice daily for 10 days and clarithromycin 500 mg twice daily for 10 days.

Hepatic Impairment

PO (Adults): *Severe hepatic impairment*—Dose should not exceed 20 mg/day.

Decrease Gastric Ulcer During Continuous NSAID Therapy

PO (Adults): 20 or 40 mg once daily for up to 6 mo.

Hepatic Impairment

PO (Adults): *Severe hepatic impairment*—Dose should not exceed 20 mg/day.

Pathological Hypersecretory Conditions Including Zollinger-Ellison Syndrome

PO (Adults): 40 mg twice daily.

Hepatic Impairment

PO (Adults): *Severe hepatic impairment*—Dose should not exceed 20 mg/day.

Availability (generic available)

Delayed-release capsules: 20 mg^{RS, OTC}, 40 mg.

Cost: 20 mg \$713.55/90, 40 mg \$731.22/90. **Delayed-release tablets:** 20 mg^{OTC}. **Delayed-release oral suspension packets:** 2.5 mg/pkt, 5 mg/pkt, 10

mg/pkt, 20 mg/pkt, 40 mg/pkt. **Cost:** All strengths \$268.01/30 pkts. **Powder for injection (requires reconstitution and further dilution):** 20 mg/vial, 40 mg/vial. **In combination with:** naproxen (Vimovo).

NURSING IMPLICATIONS

Assessment

- Assess routinely for epigastric or abdominal pain and frank or occult blood in the stool, emesis, or gastric aspirate.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of *Clostridium difficile*-associated diarrhea (CDAD).
- **Lab Test Considerations:** May cause ↑ serum creatinine, uric acid, total bilirubin, alkaline phosphatase, AST, and ALT.
- May alter hemoglobin, WBC, platelets, serum sodium, potassium, and thyroxine levels.
- May cause hypomagnesemia. Monitor serum magnesium prior to and periodically during therapy.
- May cause false positive results in diagnostic investigations for neuroendocrine tumors due to ↑ serum chromogranin A (CgA) levels secondary to drug-induced ↓ gastric acidity. Temporarily stop esomeprazole at least 14 days before assessing CgA levels and consider repeating test if initial CgA levels are high.

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- **High Alert:** Do not confuse Nexium with Nexavar (sorafenib).
- Antacids may be used while taking esomeprazole.
- **PO:** Administer at least 1 hr before meals. Swallow tablets and capsules whole.
- **Delayed-release capsules:** For patients with difficulty swallowing, place 1 tsp of applesauce in an empty bowl. Open capsule and carefully empty the pellets inside onto applesauce. Mix pellets with applesauce and swallow immediately. Applesauce should not be hot and should be soft enough to swallow without chewing. Do not store applesauce mixture for future use. Tap water, orange juice, apple juice, and yogurt have also been used. Do not crush or chew pellets.
- For patients with an NG tube, delayed-release capsules can be opened and intact granules emptied into a 60-mL syringe and mixed with 50 mL of water. Replace plunger and shake syringe vigorously for 15 sec. Hold syringe with tip up and check for granules in tip. Attach syringe to NG tube and administer solution. After administering, flush syringe with additional water. Do not administer if granules have dis-

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

solved or disintegrated. Administer immediately after mixing.

- For *Delayed-release oral suspension*: Mix contents of packet with 1 tbsp (15 mL) of water, leave 2–3 min to thicken, stir and drink within 30 min.
- For *Delayed-Release Oral Suspension Nasogastric or Gastric Tube*: Add 15 mL of water to a syringe and then add contents of packet. Shake the syringe, leave 2–3 min to thicken. Shake the syringe and inject through the nasogastric or gastric tube within 30 min.

IV Administration

- **IV Push**: Reconstitute each vial with 5 mL of 0.9% NaCl, LR, or D5W. Do not administer solutions that are discolored or contain a precipitate. Stable at room temperature for up to 12 hr. **Rate**: Administer over at least 3 min.
- **Intermittent Infusion**: **Diluent**: Dilute reconstituted solution to a volume of 50 mL with D5W, 0.9% NaCl, or LR for adults and with 0.9% NaCl for pediatric patients. **Concentration**: 0.8 mg/mL (40-mg vial) or 0.4 mg/mL (20-mg vial). Solutions diluted with 0.9% NaCl or LR are stable for 12 hr and those diluted with D5W are stable for 6 hr at room temperature. **Rate**: Administer over 10–30 min.
- **Continuous Infusion**: For 80 mg Loading Dose, reconstitute two 40 mg vials with 5 mL of 0.9% NaCl. **Diluent**: Further diluted in 100 mL 0.9% NaCl. **Rate**: Administer loading dose over 30 minutes. Follow with infusion at a rate of 8 mg/hr for 71.5 hrs.
- **Continuous Infusion**: For 80 mg dose, reconstitute two 40 mg vials with 5 mL of 0.9% NaCl. **Diluent**: Further diluted in 100 mL 0.9% NaCl. **Rate**: Follow loading dose with infusion at a rate of 8 mg/hr for 71.5 hrs.
- **Y-Site Compatibility**: ceftazoline, fentanyl, furosemide, insulin (regular), nitroglycerin.
- **Y-Site Incompatibility**: dobutamine, dopamine, midazolam, morphine, tacrolimus, telavancin, tigecycline. Do not administer with other medication or solutions. Flush line with 0.9% NaCl, LR, or D5W before and after administration.

Patient/Family Teaching

- Instruct patient to take medication as directed for the full course of therapy, even if feeling better. Take missed doses as soon as remembered but not if almost time for next dose. Do not double doses. Advise patient to read the *Patient Information* sheet prior to starting therapy and with each Rx refill in case of changes.
- Advise patient to avoid alcohol, products containing aspirin or NSAIDs, and foods that may cause an increase in GI irritation.
- Advise patient to report onset of black, tarry stools; diarrhea; abdominal pain; or persistent headache to health care professional promptly.

- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort.
- Advise patient to notify health care professional if signs of hypomagnesemia (seizures, dizziness, abnormal or fast heartbeat, jitteriness, jerking movements or shaking, muscle weakness, spasms of the hands and feet, cramps or muscle aches, spasm of the voice box) occur.
- **Caution patient to notify health care professional if fever and diarrhea occur, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.**
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in abdominal pain or prevention of gastric irritation and bleeding. Healing of duodenal ulcers can be seen on x-ray examination or endoscopy.
- Decrease in symptoms of GERD and erosive esophagitis. Sustained resolution of symptoms usually occurs in 5–8 days. Therapy is continued for 4–8 wk after initial episode.
- Decreased incidence of gastric ulcer during continuous NSAID therapy.
- Eradication of *H. pylori* in duodenal ulcer disease.
- Decrease in symptoms of hypersecretory conditions, including Zollinger-Ellison.

ESTRADIOL (es-tra-dye-ole)

Estrace

estradiol cypionate

Depo-Estradiol

estradiol valerate

Delestrogen

estradiol topical emulsion

Estrasorb

estradiol topical gel

Divigel, Elestrin, EstroGel

estradiol transdermal spray

EvaMist

estradiol transdermal system

Alora, Climara, Estraderm, ♣ Estradot, Menostar, Minivelle, ♣ Oesclim, Vivelle-Dot

estradiol vaginal insert

Vagifem

estradiol vaginal ring

Femring, Estring

Classification

Therapeutic: hormones
Pharmacologic: estrogens

Indications

PO, IM, Topical, Transdermal: Replacement of estrogen (HRT) to diminish moderate to severe vasomotor symptoms of menopause and of various estrogen deficiency states including: Female hypogonadism, Ovariectomy, Primary ovarian failure. Treatment and prevention of postmenopausal osteoporosis (not vaginal dose forms). **PO:** Inoperable metastatic postmenopausal breast or prostate carcinoma. **Vag:** Management of atrophic vaginitis that may occur with menopause (low dose), bothersome systemic symptoms of menopause (higher dose). Concurrent use of progestin is recommended during cyclical therapy to decrease the risk of endometrial carcinoma in patients with an intact uterus.

Action

Estrogens promote growth and development of female sex organs and the maintenance of secondary sex characteristics in women. Metabolic effects include reduced blood cholesterol, protein synthesis, and sodium and water retention. **Therapeutic Effects:** Restoration of hormonal balance in various deficiency states, including menopause. Treatment of hormone-sensitive tumors.

Pharmacokinetics

Absorption: Well absorbed after oral administration. Readily absorbed through skin and mucous membranes.

Distribution: Widely distributed. Crosses the placenta and enters breast milk.

Metabolism and Excretion: Mostly metabolized by the liver and other tissues. Enterohepatic recirculation occurs, and more absorption may occur from the GI tract.

Half-life: Gel: 36 hr.

TIME/ACTION PROFILE (estrogenic effects)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown
IM	unknown	unknown	unknown
TD	unknown	unknown	3–4 days (Estraderm), 7 days (Climara)
Topical	unknown	unknown	unknown
Vaginal ring	unknown	unknown	90 days
Vaginal tablet	unknown	unknown	3–4 days

Contraindications/Precautions

Contraindicated in: History of anaphylaxis or angioedema to estradiol; Thromboembolic disease (e.g.,

DVT, PE, MI, stroke); Protein C, protein S, or anti-thrombin deficiency or other thrombophilic disorder; History of breast cancer; History of estrogen-dependent cancer; Hepatic impairment; Undiagnosed vaginal bleeding; **OB:** Positive evidence of fetal risk.

Use Cautiously in: Underlying cardiovascular disease; Severe hepatic or renal disease; May ↑ the risk of endometrial carcinoma; History of porphyria; History of hereditary angioedema; **Lactation:** Usually compatible with breast feeding (AAP).

Adverse Reactions/Side Effects

CNS: headache, dizziness, lethargy. **EENT:** intolerance to contact lenses, worsening of myopia or astigmatism. **CV:** MI, THROMBOEMBOLISM, edema, hypertension. **GI:** nausea, weight changes, anorexia, ↑ appetite, jaundice, vomiting. **GU:** women—amenorrhea, dysmenorrhea, breakthrough bleeding, cervical erosions, loss of libido, vaginal candidiasis; men, erectile dysfunction, testicular atrophy. **Derm:** oily skin, acne, pigmentation, urticaria. **Endo:** gynecomastia (men), hyperglycemia. **F and E:** hypercalcemia, sodium and water retention. **MS:** leg cramps. **Misc:** breast tenderness.

Interactions

Drug-Drug: May alter requirement for warfarin, oral hypoglycemic agents, or insulins. Barbiturates or rifampin may ↓ effectiveness. **Smoking** ↑ risk of adverse CV reactions.

Route/Dosage

Estrogens should be used in the lowest doses for the shortest period of time consistent with desired therapeutic outcome.

Symptoms of Menopause, Atrophic Vaginitis, Female Hypogonadism, Ovarian Failure/Osteoporosis

PO (Adults): 0.45–2 mg daily or in a cycle.

IM (Adults): 1–5 mg monthly (estradiol cypionate) or 10–20 mg (estradiol valerate) monthly.

Topical Emulsion (Estrasorb) (Adults): Apply two 1.74-g pouches (4.35 mg estradiol) daily.

Gel (Adults): Apply contents of one packet (Divigel) or one actuation from pump (EstroGel, Elestrin) daily.

Spray EvaMist (Adults): 1 spray daily, may be ↑ to 2–3 sprays daily.

Transdermal (Adults): Alora—25–50–mcg/24-hr transdermal patch applied twice weekly. Estraderm—50–mcg/24-hr transdermal patch applied twice weekly. Climara—25-mcg/24-hr transdermal patch applied weekly. Vivelle-Dot—25–50–mcg/24-hr transdermal patch applied twice weekly. Menostar—14-mcg/24-hr transdermal patch applied q 7 days. Progestin may be administered for 10–14 days of each mo. Minivelle—37.5–mcg/24–hr transdermal patch

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

applied twice weekly (for treatment of vasomotor symptoms); 25-mcg/24-hr transdermal patch applied twice weekly (for prevention of postmenopausal osteoporosis).

Vag (Adults): *Cream*—2–4 g (0.2–0.4 mg estradiol) daily for 1–2 wk, then ↓ to 1–2 g/day for 1–2 wk; then maintenance dose of 1 g 1–3 times weekly for 3 wk, then off for 1 wk; then repeat cycle once vaginal mucosa has been restored; *Vaginal ring (Estring)*—2-mg (releases 7.5 mcg estradiol/24 hr) q 3 mo; *Vaginal ring (Femring)*—12.4 mg (releases 50 mcg estradiol/24 hr) q 3 mo or 24.8 mg (releases 100 mcg estradiol/24 hr) q 3 mo (*Femring* requires concurrent progesterone); *Vaginal insert*—1 tablet once daily for 2 wk, then twice weekly.

Postmenopausal Breast Carcinoma

PO (Adults): 10 mg 3 times daily.

Prostate Carcinoma

PO (Adults): 1–2 mg 3 times daily.

IM (Adults): 30 mg q 1–2 wk (estradiol valerate).

Availability (generic available)

Tablets: 0.5 mg, 1 mg, 2 mg. **Cost:** *Generic*—0.5 mg \$10.83/100, 1 mg \$10.83/100, 2 mg \$10.83/100. **Injection (valerate in oil):** 10 mg/mL, 20 mg/mL, 40 mg/mL. **Injection (cypionate in oil):** 5 mg/mL. **Topical emulsion:** 4.35 mg/1.74-g pouch. **Cost:** \$1.36/pouch. **Topical gel packet (Divigel):** 0.25 mg/packet, 0.5 mg/packet, 1 mg/packet. **Cost:** All strengths \$3.45/pkt. **Topical gel pump (Elestrin):** 0.52 mg/actuation. **Cost:** *Elestrin (0.52 mg/actuation)*—\$89.44/26 g. **Topical gel pump (EstroGel):** 0.75 mg/actuation. **Cost:** *EstroGel (0.75 mg/actuation)*—\$103.80/50 g. **Transdermal spray:** 1.53 mg/spray. **Cost:** \$108.76/9 mL. **Transdermal system:** 14 mcg/24-hr release rate, 25 mcg/24-hr release rate, 37.5 mcg/24-hr release rate, 50 mcg/24-hr release rate, 60 mcg/24-hr release rate, 75 mcg/24-hr release rate, 100 mcg/24-hr release rate. **Cost:** 14 mcg/24 hr \$221.46/4, 25 mcg/24 hr \$88.40/4, 37.5 mcg/24 hr \$88.40/4, 50 mcg/24 hr \$88.40/4, 60 mcg/24 hr \$88.40/4, 75 mcg/24 hr \$88.40/4, 100 mcg/24 hr \$88.40/4. **Vaginal cream:** 0.01%. **Cost:** \$165.70/43 g. **Vaginal ring (Estring):** 2 mg (releases 7.5 mcg/day over 90 days). **Cost:** \$252.72/1 ring. **Vaginal ring (Femring):** 12.4 mg (releases 50 mcg/day over 90 days), 24.8 mg (releases 100 mcg/day over 90 days). **Cost:** 50 mcg/day \$248.98/1 ring, 100 mcg/day \$259.58/1 ring. **Vaginal insert:** 10 mcg. **Cost:** \$97.05/8. **In combination with:** norethindrone (Combipatch). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess BP before and periodically during therapy.
- Monitor intake and output ratios and weekly weight. Report significant discrepancies or steady weight gain.

- **Menopause:** Assess frequency and severity of vasomotor symptoms.
- **Lab Test Considerations:** May cause ↑ HDL, phospholipids, and triglycerides and ↓ serum LDL and total cholesterol concentrations.
- May cause ↑ serum glucose, sodium, cortisol, prolactin, prothrombin, and factor VII, VIII, IX, and X levels. May ↓ serum folate, pyridoxine, antithrombin III, and urine pregnanediol concentrations.
- Monitor hepatic function before and periodically during therapy.
- May cause false interpretations of thyroid function tests, false ↑ in norepinephrine platelet-induced aggregability, and false ↓ in metyrapone tests.
- May cause hypercalcemia in patients with metastatic bone lesions.

Potential Nursing Diagnoses

Sexual dysfunction (Indications)

Implementation

- **Do not confuse Alora with Aldara.**
- **PO:** Administer with or immediately after food to reduce nausea.
- **Vag:** Manufacturer provides applicator with cream. Dose is marked on the applicator. Wash applicator with mild soap and warm water after each use.
- **Transdermal:** When switching from PO form, begin transdermal therapy 1 wk after the last dose or when symptoms reappear.
- **Topical:** In a comfortable position, apply *Estrasorb* to clean, dry skin of thighs each morning. Open each foil pouch individually. Cut or tear the first pouch at the notches near the top of the pouch. Apply the contents of pouch to top of left thigh; push entire contents from bottom through neck of pouch. Using one or both hands rub emulsion into thigh and calf for 3 min until completely absorbed. Rub any excess remaining on hands into buttocks. Repeat procedure with second pouch on right leg. Allow application sites to dry completely before covering with soap and water to prevent transfer. Wash hands with soap and water to remove residual estradiol.
- Apply *Divigel* individual-use once-daily packets of quick drying gel to an area measuring 5 inches by 7 inches (size of 2 palm prints) on the thigh. Do not wash area for at least 1 hr after gel has dried.
- Spray *EvaMist* on inside of forearm at the same time each day. Do not massage or rub the spray into the skin. Allow to dry for 2 min before dressing and at least 1 hr before washing. Never spray *EvaMist* around breast or vagina. Do not use more than 56 doses, even if fluid remains in pump.
- **IM:** Injection has oil base. Roll syringe to ensure even dispersion. Administer deep IM. Avoid IV administration.

Patient/Family Teaching

- Instruct patient on correct method of administration. Instruct patient to take medication as directed.

Take missed doses as soon as remembered as long as it is not just before next dose. If a dose of *EvaMist* is missed, apply if more than 12 hr before next dose; if less than 12 hr, omit dose and return to regular schedule. Do not double doses.

- Explain dose schedule and maintenance routine. Discontinuing medication suddenly may cause withdrawal bleeding.
- If nausea becomes a problem, advise patient that eating solid food often provides relief.
- Advise patient to report signs and symptoms of fluid retention (swelling of ankles and feet, weight gain), thromboembolic disorders (pain, swelling, tenderness in extremities, headache, chest pain, blurred vision), mental depression, or hepatic dysfunction (yellowed skin or eyes, pruritus, dark urine, light-colored stools) to health care professional.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Caution patient that cigarette smoking during estrogen therapy may cause increased risk of serious side effects, especially for women over age 35.
- Caution patient to use sunscreen and protective clothing to prevent increased pigmentation.
- Advise patient treated for osteoporosis that exercise has been found to arrest and reverse bone loss. Patient should discuss any exercise limitations with health care professional before beginning program.
- Inform patient that estrogens should not be used to decrease risk of cardiovascular disease. Estrogens may increase risk of cardiovascular disease and breast cancer.
- Instruct patient to stop taking medication and notify health care professional if pregnancy is planned or suspected.
- Emphasize the importance of routine follow-up physical exams, including BP; breast, abdomen, and pelvic examinations; Papanicolaou smears every 6–12 mo; and mammogram every 12 mo or as directed. Health care professional will evaluate possibility of discontinuing medication every 3–6 mo. If on continuous (not cyclical) therapy or without concurrent progestins, endometrial biopsy may be recommended, if uterus is intact.
- **Vag:** Instruct patient in the correct use of applicator. Patient should remain recumbent for at least 30 min after administration. May use sanitary napkin to protect clothing, but do not use tampon. If a dose is missed, do not use the missed dose, but return to regular dosing schedule.
- Instruct patient to use applicator provided with vaginal tablet. Insert as high up in the vagina as comfortable, without using force.
- **Vaginal Ring:** Instruct patient to press ring into an oval and insert into the upper third of the vaginal vault. Exact position is not critical. Once ring is in-

serted, patient should not feel anything. If discomfort is felt, ring is probably not in far enough; gently push farther into vagina. Leave in place continuously for 90 days. Ring does not interfere with sexual intercourse. If straining at defecation makes ring move to lower vagina, push up with finger. If expelled totally, rinse ring with lukewarm water and reinsert. To remove, hook a finger through the ring and pull it out.

- **Transdermal:** Instruct patient to wash and dry hands first. Apply disc to intact skin on hairless portion of abdomen (do not apply to breasts or waistline). Apply *Minivelle* patch to lower abdomen or buttocks. Press disc/patch for 10 sec to ensure contact with skin (especially around edges). Avoid areas where clothing may rub disc loose. Change site with each administration to prevent skin irritation. Do not reuse site for 1 wk; disc may be reapplied if it falls off.
- Advise patient referred for MRI test to discuss patch with referring health care professional and MRI facility to determine if removal of patch is necessary prior to test and for directions for replacing patch.
- *Evamist:* Caution patient to make sure children are not exposed to Evamist and do not come into contact with any skin area where the drug was applied. Women who cannot avoid contact with children should wear a garment with long sleeves to cover the application site.

Evaluation/Desired Outcomes

- Resolution of menopausal vasomotor symptoms.
- Decreased vaginal and vulvar itching, inflammation, or dryness associated with menopause.
- Normalization of estrogen levels in patients with ovariectomy or hypogonadism.
- Control of the spread of advanced metastatic breast or prostate cancer.
- Prevention of osteoporosis.

estradiol valerate/dienogest, See CONTRACEPTIVES, HORMONAL.

estrogens, conjugated (equine) (*ess-troe-jenz con-joo-gae-ted*)

Cenestin

Classification

Therapeutic: hormones
Pharmacologic: estrogens

✳ = Canadian drug name. ~~⊗~~ = Genetic implication. ~~⊗~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Indications

PO: Treatment of moderate to severe vasomotor symptoms of menopause. Estrogen deficiency states, including: Female hypogonadism, Ovariectomy, Primary ovarian failure. Prevention of postmenopausal osteoporosis. Advanced inoperable metastatic breast and prostatic carcinoma. **IM, IV:** Uterine bleeding resulting from hormonal imbalance. **Vag:** Atrophic vaginitis. Moderate to severe dyspareunia due to menopause. Concurrent use of progestin is recommended during cyclical therapy to decrease the risk of endometrial carcinoma in patients with an intact uterus.

Action

Estrogens promote the growth and development of female sex organs and the maintenance of secondary sex characteristics in women. **Therapeutic Effects:** Restoration of hormonal balance in various deficiency states and treatment of hormone-sensitive tumors.

Pharmacokinetics

Absorption: Well absorbed after oral administration. Readily absorbed through skin and mucous membranes.

Distribution: Widely distributed. Crosses placenta and enters breast milk.

Metabolism and Excretion: Mostly metabolized by liver and other tissues. Enterohepatic recirculation occurs, with more absorption from GI tract.

Half-life: Unknown.

TIME/ACTION PROFILE (estrogenic effects†)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	unknown	24 hr
IM	delayed	unknown	6–12 hr
IV	rapid	unknown	6–12 hr

†Tumor response may take several weeks.

Contraindications/Precautions

Contraindicated in: History of anaphylaxis or angioedema to estrogen; Thromboembolic disease (e.g., DVT, PE, MI, stroke); Undiagnosed vaginal bleeding; History of breast cancer; History of estrogen-dependent cancer; Hepatic impairment; Protein C, protein S, or antithrombin deficiency or other thrombophilic disorder; **OB:** May result in harm to the fetus; **Lactation:** Negatively affects quantity and quality of breast milk.

Use Cautiously in: Long-term use (more than 4–5 yr); may ↑ risk of myocardial infarction, stroke, invasive breast cancer, pulmonary emboli, deep vein thrombosis, and dementia in postmenopausal women; Underlying cardiovascular disease; Hypertriglyceridemia; May ↑ risk of endometrial carcinoma; History of hereditary angioedema.

Adverse Reactions/Side Effects

(Systemic use) **CNS:** headache, dizziness, insomnia, lethargy, mental depression. **CV:** MI, THROMBOEMBOLISM, edema, hypertension. **GI:** nausea, weight changes, anorexia, ↑ appetite, jaundice, vomiting. **GU:**

women—amenorrhea, breakthrough bleeding, dysmenorrhea, cervical erosion, loss of libido, vaginal candidiasis; *men,* erectile dysfunction, testicular atrophy.

Derm: acne, oily skin, pigmentation, urticaria. **Endo:** gynecomastia (men), hyperglycemia. **F and E:** hypercalcemia, sodium and water retention. **MS:** leg cramps. **Misc:** ANAPHYLAXIS, ANGIOEDEMA, breast tenderness.

Interactions

Drug-Drug: May alter requirement for warfarin, oral hypoglycemic agents, or insulins. Barbiturates, carbamazepine, or rifampin may ↓ effectiveness. Smoking ↑ risk of adverse CV reactions. Erythromycin, clarithromycin, itraconazole, ketoconazole, and ritonavir may ↑ risk of adverse effects.

Drug-Food: Grapefruit juice may ↑ risk of adverse effects.

Route/Dosage

Estrogens should be used in the lowest doses for the shortest period of time consistent with desired therapeutic outcome.

Ovariectomy, Primary Ovarian Failure

PO (Adults): 1.25 mg daily administered cyclically (3 wk on, 1 wk off).

Osteoporosis/Menopausal Symptoms

PO (Adults): 0.3–1.25 mg daily or in a cycle.

Female Hypogonadism

PO (Adults): 0.3–0.625 mg daily administered cyclically (3 wk on, 1 wk off).

Inoperable Breast Carcinoma—Men and Postmenopausal Women

PO (Adults): 10 mg 3 times daily.

Inoperable Prostate Carcinoma

PO (Adults): 1.25–2.5 mg 3 times daily.

Uterine Bleeding

IM, IV (Adults): 25 mg, may repeat in 6–12 hr if necessary.

Atrophic Vaginitis

PO (Adults): 0.3–1.25 mg daily.

Vag (Adults): 0.5–2 g cream (0.3125 mg–1.25 mg conjugated estrogens) daily for 3 wk, off for 1 wk, then repeat.

Moderate to Severe Dyspareunia

Vag (Adults): 0.5 g cream (0.3125 mg conjugated estrogens) twice weekly continuously or daily for 3 wk, off for 1 wk, then repeat.

Availability

Tablets: 0.3 mg, 0.45 mg, 0.625 mg, 0.9 mg, 1.25 mg. **Cost:** Premarin—0.3 mg \$299.14/100, 0.45 mg \$299.14/100, 0.625 mg \$299.14/100, 0.9 mg \$311.87/100, 1.25 mg \$298.45/100. **Powder for injection:** 25

mg/vial. **Vaginal cream:** 0.625 mg/g. **Cost:** \$208.20/30 g. **In combination with:** medroxyprogesterone (Prempro and Premphase [compliance package]); bazedoxifene (Duavee). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess BP before and periodically during therapy.
- Monitor intake and output ratios and weekly weight. Report significant discrepancies or steady weight gain.
- **Menopause:** Assess frequency and severity of vasomotor symptoms.
- **Lab Test Considerations:** May cause ↑ HDL and triglycerides, and ↓ serum LDL and total cholesterol concentrations.
- May cause ↑ serum glucose, sodium, cortisol, prolactin, prothrombin, and factor VII, VIII, IX, and X levels. May ↓ serum folate, pyridoxine, antithrombin III, and urine pregnanediol concentrations.
- Monitor hepatic function before and periodically during therapy.
- May cause false interpretations of thyroid function tests.
- May cause hypercalcemia in patients with metastatic bone lesions.

Potential Nursing Diagnoses

Sexual dysfunction (Indications)

Implementation

- Estrogens should be used in the lowest doses for the shortest period of time consistent with desired therapeutic outcome.
- **PO:** Administer with or immediately after food to reduce nausea.
- **Vag:** Manufacturer provides applicator with cream. Dose is marked on the applicator. Wash applicator with mild soap and warm water after each use.
- **IM:** To reconstitute, withdraw at least 5 mL of air from dry container and then slowly introduce the sterile diluent (bacteriostatic water for injection) against the container side. Gently agitate container to dissolve; do not shake vigorously. Solution is stable for 60 days if refrigerated. Do not use if precipitate is present or if solution is darkened.
- IV is preferred parenteral route because of rapid response.

IV Administration

- **IV Push:** **Diluent:** Reconstitute as for IM. Inject into distal port tubing of free-flowing IV of 0.9% NaCl, D5W, or lactated Ringer's solution. **Concentration:** 5 mg/mL. **Rate:** Administer slowly (no faster than 5 mg/min) to prevent flushing.

- **Y-Site Compatibility:** heparin, hydrocortisone sodium succinate, potassium chloride, vitamin B complex with C.
- **Y-Site Incompatibility:** pantoprazole.

Patient/Family Teaching

- Instruct patient to take oral medication as directed. Advise patient to avoid drinking grapefruit juice during therapy. Take missed doses as soon as remembered, but not just before next dose. Do not double doses.
- Explain dose schedule and maintenance routine. Discontinuing medication suddenly may cause withdrawal bleeding. Bleeding is anticipated during the wk when conjugated estrogens are withheld.
- If nausea becomes a problem, advise patient that eating solid food often provides relief. Inform patient that estrogens should not be used to decrease risk of cardiovascular disease. Estrogens may increase risk of cardiovascular disease and breast cancer.
- Advise patient to report signs and symptoms of fluid retention (swelling of ankles and feet, weight gain), **thromboembolic disorders (pain, swelling, tenderness in extremities; headache; chest pain; blurred vision)**, depression, hepatic dysfunction (yellowed skin or eyes, pruritus, dark urine, light-colored stools), or abnormal vaginal bleeding to health care professional.
- Caution patient that cigarette smoking during estrogen therapy may increase risk of serious side effects, especially for women over age 35.
- Inform patient that **Premarin** tablet may appear in stool; this is not harmful.
- Caution patient to use sunscreen and protective clothing to prevent increased pigmentation.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Advise patient treated for osteoporosis that exercise has been found to arrest and reverse bone loss. The patient should discuss any exercise limitations with health care professional before beginning program.
- Instruct patient to stop taking medication and notify health care professional if pregnancy is suspected.
- Emphasize the importance of routine follow-up physical exams, including BP; breast, abdomen, and pelvic examinations; Papanicolaou (Pap) smears every 6–12 mo; and mammogram every 12 mo or as directed. Health care professional will evaluate possibility of discontinuing medication every 3–6 mo. If on continuous (not cyclical) therapy or with-

* = Canadian drug name. † = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; _____ indicate most frequent.

out concurrent progestins, endometrial biopsy may be recommended if uterus is intact.

- **Vag:** Instruct patient in the correct use of applicator. Patient should remain recumbent for at least 30 min after administration. May use sanitary napkin to protect clothing, but do not use tampon. If a dose is missed, do not use the missed dose, but return to regular dosing schedule.

Evaluation/Desired Outcomes

- Resolution of menopausal vasomotor symptoms.
- Decreased vaginal and vulvar itching, inflammation, or dryness associated with menopause.
- Normalization of estrogen levels in patients with ovariectomy or hypogonadism.
- Control of the spread of advanced metastatic breast or prostate cancer.
- Prevention of osteoporosis.
- Relief of moderate to severe dyspareunia due to menopause.

eszopiclone (es-zop-i-clone)

Lunesta

Classification

Therapeutic: sedative/hypnotics
Pharmacologic: cyclopyrrolones

Schedule IV

Indications

Insomnia.

Action

Interacts with GABA-receptor complexes; not a benzodiazepine. **Therapeutic Effects:** Improved sleep with decreased latency and increased maintenance of sleep.

Pharmacokinetics

Absorption: Rapidly absorbed after oral administration.

Distribution: Unknown.

Metabolism and Excretion: Extensively metabolized by the liver (CYP3A4 and CYP2E1 enzyme systems); metabolites are renally excreted, <10% excreted unchanged in urine.

Half-life: 6 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1 hr	6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Debilitated patients may have ↓ metabolism or increased sensitivity; use lower initial dose; Conditions that may alter metabolic or hemodynamic function; Severe hepatic impairment (↓ dose recommended); **OB, Pedi:** Safety not estab-

lished; **Lactation:** Occasional use while breast feeding an older infant should pose little risk; **Geri:** May impair motor and/or cognitive performance; see dosing guidelines.

Adverse Reactions/Side Effects

CNS: abnormal thinking, behavior changes, depression, hallucinations, headache, next day impairment, sleep-driving. **CV:** chest pain, peripheral edema. **GI:** dry mouth, unpleasant taste. **Derm:** rash.

Interactions

Drug-Drug: ↑ risk of CNS depression and next day impairment with other **CNS depressants** including **antihistamines, antidepressants, opioids, sedative/hypnotics, and antipsychotics.** ↑ levels and risk of CNS depression with **drugs that inhibit the CYP3A4 enzyme system,** including **ketoconazole, itraconazole, clarithromycin, nefazodone, ritonavir, and nelfinavir.** Levels and effectiveness may be ↓ by **drugs that induce the CYP3A4 enzyme system,** including **rifampin.**

Route/Dosage

PO (Adults): 1 mg immediately before bedtime; may be ↑ to 2–3 mg if needed; *Geriatric patients*—1 mg immediately before bedtime; may be ↑ to 2 mg if needed; *Concurrent use of CYP3A4 inhibitors*—1 mg immediately before bedtime; may be ↑ to 2 mg if needed.

Hepatic Impairment

PO (Adults): *Severe hepatic impairment*—1 mg immediately before bedtime; may be ↑ to 2 mg if needed.

Availability (generic available)

Tablets: 1 mg, 2 mg, 3 mg. **Cost:** 1 mg \$338.76/30, 2 mg \$300.85/30, 3 mg \$300.85/30.

NURSING IMPLICATIONS

Assessment

- Assess sleep patterns prior to and during administration. Continued insomnia after 7–10 days of therapy may indicate primary psychiatric or mental illness.
- Assess mental status and potential for abuse prior to administration. Prolonged use of >7–10 days may lead to physical and psychological dependence. Limit amount of drug available to the patient.

Potential Nursing Diagnoses

Insomnia (Indications)

Implementation

- **Do not confuse Lunesta with Neulasta.**
- **PO:** Onset is rapid. Administer immediately before going to bed or after patient has gone to bed and has experienced difficulty falling asleep, only on nights when patient is able to get 8 or more hours of sleep before being active again.
- Swallow tablet whole; do not break, crush, or chew.
- Eszopiclone is more effective if not taken with or before a high-fat, heavy meal.

Patient/Family Teaching

- Instruct patient to take eszopiclone immediately before going to bed, as directed. May result in short-term memory impairment, hallucinations, impaired coordination, and dizziness. Do not increase dose or discontinue without notifying health care professional. Dose may need to be decreased gradually to minimize withdrawal symptoms. Rebound insomnia and/or anxiety may occur upon discontinuation and usually resolves within 1–2 nights.
- May cause daytime and next-day drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Inform patient that after taking eszopiclone patient may get out of bed and perform activities (driving a car (“sleep-driving”), making and eating food, talking on the phone, having sex, sleep-walking) while unaware. Patient may not remember anything done during the night; increased risk with alcohol or other CNS depressants.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any other Rx, OTC, or herbal products.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants.
- Advise patient to notify health care professional if pregnancy is planned or suspected.

Evaluation/Desired Outcomes

- Decreased sleep latency and improved sleep maintenance.

etanercept (e-tan-er-sept)

★ Brenzys, Enbrel, Erelzi

Classification

Therapeutic: antirheumatics (DMARDs)
Pharmacologic: anti-TNF agents

Indications

Moderately to severely active rheumatoid arthritis (may be used alone or with methotrexate). Moderate to severely active polyarticular juvenile idiopathic arthritis. Psoriatic arthritis (may be used alone or with methotrexate). Active ankylosing spondylitis. Moderate to severe chronic plaque psoriasis in patients who are candidates for systemic therapy or phototherapy.

Action

Binds to tumor necrosis factor (TNF), making it inactive. TNF is a mediator of inflammatory response.

Therapeutic Effects: Decreased pain and swelling with decreased rate of joint destruction in patients with rheumatoid arthritis, psoriatic arthritis, juvenile idio-

pathic arthritis, and ankylosing spondylitis. Reduced severity of plaques.

Pharmacokinetics

Absorption: 60% absorbed after subcut administration.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: 115 hr (range 98–300 hr).

TIME/ACTION PROFILE (symptom reduction)

ROUTE	ONSET	PEAK	DURATION
Subcut	2–4 wk	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Active infection (including localized); **Lactation:** Lactation; Untreated infections; Granulomatosis with polyangiitis (receiving immunosuppressive agents); Concurrent cyclophosphamide or anakinra.

Use Cautiously in: History of chronic or recurrent infection or underlying illness/treatment predisposing to infection (including advanced or poorly controlled diabetes); History of exposure to tuberculosis; History of opportunistic infection; History of hepatitis B; Patients residing, or who have resided, where tuberculosis, histoplasmosis, coccidioidomycosis, or blastomycosis is endemic; Pre-existing or recent demyelinating disorders (multiple sclerosis, myelitis, optic neuritis); Latex allergy (needle cover of diluent syringe contains latex); **Geri:** May have ↑ risk of infection; **Pedi:** Children with significant exposure to varicella virus (temporarily discontinue etanercept; consider varicella zoster immune globulin); ↑ risk of lymphoma (including hepato-splenic T-cell lymphoma [HSTCL]), leukemia, and other malignancies; **Pedi:** Children <2 yr (juvenile idiopathic arthritis) or <4 yr (plaque psoriasis) (safety and effectiveness not established); **OB:** Use only if needed.

Adverse Reactions/Side Effects

CNS: headache, dizziness, weakness. **EENT:** rhinitis, pharyngitis. **Resp:** upper respiratory tract infection, cough, respiratory disorder. **GI:** abdominal pain, dyspepsia. **Derm:** psoriasis, rash. **Hemat:** pancytopenia. **Local:** injection site reactions. **Misc:** **INFECTIONS** (including reactivation tuberculosis and other opportunistic infections due to bacterial, invasive fungal, viral, mycobacterial, and parasitic pathogens), **MALIGNANCY** (including lymphoma, HSTCL, leukemia, and skin cancer), **SARCOIDOSIS**.

Interactions

Drug-Drug: Concurrent use with **anakinra** ↑ risk of serious infections (not recommended). Concurrent use of **cyclophosphamide** may ↑ risk of malignancies. Concurrent use with **azathioprine** and/or **methotrexate** may ↑ risk of HSTCL. May ↓ antibody response

★ = Canadian drug name. ⚡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

to **live-virus vaccine** and ↑ risk of adverse reactions (do not administer concurrently).

Route/Dosage

Rheumatoid Arthritis

Subcut (Adults): 50 mg once weekly.

Psoriatic Arthritis

Subcut (Adults): 50 mg once weekly.

Ankylosing Spondylitis

Subcut (Adults): 50 mg once weekly.

Plaque Psoriasis

Subcut (Adults): 50 mg twice weekly for 3 mo, then 50 mg once weekly, may also be given as 25–50 mg once weekly as an initial dose.

Subcut (Children ≥4 yr and ≥63 kg): 50 mg once weekly.

Subcut (Children ≥4 yr and <63 kg): 0.8 mg/kg once weekly.

Juvenile Idiopathic Arthritis

Subcut (Children ≥2 yr and ≥63 kg): 50 mg once weekly.

Subcut (Children ≥2 yr and <63 kg): 0.8 mg/kg once weekly.

Availability

Solution for subcutaneous injection: 25 mg/0.5 mL (prefilled syringe), 50 mg/mL (prefilled syringe and autoinjector). **Powder for subcutaneous injection:** 25 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess range of motion, degree of swelling, and pain in affected joints before and periodically during therapy.
- Assess patient for injection site reaction (erythema, pain, itching, swelling). Reactions are usually mild to moderate and last 3–5 days after injection.
- **Monitor patients who develop a new infection while taking etanercept closely. Discontinue therapy in patients who develop a serious infection or sepsis. Do not initiate therapy in patients with active infections.**
- Assess for signs and symptoms of systemic fungal infections (fever, malaise, weight loss, sweats, cough, dyspnea, pulmonary infiltrates, serious systemic illness with or without concomitant shock). Ascertain if patient lives in or has traveled to areas of endemic mycoses. Consider empiric antifungal treatment for patients at risk of histoplasmosis and other invasive fungal infections until the pathogens are identified. Consult with an infectious diseases specialist. Consider stopping etanercept until the infection has been diagnosed and adequately treated.
- **Lab Test Considerations:** Monitor CBC with differential periodically during therapy. May cause leukopenia, neutropenia, thrombocytopenia, and pan-

cytopenia. Discontinue etanercept if symptoms of blood dyscrasias (persistent fever) occur.

Potential Nursing Diagnoses

Impaired physical mobility (Indications)

Acute pain (Indications)

Implementation

- **Do not confuse Enbrel with Levbid.**
- Administer a tuberculin skin test prior to administration of etanercept. Patients with active latent TB should be treated for TB prior to therapy.
- Needle cover of the prefilled syringe contains latex and should not be handled by people with latex allergies.
- **Subcut:** Prepare injection with single dose pre-filled syringe or multidose vial for reconstitution.
- Solution in prefilled syringe may be allowed to reach room temperature (15–30 min); do not remove needle cap during this time.
- For multidose vial, reconstitute with 1 mL of the bacteriostatic sterile water supplied by manufacturer for a concentration of 25 mg/mL. If the vial is used for multiple doses, use a 25-gauge needle for reconstituting and withdrawing solution and apply “Mixing Date” sticker with date of reconstitution entered. Inject diluent slowly into vial to avoid foaming. Some foaming will occur. Swirl gently for dissolution; do not shake or vigorously agitate to prevent excess foaming. Solution should be clear and colorless; do not administer solution that is discolored or contains particulate matter. Dissolution usually takes <10 min. Withdraw solution into syringe. Some foam may remain in vial. Amount in syringe should approximate 1 mL. Do not filter reconstituted solution during preparation or administration. Attach a 27-gauge needle to inject. Administer as soon as possible after reconstitution; stable up to 6 hr if refrigerated. Solution and pre-filled syringes are stable if refrigerated and used within 14 days.
- May be injected into abdomen, thigh, or upper arm. Rotate sites. Do not administer within 1 in. of an old site or into area that is tender, red, hard, or bruised.
- **Syringe Incompatibility:** Do not mix with other solutions or dilute with other diluents.

Patient/Family Teaching

- Instruct patient on self-administration technique, storage, and disposal of equipment. First injection should be administered under the supervision of health care professional. Provide patient with a puncture-proof container for used equipment.
- Advise patient not to receive live vaccines during therapy. Parents should be advised that children should complete immunizations to date before initiation of etanercept. Patients with significant exposure to varicella virus (chickenpox) should temporarily discontinue therapy and varicella immune globulin should be considered.

- Advise patient that methotrexate, analgesics, NSAIDs, corticosteroids, and salicylates may be continued during therapy.
- Instruct patient to notify health care professional if upper respiratory or other infections occur. Therapy may need to be discontinued if serious infection occurs.
- Advise patient of risk of malignancies such as hepatosplenic T-cell lymphoma. Instruct patient to report signs and symptoms (splenomegaly, hepatomegaly, abdominal pain, persistent fever, night sweats, weight loss) to health care professional promptly.
- Instruct female patients to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy. Advise patients who were pregnant during therapy to notify health care professional; may limit administration of live vaccines to infant.

Evaluation/Desired Outcomes

- Reduction in symptoms of rheumatoid arthritis. Symptoms may return within 1 mo of discontinuation of therapy.
- Reduced severity of plaques in chronic plaque psoriasis.

ethambutol (e-tham-byoo-tole)

★ Etibi, Myambutol

Classification

Therapeutic: antituberculars

Indications

Active tuberculosis or other mycobacterial diseases (with at least one other drug).

Action

Inhibits the growth of mycobacteria. **Therapeutic**

Effects: Tuberculostatic effect against susceptible organisms.

Pharmacokinetics

Absorption: Rapidly and well absorbed (80%) from the GI tract.

Distribution: Widely distributed; crosses blood-brain barrier in small amounts; crosses placenta and enters breast milk.

Protein Binding: 20–30%.

Metabolism and Excretion: 50% metabolized by the liver, 50% eliminated unchanged by the kidneys.

Half-life: 3.3 hr (increased in renal or hepatic impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	2–4 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Optic neuritis.

Use Cautiously in: Renal and severe hepatic impairment (dosage reduction required); **OB:** Although safety not established, ethambutol has been used with isoniazid in pregnant women without fetal adverse effects; **Lactation:** Usually compatible with breast feeding (AAP).

Adverse Reactions/Side Effects

CNS: confusion, dizziness, hallucinations, headache, malaise. **EENT:** optic neuritis. **GI:** HEPATITIS, abdominal pain, anorexia, nausea, vomiting. **Metab:** hyperuricemia. **MS:** joint pain. **Neuro:** peripheral neuritis. **Resp:** pulmonary infiltrates. **Misc:** anaphylactoid reactions, fever.

Interactions

Drug-Drug: Neurotoxicity may be ↑ with other neurotoxic agents. Aluminum hydroxide may decrease absorption (space doses 4 hr apart).

Route/Dosage

PO (Adults and Children >13 yr): 15–25 mg/kg/day (maximum 2.5 g/day) or 50 mg/kg (up to 2.5 g) twice weekly or 25–30 mg/kg (up to 2.5 g) 3 times weekly.

PO (Children 1 mo—13 yr): *HIV negative*—15–20 mg/kg/day once daily (maximum: 1 g/day) or 50 mg/kg/dose twice weekly (maximum: 2.5 g/dose); *HIV-exposed/-infected*—15–25 mg/kg/day once daily (maximum: 2.5 g/day); *MAC, secondary prophylaxis, or treatment in HIV-exposed/-infected*—15–25 mg/kg/day once daily (maximum: 2.5 g/day) with clarithromycin (or azithromycin) with or without rifabutin; *Nontuberculous mycobacterial infection*—15–25 mg/kg/day once daily (maximum: 2.5 g/day).

Availability (generic available)

Tablets: 100 mg, 400 mg.

NURSING IMPLICATIONS

Assessment

- Mycobacterial studies and susceptibility tests should be performed before and periodically during therapy to detect possible resistance.
- Assess lung sounds and character and amount of sputum periodically during therapy.
- Assessments of visual function should be made frequently during therapy. Advise patient to report blurring of vision, constriction of visual fields, or changes in color perception immediately. Visual impairment, if not identified early, may lead to permanent sight impairment.
- **Lab Test Considerations:** Monitor renal and hepatic functions, CBC, and uric acid levels routinely.

★ = Canadian drug name. ☒ = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; underline indicate most frequent.

Frequently causes elevated uric acid concentrations, which may precipitate an attack of gout.

Potential Nursing Diagnoses

Risk for infection (Indications)

Disturbed sensory perception (Side Effects)

Implementation

- Ethambutol is given as a single daily dose and should be taken at the same time each day. Some regimens require dosing 2–3 times/week. Usually administered concurrently with other antitubercular medications to prevent development of bacterial resistance.
- PO:** Administer with food or milk to minimize GI irritation.
- PO:** Tablets may be crushed and mixed with apple juice or apple sauce.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as possible unless almost time for next dose; do not double up on missed doses. A full course of therapy may take mo to yr. Do not discontinue without consulting health care professional, even though symptoms may disappear.
- Advise patient to notify health care professional if pregnancy is suspected.
- Instruct patient to notify health care professional if no improvement is seen in 2–3 wk. Health care professional should also be notified if unexpected weight gain or decreased urine output occurs.
- Emphasize the importance of routine exams to evaluate progress and ophthalmic examinations if signs of optic neuritis occur.

Evaluation/Desired Outcomes

- Resolution of clinical symptoms of tuberculosis.
- Decrease in acid-fast bacteria in sputum samples.
- Improvement seen in chest x rays. Therapy for tuberculosis is usually continued for at least 1–2 yr.

ethinyl estradiol/desogestrel, See CONTRACEPTIVES, HORMONAL.

ethinyl estradiol/drospirenone, See CONTRACEPTIVES, HORMONAL.

ethinyl estradiol/norethindrone, See CONTRACEPTIVES, HORMONAL.

ethinyl estradiol/norgestimate, See CONTRACEPTIVES, HORMONAL.

ethinyl estradiol/norgestrel, See CONTRACEPTIVES, HORMONAL.

etodolac (ee-toe-doe-lak)

Lodine, Lodine XL

Classification

Therapeutic: antirheumatics, nonopioid analgesics

Pharmacologic: pyranocarboxylic acid

Indications

Osteoarthritis. Rheumatoid arthritis. Mild to moderate pain (not XL tablets).

Action

Inhibits prostaglandin synthesis. Also has uricosuric action. **Therapeutic Effects:** Suppression of inflammation. Decreased severity of pain.

Pharmacokinetics

Absorption: Well absorbed after oral administration.

Distribution: Widely distributed.

Protein Binding: >99%.

Metabolism and Excretion: Mostly metabolized by the liver; <1% excreted unchanged in urine.

Half-life: 6–7 hr (single dose); 7.3 hr (chronic dosing).

TIME/ACTION PROFILE (analgesic effect)

ROUTE	ONSET	PEAK	DURATION
PO (analgesic)	0.5 hr	1–2 hr	4–12 hr
PO (anti-inflammatory)	days–wk	unknown	6–12 hr†

†Up to 24 hr as XL (extended-release) tablet.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Active GI bleeding or ulcer disease; Cross-sensitivity may exist with other NSAIDs, including aspirin; Peri-operative pain from coronary artery bypass graft (CABG) surgery;

OB: Use during second half of pregnancy can result in premature closure of ductus arteriosus.

Use Cautiously in: Renal or hepatic disease; Cardiovascular disease or risk factors for cardiovascular disease (may ↑ risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke, especially with prolonged use or use of higher doses); History of ulcer disease; **Lactation:** Limited information available; use other safer NSAID; **Pedi:** Safety not established; **Ger:** ↑ risk of GI bleeding.

Adverse Reactions/Side Effects

CNS: depression, dizziness, drowsiness, insomnia, malaise, nervousness, syncope, weakness. **EENT:** blurred vision, photophobia, tinnitus. **Resp:** asthma. **CV:** **HF, MYOCARDIAL INFARCTION, STROKE,** edema, hypertension, palpitations. **GI:** **GI BLEEDING, dyspepsia,** abdominal pain, constipation, diarrhea, drug-induced hepatitis, dry mouth, flatulence, gastritis, nausea, stomatitis, thirst, vomiting. **GU:** dysuria, renal failure, urinary frequency. **Derm:** **EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS,** ecchymoses, flushing, hyperpigmentation, pruritus, rash, sweating. **Hemat:** anemia, prolonged bleeding time, thrombocytopenia. **Misc:** allergic reactions including **ANAPHYLAXIS, ANGIOEDEMA,** chills, fever.

Interactions

Drug-Drug: Concurrent use with **aspirin** may ↓ effectiveness. ↑ adverse GI effects with **aspirin,** other NSAIDs, **potassium supplements, corticosteroids, antiplatelet agents,** or **alcohol.** Chronic use with **acetaminophen** may ↑ risk of adverse renal reactions. May ↓ effectiveness of **diuretic** or **antihypertensive** therapy. May ↑ serum **lithium** levels and ↑ risk of toxicity. ↑ risk of toxicity from **methotrexate.** ↑ risk of bleeding with **cefotetan, valproic acid, thrombolytics, antiplatelet agents, or anticoagulants.** ↑ risk of adverse hematologic reactions with **antineoplastics** or **radiation therapy.** May ↑ the risk of nephrotoxicity from **cyclosporine.**

Drug-Natural Products: ↑ risk of bleeding with **arnica, chamomile, clove, dong quai, fever few, garlic, ginko,** and **Panax ginseng.**

Route/Dosage

PO (Adults): **Analgesia**—200–400 mg q 6–8 hr (not to exceed 1200 mg/day). **Osteoarthritis/rheumatoid arthritis**—300 mg 2–3 times daily, 400 mg twice daily, or 500 mg twice daily; may also be given as 400–1200 mg once daily as XL tablets.

Availability (generic available)

Capsules: 200 mg, 300 mg. **Tablets:** 400 mg, 500 mg. **Extended-release tablets:** 400 mg, 500 mg, 600 mg.

NURSING IMPLICATIONS

Assessment

- Patients who have asthma, aspirin-induced allergy, and nasal polyps are at increased risk for developing hypersensitivity reactions. Monitor for rhinitis, asthma, and urticaria.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- **Osteoarthritis/Rheumatoid Arthritis:** Assess pain and range of movement before and 1–2 hr after administration.
- **Pain:** Assess location, duration, and intensity of the pain before and 60 min after administration.
- **Lab Test Considerations:** May cause ↓ hemoglobin, hematocrit, leukocyte, and platelet counts.
- Monitor liver function tests within 8 wk of initiating etodolac therapy and periodically during therapy. May cause ↑ serum alkaline phosphatase, LDH, AST, and ALT concentrations.
- Monitor BUN, serum creatinine, and electrolytes periodically during therapy. May cause ↑ BUN, serum creatinine, and electrolyte concentrations and ↓ urine electrolyte concentrations.
- May cause ↓ serum and ↑ urine uric acid concentrations.

Potential Nursing Diagnoses

Acute pain (Indications)

Impaired physical mobility (Indications)

Implementation

Administration in higher-than-recommended doses does not provide increased effectiveness but may cause increased side effects.

- Use lowest effective dose for shortest period of time.
- **PO:** For rapid initial effect, administer 30 min before or 2 hr after meals. May be administered with food, milk, or antacids containing aluminum or magnesium to decrease GI irritation.
- Do not break, crush, or chew extended-release tablets.

Patient/Family Teaching

- Advise patients to take etodolac with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Instruct patient to take medication as directed. Take missed doses as soon as possible within 1–2 hr if taking twice/day, or unless almost time for next dose if taking more than twice/day. Do not double doses.
- Etodolac may occasionally cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- **Caution patient to avoid the concurrent use of alcohol, aspirin, acetaminophen, NSAIDs, or other OTC medications without consultation with health care professional.**
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to consult health care professional if rash, itching, visual disturbances, tinnitus, weight gain, edema, black stools, persistent headache, or influenza-like syndrome (chills, fever, muscle aches, pain) occurs.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decreased severity of pain.
- Improved joint mobility. Patients who do not respond to one NSAID may respond to another. May require 2 wk or more for maximum anti-inflammatory effects.

etonogestrel, See CONTRACEPTIVES, HORMONAL.

everolimus (e-ver-oh-li-mus)

Afinitor, Afinitor Disperz,  Certican, Zortress

Classification

Therapeutic: antineoplastics, immunosuppressants
Pharmacologic: kinase inhibitors

Indications

Afinitor. Advanced renal cell carcinoma that has failed treatment with sunitinib or sorafenib. Subependymal giant cell astrocytoma (SEGA) associated with tuberous sclerosis complex (TSC) in patients who are not candidates for curative surgical resection. Progressive neuroendocrine tumors of pancreatic origin (PNET) in patients with unresectable, locally advanced, or metastatic disease. Progressive, well-differentiated, non-functional neuroendocrine tumors (NET) of GI or lung origin in patients with unresectable, locally advanced, or metastatic disease. Renal angiomyolipoma with TSC in patients not requiring immediate surgery.  Treatment of postmenopausal women with advanced hormone receptor-positive, HER2-negative breast cancer in combination with exemestane, after failure of treatment with letrozole or anastrozole. **Zortress.** Prevention of organ rejection in patients who have received a kidney transplant and are at low-to-moderate immunologic risk. Prevention of organ rejection in patients who have received a liver transplant.

Action

Acts as a kinase inhibitor, decreasing cell proliferation. Inhibits activation and proliferation of T and B lymphocytes. **Therapeutic Effects:** Decreased spread of renal cell carcinoma. Improvement in progression-free survival in patients with PNET. Decreased volume of SEGA and angiomyolipoma lesions. Prevention of kidney and liver transplant rejection.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: 20% confined to plasma.

Metabolism and Excretion: Mostly metabolized by liver and other systems (CYP3A4 and P-gp; metabolites are mostly excreted in feces [80%] and urine [5%]).

Half-life: 30 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–2 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to everolimus or other rapamycins; Severe hepatic impairment (Child-Pugh class C); use only if benefit exceeds risk for renal cell carcinoma, PNET, breast cancer, and renal angiomyolipoma with TSC; Concurrent use with strong CYP3A4 inhibitors (i.e., ketoconazole, itraconazole, clarithromycin, atazanavir, nefazodone, saquinavir, ritonavir, indinavir, nelfinavir, voriconazole); Heart transplantation (Zortress) (↑ risk of mortality); Functional carcinoid tumors; **OB:** May cause fetal harm; avoid use during pregnancy (Afinitor); use only if benefit to mother outweighs risk to fetus (Zortress); **Lactation:** Avoid breast feeding.

Use Cautiously in: Mild or moderate hepatic impairment (Child-Pugh class A or B); dose ↓ required; Concurrent use of moderate CYP3A4 and/or P-gp inhibitors; dose ↓ required; Exposure to sunlight/UV light (may ↑ risk of malignant skin changes); **Ger:** May be more sensitive to drug effects; consider age-related ↓ in hepatic function, concurrent disease states and drug therapy; **Pedi:** Safety not established for indications other than SEGA.

Adverse Reactions/Side Effects

CNS: fatigue, weakness, headache. **CV:** peripheral edema. **Resp:** INTERSTITIAL LUNG DISEASE, PULMONARY HYPERTENSION, cough, dyspnea, pulmonary embolism. **GI:** HEPATIC ARTERY THROMBOSIS, anorexia, constipation, diarrhea, mucositis, mouth ulcers, nausea, stomatitis, vomiting, dysgeusia. **GU:** acute renal failure, infertility, proteinuria. **Derm:** delayed wound healing, dry skin, pruritus, rash. **Hemat:** HEMOLYTIC UREMIC SYNDROME, THROMBOTIC MICROANGIOPATHY, THROMBOTIC THROMBOCYTOPENIC PURPURA, anemia, leukopenia, thrombocytopenia. **Metab:** hyperlipidemia, hypergly-

emia, hypertriglyceridemia. **MS:** extremity pain.

Misc: **ANGIOEDEMA**, fever, hypersensitivity reactions including ANAPHYLAXIS, infection (including activation of latent viral infections such as BK virus-associated nephropathy), kidney arterial/venous thrombosis (Zortress), ↑ risk of lymphoma/skin cancer (Zortress).

Interactions

Drug-Drug: Strong CYP3A4 inhibitors, including atazanavir, clarithromycin, indinavir, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, saquinavir, or voriconazole ↑ levels and the risk of toxicity; avoid concurrent use. Moderate inhibitors of CYP3A4, including aprepitant, diltiazem, erythromycin, fluconazole, fosamprenavir, and verapamil ↑ levels and the risk of toxicity; ↓ dose of everolimus (Afinitor). Avoid concurrent use with strong CYP3A4 inducers including carbamazepine, dexamethasone, phenobarbital, phenytoin, rifabutin, and rifampin; ↑ dose of everolimus may be required. Cyclosporine, aprepitant, diltiazem, verapamil, fluconazole, and fosamprenavir may ↑ levels. ↑ risk of nephrotoxicity with aminoglycosides, amphotericin B, cisplatin, or cyclosporine. ACE inhibitors may ↑ risk of angioedema. May ↓ antibody formation and ↑ risk of adverse reactions from live-virus vaccines; avoid use of live-virus vaccines during treatment. **Drug-Natural Products:** St. John's wort may ↓ levels and efficacy; avoid concurrent use. **Drug-Food:** ↑ blood levels and risk of toxicity with grapefruit juice; avoid concurrent use.

Route/Dosage

Advanced Renal Cell Carcinoma, Advanced PNET, Advanced NET, Advanced Hormone Receptor-Positive, HER2-Negative Breast Cancer, and Renal Angiomyolipoma with TSC

PO (Adults): 10 mg once daily; *Concurrent use of moderate inhibitors of CYP3A4 and/or P-gp*—↓ dose to 2.5 mg daily; *Concurrent use of strong inducers of CYP3A4*—↑ dose in 5 mg increments up to 20 mg/daily.

Hepatic Impairment

PO (Adults): *Mild hepatic impairment (Child–Pugh Class A)*—7.5 mg once daily; may be ↓ to 5 mg once daily if not well tolerated; *Moderate hepatic impairment (Child–Pugh Class B)*—5 mg once daily; may be ↓ to 2.5 mg once daily if not well tolerated; *Severe hepatic impairment (Child–Pugh Class C)*—2.5 mg once daily.

SEGA with TSC

PO (Adults and Children ≥1 yr): 4.5 mg/m². Titrate, as needed, at 2-wk intervals to achieve recommended

whole blood trough concentration. *Concurrent use of moderate inhibitors of CYP3A4 and/or P-glycoprotein*—2.25 mg/m²; *Concurrent use of strong inducers of CYP3A4*—9 mg/m².

Hepatic Impairment

PO (Adults and Children ≥1 yr): *Severe hepatic impairment (Child–Pugh Class C)*—2.5 mg/m².

Kidney Transplantation

PO (Adults): 0.75 mg twice daily (with reduced-dose cyclosporine); titrate to achieve recommended whole blood trough concentration.

Hepatic Impairment

PO (Adults): *Mild hepatic impairment (Child–Pugh Class A)*—↓ daily dose by 33%; *Moderate or severe hepatic impairment (Child–Pugh Class B or C)*—↓ daily dose by 50%.

Liver Transplantation

PO (Adults): 1 mg twice daily (with reduced-dose tacrolimus) (start ≥30 days post-transplant); titrate to achieve recommended whole blood trough concentration.

Hepatic Impairment

PO (Adults): *Mild hepatic impairment (Child–Pugh Class A)*—↓ daily dose by 33%; *Moderate or severe hepatic impairment (Child–Pugh Class B or C)*—↓ daily dose by 50%.

Availability

Tablets (Afinitor): 2.5 mg, 5 mg, 7.5 mg, 10 mg. **Tablets for oral suspension (Afinitor Disperz):** 2 mg, 3 mg, 5 mg. **Tablets (Zortress):** 0.25 mg, 0.5 mg, 0.75 mg.

NURSING IMPLICATIONS

Assessment

- Assess for symptoms of noninfectious pneumonitis (hypoxia, pleural effusion, cough, dyspnea) during therapy. If symptoms are mild, therapy may continue. Therapy should be interrupted for moderate symptoms and corticosteroids may be used. Reinitiate everolimus at a 50% reduced dose when symptoms resolve. If symptoms are severe, discontinue therapy. Corticosteroids may be used until clinical symptoms resolve. Base reinitiation of therapy on individual clinical circumstances.
- Assess for mouth ulcers, stomatitis, or oral mucositis. Topical treatments may be used; avoid peroxide-containing mouthwashes and antifungals unless fungal infection has been diagnosed.
- Assess for signs and symptoms of systemic fungal infections (fever, malaise, weight loss, sweats, cough, dyspnea, pulmonary infiltrates, serious systemic illness with or without concomitant shock). Consider

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

stopping therapy until infection has been diagnosed and adequately treated.

- **Lab Test Considerations:** Monitor renal function prior to and periodically during therapy. May cause ↑ BUN, serum creatinine, and proteinuria.
- Monitor fasting serum glucose and lipid profile prior to and periodically during therapy. May cause ↑ cholesterol, triglycerides, glucose. Attempt to achieve optimal glucose and lipid control prior to therapy.
- Monitor CBC prior to and periodically during therapy; may cause ↓ hemoglobin, lymphocytes, neutrophils, and platelets.
- May cause ↑ AST, ALT, phosphate, and bilirubin.
- **Afinitor:** Monitor *Afinitor* trough levels 2 wk after initiation of therapy, a change in dose, a change in co-administration of CYP3A4 and/or P-gp inducers or inhibitors, change in hepatic function, or change in dose form between everolimus tablets and Disperz. Once at a stable dose, monitor trough concentrations every 3 to 6 mo in patients with changing body surface area or every 6 to 12 mo in patients with stable body surface area for duration of treatment. Therapeutic blood concentrations are 5–15 (*Afinitor*). If trough concentration is <5 ng/mL increase daily dose by 2.5 mg in patients taking tablets and 2 mg for Disperz. If trough concentration is >15 ng/mL decrease daily dose by 2.5 mg in patients taking tablets and 2 mg for Disperz. If dose reduction is required with lowest dose, administer every other day. Do not combine dose forms to achieve dose. **Zortress:** Therapeutic blood concentrations are 3–8 ng/mL via the LCMSMS assay (*Zortress*). Base dose adjustments of *Zortress* on trough concentrations obtained 4 or 5 days after a previous dosing change. Adjust dose if trough concentration is <3 ng/mL by doubling dose using available tablet strengths (0.25 mg, 0.5 mg or 0.75 mg). If trough concentration is >8 ng/mL on 2 consecutive measures; decrease dose of *Zortress* by 0.25 mg twice daily.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)

Implementation

- **PO:** Administer at the same time each day consistently with or without food, followed by a whole glass of water. Swallow tablets whole; do not break, crush, or chew.
- Do not combine the 2 dose forms (*Afinitor* Tablets and *Afinitor* Disperz) to achieve the desired total dose. Use one dosage form or the other.
- Administer *Disperz*, dispersible tablet, as a suspension only. Wear gloves to avoid possible contact with everolimus when preparing suspensions for another person. Place dose in 10 mL syringe; do not exceed 10 mg/syringe. If higher dose required, use addi-

tional syringe. Do not break or crush tablets. Draw 5 mL water and 4 mL of air into syringe. Place filled syringe into container (tip up) for 3 min until tablets are in suspension. Invert syringe five times immediately prior to administration. Administer immediately after preparation; discard suspension if not administered within 60 minutes after preparation. After administration, draw 5 mL of water and 4 mL of air into same syringe, and swirl contents to suspend remaining particles. Administer entire contents of syringe. Can also be dispersed using same technique and 25 mL water in small glass.

Patient/Family Teaching

- Instruct patient to take everolimus at the same time each day as directed. Take missed doses as soon as remembered up to 6 hr after time of normal dose. If more than 6 hr after normal dose, omit dose for that day and take next dose next day; do not take two doses to make up missed dose. Do not eat grapefruit or drink grapefruit juice during therapy. Advise patient to read *Patient Information Leaflet* prior to beginning therapy and with each Rx refill in case of new information.
- Advise patient to report worsening respiratory symptoms or signs of infection (new or worsening cough, shortness of breath, chest pain, difficulty breathing or wheezing, fever, chills, skin rash, joint pain and inflammation, tiredness, loss of appetite, nausea, pale stool or dark urine, yellowing of the skin, pain in upper right side) to health care professional promptly.
- Inform patient that mouth sores may occur. Consult health care professional for treatment if pain, discomfort, or open sores in mouth occur. May require special mouthwash or gel.
- Instruct patient to avoid use of live vaccines and close contact with those who have received live vaccines.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- **Rep:** May have teratogenic effects and decrease male and female fertility. Advise female patients to use effective contraception during and for up to 8 wk following therapy and to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of routine blood tests to determine effectiveness and side effects.

Evaluation/Desired Outcomes

- Decreased spread of tumor. Continue treatment as long as clinical benefit is observed or until unacceptable toxicity occurs.
- Prevention of kidney or liver transplant rejection.

evolocumab

(e-vo-lo-kyoo-mab)

Repatha

Classification

Therapeutic: lipid-lowering agents
 Pharmacologic: proprotein convertase subtilisin kexin type 9 (PCSK9) inhibitor antibodies

Indications

Lowering of low density lipoprotein cholesterol (LDL-C) as an adjunct to diet and maximally tolerated statin (HMG CoA reductase inhibitor) therapy in patients with heterozygous familial hypercholesterolemia (HeFH) or cardiovascular disease who require supplemental agents. Additional lowering of low density lipoprotein cholesterol (LDL-C) as an adjunct to diet and maximally tolerated statin and other drug therapies in patients with homozygous familial hypercholesterolemia (HoFH).

Action

A human monoclonal immunoglobulin (IgG2) produced in genetically engineered Chinese hamster ovary cells that binds to PCSK9 inhibiting its binding to the low density lipoprotein receptor (LDLR) resulting in ↑ number of LDLRs available to clear LDL from blood.

Therapeutic Effects: ↓ LDL-C.

Pharmacokinetics

Absorption: Well absorbed (72%) following subcut administration.

Distribution: Crosses the placenta.

Metabolism and Excretion: Eliminated by binding to PCSK9 and by proteolytic degradation.

Half-life: 11–17 days.

TIME/ACTION PROFILE (effect circulating unbound PCSK9)

ROUTE	ONSET	PEAK	DURATION
subcut	rapid	4 hr	2–4 wk

Contraindications/Precautions

Contraindicated in: History of serious hypersensitivity to evolocumab.

Use Cautiously in: Severe renal/hepatic impairment; **Geri:** Elderly patients may be more sensitive to drug effects; **OB:** Crosses the placenta, consider fetal risks; **Lactation:** Consider benefits of breast feeding against possible risk to infant; **Pedi:** Safe and effective use in children <13 yr has not been established.

Adverse Reactions/Side Effects

Local: injection site reactions. **MS:** back pain. **Misc:** allergic reactions (including urticaria and rash), flu-like symptoms.

Interactions

Drug-Drug: None noted.

Route/Dosage

Subcut (Adults): *Primary hyperlipidemia with established CVD/HeFH*—140 mg every two wk or 420 mg monthly; *HoFH*—420 mg monthly.

Availability

Solution for subcutaneous injection (needle cover contains latex derivative): 120 mg/mL (in Pushtronex system), 140 mg/mL (in prefilled syringes and autoinjector).

NURSING IMPLICATIONS**Assessment**

- Obtain a diet history, especially with regard to fat consumption.
- Monitor for signs and symptoms of hypersensitivity reactions (rash, urticaria) during therapy. If symptoms occur, discontinue therapy.
- Assess for latex allergy. Needle cover of the glass prefilled syringe and the autoinjector contain dry natural rubber (a derivative of latex); may cause allergic reactions.
- **Lab Test Considerations:** Assess LDL-C levels within 4 to 8 wk of initiating; response to therapy depends on degree of LDL-receptor function.

Potential Nursing Diagnoses

Noncompliance, related to diet and medication regimen (Patient/Family Teaching)

Implementation

- **Subcut:** Administer 140 mg every 2 wks or 420 mg once monthly. To administer the 420 mg dose, give 3 injections, using 3 separate pens/syringes in 3 separate sites, consecutively within 30 minutes. When switching dose regimens, administer first dose of new regimen on next scheduled date of prior regimen. If stored in refrigerator allow solution to warm to room temperature for at least 30 min before injecting. May also be stored at room temperature, but only stable for 30 days. Solution is clear to opalescent and colorless to pale yellow; do not administer solutions that are cloudy or contain particulate matter. Do not shake. Inject into thigh, abdomen, or upper arm. Rotate sites with each injection. Do not inject into areas that are tender, bruised, red, or indurated. Do not re-use pre-filled pen or syringe. Do not administer other injectable drugs at same site.
- **Pushtronex on-body infusor system:** Remove on-body infusor and prefilled cartridge from refrigerator 45 min prior to use to allow to reach room temperature; do not use other sources of warming. Prepare injection site with little hair (may trim) and firm and flat skin surface by cleaning with alcohol

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

and allowing to dry. May use thigh, abdomen (except 2 inches from umbilicus) or outer area of upper arm if not self-administered. Avoid areas that are tender, bruised, red, or hard, or areas with wrinkles, skin folds, scars, stretch marks, moles and excessive hair. Solution in cartridge should be clear and colorless to slightly yellow; do not administer solutions that are discolored or contain particular matter. Clean bottom of cartridge with alcohol and load into on-body infusor; press firmly on top of unit to secure. Swing door close until it snaps. Peel away both green pull tabs to show adhesive. When blue light flashes, infusor is on. If using abdomen, stretch skin prior to applying; do not stretch skin for thigh placement. Apply infusor to skin making sure blue light is visible and firmly press start button. Flashing green light and click indicates infusion has begun; may beep and patient may feel a pinch. When green light changes to solid, infusion is complete. Remove from skin and check medicine window for green light to be off. Dispose of on-body infusor in a sharps container.

Patient/Family Teaching

- Instruct patient in correct technique for self-injection or on-body infusor, care and disposal of equipment. Administer missed doses within 7 days, then resume original schedule. If not administered within 7 days, wait until next dose on original schedule. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Advise patient that this medication should be used in conjunction with diet restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, and cessation of smoking.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any other Rx, OTC, or herbal products.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- ↓ LDL-C levels.

exemestane (ex-e-mes-tane)
Aromasin

Classification

Therapeutic: antineoplastics

Pharmacologic: aromatase inhibitors

Indications

Adjuvant treatment of breast cancer in postmenopausal women who have estrogen-receptor positive early dis-

ease and who have already received 2–3 yr of tamoxifen and are then switched to exemestane to complete a total of 5 yr of adjuvant therapy. Treatment of advanced postmenopausal breast cancer that has progressed despite tamoxifen therapy.

Action

Inhibits aromatase, an enzyme responsible for the conversion of androgen to estrogen. In postmenopausal women, the primary source of estrogen is androgen. Decreases circulating estrogen. **Therapeutic Effects:** Decreased spread of estrogen-sensitive breast cancer.

Pharmacokinetics

Absorption: 42% absorbed following oral administration.

Distribution: Extensively distributed.

Metabolism and Excretion: Mostly metabolized by the liver (CYP3A4 enzyme system); metabolites are excreted in urine (40%) and feces (40%); <1% excreted unchanged in urine.

Half-life: 24 hr.

TIME/ACTION PROFILE (suppression of circulating estrogen)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–3 days	4–5 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Premenopausal status; **OB:** Pregnancy (may cause fetal harm); **Lactation:** Breast feeding should be avoided.

Use Cautiously in: **Rep:** Women of reproductive potential; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: fatigue, depression, insomnia. **CV:** **THROMBOEMBOLISM**, hypertension. **GI:** diarrhea, nausea. **GU:** endometrial hyperplasia, uterine polyps. **Endo:** visual disturbances. **Derm:** alopecia, hot flashes, ↑ sweating, dermatitis. **MS:** arthralgia, musculoskeletal pain, carpal tunnel syndrome, muscle cramps, osteoporosis. **Neuro:** neuropathy, paresthesia.

Interactions

Drug-Drug: Strong CYP3A4 inducers including rifampin or phenytoin may ↓ levels and effectiveness; ↑ daily dose to 50 mg once daily. **Estrogens** can interfere with action.

Route/Dosage

PO (Adults): 25 mg once daily; *Concurrent use with strong CYP3A4 inducers*—50 mg once daily.

Availability (generic available)

Tablets: 25 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for pain and other side effects periodically during therapy.

- **Lab Test Considerations:** May cause ↑ GTT, AST, ALT, alkaline phosphatase, bilirubin, and creatinine levels.
- Assess 25-hydroxy vitamin D levels prior to starting therapy. Supplement vitamin D deficiency with vitamin D due to high prevalence of vitamin D deficiency in women with early breast cancer.

Potential Nursing Diagnoses

Acute pain (Side Effects)

Implementation

- Take 1 tablet daily after a meal.

Patient/Family Teaching

- Instruct patient to take exemestane as directed at the same time each day. Take missed doses as soon as remembered unless it is almost time for next dose. Do not double doses. Advise patient to read the *Patient Information* leaflet before starting and with each Rx refill in case of changes.
- Advise patient not to take other estrogen-containing agents; may interfere with action of exemestane.
- Inform patient that lower level of estrogen may lead to decreased bone mineral density over time and increased risk of osteoporosis and fracture. Women with osteoporosis or at risk of osteoporosis should have their bone mineral density formally assessed by bone densitometry at end of treatment. Monitor patients for bone mineral density loss and treat as appropriate.
- Advise patient to notify health care professional immediately if chest pain or signs of heart failure or stroke occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- **Rep:** Exemestane is teratogenic; advise female patients to use effective contraception during therapy and for at least 1 mo after last dose and to avoid breast feeding.
- Explain need for follow-up blood tests to check liver and kidney function.

Evaluation/Desired Outcomes

- Slowing of disease progression in women with breast cancer.

exenatide (ex-en-a-tide)

Bydureon, Byetta

Classification

Therapeutic: antidiabetics

Pharmacologic: incretin mimetic agents

Indications

Management of type 2 diabetes as an adjunct to diet and exercise (not recommended as first-line therapy).

Action

Mimics the action of incretin which promotes endogenous insulin secretion and promotes other mechanisms of glucose-lowering. **Therapeutic Effects:** Improved control of blood glucose.

Pharmacokinetics

Absorption: Well absorbed following subcutaneous administration.

Distribution: Unknown.

Metabolism and Excretion: Excreted mostly by glomerular filtration followed by degradation.

Half-life: *Immediate-release* — 2.4 hr.

TIME/ACTION PROFILE (effects on postprandial blood glucose)

ROUTE	ONSET	PEAK	DURATION
Subcut (immediate-release)	within 30 min	2.1 hr	8 hr
Subcut (extended-release)	unknown	9 wk	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Type 1 diabetes or diabetic ketoacidosis; Severe renal impairment or end-stage renal disease (CCr <30 mL/min); Severe gastrointestinal disease; Personal or family history of medullary thyroid carcinoma (extended-release only); Multiple Endocrine Neoplasia syndrome type 2 (extended-release only); **OB:** Has caused fetal physical defects and neonatal death in animal studies; **Lactation:** Excretion into breast milk unknown.

Use Cautiously in: History of pancreatitis; Moderate renal impairment (CCr 30–50 mL/min); Concurrent use of insulin (extended-release only); **Pedi:** Safety not established.

Adverse Reactions/Side Effects

CV: dizziness, headache, jitteriness, weakness. **GI:** PANCREATITIS, diarrhea, nausea, vomiting, dyspepsia, gastrointestinal reflux. **Endo:** THYROID C-CELL TUMORS (extended-release), hypoglycemia. **GU:** acute renal failure. **Derm:** hyperhidrosis. **Metab:** ↓ appetite, weight loss. **Misc:** injection site reactions.

Interactions

Drug-Drug: Concurrent use with **sulfonylureas** or **insulin** may ↑ risk of hypoglycemia (↓ dose of **sulfonylurea** or **insulin** if hypoglycemia occurs); concomitant use of **insulin** with extended-release exenatide not recommended. Concurrent use with **nateglinide** or

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

repaglinide may ↑ risk of hypoglycemia. Due to slowed gastric emptying, may ↓ absorption of **orally administered medications**, especially those requiring rapid GI absorption or require a specific level for efficacy; take oral **anti-infectives** and **oral contraceptives** at least 1 hr before injecting exenatide).

Route/Dosage

Immediate Release (Byetta)

Subcut (Adults): 5 mcg within 60 min before morning and evening meal; after 1 mo, dose may be ↑ to 10 mcg depending on response.

Renal Impairment

Subcut (Adults): *CCr 30–50 mL/min*—Use caution when ↑ dose from 5 mcg to 10 mcg.

Extended Release (Bydureon)

Subcut (Adults): 2 mg every 7 days.

Availability

Solution for subcutaneous injection (Byetta): 250 mcg/mL in prefilled pen-injector that delivers either 5 mcg/dose (1.2-mL pen) or 10 mcg/dose (2.4-mL pen) for 60 doses (30 days of twice daily dosing). **Suspension for subcutaneous injection (Bydureon):** 2 mg/vial or pen.

NURSING IMPLICATIONS

Assessment

- Observe for signs and symptoms of hypoglycemic reactions (abdominal pain, sweating, hunger, weakness, dizziness, headache, drowsiness, tremor, tachycardia, anxiety, confusion, irritability, jitteriness), especially when combined with oral sulfonylureas.
- **Assess for signs and symptoms of pancreatitis** (persistent severe abdominal pain, sometimes radiating to the back, may or may not be accompanied by vomiting) at beginning of therapy and with dose increases. If suspected, promptly discontinue therapy and initiate appropriate management. If pancreatitis is confirmed, do not restart exenatide. Consider other antidiabetic therapies in patients with a history of pancreatitis.
- **Lab Test Considerations:** Monitor serum glucose and glycosylated hemoglobin periodically during therapy to evaluate effectiveness of therapy.
- Monitor renal function prior to and periodically during therapy. Renal dysfunction may be reversed with discontinuation of therapy.

Potential Nursing Diagnoses

Imbalanced nutrition: more than body requirements (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- Some medications may need to be taken 1 hr before exenatide.

- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- **Subcut: Immediate release:** Follow directions for *New Pen Setup* in *Information for Patient* prior to use of each new pen. Inject exenatide in thigh, abdomen, or upper arm at any time within the 60-min period **before** the morning and evening meals. Do not administer after a meal. Do not mix with insulin. Solution should be clear and colorless; do not administer solutions that are discolored or contain particulate matter. Refrigerate; discard pen 30 days after 1st use, even if some drug remains in pen. Do not freeze. Do not store pen with needle attached; medication may leak from pen or air bubbles may form in the cartridge.
- **Subcut: Extended release:** Dilute with diluent and needles included in tray. Suspension should be white or off-white and cloudy. Administer without regard to meals. Inject into upper arm, abdomen, or thigh; change site each week. Refrigerate; each tray can be kept at room temperature if not >77°F for up to 4 wk. Do not use beyond expiration date.

Patient/Family Teaching

- Instruct patient to take exenatide *immediate release* as directed within 60 min before a meal. Do not take after a meal. If a dose is missed, skip the dose and take the next dose at the prescribed time. Do not take an extra dose or increase the amount of the next dose to make up for missed dose. If a dose of exenatide *extended release* is missed, administer as soon as remembered as long as the next dose is due at least 3 days later; if 1 or 2 days later skip dose and administer next dose as scheduled. The day of weekly administration can be changed as long as the last dose was administered 3 or more days before.
- Instruct patient in proper technique for administration, timing of dose, and concurrent oral medications, storage of medication, and disposal of used needles. Patients should read the *Information for Patient* insert prior to initiation of therapy and with each Rx refill. Advise patient that *New Pen Setup* should be done only with each new pen, not with each dose.
- Inform patient that pen needles are not included with pen and must be purchased separately. Advise patient which needle length and gauge should be used. Caution patient not to share pen and needles.
- Caution patient to never share pen with others, even if needle is changed. May cause transmission of blood-borne pathogens.
- Explain to patient that exenatide helps control hyperglycemia but does not cure diabetes. Therapy is usually long term.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hyperglycemic or hypoglycemic episodes.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient

to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water, and notify health care professional. Risk of hypoglycemia is increased if sulfonureas are taken concurrently with exenatide.

- Advise patient to notify health care professional immediately if symptoms of pancreatitis (unexplained, persistent, severe abdominal pain which may or may not be accompanied by vomiting) occur.
- Inform patient that therapy may result in reduction of appetite, food intake, and/or body weight. Dose modification is not necessary. Nausea is more common at initiation of therapy and usually decreases over time.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any other Rx, OTC, or herbal products. Exenatide delays stomach emptying. Some medications (such as anti-infectives and oral contraceptives) may need to be taken 1 hr before exenatide injection.
- Instruct patient in proper testing of blood glucose and urine ketones. These tests should be monitored closely during periods of stress or illness and health care professional notified if significant changes occur.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to notify health care professional if pregnancy is suspected or planned.
- Advise patient to carry a form of sugar (sugar packets, candy) and identification describing disease process and medication regimen at all times.
- Emphasize the importance of routine follow-up exams and regular testing of blood glucose and glycosylated hemoglobin.

Evaluation/Desired Outcomes

- Control of blood glucose levels without the appearance of hypoglycemic or hyperglycemic episodes.

ezetimibe (e-zet-i-mibe)

★ Ezetrol, Zetia

Classification

Therapeutic: lipid-lowering agents
Pharmacologic: cholesterol absorption inhibitors

Indications

Alone or with other agents (HMG-CoA reductase inhibitors) in the management of dyslipidemias including primary hypercholesterolemia, homozygous familial hypercholesterolemia, and homozygous sitosterolemia.

Action

Inhibits absorption of cholesterol in the small intestine.

Therapeutic Effects: Lowering of cholesterol, a known risk factor for atherosclerosis.

Pharmacokinetics

Absorption: Following absorption, rapidly converted to ezetimibe-glucuronide, which is active. Bioavailability is variable.

Distribution: Unknown.

Metabolism and Excretion: Undergoes enterohepatic recycling, mostly eliminated in feces, minimal renal excretion.

Half-life: 22 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Acute liver disease or unexplained laboratory evidence of liver disease (when used with HMG-CoA reductase inhibitor); Moderate or severe hepatic impairment; Concurrent use of fibrates; **OB:** May cause fetal harm by interfering with cholesterol synthesis and, possibly, biologically active substances derived from cholesterol; **Lactation:** Potential for adverse effects in nursing infant.

Use Cautiously in: **Pedi:** Children <10 yr (safety not established).

Adverse Reactions/Side Effects

GI: cholecystitis, cholelithiasis, ↑ liver enzymes (with HMG-CoA reductase inhibitors), nausea, pancreatitis.

Derm: rash. **Misc:** ANGIOEDEMA.

Interactions

Drug-Drug: Effects may be ↓ by cholestyramine or other bile acid sequestrants. Concurrent use of fibrates may ↑ levels and the risk of cholelithiasis. Cyclosporine may ↑ levels. May ↑ risk of rhabdomyolysis when used with HMG CoA-reductase inhibitors.

Route/Dosage

PO (Adults): 10 mg once daily.

Renal Impairment

PO (Adults): *CCr* <60 mL/min and concurrent use with simvastatin—Do not exceed simvastatin dose of 20 mg/day.

Availability (generic available)

Tablets: 10 mg. **Cost:** \$517.89/90. **In combination with:** simvastatin (Vytorin); see Appendix B.

NURSING IMPLICATIONS

Assessment

- Obtain a diet history, especially with regard to fat consumption.

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- **Lab Test Considerations:** Evaluate serum cholesterol and triglyceride levels before initiating, after 2–4 wk of therapy, and periodically thereafter.
- May cause ↑ liver transaminases when administered with HMG-CoA reductase inhibitors. Monitor liver enzymes prior to initiation and during therapy according to recommendations of HMG-CoA reductase inhibitor. Elevations are usually asymptomatic and return to baseline with continued therapy.

Potential Nursing Diagnoses

Noncompliance, related to diet and medication regimen (Patient/Family Teaching)

Implementation

- **Do not confuse Zetia with Zebeta (bisoprolol) or Zestril (lisinopril).**
- **PO:** Administer without regard to meals. May be taken at the same time as HMG-CoA reductase inhibitors.

Patient/Family Teaching

- Instruct patient to take ezetimibe as directed, at the same time each day, even if feeling well. Take missed doses as soon as remembered, but do not take more than 1 dose/day. Medication helps control but does not cure elevated serum cholesterol levels.

- Advise patient that this medication should be used in conjunction with diet restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, and cessation of smoking. Ezetimibe does not assist with weight loss.
- Instruct patient to notify health care professional if unexplained muscle pain, tenderness, or weakness occur. Risk may increase when used with HMG-CoA reductase inhibitors.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any other Rx, OTC, or herbal products.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Instruct female patients to notify health care professional promptly if pregnancy is planned or suspected or if breast feeding. If regimen includes HMG-CoA reductase inhibitors, they are contraindicated in pregnancy.
- Emphasize the importance of follow-up exams to determine effectiveness and to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in serum LDL and total cholesterol levels.

famciclovir (fam-sye-kloe-veer)

Famvir

Classification

Therapeutic: antivirals

Indications

Acute herpes zoster infections (shingles). Treatment/suppression of recurrent herpes genitalis in immunocompetent patients. Treatment of recurrent herpes labialis (cold sores) in immunocompetent patients. Treatment of recurrent mucocutaneous herpes simplex virus (HSV) infection in HIV-infected patients.

Action

Inhibits viral DNA synthesis in herpes-infected cells only. **Therapeutic Effects:** Decreased duration of herpes zoster infection with decreased duration of viral shedding. Decreased time to healing for cold sores. Decreased lesion formation and improved healing in recurrent HSV infection.

Pharmacokinetics

Absorption: Following absorption, famciclovir is rapidly converted in the intestinal wall to penciclovir, the active compound.

Distribution: Unknown.

Metabolism and Excretion: Penciclovir is mostly excreted by the kidneys.

Half-life: *Penciclovir*—2.1–3 hr (↑ in renal impairment).

TIME/ACTION PROFILE (penciclovir blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	0.9 hr	8–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Patients with impaired renal function (↑ dose interval/↓ dose recommended if $CCr < 40$ – 60 mL/min); **OB, Lactation:** Limited information; use only if maternal benefit clearly outweighs potential risks to fetus or infant; **Pedi:** Safety not established in children <18 yr; **Geri:** Consider age-related ↓ in renal function when prescribing.

Adverse Reactions/Side Effects

CNS: SEIZURES, headache, dizziness, fatigue. **CV:** palpitations. **Derm:** hypersensitivity vasculitis. **GI:** diarrhea, nausea, vomiting. **Misc:** ANAPHYLAXIS.

Interactions

Drug-Drug: **Probenecid** ↑ plasma concentrations of penciclovir.

Route/Dosage**Herpes Zoster**

PO (Adults): 500 mg every 8 hr for 7 days.

Renal Impairment

PO (Adults): *CCr 40–59 mL/min*—500 mg every 12 hr; *CCr 20–39 mL/min*—500 mg every 24 hr; *CCr <20 mL/min*—250 mg every 24 hr; *Hemodialysis*—250 mg after each dialysis.

Recurrent Genital Herpes Simplex Infections

PO (Adults): 1000 mg twice daily for one day.

Renal Impairment

PO (Adults): *CCr 40–59 mL/min*—500 mg twice daily for 1 day; *CCr 20–39 mL/min*—500 mg as a single dose; *CCr <20 mL/min*—250 mg as a single dose; *Hemodialysis*—250 mg as a single dose after dialysis.

Suppression of Recurrent Herpes Simplex Infections

PO (Adults): 250 mg every 12 hr for up to 1 yr.

Renal Impairment

PO (Adults): *CCr 20–39 mL/min*—125 mg every 12 hr for 5 days; *CCr <20 mL/min*—125 mg every 24 hr for 5 days; *Hemodialysis*—125 mg after each dialysis.

Recurrent Herpes Labialis Infections (cold sores)

PO (Adults): 1500 mg as a single dose.

Renal Impairment

PO (Adults): *CCr 40–59 mL/min*—750 mg as a single dose; *CCr 20–39 mL/min*—500 mg as a single dose; *CCr <20 mL/min*—250 mg as a single dose; *Hemodialysis*—250 mg as a single dose after dialysis.

Herpes Simplex in HIV-Infected Patients

PO (Adults): 500 mg every 12 hr for 7 days.

Renal Impairment

PO (Adults): *CCr 20–39 mL/min*—500 mg every 24 hr for 7 days; *CCr <20 mL/min*—250 mg every 24 hr for 7 days; *Hemodialysis*—250 mg after each dialysis.

Availability (generic available)

Tablets: 125 mg, 250 mg, 500 mg.

NURSING IMPLICATIONS**Assessment**

- Assess lesions prior to and daily during therapy.
- Assess patient for postherpetic neuralgia periodically during and following therapy.

★ = Canadian drug name. † = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; _____ indicate most frequent.

Potential Nursing Diagnoses

Risk for impaired skin integrity (Indications)

Risk for infection (Indications, Patient/Family Teaching)

Implementation

- Famciclovir therapy should be started as soon as herpes zoster is diagnosed, at least within 72 hr, preferably within 48 hr.
- **PO:** Famciclovir may be administered without regard to meals.

Patient/Family Teaching

- Instruct patient to take famciclovir as directed for the full course of therapy. Take missed doses as soon as remembered, if not just before next dose.
- Inform patient that famciclovir does not prevent the spread of infection to others. Until all lesions have crusted, precautions should be taken around others who have not had chickenpox or varicella vaccine or people who are immunosuppressed.
- Advise patient that condoms should be used during sexual contact and that no sexual contact should be made while lesions are present.
- May cause dizziness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional immediately if seizures or signs and symptoms of anaphylaxis (rash, facial swelling, difficulty breathing) occur.
- Instruct women with genital herpes to have yearly Papanicolaou (Pap) smears because of increased risk of cervical cancer.
- Advise women of childbearing potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in time to full crusting, loss of vesicles, loss of ulcers, and loss of crusts in patients with acute herpes zoster (shingles).
- Crusting over and healing of lesions in herpes labialis, genital herpes, and in recurrent mucocutaneous HSV infection in HIV-infected patients.
- Prevention of recurrence of herpes genitalis.
- Decreased time to healing for cold sores.

famotidine, See HISTAMINE H₂ ANTAGONISTS.

febuxostat (fe-bux-o-stat)

Uloric

Classification

Therapeutic: antigout agents

Pharmacologic: xanthine oxidase inhibitors

Indications

Chronic management of hyperuricemia in patients with a history of gout.

Action

Decreases production of uric acid by inhibiting xanthine oxidase. **Therapeutic Effects:** Lowering of serum uric acid levels with resultant decrease in gouty attacks.

Pharmacokinetics

Absorption: Well absorbed (49%) following oral administration.

Distribution: Unknown.

Protein Binding: 99.2%.

Metabolism and Excretion: Extensively metabolized by the liver; minimal renal excretion of unchanged drug, 45% eliminated in feces as unchanged drug, remainder is eliminated in urine and feces as inactive metabolites.

Half-life: 5–8 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1–1.5 hr*	24 hr

*Maximum lowering of uric acid may take 2 wk.

Contraindications/Precautions

Contraindicated in: Concurrent azathioprine or mercaptopurine.

Use Cautiously in: Severe renal impairment (CCr <30 mL/min); Severe hepatic impairment; **OB:** Use only when potential maternal benefit outweighs potential fetal risk; **Lactation:** Unknown if excreted into breast milk; use caution when breast feeding; **Pedi:** Safety in children <18 yr not established.

Adverse Reactions/Side Effects

GI: ↑ liver function tests, nausea. **Derm:** rash. **MS:** gout flare, arthralgia.

Interactions

Drug-Drug: Significantly ↑ levels of and risk of serious toxicity from **azathioprine** and **mercaptopurine**; concurrent use is contraindicated. May ↑ levels of **theophylline**; use cautiously together.

Route/Dosage

PO (Adults): 40 mg once daily initially; if serum uric acid does not ↓ to <6 mg/dL, dose should be ↑ to 80 mg once daily.

Availability

Tablets: 40 mg, 80 mg.

NURSING IMPLICATIONS

Assessment

- Assess for joint pain and swelling, especially during early therapy. Changing serum uric acid levels from mobilization of urate from tissue deposits may cause

gout flares. Use prophylactic NSAID or colchicine therapy for up to 6 mo. If a gout flare occurs, continue febusostat therapy and treat flare concurrently.

- Monitor for signs and symptoms of MI and stroke.
- **Lab Test Considerations:** Monitor serum uric acid levels prior to, 2 wk after initiating, and periodically thereafter. If serum uric acid levels are ≥ 6 mg/dL after 2 wk of daily 40 mg therapy, increase dose to 80 mg daily.
- Monitor liver function at 2 and 4 mo of therapy and periodically thereafter. May cause \uparrow AST, ALT, CPK, LDH, alkaline phosphatase, and creatinine.
- May cause prolonged aPTT and PT, and \downarrow hematocrit, hemoglobin, RBC, platelet count, and lymphocyte, neutrophil counts. May cause \uparrow or \downarrow WBC.
- May cause \downarrow serum bicarbonate and \uparrow serum sodium, glucose, potassium, and TSH levels.
- May cause \uparrow serum cholesterol, triglycerides, amylase, and LDL levels.
- May cause \uparrow BUN and serum creatinine and proteinuria.

Potential Nursing Diagnoses

Chronic pain (Indications)

Implementation

- **PO:** May be taken with or without food and with antacids.

Patient/Family Teaching

- Instruct patient to take febusostat as directed. If a gout flare occurs, continue febusostat and consult health care professional; medications to manage gout flare may be added.
- Advise patient to notify health care professional if rash, chest pain, shortness of breath, or stroke symptoms (weakness, headache, confusion, slurred speech) occur or if side effects are persistent or bothersome.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any other Rx, OTC, or herbal products.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of follow-up lab tests to monitor therapy.

Evaluation/Desired Outcomes

- Reduction in serum uric acid levels and resultant gout attacks.

felodipine (fe-loe-di-peen)

★ Plendil

Classification

Therapeutic: antianginals, antihypertensives

Pharmacologic: calcium channel blockers

Indications

Management of hypertension, angina pectoris, and vasospastic (Prinzmetal's) angina.

Action

Inhibits the transport of calcium into myocardial and vascular smooth muscle cells, resulting in inhibition of excitation-contraction coupling and subsequent contraction. **Therapeutic Effects:** Systemic vasodilation resulting in decreased BP. Coronary vasodilation resulting in decreased frequency and severity of attacks of angina.

Pharmacokinetics

Absorption: Well absorbed after oral administration, but extensively metabolized, resulting in \downarrow bioavailability.

Distribution: Unknown.

Protein Binding: $>99\%$.

Metabolism and Excretion: Mostly metabolized; minimal amounts excreted unchanged by kidneys.

Half-life: 11–16 hr.

TIME/ACTION PROFILE (antihypertensive effect)

ROUTE	ONSET	PEAK	DURATION
PO	1 hr	2–4 hr	up to 24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity (cross-sensitivity may occur); Sick sinus syndrome; 2nd- or 3rd-degree AV block (unless an artificial pacemaker is in place); Systolic BP <90 mm Hg.

Use Cautiously in: Severe hepatic impairment (dose \downarrow recommended); **Geri:** Dose \downarrow recommended; \uparrow risk of hypotension; Severe renal impairment; History of serious ventricular arrhythmias or HF; **OB, Lactation, PEDI:** Safety not established.

Adverse Reactions/Side Effects

CNS: headache, abnormal dreams, anxiety, confusion, dizziness, drowsiness, nervousness, psychiatric disturbances, weakness. **EENT:** blurred vision, disturbed equilibrium, epistaxis, tinnitus. **Resp:** cough, dyspnea.

CV: ARRHYTHMIAS, HF, peripheral edema, chest pain, hypotension, palpitations, syncope, tachycardia. **GI:** anorexia, constipation, diarrhea, dry mouth, dysgeusia, dyspepsia, \uparrow liver enzymes, nausea, vomiting. **GU:** dysuria, nocturia, polyuria, sexual dysfunction, urinary fre-

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

quency. **Derm:** dermatitis, erythema multiforme, flushing, ↑ sweating, photosensitivity, pruritus/urticaria, rash. **Endo:** gynecmastia, hyperglycemia. **Hemat:** anemia, leukopenia, thrombocytopenia. **Metab:** weight gain. **MS:** joint stiffness, muscle cramps. **Neuro:** paresthesia, tremor. **Misc:** STEVENS-JOHNSON SYNDROME, gingival hyperplasia.

Interactions

Drug-Drug: Additive hypotension may occur when used concurrently with **fentanyl**, other **anti-hypertensives**, **nitrates**, acute ingestion of **alcohol**, or **quinidine**. Antihypertensive effects may be ↓ by concurrent use of **NSAIDs**. **Ketoconazole**, **itraconazole**, **propranolol**, and **erythromycin** ↓ metabolism and ↑ blood levels and the risk of toxicity (dose ↓ may be necessary).

Drug-Food: **Grapefruit juice** ↑ serum levels and effect.

Route/Dosage

PO (Adults): 5 mg/day (2.5 mg/day in geriatric patients); may ↑ q 2 wk (range 5–10 mg/day; not to exceed 10 mg/day).

Availability (generic available)

Extended-release tablets: 2.5 mg, 5 mg, 10 mg.

NURSING IMPLICATIONS

Assessment

- Monitor BP and pulse before therapy, during dosage titration, and periodically during therapy. **Monitor ECG periodically during prolonged therapy.**
- Monitor intake and output ratios and daily weight. Assess for signs of HF (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- **Angina:** Assess location, duration, intensity, and precipitating factors of patient's anginal pain.
- **Hypertension:** Check frequency of refills to monitor adherence.
- **Lab Test Considerations:** Total serum calcium concentrations are not affected by calcium channel blockers.
- Monitor serum potassium periodically. Hypokalemia ↑ risk of arrhythmias and should be corrected.
- Monitor renal and hepatic functions periodically during long-term therapy. May cause ↑ in hepatic enzymes after several days of therapy, which return to normal upon discontinuation of therapy.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)

Acute pain (Indications)

Implementation

- **PO:** May be administered without regard to meals. May be administered with meals if GI irritation becomes a problem.
- Swallow tablets whole; do not break, crush, or chew. Empty tablets that appear in stool are not significant.

Patient/Family Teaching

- Advise patient to take medication as directed, even if feeling well. If a dose is missed, take as soon as possible unless almost time for next dose; do not double doses. May need to be discontinued gradually.
- Instruct patient on correct technique for monitoring pulse. Instruct patient to contact health care professional if heart rate is <50 bpm.
- Advise patient to avoid grapefruit or grapefruit juice during therapy.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Instruct patient on importance of maintaining good dental hygiene and seeing dentist frequently for teeth cleaning to prevent tenderness, bleeding, and gingival hyperplasia (gum enlargement).
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to avoid concurrent use of alcohol or OTC medications and herbal products, especially cold preparations, without consulting health care professional.
- Advise patient to notify health care professional if rash, irregular heartbeat, dyspnea, swelling of hands and feet, pronounced dizziness, nausea, constipation, or hypotension occurs or if headache is severe or persistent.
- Caution patient to wear protective clothing and to use sunscreen to prevent photosensitivity reactions.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- **Angina:** Instruct patient on concurrent nitrate or beta-blocker therapy to continue taking both medications as directed and to use SL nitroglycerin as needed for anginal attacks.
- Advise patient to contact health care professional if chest pain does not improve or worsens after therapy; occurs with diaphoresis or shortness of breath; or if severe, persistent headache occurs.
- Caution patient to discuss exercise restrictions with health care professional before exertion.
- **Hypertension:** Encourage patient to comply with other interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, and stress management). Medication controls but does not cure hypertension.

- Instruct patient and family in proper technique for monitoring BP. Advise patient to take BP weekly and to report significant changes.

Evaluation/Desired Outcomes

- Decrease in BP.
- Decrease in frequency and severity of anginal attacks.
- Decrease in need for nitrate therapy.
- Increase in activity tolerance and sense of well-being.

fenofibrate (fen-o-fi-brate)

Antara, Fenoglide, ★ Fenomax,
★ Lipidil EZ, ★ Lipidil Micro,
★ Lipidil Supra, Lipofen, Lofibra, Tricor, Triglide

Classification

Therapeutic: lipid-lowering agents
Pharmacologic: fibric acid derivatives

Indications

With dietary therapy to decrease LDL cholesterol, total cholesterol, triglycerides, and apolipoprotein B in adult patients with hypercholesterolemia or mixed dyslipidemia. With dietary management in the treatment of hypertriglyceridemia (types IV and V hyperlipidemia) in patients who are at risk for pancreatitis and do not respond to nondrug therapy.

Action

Fenofibric acid primarily inhibits triglyceride synthesis.

Therapeutic Effects: Lowering of cholesterol and triglycerides with subsequent decreased risk of pancreatitis.

Pharmacokinetics

Absorption: Well absorbed (60%) after oral administration; absorption ↑ by food.

Distribution: Unknown.

Protein Binding: 99%.

Metabolism and Excretion: Rapidly converted to fenofibric acid, which is the active metabolite; fenofibric acid is metabolized by the liver. Fenofibric acid and its metabolites are primarily excreted in urine (60%).

Half-life: 20 hr.

TIME/ACTION PROFILE (lowering of triglycerides)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2 wk	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hepatic impairment (including primary biliary cirrhosis); Pre-ex-

isting gallbladder disease; Severe renal impairment; Concurrent use of HMG-CoA reductase inhibitors; **Lactation:** Potential for tumorigenicity noted in animal studies; discontinue breast feeding.

Use Cautiously in: Concurrent warfarin or HMG-CoA reductase inhibitor therapy; **OB:** Embryocidal and teratogenic in animal studies; use only if potential benefits outweigh risks to the fetus; **Pedi:** Safety not established; **Ger:** Age-related ↓ in renal function may make older patients more susceptible to adverse reactions.

Adverse Reactions/Side Effects

CNS: fatigue/weakness, headache. **CV:** PULMONARY EMBOLISM, arrhythmias, deep vein thrombosis. **GI:** cholelithiasis, pancreatitis. **Derm:** rash, urticaria. **Metab:** ↓ HDL levels. **MS:** rhabdomyolysis. **Misc:** hypersensitivity reactions.

Interactions

Drug-Drug: ↑ anticoagulant effects of warfarin. **HMG-CoA reductase inhibitors** ↑ risk of rhabdomyolysis (concurrent use should be avoided). Absorption is ↓ by **bile acid sequestrants** (fenofibrate should be given 1 hr before or 4–6 hr after). ↑ risk of nephrotoxicity with **cyclosporine**. Concurrent use with **colchicine** may ↑ risk of rhabdomyolysis.

Route/Dosage

Primary hypercholesterolemia/mixed dyslipidemia

PO (Adults): *Antara*—90 mg/day initially; *Fenoglide*—120 mg/day; *Lofibra*—200 mg/day initially; *Tricor*—145 mg/day initially; *Triglide*—160 mg/day initially; *Lipofen*—50 mg daily.

Hypertriglyceridemia

PO (Adults): *Antara*—30–90 mg/day; *Fenoglide*—40–120 mg/day; *Lofibra*—67–200 mg/day initially; *Tricor*—48–145 mg/day initially; *Triglide*—50–160 mg/day initially; *Lipofen*—50 mg daily.

Renal impairment/Geriatric patients

PO (Adults): *Antara*—30 mg/day; *Fenoglide*—start at 40 mg/day; *Lofibra*—67 mg/day; *Tricor*—48 mg/day.

Availability (generic available)

Tablets (Tricor): 48 mg, 145 mg. **Cost:** *Generic*—48 mg \$171.86/90, 145 mg \$515.58/90. **Tablets (Fenoglide):** 40 mg, 120 mg. **Cost:** 40 mg \$289.44/90, 120 mg \$869.40/90. **Tablets (Triglide):** 50 mg, 160 mg. **Cost:** *Generic*—160 mg \$176.40/100. **Micronized tablets (Lofibra):** 54 mg, ★ 100 mg, 160 mg. **Cost:** *Generic*—54 mg \$71.29/90, 160 mg \$213.88/90. **Micronized capsules (Antara):** 30 mg, 90 mg. **Capsules (Lipofen):** 50 mg, 150 mg. **Cost:** 50 mg \$213.58/90, 150 mg \$468.24/90. **Micronized**

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

capsules (Lofibra): 67 mg, 134 mg, 200 mg. **Cost:** *Generic*—67 mg \$74.95/100, 134 mg \$199.62/100, 200 mg \$266.45/100.

NURSING IMPLICATIONS

Assessment

- Obtain a diet history, especially with regard to fat consumption. Every attempt should be made to obtain normal serum triglyceride levels with diet, exercise, and weight loss in obese patients before fenofibrate therapy is instituted.
- Assess patient for cholelithiasis. If symptoms occur, gallbladder studies are indicated. Discontinue therapy if gallstones are found.
- **Lab Test Considerations:** Monitor serum lipids before therapy to determine consistent elevations, then monitor periodically during therapy.
- Monitor serum AST and ALT periodically during therapy. May cause ↑ levels. Therapy should be discontinued if levels rise >3 times the normal limit.
- If patient develops muscle tenderness during therapy, monitor CPK levels. If CPK levels are markedly ↑ or myopathy occurs, discontinue therapy.
- May cause mild to moderate ↓ in hemoglobin, hematocrit, and WBCs. Monitor periodically during first 12 mo of therapy. Levels usually stabilize during long-term therapy.
- Monitor prothrombin levels frequently until levels stabilize in patients taking anticoagulants concurrently.

Potential Nursing Diagnoses

Noncompliance (Patient/Family Teaching)

Implementation

- Do not confuse *Tricor* with *Tracleer* (bosentan).
- Place patients on a triglyceride-lowering diet before therapy and remain on this diet throughout therapy.
- Dose may be increased after repeated serum triglyceride levels every 4–8 wk.
- Brands are not interchangeable.
- **PO:** Administer *Antara*, *Fenoglide*, *Lipofen*, *Lipidil Micro*, *Lipidil Supra*, *Lofibra*, and *Tricor* products with meals. *Triglide* formulation may be taken without regard to meals.

Patient/Family Teaching

- Instruct patient to take medication as directed, not to skip doses or double up on missed doses. Medication helps control but does not cure elevated serum triglyceride levels.
- Advise patient that this medication should be used in conjunction with diet restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, and cessation of smoking.
- Instruct patient to notify health care professional if unexplained muscle pain, tenderness, or weakness occurs, especially if accompanied by fever or malaise.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.

- Instruct female patients to notify health care professional promptly if pregnancy is planned or suspected.
- Emphasize the importance of follow-up exams to determine effectiveness and to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in serum triglycerides and cholesterol to normal levels. Therapy should be discontinued in patients who do not have an adequate response in 2 mo of therapy.

fenofibric acid (feen-oh-fye-brik as-id) Fibricor, TriLipix

Classification

Therapeutic: lipid-lowering agents
Pharmacologic: fibric acid derivatives

Indications

With a statin to reduce triglycerides (TG) and increase high density lipoprotein-C (HDL-C) in patients with mixed dyslipidemias and CHD or a CHD risk equivalent who are on statin therapy to achieve their low-density lipoprotein-C (LDL-C) goal (TriLipix only). As monotherapy to reduce TG in patients with severe hypertriglyceridemia. As monotherapy to reduce elevated LDL-C, total cholesterol (Total-C), TG, and apolipoprotein B (Apo B), and increase HDL-C in patients with primary hyperlipidemia or mixed dyslipidemia. Part of a comprehensive program to decrease cardiovascular risk factors.

Action

Activates the peroxisome proliferator activated receptor α (PPAR α), resulting in increased lipolysis and elimination of triglycerides from plasma. Activation of PPAR α also increases production of HDL. **Therapeutic Effects:** Improvement in lipid profile with lowered triglycerides and LDL cholesterol, and increased HDL cholesterol.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Unknown.

Protein Binding: 99%.

Metabolism and Excretion: Fenofibric acid is the active metabolite of fenofibrate. Fenofibric acid is mostly metabolized by glucuronidation and the metabolites are mostly excreted by the kidneys.

Half-life: 20 hr.

TIME/ACTION PROFILE (effects on blood lipids)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	4–5 hr†	unknown

†Blood levels.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to fenofibric acid, choline fenofibrate or fenofibrate; Severe renal impairment ($CCr < 30$ mL/min); Active liver or gallbladder disease; **Lactation:** Avoid use during breast feeding.

Use Cautiously in: Mild/moderate renal impairment (dose ↓ required for CCr 30–80 mL/min); Concurrent use with statins in elderly patients, patients with diabetes, renal failure, or hypothyroidism (↑ risk of myopathy/rhabdomyolysis); **Geri:** Consider age-related ↓ in renal function, concurrent illnesses and drug therapy; **OB:** Use only if the potential benefit justifies the potential risk to the fetus; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: headache. **GI:** diarrhea, nausea, cholelithiasis, ↑ liver enzymes, pancreatitis. **GU:** ↑ serum creatinine. **Metab:** ↓ HDL levels. **MS:** MYOPATHY/RHABDOMYOLYSIS, myalgia, back pain.

Interactions

Drug-Drug: ↑ effects and risk of bleeding with warfarin; monitor prothrombin time/INR. **Bile acid sequestrants** may ↓ absorption and effectiveness; administer at least 1 hr before or 4–6 hr after a bile acid sequestrant. Concurrent use with **nephrotoxic drugs** including cyclosporine may impair renal function and excretion, ↑ risk of adverse reactions. Concurrent use with colchicine may ↑ risk of rhabdomyolysis.

Route/Dosage

Mixed Dyslipidemia

PO (Adults): *TriLipix*—135 mg once daily; *Hypertriglyceridemia*—45–135 mg once daily.

Hypertriglyceridemia

PO (Adults): *Fibricor*—35–105 mg once daily; *TriLipix*—45–135 mg once daily.

Primary Hypercholesterolemia or Mixed Dyslipidemia

PO (Adults): *Fibricor*—105 mg once daily; *TriLipix*—135 mg once daily.

Renal Impairment

PO (Adults): *CCr* 30–80 mL/min—*Fibricor*: Initiate with 35 mg once daily; may titrate cautiously; *TriLipix*: Initiate with 45 mg once daily; may titrate cautiously; *CCr* <30 mL/min—Contraindicated.

Availability (generic available)

Delayed-release capsules (Fibricor): 35 mg, 105 mg. **Delayed-release capsules (TriLipix):** 45 mg, 135 mg.

NURSING IMPLICATIONS

Assessment

- Obtain a diet history, especially with regard to fat consumption. Every attempt should be made to obtain normal serum triglyceride levels with diet, exercise, and weight loss in obese patients before fenofibric acid therapy is instituted.
- Assess patient for cholelithiasis. If symptoms occur, gallbladder studies are indicated. Discontinue therapy if gallstones are found.
- **Lab Test Considerations:** Monitor serum lipids before therapy to determine consistent elevations, then monitor periodically during therapy.
- Monitor serum AST and ALT periodically during therapy. May cause ↑ levels. Discontinue therapy if levels rise >3 times the normal limit.
- **If patient develops muscle tenderness during therapy, CPK levels should be monitored. If CPK levels are markedly ↑ or myopathy occurs, therapy should be discontinued.**
- May cause reversible ↑ in serum creatinine. Monitor renal function in patients at risk for renal insufficiency (elderly, diabetics).
- May cause mild to moderate ↓ in hemoglobin, hematocrit, and WBCs. Monitor periodically during first 12 mo of therapy. Levels usually stabilize during long-term therapy.
- Monitor prothrombin time and INR monitored frequently until levels stabilize in patients taking anticoagulants concurrently.

Potential Nursing Diagnoses

Noncompliance (Patient/Family Teaching)

Implementation

- Patients should be placed on a triglyceride-lowering diet before therapy and remain on this diet throughout therapy.
- **PO:** Administer without regard to meals. Swallow capsules whole; do not open, crush, or chew. May be administered at same time as statin dose.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as remembered; if time for next dose, skip dose and take next dose at regular time. Do not double doses. Medication helps control but does not cure elevated serum triglyceride levels. Advise patient to read *Medication Guide* before starting and with each Rx refill, as new information may be available.
- Advise patient that this medication should be used in conjunction with diet restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, and cessation of smoking.
- **Instruct patient to notify health care professional if unexplained muscle pain, tenderness, weakness,**

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

tiredness, fever, nausea, vomiting, or abdominal pain occurs, especially if accompanied by fever or malaise.

- Instruct female patients to notify health care professional promptly if pregnancy is planned or suspected.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Emphasize the importance of follow-up exams to determine effectiveness and to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in serum triglycerides and LDL cholesterol to normal levels with an increase in HDL levels.

HIGH ALERT

fentaNYL (parenteral)

(fen-ta-nil)
Sublimaze

Classification

Therapeutic: opioid analgesics
Pharmacologic: opioid agonists

Schedule II

Indications

Analgesic supplement to general anesthesia; usually with other agents (ultra–short-acting barbiturates, neuromuscular blocking agents, and inhalation anesthetics) to produce balanced anesthesia. Induction/maintenance of anesthesia (with oxygen or oxygen/nitrous oxide and a neuromuscular blocking agent). Neuroleptanalgesia/neuroleptanesthesia (with or without nitrous oxide). Supplement to regional/local anesthesia. Preoperative and postoperative analgesia. **Unlabeled Use:** Continuous IV infusion as part of PCA.

Action

Binds to opiate receptors in the CNS, altering the response to and perception of pain. Produces CNS depression. **Therapeutic Effects:** Supplement in anesthesia. Decreased pain.

Pharmacokinetics

Absorption: Well absorbed after IM administration.

Distribution: Unknown.

Metabolism and Excretion: Mostly metabolized by the liver, 10–25% excreted unchanged by the kidneys.

Half-life: Children: Bolus dose—2.4 hr, long-term continuous infusion—11–36 hr; Adults: 2–4 hr (↑ after cardiopulmonary bypass and in geriatric patients).

TIME/ACTION PROFILE (analgesia*)

ROUTE	ONSET	PEAK	DURATION
IM	7–15 min	20–30 min	1–2 hr
IV	1–2 min	3–5 min	0.5–1 hr

*Respiratory depression may last longer than analgesia.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; cross-sensitivity among agents may occur; Known intolerance.

Use Cautiously in: Geriatric, debilitated, or critically ill patients; Diabetes; Severe renal, pulmonary, or hepatic disease; CNS tumors; ↑ intracranial pressure; Head trauma; Adrenal insufficiency; Undiagnosed abdominal pain; Hypothyroidism; Alcoholism; Cardiac disease (arrhythmias); **OB:** Use only if the potential benefit justifies the potential risk to the fetus. Chronic maternal treatment with opioids during pregnancy may result in neonatal abstinence syndrome; **Lactation:** Use only if the potential benefit of breast feeding justifies that potential risk to the infant (may cause infant sedation and/or respiratory depression).

Adverse Reactions/Side Effects

CNS: confusion, paradoxical excitation/delirium, postoperative depression, postoperative drowsiness.

EENT: blurred/double vision. **Resp:** **APNEA, LARYNGOSPASM,** allergic bronchospasm, respiratory depression.

CV: arrhythmias, bradycardia, circulatory depression, hypotension. **GI:** biliary spasm, nausea/vomiting.

Derm: facial itching. **Endo:** adrenal insufficiency.

MS: skeletal and thoracic muscle rigidity (with rapid IV infusion).

Interactions

Drug-Drug: Avoid use in patients who have received **MAO inhibitors** within the previous 14 days (may produce unpredictable, potentially fatal reactions).

Concomitant use of **CYP3A4 inhibitors** including ritonavir, ketoconazole, itraconazole, clarithromycin, nelfinavir, nefazodone, diltiazem, aprepitant, fluconazole, fosamprenavir, verapamil, and erythromycin may result in ↑ plasma levels and ↑ risk of CNS and respiratory depression. Concurrent use with **CYP3A4 inducers** including barbiturates, carbamazepine, efavirenz, corticosteroids, modafinil, nevirapine, oxcarbazepine, phenobarbital, phenytoin, rifabutin, or rifampin may ↓ fentanyl levels and analgesia; if inducers are discontinued or dosage ↓, patients should be monitored for signs of opioid toxicity and necessary dose adjustments should be made. Use with **benzodiazepines** or other **CNS depressants** including other **opioids, non-benzodiazepine sedative/hypnotics, anxiolytics, general anesthetics, muscle relaxants, antipsychotics,** and **alcohol** may cause profound sedation, respiratory depression, coma, and death; reserve concurrent use for when alternative treatment options are inadequate. ↑ risk of hypotension with **benzodiazepines.** Nalbu-

phine, buprenorphine, or pentazocine may ↓ analgesia. Drugs that affect serotonergic neurotransmitter systems, including tricyclic antidepressants, SSRIs, SNRIs, MAO inhibitors, TCAs, tramadol, trazodone, mirtazapine, 5-HT₃ receptor antagonists, linezolid, methylene blue, and triptans ↑ risk of serotonin syndrome.

Drug-Food: Grapefruit juice is a moderate inhibitor of the CYP3A4 enzyme system; concurrent use may ↑ blood levels and the risk of respiratory and CNS depression. Careful monitoring and dose adjustment is recommended.

Route/Dosage

Preoperative Use

IM, IV (Adults and Children >12 yr): 50–100 mcg 30–60 min before surgery.

Adjunct to General Anesthesia

IM, IV (Adults and Children >12 yr): *Low dose—minor surgery*—2 mcg/kg. *Moderate dose—major surgery*—2–20 mcg/kg. *High dose—major surgery*—20–50 mcg/kg.

Adjunct to Regional Anesthesia

IM, IV (Adults and Children >12 yr): 50–100 mcg.

Postoperative Use (Recovery Room)

IM, IV (Adults and Children >12 yr): 50–100 mcg; may repeat in 1–2 hr.

General Anesthesia

IV (Adults and Children >12 yr): 50–100 mcg/kg (up to 150 mcg/kg).

IV (Children 1–12 yr): 2–3 mcg/kg.

Sedation/Analgesia

IV (Adults and Children >12 yr): 0.5–1 mcg/kg/dose, may repeat after 30–60 min.

IV (Children 1–12 yr): *Bolus*—1–2 mcg/kg/dose, may repeat at 30–60 min intervals. *Continuous infusion*—1–5 mcg/kg/hr following bolus dose.

IV (Neonates): *Bolus*—0.5–3 mcg/kg/dose. *Continuous infusion*—0.5–2 mcg/kg/hr following bolus dose. *Continuous infusion during ECMO*—5–10 mcg/kg bolus followed by 1–5 mcg/kg/hr, may require up to 20 mcg/kg/hr after 5 days of therapy.

Availability (generic available)

Injection: 50 mcg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor respiratory rate and BP frequently throughout therapy. Report significant changes immediately. The respiratory depressant effects of fentanyl may last longer than the analgesic effects. Initial doses of

other opioids should be reduced by 25–33% of the usually recommended dose. Monitor closely.

- **Geri:** Opioids have been associated with increased risk of falls in geriatric patients. Assess risk and implement fall prevention strategies.
- **IV, IM:** Assess type, location, and intensity of pain before and 30 min after IM administration or 3–5 min after IV administration when fentanyl is used to treat pain.
- **Lab Test Considerations:** May cause ↑ serum amylase and lipase concentrations.
- **Toxicity and Overdose:** Symptoms of toxicity include respiratory depression, hypotension, arrhythmias, bradycardia, and asystole. Atropine may be used to treat bradycardia. If respiratory depression persists after surgery, prolonged mechanical ventilation may be required. If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by IV push every 2 min. **Pedi:** For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain. Administration of naloxone in these circumstances, especially in cardiac patients, has resulted in hypertension and tachycardia, occasionally causing left ventricular failure and pulmonary edema.

Potential Nursing Diagnoses

Acute pain (Indications)

Ineffective breathing pattern (Adverse Reactions)

Risk for injury (Side Effects)

Implementation

- **High Alert:** Accidental overdosage of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders; have second practitioner independently check original order, dose calculations, route of administration, and infusion pump programming.
- Do not confuse fentanyl with sufentanil.
- Benzodiazepines may be administered before or after administration of fentanyl to reduce the induction dose requirements, decrease the time to loss of consciousness, and produce amnesia. This combination may also increase the risk of hypotension.

IV Administration

- **IV Push:** **Diluent:** Administer undiluted. **Concentration:** 50 mcg/mL. **Rate:** Injections should be administered slowly over 1–3 min. Administer doses >5 mcg/kg over 5–10 min. Slow IV administration may reduce the incidence and severity of muscle rigidity, bradycardia, or hypotension. Neuro-

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

muscular blocking agents may be administered concurrently to decrease chest wall muscle rigidity.

- **Intermittent Infusion:** **Diluent:** May be diluted in D5W or 0.9% NaCl. **Concentration:** Up to 50 mcg/mL. **Rate:** see IV Push.
- **Y-Site Compatibility:** acetaminophen, acyclovir, alantuzumab, alfentanil, alprostadil, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, azathioprine, aztreonam, benzotropine, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, cefuroxime, chloramphenicol, chlorpromazine, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxacurium, doxapram, doxorubicin, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, epifibatide, erythromycin, esmolol, etomidate, etoposide, etoposide phosphate, famotidine, fenoldopam, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorothamine, meperidine, metaraminol, methotrexate, methylodopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidrone, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, propramine, pyridoxime, quinupristin/dalfopristin, ranitidine, remifentanyl, rituximab, rocuronium, sargramostim, scopolamine, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiopental, thiotopa, tigecycline, tirofiban, tobramycin, tolazoline, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, vitamin B complex with C, voriconazole, zoledronic acid.

- **Y-Site Incompatibility:** dantrolene, diazoxide, pantoprazole, phenytoin, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Discuss the use of anesthetic agents and the sensations to expect with the patient before surgery.
- Explain pain assessment scale to patient.
- Caution patient to change positions slowly to minimize orthostatic hypotension. **Ger:** Geriatric patients may be at a greater risk for orthostatic hypotension and, consequently, falls. Teach patient to take precautions until drug effects have completely resolved.
- Medication causes dizziness and drowsiness. Advise patient to call for assistance during ambulation and transfer, and to avoid driving or other activities requiring alertness for 24 hr after administration during outpatient surgery.
- Instruct patient to avoid alcohol or other CNS depressants for 24 hr after administration for outpatient surgery.

Evaluation/Desired Outcomes

- General quiescence.
- Reduced motor activity.
- Pronounced analgesia.

REMS HIGH ALERT

fentaNYL (transdermal) (fen-ta-nil) Duragesic

Classification

Therapeutic: opioid analgesics, anesthetic adjuncts

Pharmacologic: opioid agonists

Schedule II

Indications

Moderate to severe chronic pain in opioid-tolerant patients requiring use of daily, around-the-clock long-term opioid treatment and for which alternative treatment options are inadequate (extended-release).

Transdermal fentanyl is not recommended for the control of postoperative, mild, or intermittent pain, nor should it be used for short-term pain relief.

Action

Binds to opiate receptors in the CNS, altering the response to and perception of pain. **Therapeutic Effects:** Decrease in severity of chronic pain.

Pharmacokinetics

Absorption: Well absorbed (92% of dose) through skin surface under transdermal patch, creating a depot in the upper skin layers. Release from transdermal system into systemic circulation ↑ gradually to a constant rate, providing continuous delivery for 72 hr.

Distribution: Crosses the placenta; enters breast milk.

Metabolism and Excretion: Mostly metabolized by the liver (CYP3A4 enzyme system); 10–25% excreted unchanged by the kidneys.

Half-life: 17 hr after removal of a single application patch, ↑ to 21 hr after removal of multiple patches (because of continued release from deposition of drug in skin layers).

TIME/ACTION PROFILE (↓ pain)

ROUTE	ONSET	PEAK	DURATION
Transdermal	6 hr†	12–24 hr	72 hr‡

†Achievement of blood levels associated with analgesia. Maximal response and dose titration may take up to 6 days.

‡While patch is worn.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to fentanyl or adhesives; Patients who are not opioid tolerant; Acute, mild, intermittent, or postoperative pain; Significant respiratory depression; Acute or severe bronchial asthma; Paralytic ileus; Severe hepatic or renal impairment; Alcohol intolerance (small amounts of alcohol released into skin); **OB:** Not recommended during labor and delivery; **Lactation:** Avoid use during breast feeding; may cause infant sedation and/or respiratory depression.

Use Cautiously in: Diabetes; Patients with severe pulmonary disease; Mild or moderate hepatic or renal impairment; CNS tumors; ↑ intracranial pressure; Head trauma; Adrenal insufficiency; Undiagnosed abdominal pain; Hypothyroidism; Alcoholism; Cardiac disease (particularly bradyarrhythmias); Fever or situations that ↑ body temperature (↑ release of fentanyl from delivery system); Titration period (additional analgesics may be required); Cachectic or debilitated patients (dose ↓ suggested because of altered drug disposition); **OB:** Use only if the potential benefit justifies the potential risk to the fetus. Chronic maternal treatment with opioids during pregnancy may result in neonatal abstinence syndrome; **Pedi:** Children <2 yr (safety not established); pediatric patients initiating therapy at 25 mcg/hr should be opioid tolerant and receiving at least 60 mg oral morphine equivalents per day; **Geri:** ↑ risk of respiratory depression; dose ↓ suggested.

Adverse Reactions/Side Effects

CNS: confusion, sedation, weakness, dizziness, restlessness. **Resp:** **APNEA**, bronchoconstriction, laryngospasm, **RESPIRATORY DEPRESSION**. **CV:** bradycardia, hypotension. **GI:** anorexia, constipation, dry mouth, nausea, vomiting. **Derm:** sweating, erythema. **Endo:** adrenal insufficiency. **Local:** application site reactions. **MS:** skeletal and thoracic muscle rigidity. **Misc:** physical dependence, psychological dependence.

Interactions

Drug-Drug: Avoid use in patients who have received **MAO inhibitors** within the previous 14 days (may produce unpredictable, potentially fatal reactions).

Concomitant use of **CYP3A4 inhibitors** including **ritonavir**, **ketoconazole**, **itraconazole**, **clarithromycin**, **nelfinavir**, **nefazodone**, **amiodarone**, **diltiazem**, **aprepitant**, **ketoconazole**, **fosamprenavir**, **verapamil**, and **erythromycin** may result in ↑ plasma levels and ↑ risk of CNS and respiratory depression.

Levels and effectiveness may be ↓ by **CYP3A4 inducers** including **rifampin**, **carbamazepine**, and **phenytoin**. Use with **benzodiazepines** or other **CNS depressants** including other **opioids**, **non-benzodiazepine sedative/hypnotics**, **anxiolytics**, **general anesthetics**, **muscle relaxants**, **antipsychotics**, and **alcohol** may cause profound sedation, respiratory depression, coma, and death; reserve concurrent use for when alternative treatment options are inadequate. Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SSRIs**, **SNRIs**, **MAO inhibitors**, **TCAs**, **tramadol**, **trazodone**, **mirtazapine**, **5-HT₃ receptor antagonists**, **linezolid**, **methylene blue**, and **triptans** ↑ risk of serotonin syndrome.

Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression.

Drug-Food: **Grapefruit juice** is a moderate inhibitor of the CYP3A4 enzyme system; concurrent use may ↑ blood levels and the risk of respiratory and CNS depression. Careful monitoring and dose adjustment is recommended.

Route/Dosage

Transdermal (Adults): 25 mcg/hr is the initial dose; patients who have not been receiving opioids should receive not more than 25 mcg/hr. To calculate the dose of transdermal fentanyl required in patients who are already receiving opioid analgesics, assess the 24-hr requirement of currently used opioid. Using the equianalgesic table in Appendix J, convert this to an equivalent amount of morphine/24 hr. Conversion to fentanyl transdermal may be accomplished by using the fentanyl conversion table (Appendix J). During dose titration, additional short-acting opioids should be available for any breakthrough pain that may occur. Morphine 10 mg IM or 60 mg PO q 4 hr (60 mg/24 hr IM or 360 mg/24 hr PO) is considered to be approximately equivalent to transdermal fentanyl 100 mcg/hr. Transdermal patch lasts 72 hr in most patients. Some patients require a new patch every 48 hr.

Transdermal (Adults >60 yr, Debilitated, or Cachectic Patients): Initial dose should be 25 mcg/hr unless previous opioid use was >135 mg morphine PO/day (or other opioid equivalent).

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Hepatic Impairment

Transdermal (Adults): *Mild-to-moderate hepatic impairment*—12 mcg/hr is the initial dose.

Renal Impairment

Transdermal (Adults): *Mild-to-moderate renal impairment*—12 mcg/hr is the initial dose.

Availability (generic available)

Transdermal systems: 12.5 mcg/hr, 25 mcg/hr, 50 mcg/hr, 75 mcg/hr, 100 mcg/hr. **Cost:** *Generic*—12 mcg/hr \$101.51/5, 25 mcg/hr \$72.17/5, 50 mcg/hr \$131.92/5, 75 mcg/hr \$201.23/5, 100 mcg/hr \$267.07/5.

NURSING IMPLICATIONS

Assessment

- Assess type, location, and intensity of pain before and 24 hr after application and periodically during therapy. Monitor pain frequently during initiation of therapy and dose changes to assess need for supplementary analgesics for breakthrough pain.
- Assess BP, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Physical stimulation may be sufficient to prevent significant hypoventilation. Dose may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use.
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive opioid analgesics for pain do not develop psychological dependence.
- Progressively higher doses may be required to relieve pain with long-term therapy. It may take up to 6 days after increasing doses to reach equilibrium, so patients should wear higher dose through 2 applications before increasing dose again.
- Assess bowel function routinely. Prevent constipation with increased intake of fluids and bulk, and laxatives to minimize constipating effects. Administer stimulant laxatives routinely if opioid use exceeds 2–3 days, unless contraindicated.
- Assess risk for opioid addiction, abuse, or misuse prior to administration. Monitor for respiratory depression, especially during initiation or following dose increase; serious, life-threatening, or fatal respiratory depression may occur. Misuse or abuse of *transdermal fentanyl* by chewing, swallowing, snorting or injecting fentanyl extracted from transdermal system will result in the uncontrolled delivery of fentanyl and risk of overdose and death.
- **Lab Test Considerations:** May ↑ plasma amylase and lipase levels.
- **Toxicity and Overdose:** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone is the antidote. Dilute the 0.4-mg ampule

of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by IV push every 2 min. For patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain. Monitor patient closely; dose may need to be repeated or may need to be administered as an infusion because of long duration of action despite removal of patch.

Potential Nursing Diagnoses

Chronic pain (Indications)

Risk for injury (Side Effects)

Implementation

- Do not confuse fentanyl with sufentanil.
- **High Alert:** Accidental overdose of opioid analgesics has resulted in fatalities. Before administering, confirm patient is opioid tolerant and clarify ambiguous orders; have second practitioner independently check original order and dose calculations.
- 12-mcg patch delivers 12.5 mcg/hr of fentanyl. Use supplemental doses of short-acting opioid analgesics to manage pain until relief is obtained with the transdermal system. Patients may continue to require supplemental opioids for breakthrough pain. If >100 mcg/hr is required, use multiple transdermal systems.
- Titrate dose based on patient's report of pain until adequate analgesia (50% reduction in patient's pain rating on numerical or visual analogue scale or patient reports satisfactory relief) is attained. Determine dose by calculating the previous 24-hr analgesic requirement and converting to the equianalgesic morphine dose using Appendix J. The conversion ratio from morphine to transdermal fentanyl is conservative; 50% of patients may require a dose increase after initial application. Increase after 3 days based on required daily doses of supplemental analgesics. Increases should be based on ratio of 45 mg/24 hr of oral morphine to 12.5 mcg/hr increase in transdermal fentanyl dose.
- Coadministration with nonopioid analgesics may have additive analgesic effects and permit lower opioid doses.
- To convert to another opioid analgesic, remove transdermal fentanyl system and begin treatment with half the equianalgesic dose of the new analgesic in 12–18 hr.
- Medication should be discontinued gradually after long-term use to prevent withdrawal symptoms.
- **Transdermal:** Apply system to flat, nonirritated, and nonirradiated site such as chest, back, flank, or upper arm. If skin preparation is necessary, use clear water and clip, do not shave, hair. Allow skin to dry completely before application. Apply immediately after removing from package. Do not alter the

system (i.e., cut) in any way before application. Remove liner from adhesive layer and press firmly in place with palm of hand for 30 sec, especially around the edges, to make sure contact is complete. Remove used system and fold so that adhesive edges are together. Flush system down toilet immediately on removal or follow the institutional policy. Apply new system to a different site.

Patient/Family Teaching

- Instruct patient in how and when to ask for and take pain medication.
- Instruct patient in correct method for application and disposal of transdermal system. **Fatalities have occurred from children having access to improperly discarded patches.** May be worn while bathing, showering, or swimming.
- Advise patient to avoid grapefruit juice during therapy.
- Advise patient that fentanyl is a drug with known abuse potential. Protect it from theft, and never give to anyone other than the individual for whom it was prescribed.
- May cause drowsiness or dizziness. Caution patient to call for assistance when ambulating or smoking and to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to change positions slowly to minimize dizziness.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Advise patient that fever, electric blankets, heating pads, saunas, hot tubs, and heated water beds increase the release of fentanyl from the patch.
- Advise patient that good oral hygiene, frequent mouth rinses, and sugarless gum or candy may decrease dry mouth.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Instruct female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Advise patient referred for MRI test to discuss patch with referring health care professional and MRI facility to determine if removal of patch is necessary prior to test and for directions for replacing patch.

Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness, respiratory status, or BP.

Abstral

Classification

Therapeutic: opioid analgesics

Pharmacologic: opioid agonists

Schedule II

Indications

Management of breakthrough pain in cancer patients >18 yr old already receiving opioids and tolerant to around-the-clock opioids for persistent cancer pain (60 mg/day of oral morphine or equivalent).

Action

Binds to opioid receptors in the CNS, altering the response to and perception of pain. **Therapeutic Effects:** Decrease in severity of breakthrough pain.

Pharmacokinetics

Absorption: *Buccal tablet*—65% absorbed from buccal mucosa; 50% is absorbed transmucosally, remainder is swallowed and is absorbed slowly from the GI tract. Buccal absorption is enhanced by an effervescent reaction in the dose form; *Nasal spray*—Well absorbed from nasal mucosa (bioavailability higher than that of oral transmucosal lozenge); *Oral transmucosal lozenge*—Initial rapid absorption (25%) from buccal mucosa is followed by more prolonged absorption (25%) from GI tract (combined bioavailability 50%); *Sublingual spray*—76% absorbed through sublingual mucosa; *Sublingual tablets*—54% absorbed from oral mucosa following sublingual administration.

Distribution: Readily crosses the placenta and enters breast milk.

Metabolism and Excretion: Mostly metabolized in the liver and intestinal mucosa via the CYP3A4 enzyme system; inactive metabolites are excreted in urine; <7% excreted unchanged in urine.

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Half-life: *Buccal tablet*—2.6–11.7 hr (↑ with dose); *Nasal spray*—15–25 hr (↑ with dose); *Sublingual spray*—5–12 hr; *Sublingual tablet*—5–10 hr (↑ with dose); *Transmucosal lozenge*—7 hr.

TIME/ACTION PROFILE (↓ pain)

ROUTE	ONSET	PEAK	DURATION
Buccal tablet	15 min	40–60 min	60 min
Nasal spray	within 10 min	unknown	2–4 hr
Oral transmucosal lozenge	rapid	15–30 min	several hr
SL	within 30 min	30–60 min	2–4 hr

Contraindications/Precautions

Contraindicated in: Known intolerance or hypersensitivity; Acute/postoperative pain including headache/migraine, dental pain, or emergency room use; Opioid—naïve (nontolerant) patients; Concurrent use of MAO inhibitors; **OB:** Labor and delivery; **Lactation:** Avoid use during breast feeding; may cause infant sedation and/or respiratory depression.

Use Cautiously in: Chronic obstructive pulmonary disease or pre-existing medical conditions predisposing to hypoventilation; Concurrent use of CNS active drugs; History of substance abuse; Severe renal/hepatic impairment (use lowest effective starting dose); Concurrent use of CYP3A4 inhibitors (use lowest effective dose); Bradyarrhythmias; **OB:** Use only if the potential benefit justifies the potential risk to the fetus. Chronic maternal treatment with opioids during pregnancy may result in neonatal abstinence syndrome; **Ger:** May be more sensitive to effects and may have an ↑ risk of adverse reactions; titrate dosage carefully; **Pedi:** Safety and effectiveness not established.

Exercise Extreme Caution in: Patients susceptible to intracranial effects of CO₂ retention including those with ↑ intracranial pressure, head injuries, or impaired consciousness.

Adverse Reactions/Side Effects

Opioid side effects ↑ with ↑ dosage.

CNS: dizziness, drowsiness, headache, confusion, depression, fatigue, hallucinations, headache, insomnia, weakness. **Resp:** **RESPIRATORY DEPRESSION**, dyspnea.

CV: hypotension. **Endo:** adrenal insufficiency. **GI:** constipation, nausea, vomiting, abdominal pain, anorexia, dry mouth. **Misc:** allergic reaction including **ANAPHYLAXIS**, physical dependence, psychological dependence.

Interactions

Drug-Drug: Should not be used within 14 days of **MAO inhibitors** because of possible severe and unpredictable reactions. Concurrent use of **CYP3A4 inhibitors** including **ritonavir**, **ketoconazole**, **itraconazole**, **fluconazole**, **clarithromycin**, **erythromycin**, **nefazodone**, **diltiazem**, **verapamil**, **nelinavir**, and **fosamprenavir** ↑ levels and risk of

opioid toxicity; careful monitoring during initiation, dose changes, or discontinuation of the inhibitor is recommended. Concurrent use with **CYP3A4 inducers** including **barbiturates**, **carbamazepine**, **efavirenz**, **corticosteroids**, **modafinil**, **nevirapine**, **oxcarbazepine**, **phenobarbital**, **phenytoin**, **rifabutin**, or **rifampin** may ↓ fentanyl levels and analgesia; if inducers are discontinued or dosage ↓, patients should be monitored for signs of opioid toxicity and necessary dose adjustments should be made. Use with **benzodiazepines** or other **CNS depressants** including other **opioids**, **non-benzodiazepine sedative/hypnotics**, **anxiolytics**, **general anesthetics**, **muscle relaxants**, **antipsychotics**, and **alcohol** may cause profound sedation, respiratory depression, coma, and death; reserve concurrent use for when alternative treatment options are inadequate. Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SSRIs**, **SNRIs**, **MAO inhibitors**, **TCAs**, **tramadol**, **trazodone**, **mirtazapine**, **5-HT₃ receptor antagonists**, **linezolid**, **methylene blue**, and **triptans** ↑ risk of serotonin syndrome.

Drug-Natural Products: **St. John's wort** is an inducer of CYP3A4; concurrent use may ↓ levels and analgesia; if inducers are discontinued or dosage decreased, patients should be monitored for signs of opioid toxicity and necessary dosage adjustments made.

Drug-Food: **Grapefruit juice** is a moderate inhibitor of CYP3A4 enzyme system; concurrent use may ↑ levels and the risk of CNS and respiratory depression. Careful monitoring and dose adjustment may be necessary.

Route/Dosage

Transmucosal Products Are Not Equivalent on a mcg-to-mcg Basis

Buccal (Adults): *Tablets*—100 mcg, then titrate to dose that provides adequate analgesia without undue side effects.

Intranasal (Adults): One 100-mcg spray in one nostril initially, then titrate in a step-wise manner (↑ to one 100-mcg spray in each nostril [200 mcg total]), then a total of three 100-mcg sprays (one in right nostril, then one in left nostril, then last spray in right nostril), then one 400-mcg spray in one nostril (or two 100-mcg sprays in each nostril [400 mcg total]), then two 300-mcg sprays in each nostril [600 mcg total], then one 400-mcg spray in each nostril [800 mcg total] to provide adequate analgesia without undue side effects (up to a maximum of one 400-mcg spray in each nostril).

Oral transmucosal (Adults): One 200-mcg unit dissolved in mouth (see Implementation section) over 15 min; additional unit may be used 15 min after first unit is completed. If more than 1 unit is required per episode (as evaluated over several episodes), dose may be ↑ as required to control pain. Optimal usage/titration should result in using no more than 4 units/day.

SL (Adults): *Tablets*—100 mcg initially, then titrate using 100-mcg increments to provide adequate analge-

sia without undue side effects (not to exceed 2 doses per episode; no more than 4 doses per day; separate by at least 2 hr); *Spray*—100 mcg initially; if pain not relieved within 30 min, repeat 100-mcg dose (do not take more than 2 doses per breakthrough pain episode); patients must wait ≥ 4 hr before treating another episode of breakthrough pain. Dose may be titrated during subsequent pain episodes to 200 mcg, then 400 mcg, then 600 mcg, then 800 mcg, then 1200 mcg, and then 1600 mcg to provide adequate analgesia and undue side effects.

Availability (generic available)

Buccal tablets: 100 mcg, 200 mcg, 300 mcg, 400 mcg, 600 mcg, 800 mcg. **Cost:** 200 mcg \$1,006.04/28. **Nasal spray:** 100 mcg/spray, 300 mcg/spray, 400 mcg/spray. **Oral transmucosal lozenge on a stick (berry flavor-sugar free):** 200 mcg, 400 mcg, 600 mcg, 800 mcg, 1200 mcg, 1600 mcg. **Cost:** *Generic*—400 mcg \$599.93/30, 1200 mcg \$799.93/30, 1600 mcg \$1,155.89/30. **Sublingual spray:** 100 mcg/spray, 200 mcg/spray, 400 mcg/spray, 600 mcg/spray, 800 mcg/spray. **Sublingual tablets:** 100 mcg, 200 mcg, 300 mcg, 400 mcg, 600 mcg, 800 mcg.

NURSING IMPLICATIONS

Assessment

- Monitor type, location, and intensity of pain before and 1 hr after administration of transmucosal fentanyl.
- Assess BP, pulse, and respirations before and periodically during administration. If respiratory rate is < 10 min, assess level of sedation. Physical stimulation may be sufficient to prevent hypoventilation. Subsequent doses may need to be decreased. Patients tolerant to opioid analgesics are usually tolerant to the respiratory depressant effects also.
- Monitor for application site reactions (paresthesia, ulceration, bleeding, pain, ulcer, irritation). Reactions are usually self-limited and rarely require discontinuation.
- **Lab Test Considerations:** May cause anemia, neutropenia, thrombocytopenia, and leukopenia.
- May cause hypokalemia, hypoalbuminemia, hypercalcemia, hypomagnesemia, and hyponatremia.
- **Toxicity and Overdose:** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by IV push every 2 min. For patients weighing < 40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg every 2 min. Use extreme caution when titrating dose in patients physically dependent on opioid analgesics to avoid withdrawal, seizures, and severe pain. Duration of

respiratory depression may be longer than duration of opioid antagonist, requiring repeated doses.

Potential Nursing Diagnoses

Acute pain (Indications)

Risk for injury (Adverse Reactions)

Implementation

- **High Alert:** Accidental overdose of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders; have second practitioner independently check original order and dose calculations.
- Do not confuse fentanyl with sufentanil.
- Patients considered opioid-tolerant are those who are taking ≥ 60 mg of oral morphine/day, at least 25 mcg transdermal fentanyl/hr, 30 mg of oxycodone/day, 8 mg of hydromorphone/day or an equianalgesic dose of another opioid for ≥ 1 wk.
- **High Alert:** Dose may be lethal to a child; keep out of reach of children.
- Do not substitute fentanyl products; doses are not equivalent.
- **REMS:** Health care professionals who prescribe transmucosal immediate-release fentanyl (TIRF) medicines for outpatient use are required to enroll in the TIRF REMS Access program. Health care professionals already enrolled in an individual Risk Evaluation and Mitigation Strategy (REMS) program for at least one TIRF medicine, will be automatically transitioned to the shared TIRF REMS Access program, and do not need to re-enroll. Enrollment renewal in TIRF REMS program is required every 2 yr from the date of enrollment. Information can be found at www.TIRFREMSaccess.com. A TIRF REMS Access Patient-Prescriber Agreement Form must be signed with each new patient before writing the patient's first TIRF prescription and health care professionals must also provide patients with a copy of the *Medication Guide* during counseling about the proper use of their TIRF medicine. Pharmacists who dispense TIRF medicines are also required to enroll in the TIRF REMS program and re-enroll every 2 yr. Patients are enrolled in the TIRF REMS Access program by the pharmacy at the time their first prescription is filled. Patients can locate a participating pharmacy by consulting their prescriber or calling the TIRF REMS Access program at 1-866-822-1483.
- **Buccal:** *Fentora:* Do not attempt to push tablet through blister, may cause damage to tablet. Open by tearing along perforations to separate from blister card. Then bend blister unit on line where indicated. Blister backing should then be peeled to expose tablets. Use immediately; do not store, may damage integrity of tablet. Tablets are not to be sucked, chewed, or swallowed whole; this will reduce medication effectiveness. Place between cheek and gum

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

above a molar or under tongue and allow medication to dissolve, usually 14–25 min. May cause bubbling sensation between teeth and gum while tablet dissolves. Do not attempt to split tablet. After 30 min, if remnants of tablet remain, swallow with glass of water.

- For patients not previously using transmucosal fentanyl, initial dose should be 100 mcg. Titrate to provide adequate relief while minimizing side effects. For patients switching from oral transmucosal fentanyl to fentanyl buccal, if transmucosal dose is 200–400 mcg, switch to 100 mcg buccal; if transmucosal dose is 600–800 mcg, switch to 200 mcg buccal; if transmucosal dose is 1200–1600 mcg, switch to 400 mcg buccal fentanyl.
 - Dose may be repeated once during a single episode of breakthrough pain if not adequately relieved. Redose may occur 30 min after start of administration of fentanyl buccal and the same dose should be used.
 - If more than 1 dose is required per breakthrough pain episode for several consecutive episodes, dose of maintenance opioid and fentanyl buccal should be adjusted. To increase dose, use multiples of 100 mcg tablet, use two 100-mcg tablets (1 on each side of mouth in buccal cavity). If unsuccessful in controlling breakthrough pain episode, two 100-mcg tablets may be placed on each side of mouth in buccal cavity (four 100-mcg tablets). Titrate above 400 mcg by 200 mcg increments. To reduce risk of overdose, patients should have only one strength available at any one time.
 - Once a successful dose has been established, if more than 4 breakthrough pain episodes/day occur, re-evaluate opioid dose for persistent pain.
 - Inform patient if medication is no longer needed they should contact Cephalon at 1-800-896-5855 or remove from blister pack and flush any remaining product down toilet.
 - **Intranasal: Lazanda:** Prime the device before use by spraying into the pouch (4 sprays in total). Insert nozzle of the bottle a short distance (about ½ inch or 1 cm) into nose and point toward bridge of nose, tilting the bottle slightly. Press down firmly on finger grips until a “click” is heard and the number in the counting window advances by one. Advise patients that the fine-mist spray is not always felt on the nasal mucosal membrane and to rely on the audible click and advancement of dose counter to confirm a spray has been administered.
 - All patients (including those switching from another fentanyl product) must start using one 100-mcg spray of fentanyl sublingual (1 spray in 1 nostril). If adequate analgesia is obtained within 30 min of administration of the 100-mcg single spray, treat subsequent episodes of breakthrough pain with this dose. If adequate analgesia is not achieved with first 100-mcg dose, ↑ dose in a step-wise manner over consecutive episodes of breakthrough pain until ad-
- equate analgesia with tolerable side effects is achieved. Patients MUST wait at least 2 hr before treating another episode of breakthrough cancer pain with fentanyl intranasal. Confirm the dose of fentanyl intranasal that works for patient with a second episode of breakthrough pain and review their experience with their health care professional to determine if that dose is appropriate, or whether a further adjustment is warranted.
- During any episode of breakthrough cancer pain, if there is inadequate pain relief after 30 min following fentanyl intranasal dosing or if a separate episode of breakthrough cancer pain occurs before the next dose of fentanyl intranasal is permitted (i.e., within 2 hr), patients may use a rescue medication as directed by their health care professional.
 - For patients no longer requiring opioid therapy, consider discontinuing fentanyl sublingual along with a gradual downward titration of other opioids to minimize possible withdrawal effects. In patients who continue to take chronic opioid therapy for persistent pain but no longer require treatment for breakthrough pain, fentanyl intranasal therapy can usually be discontinued immediately.
 - **Transmucosal: Actiq:** Open the foil package immediately before use. Instruct patient to place unit in the mouth between the cheek and lower gum, moving it from one side to the other using the handle. Patient should suck, not chew, the lozenge. If it is chewed and swallowed, lower peak concentrations and lower bioavailability may occur. Instruct patient to consume lozenge over 15-min period; longer or shorter periods may be less efficacious. If signs of excessive opioid effects occur, remove from patient’s mouth immediately and decrease future doses.
 - Initial dose for breakthrough pain should be 200 mcg. Six 200-mcg units should be prescribed and should be used before increasing to a higher dose. If one unit is ineffective, a second unit may be started 15 min after the completion of the first unit. Do not use more than 2 units during a single episode of breakthrough pain during titration phase. With each new dose during titration, 6 units should be prescribed, allowing treatment of several episodes of breakthrough pain. Adequate dose is determined based on effective analgesia with acceptable side effects. Side effects during titration period are usually greater than after effective dose is determined.
 - Once an effective dose is determined, instruct patient to limit dose to 4 units/day. If >4 units/day are required, consider increasing the dose of the long-acting opioid.
 - Discontinue with a gradual decrease in dose to prevent signs and symptoms of abrupt withdrawal.
 - To dispose of remaining unit, using wire-cutting pliers cut off the drug matrix end so that it falls into the toilet. Flush remaining drug matrix down toilet. Drug remaining on handle may be removed by placing un-

der running warm water until dissolved. Dispose of drug-free handle according to institutional protocol.

High Alert: Partially consumed units are no longer protected by child-resistant pouch; dose may still be fatal. A temporary child-resistant storage bottle is provided for partially consumed units that cannot be disposed of properly.

- **SI: Abstral:** Dose must start with 100 mcg initially, titrate to adequate pain relief; if initial dose is adequate, this will be the dose for subsequent breakthrough pain; if dose is inadequate within 30 min give supplemental 100-mcg dose and ↑ next breakthrough dose by 100 mcg; if inadequate continue to ↑ breakthrough dose to 300, then 400, then 600 mcg, then 800 mcg; limit treatment to 4 episodes/24 hr.
- If inadequate analgesia after first dose, a second dose may be used after 30 min. No more than 2 doses may be used to treat an episode of breakthrough pain. Episodes should be separated by at least 2 hr. Other rescue medications may be used as directed.
- Once a successful dose has been established, if more than 4 breakthrough pain episodes/day occur, re-evaluate opioid dose for persistent pain.
- Place tablet on the floor of the mouth directly under the tongue and allow to dissolve completely; do not chew, suck, or swallow. Do not eat or drink anything until tablet is dissolved. In patients with dry mouth, water may be used to moisten oral mucosa *before* taking sublingual fentanyl. Advise patient to dispose of unused fentanyl sublingual tablets by removing from blister pack and flushing down toilet.
- **SI: Subsys:** Dose must start with 100 mcg initially, titrate to adequate pain relief; if initial dose is adequate, this will be the dose for subsequent breakthrough pain; if dose is inadequate within 30 min give supplemental 100-mcg dose and ↑ next breakthrough dose by 100 mcg; if inadequate continue to ↑ breakthrough dose to 400, then 600 mcg, then 800 mcg, then 1600 mcg.
- If inadequate analgesia after first dose, a second dose may be used after 30 min. No more than 2 doses may be used to treat an episode of breakthrough pain. Episodes should be separated by at least 4 hr. Other rescue medications may be used as directed.
- Spray contents under tongue. Follow instructions in *Medication Guide*.
- Before you throw away the *Subsys* spray units, empty all of medicine (up to 10 spray units) into charcoal-lined disposal pouch provided with each dose. Put nozzle of spray unit upside-down into opening of charcoal-lined disposal pouch. Squeeze fingers and thumb together to spray into the charcoal lined disposal pouch. Place empty spray unit into pouch. To

seal used charcoal-lined disposal pouch, remove backing from adhesive strip. Fold the flap down and press to seal charcoal-lined disposal pouch. Place sealed charcoal-lined disposal pouch into a disposal bag and seal. Discard sealed disposal bag in trash out of reach of children. This protects others, especially children from harm. Follow instructions for use of disposal pouch in *Medication Guide* and *Instructions for Use*.

Patient/Family Teaching

- Instruct patient to take fentanyl as directed. Do not take more often than prescribed, keep out of reach of children, protect it from being stolen, and do not share with others, even if they have the same symptoms. Open only when ready to administer. Advise patient to review *Medication Guide* before and with each Rx refill; new information may be available. Advise patient to notify health care professional if breakthrough pain is not alleviated, worsens, if >4 units/day are required to control pain, or if excessive opioid effects occur.
- Explain TIRF REMS program to patient and caregiver. Patients must sign the Patient-Prescriber Agreement Form to confirm they understand the risks, appropriate use, and storage of fentanyl transmucosal.
- Advise patient to avoid grapefruit juice during therapy.
- Caution patient to make position changes slowly to minimize orthostatic hypotension.
- Medication causes dizziness and drowsiness. Advise patient to call for assistance during ambulation and transfer, and to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient to avoid concurrent use of alcohol or other CNS depressants, such as sleep aids.
- Advise patient to notify health care professional if sores on gums or inside cheek become a problem.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- **Actiq:** Inform patient that this drug may contain sugar and may cause dry mouth. Advise patient to maintain good oral hygiene regular dental exams.

Evaluation/Desired Outcomes

- Decrease in severity of pain during episodes of breakthrough pain in patients receiving and tolerant to long-acting opioids.

* = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

ferric citrate (fe-rik si-trate)

Auryxia

Classification

Therapeutic: electrolyte modifiers

Pharmacologic: phosphate binders

Indications

Control of serum phosphorous in chronic renal failure patients on dialysis.

ActionBinds phosphorous and precipitates it as ferric phosphate. **Therapeutic Effects:** Maintenance of normal phosphorous levels.**Pharmacokinetics****Absorption:** Some absorption follows oral administration and may lead to iron overload.**Distribution:** Unknown.**Metabolism and Excretion:** Following binding, precipitated ferric phosphate is excreted in stool.**Half-life:** Unknown.

TIME/ACTION PROFILE (lowering of serum phosphorous)

ROUTE	ONSET	PEAK	DURATION
PO	within 1 wk	unknown	unknown

Contraindications/Precautions**Contraindicated in:** Iron overload syndromes including hemochromatosis.**Use Cautiously in:** GI bleeding/inflammation; **OB:** Use cautiously during pregnancy (consider effects on vitamins/nutrient and potential iron overload); **Lactation:** Consider possible iron transport into milk; **Pedi:** Safety and effectiveness not established.**Adverse Reactions/Side Effects****GI:** diarrhea, discolored feces, nausea, constipation, vomiting. **Misc:** iron overload.**Interactions****Drug-Drug:** Binds and ↓ absorption of doxycycline (should be given ≥ 1 hr prior to ferric citrate). Binds and ↓ absorption of ciprofloxacin (should be given ≥ 2 hr prior to or after ferric citrate).**Route/Dosage****PO (Adults):** 2 tablets (2 g ferric citrate) 3 times daily. Adjust by 1–2 tablets/day at weekly (or longer) intervals to attain target phosphorous levels.**Availability (generic available)****Tablets:** 1 g (contains 210 mg ferric iron).**NURSING IMPLICATIONS****Assessment**

- Monitor clinical responses or blood levels of concurrent medications; may decrease bioavailability of medications administered concurrently.

- **Lab Test Considerations:** Monitor serum phosphorous prior to starting and periodically during therapy to keep serum phosphorous at target levels.
- Assess iron parameters (serum ferritin and transferrin saturation TSAT) prior to starting and periodically during therapy. May cause ↑ serum ferritin and TSAT requiring reduced dose or discontinuation of IV iron therapy.

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- **PO:** Administer 3 times daily with meals.

Patient/Family Teaching

- Instruct patient to take ferric citrate as directed and to continue with prescribed diet.
- Advise patient that ferric citrate may cause dark stools; this is normal for medications containing iron.
- Inform patient that ferric citrate may cause diarrhea, nausea, constipation, and vomiting. Notify health care professional if GI symptoms become severe or persistent.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications. Medications may need to be taken separately from ferric citrate.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Normal serum phosphorous levels.

ferrous fumarate, See IRON SUPPLEMENTS.**ferrous gluconate, See IRON SUPPLEMENTS.****ferrous sulfate, See IRON SUPPLEMENTS.****fesoterodine**
(fee-soe-ter-o-deen)

Toviaz

Classification

Therapeutic: urinary tract antispasmodics

Pharmacologic: anticholinergics

Indications

Treatment of overactive bladder function that results in urinary frequency, urgency, or urge incontinence.

Action

Acts as a competitive muscarinic receptor antagonist resulting in inhibition of cholinergically mediated bladder contraction. **Therapeutic Effects:** Decreased urinary frequency, urgency, and urge incontinence.

Pharmacokinetics

Absorption: Rapidly absorbed following oral administration, but is rapidly converted to its active metabolite (bioavailability of metabolite 52%); further metabolism occurs in the liver via CYP2D6 and CYP3A4 enzyme systems; \boxtimes the CYP2D6 enzyme system exhibits genetic polymorphism; ~7% of population may be poor metabolizers (PMs) and may have significantly \uparrow fesoterodine concentrations and an \uparrow risk of adverse effects. 16% of active metabolite is excreted in urine, most of the remainder of inactive metabolites are renally excreted. 7% excreted in feces.

Distribution: Unknown.

Metabolism and Excretion: Rapidly converted by esterases to active metabolite.

Half-life: 7 hr (following oral administration).

TIME/ACTION PROFILE (active metabolite)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	5 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Urinary retention; Gastric retention; Severe hepatic impairment; Uncontrolled narrow-angle glaucoma.

Use Cautiously in: Significant bladder outlet obstruction (\uparrow risk of retention); Severe renal insufficiency (dose adjustment required); \downarrow GI motility including severe constipation; Treated narrow-angle glaucoma (use only if benefits outweigh risks); Myasthenia gravis; Severe renal impairment (dose should not exceed 4 mg/day); **Geri:** \uparrow risk of anticholinergic side effects in patients >75 yr; **OB, Lactation:** Avoid using unless potential benefits outweighs potential risk to fetus/neonate; **Pedi:** Safety not established.

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, headache. **CV:** tachycardia (dose related). **GI:** dry mouth, constipation, nausea, upper abdominal pain. **GU:** dysuria, urinary retention. **MS:** back pain. **Misc:** ANGIOEDEMA.

Interactions

Drug-Drug: Concurrent use of **potent CYP3A4 enzyme inhibitors** including **ketoconazole, itraconazole, and clarithromycin** \uparrow blood levels and risk of toxicity; daily dose should not exceed 4 mg. Use **less**

potent inhibitors of CYP3A4 (such as **erythromycin**) with caution; escalate dose carefully. Anticholinergic effects may alter the GI absorption of other drugs.

Route/Dosage

PO (Adults): 4 mg once daily initially may be \uparrow to 8 mg/daily; *Concurrent potent CYP3A4 inhibitors or CCr <30 mL/min*—dose should not exceed 4 mg/day.

Availability (generic available)

Extended-release tablets: 4 mg, 8 mg.

NURSING IMPLICATIONS

Assessment

- Assess for urinary urgency, frequency, and urge incontinence periodically during therapy.
- **Monitor for signs and symptoms of angioedema** (swelling of face, lips, tongue, and/or larynx). May occur with first or subsequent doses. Discontinue therapy and provide supportive therapy. Have epinephrine, corticosteroids, and resuscitation equipment available.
- **Lab Test Considerations:** May cause \uparrow ALT and GGT.

Potential Nursing Diagnoses

Impaired urinary elimination (Indications)
Urinary retention (Indications)

Implementation

- **PO:** Administer without regard to food.
- Swallow extended-release tablets whole; do not break, crush, or chew.

Patient/Family Teaching

- Instruct patient to take fesoterodine as directed. If a dose is missed, omit and begin taking again the next day; do not take 2 doses the same day. Advise patient to read the *Patient Information* sheet prior to initiation of therapy and with each Rx refill in case of changes.
- May cause drowsiness, dizziness, and blurred vision. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid alcohol; may increase drowsiness.
- Advise patient to use caution in hot environments; may cause decreased sweating and severe heat illness.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- **Advise patient to stop medication and notify health care professional if signs and symptoms of angioedema occur.**

* = Canadian drug name. \boxtimes = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decreased urinary frequency, urgency, and urge incontinence.

fexofenadine

(fex-oh-fen-a-deen)

Allegra, Children's Allegra Allergy, Children's Allegra Hives, Mucinex Allergy

Classification

Therapeutic: allergy, cold, and cough remedies, antihistamines

Indications

Relief of symptoms of seasonal allergic rhinitis. Management of chronic idiopathic urticaria.

Action

Antagonizes the effects of histamine at peripheral histamine-1 (H₁) receptors, including pruritus and urticaria. Also has a drying effect on the nasal mucosa.

Therapeutic Effects: Decreased sneezing, rhinorrhea, itchy eyes, nose, and throat associated with seasonal allergies. Decreased urticaria.

Pharmacokinetics

Absorption: Rapidly absorbed after oral administration.

Distribution: Unknown.

Metabolism and Excretion: 80% excreted in urine, 11% excreted in feces.

Half-life: 14.4 hr (↑ in renal impairment).

TIME/ACTION PROFILE (antihistaminic effect)

ROUTE	ONSET	PEAK	DURATION
PO	within 1 hr	2–3 hr	12–24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Impaired renal function (↑ dosing interval recommended); **OB:** use only if maternal benefit outweighs potential risk to fetus; **Lactation:** Usually compatible with breast feeding (AAP).

Adverse Reactions/Side Effects

CNS: drowsiness, fatigue. **GI:** dyspepsia. **Endo:** dysmenorrhea.

Interactions

Drug-Drug: Magnesium and aluminum-containing antacids ↓ absorption and may decrease effectiveness.

Drug-Food: Apple, orange, and grapefruit juice ↓ absorption and may decrease effectiveness.

Route/Dosage

PO (Adults and Children ≥12 yr): 60 mg twice daily, or 180 mg once daily.

PO (Children 2–11 yr): 30 mg twice daily.

PO (Children 6 mo–2 yr): 15 mg twice daily.

Renal Impairment

PO (Adults): 60 mg once daily as a starting dose.

PO (Children 6–11 yr): 30 mg once daily as a starting dose.

Availability (generic available)

Tablets: 30 mg^{OTC}, 60 mg^{OTC}, 120 mg^{OTC}, 180 mg^{OTC}.

Orally disintegrating tablets: 30 mg^{OTC}. **Gelcaps:** 180 mg^{OTC}. **Suspension (berry flavor):** 30 mg/5 mL^{OTC}. **In combination with:** pseudoephedrine (Allegra-D). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess allergy symptoms (rhinitis, conjunctivitis, hives) before and periodically during therapy.
- Assess lung sounds and character of bronchial secretions. Maintain fluid intake of 1500–2000 mL/day to decrease viscosity of secretions.
- **Lab Test Considerations:** Will cause false-negative reactions on allergy skin tests; discontinue 3 days before testing.

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)
Risk for injury (Adverse Reactions)

Implementation

- **Do not confuse Allegra (fexofenadine) with Viagra (sildenafil). Do not confuse Allegra (fexofenadine) with Allegra Anti-Itch Cream (diphenhydramine/al-lantoin).**
- **PO:** Administer with food or milk to decrease GI irritation. Capsules and tablets should be taken with water or milk, not juice.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as remembered unless almost time for next dose.
- Inform patient that drug may cause drowsiness, although it is less likely to occur than with other antihistamines. Avoid driving or other activities requiring alertness until response to drug is known.
- Instruct patient to contact health care professional if symptoms persist.

Evaluation/Desired Outcomes

- Decrease in allergic symptoms.
- Decrease in urticaria.

fidaxomicin (fi-dax-oh-mye-sin)

Dificid

ClassificationTherapeutic: anti-infectives
Pharmacologic: macrolides**Indications**Treatment of diarrhea associated with *Clostridium difficile*.**Action**Bacterial action mostly against clostridia; inhibits RNA synthesis. Acts locally in the GI tract to eliminate *Clostridium difficile*. **Therapeutic Effects:** Elimination of diarrhea caused by *Clostridium difficile*.**Pharmacokinetics****Absorption:** Minimal systemic absorption.**Distribution:** Stays primarily in the GI tract.**Metabolism and Excretion:** Mostly transformed via hydrolysis in the GI tract to OP-1118, its active metabolite. Eliminated mostly (>92%) in feces; <1% excreted in urine.**Half-life:** *Fidaxomicin*—11.7 hr; *OP-1118*—11.2 hr.**TIME/ACTION PROFILE**

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown

Contraindications/Precautions**Contraindicated in:** Hypersensitivity.**Use Cautiously in:** **OB, Lactation:** Use during pregnancy only if clearly needed, use cautiously during lactation; **Pedi:** Safe and effective use in children <18 yr has not been established.**Adverse Reactions/Side Effects****GI:** GI HEMORRHAGE, nausea, abdominal pain. **Hemat:** anemia, neutropenia. **Misc:** HYPERSENSITIVITY REACTIONS.**Interactions****Drug-Drug:** No significant interactions noted.**Route/Dosage****PO (Adults >18 yr):** 200 mg twice daily for 10 days.**Availability****Tablets:** 200 mg.**NURSING IMPLICATIONS****Assessment**

- Monitor bowel function for diarrhea, abdominal cramping, fever, and bloody stools. May begin up to several wk following cessation of antibiotic therapy.

- Monitor for signs and symptoms of hypersensitivity reactions (dyspnea, pruritus, rash, angioedema of mouth, throat, and face) periodically during therapy. Risk increases with a macrolide allergy.
- **Lab Test Considerations:** May cause ↑ serum alkaline phosphatase, and hepatic enzymes.
- May cause ↓ serum bicarbonate, ↓ platelet count, anemia, and neutropenia.
- May cause hyperglycemia and metabolic acidosis.

Potential Nursing Diagnoses

Risk for infection (Indications)

Diarrhea (Indications)

Implementation

- **PO:** Administer twice daily without regard to food.

Patient/Family Teaching

- Instruct patient to take fidaxomicin as directed for the full course of therapy, even if feeling better. Skipping doses or not completing full course of therapy may decrease effectiveness of therapy and increase risk that bacteria will develop resistance and not be treatable in the future.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in diarrhea caused by *Clostridium difficile*.

filgrastim (fil-gra-stim)

Granix, *Grastofil, Neupogen, Zarxio

Classification

Therapeutic: colony-stimulating factors

IndicationsPrevention of febrile neutropenia and associated infection in patients who have received bone marrow-depressing antineoplastics for the treatment of nonmyeloid malignancies. Reduction of time for neutrophil recovery and duration of fever in patients undergoing induction and consolidation chemotherapy for acute myelogenous leukemia. Reduction of time to neutrophil recovery and sequelae of neutropenia in patients with nonmyeloid malignancies undergoing myeloablative chemotherapy followed by bone marrow transplantation. Mobilization of hematopoietic progenitor cells into peripheral blood for collection by leukapheresis. Management of severe chronic neutropenia. Survival improvement in patients acutely exposed to myelosuppressive doses of radiation. **Unlabeled Use:** Neutropenia associated with HIV infection. Neonatal neutropenia.* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.*CAPITALS indicates life-threatening; underlines indicate most frequent.

Action

A glycoprotein, filgrastim binds to and stimulates immature neutrophils to divide and differentiate. Also activates mature neutrophils. **Therapeutic Effects:** Decreased incidence of infection in patients who are neutropenic from chemotherapy or other causes. Improved harvest of progenitor cells for bone marrow transplantation. Improved survival in patients exposed to myelosuppressive doses of radiation.

Pharmacokinetics

Absorption: Well absorbed after subcut administration.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: *Adults*—3.5 hr; *Neonates*—4.4 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV, subcut	unknown	unknown	4 days†

†Return of neutrophil count to baseline.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to filgrastim or *Escherichia coli*-derived proteins.

Use Cautiously in: Malignancy with myeloid characteristics; Pre-existing cardiac disease; **OB:** Use only if potential benefit justifies potential risk to fetus; **Lactation:** Unlikely to adversely affect breast-fed infant.

Adverse Reactions/Side Effects

CV: vasculitis. **GI:** **SPLENIC RUPTURE**, splenomegaly.

EENT: hemoptysis. **GU:** glomerulonephritis. **Hemat:** excessive leukocytosis, sickle cell crises, thrombocytopenia. **Resp:** **ACUTE RESPIRATORY DISTRESS SYNDROME**, pulmonary infiltrates. **Local:** **ALLERGIC REACTIONS**, pain, redness at subcut site. **MS:** **medullary bone pain.**

Interactions

Drug-Drug: Simultaneous use with **antineoplastics** may have adverse effects on rapidly proliferating neutrophils—avoid use for 24 hr before and 24 hr after chemotherapy. **Lithium** may potentiate the release of neutrophils; concurrent use should be undertaken cautiously.

Route/Dosage

After Myelosuppressive Chemotherapy

IV, Subcut (Adults and Children): 5 mcg/kg/day as a single subcut injection, by short IV infusion, or via continuous IV infusion for up to 2 wk or until ANC reaches 10,000/mm³. Initiate at least 24 hr after chemotherapy. Dose may be ↑ by 5 mcg/kg during each cycle of chemotherapy, depending on blood counts.

After Bone Marrow Transplantation

IV (Adults): 10 mcg/kg/day as a continuous IV infusion for up to 24 hr; initiate at least 24 hr after chemotherapy and at least 24 hr after bone marrow transplan-

tion. Subsequent dose is adjusted according to blood counts.

Peripheral Blood Progenitor Cell Collection and Therapy

Subcut (Adults): 10 mcg/kg/day for at least 4 days before first leukapheresis and continued until last leukapheresis; Discontinue if WBC > 100,000 cells/mm³.

Severe Chronic Neutropenia

Subcut (Adults): *Congenital neutropenia*—6 mcg/kg twice daily. *Idiopathic/cyclical neutropenia*—5 mcg/kg daily (↓ if ANC remains > 10,000/mm³).

After Myelosuppressive Radiation

Subcut (Adults): 10 mcg/kg once daily; initiate as soon as possible after exposure to radiation doses greater than 2 gray; continue until ANC remains > 1000/mm³ for 3 consecutive blood counts (performed q 3 days) or is > 10,000/mm³ after a radiation-induced nadir.

Neonatal Neutropenia

IV, Subcut (Neonates): 5–10 mcg/kg/day once daily for 3–5 days.

Availability

Injection: 300 mcg/1 mL, 480 mcg/1.6 mL. **Prefilled syringe:** 300 mcg/0.5 mL, 480 mcg/0.8 mL.

NURSING IMPLICATIONS

Assessment

- Monitor heart rate, BP, and respiratory status before and periodically during therapy.
- Assess bone pain throughout therapy. Pain is usually mild to moderate and controllable with nonopioid analgesics, but may require treatment with opioid analgesics, especially in patients receiving high-dose IV therapy. Loratadine 10 mg PO administered before filgrastim dose has been used to prevent bone pain.
- Monitor for signs and symptoms of allergic reactions (rash, urticaria, facial edema, wheezing, dyspnea, hypotension, tachycardia). Usually occur within 30 min of administration. Treatment includes antihistamines, steroids, bronchodilators, and/or epinephrine; may recur with rechallenge.
- Assess for signs and symptoms of acute respiratory distress syndrome (fever, lung infiltrates, or respiratory distress). If symptoms occur, withhold filgrastim until symptoms resolve or discontinue.
- Monitor for signs and symptoms of splenic enlargement or rupture (left upper abdominal or shoulder pain).
- **Lab Test Considerations:** After chemotherapy, obtain a CBC with differential, including examination for the presence of blast cells, and platelet count before chemotherapy and twice weekly during therapy to avoid leukocytosis. Monitor ANC. A transient rise is seen 1–2 days after initiation of therapy, but ther-

apy should not be discontinued until ANC > 10,000/mm³.

- **After bone marrow transplant**, the daily dose is titrated by the neutrophil response. When the ANC is > 1000/mm³ for 3 consecutive days, the dose should be reduced by 5 mcg/kg/day. If the ANC remains > 1000/mm³ for 3 or more consecutive days, filgrastim is discontinued. If the ANC decreases to < 1000/mm³, filgrastim should be resumed at 5 mcg/kg/day.
- **For chronic severe neutropenia**, monitor CBC with differential and platelet count twice weekly during initial 4 wk of therapy and during 2 wk after any dose adjustment.
- May cause ↓ platelet count and transient ↑ in uric acid, LDH, and alkaline phosphatase concentrations.

Potential Nursing Diagnoses

Risk for infection (Indications)

Acute pain (Side Effects)

Implementation

- **Do not confuse Neupogen with Neumega (oprelvekin).**
- Administer no earlier than 24 hr after cytotoxic chemotherapy, at least 24 hr after bone marrow infusion, and not during the 24 hr before administration of chemotherapy.
- Refrigerate; do not freeze. Do not shake. May warm to room temperature for up to 6 hr before injection. Discard if left at room temperature for > 6 hr. Vial is for 1-time use only.
- **Subcut:** May be administered in outer area of upper arms, abdomen, thighs, or upper outer areas of buttock. If dose requires > 1 mL of solution, may be divided into 2 injection sites.
- Cap of needle contains latex; avoid administration by persons with latex allergy.
- May also be administered as a continuous subcut infusion over 24 hr after bone marrow transplantation.

IV Administration

- **Continuous Infusion: Diluent:** Dilute in D5W; do not dilute with 0.9% NaCl, will precipitate. Refrigerate; do not freeze. Do not shake. May warm to room temperature for up to 6 hr before injection. Vial is for 1-time use only. **Concentration:** Dilute to a final concentration of at least 15 mcg/mL. If the final concentration is < 15 mcg/mL, human albumin in a concentration of 2 mg/mL must be added to D5W before filgrastim to prevent adsorption of the components of the drug delivery system. **Rate:** After chemotherapy dose is administered via infusion over 15–60 min.
- **After chemotherapy** dose may also be administered as a continuous infusion.
- **After bone marrow transplant**, dose should be administered as an infusion over 4 or 24 hr.

- **Y-Site Compatibility:** acyclovir, allopurinol, amikacin, aminophylline, ampicillin, ampicillin/sulbactam, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, cefazolin, cefotetan, ceftazidime, chlorpromazine, cisplatin, cyclophosphamide, cytarabine, dacarbazine, daunorubicin hydrochloride, dexamethasone, diphenhydramine, doxorubicin, doxycycline, droperidol, enalaprilat, famotidine, fluconazole, fludarabine, ganciclovir, granisetron, haloperidol, hydrocortisone, hydromorphone, idarubicin, ifosfamide, leucovorin calcium, levofloxacin, lorazepam, mechlorethamine, melphalan, meperidine, mesna, methotrexate, metoclopramide, mitoxantrone, morphine, nalbuphine, ondansetron, potassium chloride, promethazine, ranitidine, rituximab, sodium acetate, sodium bicarbonate, streptozocin, tobramycin, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vinblastine, vincristine, vinorelbine, zidovudine.
- **Y-Site Incompatibility:** aminocaproic acid, amphotericin B colloidal, cefepime, cefotaxime, cefoxitin, ceftazolin, ceftriaxone, cefuroxime, clindamycin, dactinomycin, etoposide, fluorouracil, furosemide, heparin, mannitol, methylprednisolone sodium succinate, metronidazole, mitomycin, prochlorperazine, thiopeta.

Patient/Family Teaching

- Explain purpose of filgrastim to patient. Advise patient to notify health care professional regarding when to give next dose if a dose is missed. Instruct patient and caregiver to read *Instructions for Patients and Caregivers* before starting therapy and with each Rx refill in case of changes.
- **Instruct patient to notify health care professional immediately if signs and symptoms of spleen enlargement or rupture, allergic reaction, ARDS, or vasculitis (skin redness, purple spots on skin) occur.** Discuss risk of sickle cell crisis with patients with sickle cell disease before administering.
- **Rep:** Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding. Encourage patients that become pregnant during therapy to enroll in Amgen's Pregnancy Surveillance Program by calling 1-800-777AMGEN (1-800-772-6436). Encourage patients that breast feed during therapy to enroll in Amgen's Lactation Surveillance Program by calling 1-800-777AMGEN (1-800-772-6436).
- **Home Care Issues:** Instruct patient on correct technique and proper disposal for home administration. Caution patient not to reuse needle, vial, or syringe. Provide patient with a puncture-proof container for needle and syringe disposal.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Evaluation/Desired Outcomes

- Decreased incidence of infection in patients who receive bone marrow—depressing antineoplastics.
- Reduction of duration and sequelae of neutropenia after bone marrow transplantation.
- Reduction of the incidence and duration of sequelae of neutropenia in patients with severe chronic neutropenia.
- Improved harvest of progenitor cells for bone marrow transplantation.
- Improved survival in patients exposed to myelosuppressive doses of radiation.

finasteride (fi-nas-ter-ide)

Propecia, Proscar

Classification

Therapeutic: hair regrowth stimulants
Pharmacologic: androgen inhibitors

Indications

Benign prostatic hyperplasia (BPH); can be used with doxazosin. Androgenetic alopecia (male pattern baldness) in men only.

Action

Inhibits the enzyme 5-alpha-reductase, which is responsible for converting testosterone to its potent metabolite 5-alpha-dihydrotestosterone in prostate, liver, and skin; 5-alpha-dihydrotestosterone is partially responsible for prostatic hyperplasia and hair loss.

Therapeutic Effects: Reduced prostate size with associated decrease in urinary symptoms. Decreases hair loss; promotes hair regrowth.

Pharmacokinetics

Absorption: Well absorbed after oral administration (63%).

Distribution: Enters prostatic tissue and crosses the blood-brain barrier. Remainder of distribution not known.

Protein Binding: 90%.

Metabolism and Excretion: Mostly metabolized; 39% excreted in urine as metabolites; 57% excreted in feces.

Half-life: 6 hr (range 6–15 hr; slightly ↑ in patients >70 yr).

TIME/ACTION PROFILE (↓ in dihydrotestosterone levels†)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	8 hr	2 wk

†Clinical effects as noted by urinary tract symptoms and hair regrowth may not be evident for several mo and remain for 4 mo after discontinuation.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Women.

Use Cautiously in: Patients with hepatic impairment or obstructive uropathy.

Adverse Reactions/Side Effects

Endo: gynecomastia. **GU:** PROSTATE CANCER (HIGH-GRADE), ↓ libido, ↓ volume of ejaculate, erectile dysfunction, infertility. **Misc:** ANGIOEDEMA, BREAST CANCER.

Interactions

Drug-Drug: None noted.

Route/Dosage

PO (Adults): BPH—5 mg once daily (Proscar); *Androgenetic alopecia*—1 mg once daily (Propecia).

Availability (generic available)

Tablets: 1 mg (Propecia), 5 mg (Proscar). **Cost:** *Generic*—1 mg \$134.61/100, 5 mg \$21.85/100.

NURSING IMPLICATIONS

Assessment

- Assess for symptoms of prostatic hyperplasia (urinary hesitancy, feeling of incomplete bladder emptying, interruption of urinary stream, impairment of size and force of urinary stream, terminal urinary dribbling, straining to start flow, dysuria, urgency) before and periodically during therapy.
- Digital rectal examinations should be performed before and periodically during therapy for BPH.
- **Lab Test Considerations:** Serum prostate-specific antigen (PSA) concentrations, which are used to screen for prostate cancer, may be evaluated before and periodically during therapy. Finasteride may cause a ↓ in serum PSA levels.

Potential Nursing Diagnoses

Impaired urinary elimination (Indications)

Implementation

- **Do not confuse Proscar with Provera.**
- **PO:** Administer once daily with or without meals.

Patient/Family Teaching

- Instruct patient to take finasteride as directed, even if symptoms improve or are unchanged. At least 6–12 mo of therapy may be necessary to determine whether or not an individual will respond to finasteride. Advise patient to read the *Patient Package Insert* prior to starting therapy and with each Rx refill in case of changes.
- Inform patient that the volume of ejaculate may be decreased and erectile dysfunction and decreased libido may occur during therapy and after therapy is completed.
- Advise patient to notify health care professional promptly if changes in breasts (lumps, pain, nipple discharge) occur.
- Inform patient that there is an increased risk of high grade prostate cancer in men taking this drug.

- **Rep:** Caution patient that finasteride poses a potential risk to a male fetus. Women who are pregnant or may become pregnant should avoid exposure to semen of a partner taking finasteride and should not handle crushed finasteride because of the potential for absorption.
- Emphasize the importance of periodic follow-up exams to determine whether a clinical response has occurred.

Evaluation/Desired Outcomes

- Decrease in urinary symptoms of benign prostatic hyperplasia.
- Hair regrowth in androgenetic alopecia. Evidence of hair growth usually requires 3 mo or longer. Continued use is recommended to sustain benefit. Withdrawal leads to reversal of effect within 12 mo.

fingolimod (fin-go-li-mod)

Gilenya

Classification

Therapeutic: anti-multiple sclerosis agents

Pharmacologic: receptor modulators

Indications

Treatment of relapsing forms of multiple sclerosis.

Action

Converted by sphingosine kinase to the active metabolite fingolimod-phosphate, which binds to sphingosine 1-phosphate receptors, resulting in ↓ migration of lymphocytes into peripheral blood. This may ↓ lymphocyte migration into the CNS. **Therapeutic Effects:** ↓ frequency of relapses/delayed accumulation of disability.

Pharmacokinetics

Absorption: Well absorbed (93%) following oral administration.

Distribution: Extensively distributed to body tissues; 86% of parent drug distributes into red blood cells; active metabolite uptake 17%.

Metabolism and Excretion: Converted to its active metabolite, then metabolized mostly by the CYP450 4F2 enzyme system, with further degradation by other enzyme systems. Most inactive metabolites excreted in urine (81%); <2.5% excreted as fingolimod and fingolimod-phosphate in feces.

Protein Binding: >99.7%.

Half-life: 6–9 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–2 mo*	2 mo†

*Time to steady state blood levels, peak blood levels after a single dose at 12–16 hr.

†Time for complete elimination.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; MI, unstable angina, stroke, TIA, or class III or IV HF within previous 6 mo; 2nd- or 3rd-degree heart block or sick sinus syndrome (in the absence of a pacemaker); QT interval ≥ 500 msec; Concurrent use of class Ia or III antiarrhythmics; Active acute/chronic untreated infections; **Lactation:** Breast feeding should be avoided.

Use Cautiously in: Concurrent use of beta blockers, diltiazem, verapamil, or digoxin (↑ risk of bradycardia/heart block); History of ischemic heart disease, MI, HF, cerebrovascular disease, uncontrolled hypertension, AV block, bradycardia, syncope, cardiac arrest, or severe sleep apnea (↑ risk of bradycardia/heart block); Severe hepatic impairment (↑ blood levels and risk of adverse reactions); Diabetes mellitus/history of uveitis (↑ risk of macular edema); Negative history for chickenpox or vaccination against varicella zoster virus vaccination; **Ger:** Risk of adverse reactions may be ↑ consider age-related ↓ in cardiac/renal/hepatic function, chronic illnesses, and concurrent drug therapy; **Pedi:** Safety and effectiveness not established; **OB:** Use only if potential benefit justifies potential risk to fetus.

Adverse Reactions/Side Effects

CNS: POSTERIOR REVERSIBLE ENCEPHALOPATHY SYNDROME (PRES), PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY (PML), headache. **EENT:** blurred vision, eye pain, macular edema. **Resp:** cough, ↓ pulmonary function. **CV:** ASYSTOLE, BRADYCARDIA, HEART BLOCK, QT INTERVAL PROLONGATION, hypertension, syncope.

Derm: basal cell carcinoma. **GI:** diarrhea, ↑ liver enzymes. **Hemat:** leukopenia, lymphopenia. **MS:** back pain. **Misc:** INFECTION (including bacterial, viral and fungal), HYPERSENSITIVITY REACTION (including rash, urticaria, and angioedema).

Interactions

Drug-Drug: Concurrent use of class Ia or class III antiarrhythmics may ↑ risk of serious arrhythmias; careful monitoring recommended. Concurrent use of beta blockers, diltiazem, verapamil, or digoxin may ↑ risk of bradycardia; careful monitoring recommended. Concurrent use of ketoconazole may ↑ blood levels and risk of adverse reactions. ↑ risk of immunosuppression with antineoplastics, immunosuppressants, or immune modulating therapies. **Live-attenuated vaccines** ↑ risk of infection.

Route/Dosage

PO (Adults): 0.5 mg once daily.

Availability

Capsules: 0.5 mg.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

NURSING IMPLICATIONS

Assessment

- Monitor pulse and BP hourly for bradycardia for at least 6 hr following first dose and periodically during therapy. Obtain baseline ECG before first dose and at end of observation period. If patient develops heart rate <45 bpm or new onset 2nd-degree or higher heart block, monitor until resolved. If bradycardia is symptomatic, patient has coexisting medical condition that affects heart rate, or if QTc prolongation occurs, monitor continuous ECG; if pharmacologic therapy is required, monitor in hospital overnight and repeat first-dose monitoring for 2nd dose. If fingolimod is stopped for 2 wk or more, first-dose monitoring must be followed when restarting. Have cardiologist perform cardiac evaluation on patients with a pre-existing CV condition prior to starting therapy. Monitor overnight with continuous ECG for 1st dose.
- Monitor for signs of infection (fever, tiredness, body aches, chills, nausea, vomiting, headache, sore throat) during and for 2 mo after discontinuation of therapy. Consider suspending therapy if serious infection develops.
- Perform an ophthalmologic exam prior to starting fingolimod, at 3–4 mo after treatment initiation, and if visual disturbances occur. Monitor visual acuity at baseline and during routine exams. Patients with diabetes or history of uveitis are at ↑ risk and should have regular ophthalmologic exams.
- Monitor pulmonary function tests for decline periodically during therapy. Obtain spirometry and diffusion lung capacity for carbon monoxide when indicated clinically.
- Assess for any new signs or symptoms that may be suggestive of PML, an opportunistic infection of the brain caused by the Jakob Cruzfeldt (JC) virus, that may be fatal; withhold dose and notify health care professional promptly. PML symptoms may begin gradually (hemiparesis, apathy, confusion, cognitive deficiencies, and ataxia) and may include deteriorating renal function.
- **Lab Test Considerations:** Obtain baseline liver function test before starting therapy. May cause ↑ liver transaminases and bilirubin. Monitor liver function tests if symptoms develop and discontinue therapy if liver injury is confirmed.
- Before initiating therapy, obtain a recent (within 6 mo) CBC. May cause ↓ lymphocyte counts.

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- **PO:** Administer once daily without regard to food.

Patient/Family Teaching

- Instruct patient to take fingolimod as directed. If a dose is missed, contact health care professional be-

fore taking next dose; may need to be observed by a health care professional for at least 6 hrs after taking next dose. Do not discontinue therapy without consulting health care professional. Advise patient to read the *Medication Guide* prior to starting therapy and with each Rx refill in case of changes.

- Advise patient to notify health care professional if signs and symptoms of liver dysfunction (unexplained nausea, vomiting, abdominal pain, fatigue, anorexia, jaundice, dark urine), infection, PML, new onset of dyspnea, PRES (sudden headache, confusion, seizures, loss of vision, weakness), hypersensitivity reactions (rash or itchy hives, swelling of lips, tongue, or face), skin nodules (shiny pearly nodules), patches or open sores that do not heal within weeks, or changes in vision develop.
- Instruct patient not to receive live-attenuated vaccines during and for 2 mo after treatment due to risk of infection. Patients who have not had a health care professional confirmed history of chickenpox or documentation of a full course vaccination should be tested for antibodies to varicella zoster virus before starting therapy. Antibody-negative patients should receive vaccination prior to starting therapy, then postpone start of fingolimod for 1 mo to allow for full effect of vaccination.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- **Rep:** Advise female patients to use contraception during and for at least 2 mo after discontinuation of therapy and to notify health care professional immediately if pregnancy is planned or suspected or if breast feeding. Encourage pregnant patients to enroll in the pregnancy registry by calling 1-877-598-7237.

Evaluation/Desired Outcomes

- Reduction in frequency of clinical exacerbations and delay of accumulation of physical disability in patients with relapsing forms of multiple sclerosis.

REMS

 **flibanserin** (flib-an-ser-in)
Addyi

Classification

Therapeutic: sexual dysfunction agents

Indications

Treatment of premenopausal women with hypoactive sexual desire disorder (HSDD) unrelated to concurrent medical/psychiatric diagnoses, relationship issues, or substance abuse. Does not enhance sexual performance.

Action

May be explained by agonist activity at 5-HT_{1A} receptors and antagonist activity at 5-HT_{2A} receptors; also

has moderate antagonist activity at 5-HT_{2B}, 5-HT_{2C}, and dopamine D₄ receptors. **Therapeutic Effects:** ↑ sexual desire with ↓ distress and interpersonal dysfunction.

Pharmacokinetics

Absorption: Moderately absorbed (33%) following oral administration.

Distribution: Unknown.

Protein Binding: 98%.

Metabolism and Excretion: ☒ Highly metabolized, mostly by the CYP3A4 enzyme system with lesser metabolized by CYP2C19; the CYP2C19 enzyme system exhibits genetic polymorphism; poor metabolizers may have significantly ↑ flibanserin concentrations and an ↑ risk of adverse effects. 44% excreted in urine, 51% in feces almost entirely as metabolites which do not appear to be pharmacologically active.

Half-life: 11 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	within 1 hr	1 hr	24 hr

Contraindications/Precautions

Contraindicated in: Alcohol ingestion (excess risk of hypotension/syncope); Concurrent use of strong/moderate CYP3A4 inhibitors; Concurrent use of CYP3A4 inducers; Hepatic impairment; **Lactation:** Breast feeding is not recommended.

Use Cautiously in: ☒ CYP2C19 poor metabolizers (↑ risk of adverse reactions including hypotension, syncope, and drowsiness); **Geri:** Not indicated for use in the elderly; **OB:** Safe use during pregnancy has not been established; **Pedi:** Not indicated for use in children.

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, anxiety, fatigue, insomnia, vertigo. **CV:** HYPOTENSION/SYNCOPE. **GI:** nausea, constipation, dry mouth. **Derm:** rash.

Interactions

Drug-Drug: Concurrent use of **strong or moderate CYP3A4 inhibitors** including atazanavir, ciprofloxacin, clarithromycin, conivaptan, diltiazem, erythromycin, fluconazole, fosamprenavir, indinavir, itraconazole, ketoconazole, indinavir, nefinavir, posaconazole, ritonavir, saquinavir, and verapamil ↑ blood levels, effects and risk of serious adverse reactions; concurrent use is contraindicated. Wait two wk after discontinuing inhibitor before initiating flibanserin. If initiating inhibitor, wait two days after last dose of flibanserin. Concurrent use with **alcohol** ↑ risk of hypotension/syncope and excess sedation; concurrent use is contraindicated. Concurrent use of **oral hormonal contraceptives** and **weak CYP3A4 inhibitors** including cimetidine, fluoxetine, and rani-

tidine may also ↑ blood levels, effects and the risk of adverse reactions; avoid use of multiple weak CYP3A4 inhibitors. **Strong CYP2C19 inhibitors** including **proton pump inhibitors**, **SSRIs**, **benzodiazepines**, and **antifungals** ↑ blood levels, effects, and the risk of adverse reactions including hypotension, syncope, and CNS depression; concurrent use should be undertaken with caution. **CYP3A4 inducers** including **carbamazepine**, **phenobarbital**, **phenytoin**, **rifabutin**, **rifampin**, and **rifapentine** ↓ blood levels and effectiveness; concurrent use in not recommended. ↑ **digoxin** and **sirolimus** levels and risk of toxicity; careful monitoring recommended. ↑ risk of CNS depression with other **CNS depressants** including **alcohol**, **antihistamines**, **opioids**, **sedative/hypnotics**, some **anti-anxiety agents**, **antidepressants**, and **antipsychotics**.

Natural-Natural: Concurrent use with **ginkgo** may also ↑ blood levels, effects and the risk of adverse reactions; avoid use with other weak CYP3A4 inhibitors. **St. John's wort** ↓ blood levels and effectiveness; concurrent use is not recommended.

Drug-Food: Concurrent ingestion of **grapefruit juice** ↑ blood levels, effects, and risk of hypotension/syncope; concurrent ingestion is contraindicated.

Route/Dosage

PO (Adults): 100 mg once daily (at bedtime).

Availability

Tablets: 100 mg.

NURSING IMPLICATIONS

Assessment

- Assess sexual desire and related distress and interpersonal dysfunction before and periodically during therapy.
- Monitor for hypotension and syncope. Have patient lie supine if dizziness occurs.
- Assess likelihood of patient abstaining from alcohol, taking into account the patient's current and past drinking behavior, and other pertinent social and medical history. Counsel patients who are prescribed flibanserin about the importance of abstaining from alcohol use; interaction with alcohol increases risk of hypotension and syncope.

Potential Nursing Diagnoses

Sexual dysfunction (Indications)
Risk for injury (Adverse Reactions)

Implementation

- Administer once daily at bedtime; administration during waking hrs increases risks of hypotension, syncope, accidental injury, and central nervous system (CNS) depression.

* = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.
*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Only available through a restricted program, *Addyi REMS Program* due to increased risk of severe hypotension and syncope interaction with alcohol.

Patient/Family Teaching

- Instruct patient to take flibanserin as directed. If dose is missed, omit and take next dose at bedtime on next day. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Advise patient to avoid grapefruit juice during therapy.
- Caution patient to avoid alcohol during therapy; increases hypotensive effects. May cause dizziness and fainting.
- Advise patient if dizziness occurs, immediately lie supine and promptly seek medical help if symptoms do not resolve.
- May cause drowsiness. Caution patient to avoid driving and other activities requiring alertness until 6 hrs after each dose or until response to medication is known.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort.
- Advise patient to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding.

Evaluation/Desired Outcomes

- Increase in sexual desire. If no improvement in 8 wks, discontinue flibanserin.

fluconazole (floo-kon-a-zole)

- ✳️ Canesoral, Diflucan, ✳️ Diflucan One, ✳️ Monicure

Classification

Therapeutic: antifungals (systemic)

Indications

PO, IV: Fungal infections caused by susceptible organisms, including: Oropharyngeal or esophageal candidiasis, Serious systemic candidal infections, Urinary tract infections, Peritonitis, Cryptococcal meningitis. Prevention of candidiasis in patients who have undergone bone marrow transplantation. **PO:** Single-dose oral treatment of vaginal candidiasis. **Unlabeled Use:** Prevention of recurrent vaginal yeast infections.

Action

Inhibits synthesis of fungal sterols, a necessary component of the cell membrane. **Therapeutic Effects:** Fungistatic action against susceptible organisms. May be fungicidal in higher concentrations. **Spectrum:** *Cryptococcus neoformans*. *Candida* spp.

Pharmacokinetics

Absorption: Well absorbed after oral administration.

Distribution: Widely distributed, good penetration into CSF, saliva, sputum, vaginal fluid, skin, eye, and peritoneum. Excreted in breast milk.

Metabolism and Excretion: >80% excreted unchanged by the kidneys; <10% metabolized by the liver.

Half-life: Premature neonates: 46–74 hr; Children: 19–25 hr (PO) and 15–17 hr (IV); Adults: 30 hr (↑ in renal impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–4 hr	24 hr
IV	rapid	end of infusion	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to fluconazole or other azole antifungals; Concurrent use with pimozide, erythromycin, or quinidine.

Use Cautiously in: Renal impairment (dose ↓ required if CCr <50 mL/min); Underlying liver disease; **OB:** Safety not established; congenital defects have occurred with use of high-dose fluconazole (400–800 mg/day); **Lactation:** Usually compatible with breast feeding; **Geri:** ↑ risk of adverse reactions (rash, vomiting, diarrhea, seizures); consider age-related ↓ in renal function in determining dose.

Adverse Reactions/Side Effects

Incidence of adverse reactions is increased in HIV patients.

CNS: headache, dizziness, seizures. **GI:** HEPATOTOXICITY, abdominal discomfort, diarrhea, nausea, vomiting.

Derm: exfoliative skin disorders including STEVENS-JOHNSON SYNDROME. **Endo:** hypokalemia, hypertriglyceridemia. **Misc:** allergic reactions, including ANAPHYLAXIS.

Interactions

Drug-Drug: May ↑ levels of pimozide, erythromycin, and quinidine which can prolong the QT interval and ↑ the risk of torsade de pointes. May ↑ levels of and the risk of bleeding with warfarin. Rifampin, rifabutin, and isoniazid ↓ levels. Fluconazole at doses >200 mg/day may inhibit the CYP3A4 enzyme system and effect the activity of drugs metabolized by this system. ↑ hypoglycemic effects of tolbutamide, glyburide, or glipizide. ↑ levels and risk of toxicity from cyclosporine, carbamazepine, celecoxib, rifabutin, tacrolimus, sirolimus, theophylline, zidovudine, alfen-tanil, and phenytoin. ↑ levels and effects of benzodiazepines, amlodipine, felodipine, isradipine, nifedipine, nisoldipine, verapamil, atorvastatin, fluvastatin, lovastatin, simvastatin, methadone, flurbiprofen, prednisone, saquinavir, tricyclic antidepressants, and losartan. ↑ levels of tofacitinib; ↓ dose of tofacitinib to 5 mg once daily.

May ↑ risk of bleeding with **warfarin**. May antagonize effects of **amphotericin B**. May ↑ **voriconazole** levels; avoid concurrent use.

Route/Dosage

Oropharyngeal Candidiasis

PO, IV (Adults): 200 mg initially, then 100 mg daily for at least 2 wk.

PO, IV (Children >14 days): 6 mg/kg initially, then 3 mg/kg/day for at least 2 wk.

PO, IV (Neonates <14 days, 30–36 wk gestation): same dose as older children except frequency is q 48 hr; Premature neonates <29 wk gestation: 5–6 mg/kg/dose q 48–72 hr.

Esophageal Candidiasis

PO, IV (Adults): 200 mg initially, then 100 mg once daily for at least 3 wk (up to 400 mg/day).

PO, IV (Children >14 days): 6 mg/kg initially, then 3–12 mg/kg/day for at least 3 wk.

PO, IV (Neonates <14 days, 30–36 wk gestation): same dose as older children except frequency is q 48 hr; Premature neonates <29 wk gestation: 5–6 mg/kg/dose q 48–72 hr.

Vaginal Candidiasis

PO (Adults): 150-mg single dose; prevention of recurrence (unlabeled) — 150 mg daily for 3 days then weekly for 6 mo.

Systemic Candidiasis

PO, IV (Adults): 400 mg/day initially, then 200–800 mg/day for 28 days.

PO, IV (Children >14 days): 6–12 mg/kg/day for 28 days.

PO, IV (Neonates <14 days, 30–36 wk gestation): same dose as older children except frequency is q 48 hr; Premature neonates <29 wk gestation: 5–6 mg/kg/dose q 48–72 hr.

Cryptococcal Meningitis

PO, IV (Adults): *Treatment* — 400 mg once daily until favorable clinical response, then 200–800 mg once daily for at least 10–12 wk after clearing of CSF; change to oral therapy as soon as possible. *Suppressive therapy* — 200 mg once daily.

PO, IV (Children >14 days): 12 mg/kg/day initially, then 6–12 mg/kg/day for at least 10–12 wk after clearing of CSF; change to oral therapy as soon as possible. *Suppressive therapy* — 6 mg/kg/day.

PO, IV (Neonates <14 days, 30–36 wk gestation): same dose as older children except frequency is q 48 hr; Premature neonates <29 wk gestation: 5–6 mg/kg/dose q 48–72 hr.

Prevention of Candidiasis after Bone Marrow Transplant

PO, IV (Adults): 400 mg once daily; begin several days before procedure if severe neutropenia is expected, and continue for 7 days after ANC >1000/mm³.

PO, IV (Children >14 days): 10–12 mg/kg/day, not to exceed 600 mg/day.

Renal Impairment

PO, IV (Adults): *CCr* ≤50 mL/min (no hemodialysis) — Give 50% of the usual dose (not for single-dose therapy); *Hemodialysis* — Give 100% of the usual dose after each dialysis session; give reduced dose based on *CCr* on non-dialysis days (not for single-dose therapy).

Availability (generic available)

Tablets: 50 mg, 100 mg, 150 mg, 200 mg. **Cost:** *Generic* — 100 mg \$88.17/30, 150 mg \$6.99/1. **Powder for oral suspension (orange flavor):** 10 mg/mL, 40 mg/mL. **Cost:** *Generic* — 10 mg/mL \$36.00/35 mL, 40 mg/mL \$130.76/35 mL. **Premixed infusion:** 2 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess infected area and monitor CSF cultures before and periodically during therapy.
- Specimens for culture should be taken before instituting therapy. Therapy may be started before results are obtained.
- Assess patient for rash (mild to moderate rash usually occurs in the 2nd wk of therapy and resolves within 1–2 wk of continued therapy). If rash is severe (extensive erythematous or maculopapular rash with moist desquamation or angioedema), accompanied by systemic symptoms (serum sickness-like reaction, Stevens-Johnson syndrome, toxic epidermal necrolysis), or occurs during treatment for a superficial fungal infection, therapy must be discontinued immediately.
- **Lab Test Considerations:** Monitor BUN and serum creatinine before and periodically during therapy; patients with renal dysfunction will require dose adjustment.
- Monitor liver function tests before and periodically during therapy. May cause ↑ AST, ALT, serum alkaline phosphate, and bilirubin concentrations.

Potential Nursing Diagnoses

Risk for infection (Indications)

Implementation

- Do not confuse Diflucan (fluconazole) with Diprivan (propofol).
- **PO:** Shake oral suspension well before administration.

* = Canadian drug name. † = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; _____ indicate most frequent.

IV Administration

- **Intermittent Infusion:** **Diluent:** Premixed infusions are prediluted and ready to use. Do not unwrap until ready to use. Do not administer solution that is cloudy or has a precipitate. Check for leaks by squeezing inner bag. If leaks are found, discard container as unsterile. **Concentration:** 2 mg/mL.

Rate: Infuse over 1–2 hr. Do not exceed a rate of 200 mg/hr. **Pedi:** For children receiving doses >6 mg/kg/day, give over 2 hr.

- **Y-Site Compatibility:** acyclovir, aldesleukin, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, anidulafungin, argatroban, ascorbic acid, atropine, azathioprine, azithromycin, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, cangrelor, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotetan, cefoxitin, cefaroline, chlorpromazine, cisatracurium, cisplatin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone sodium phosphate, dexmedetomidine, dexrazoxane, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, epitifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fludarabine, fluorouracil, folic acid, fosfarnet, fosphenytoin, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, hydromorphone, idarubicin, ifosfamide, indomethacin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechloroethamine, melphalan, meperidine, meropenem, mesna, methotrexate, methylodopate, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, pentazocine, pentobarbital, phenobarbital, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quinupristin-dalfopristin, ranitidine, remifentanyl, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, telavancin, teniposide, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblas-

tine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** amphotericin B colloidal, amphotericin B lipid complex, ampicillin, dantrolene, diazepam, pantoprazole, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Instruct patient to take medication as directed, even if feeling better. Doses should be taken at the same time each day. Take missed doses as soon as remembered, but not if almost time for next dose. Do not double doses.
- **Instruct patient to notify health care professional if skin rash, abdominal pain, fever, or diarrhea becomes pronounced, if signs and symptoms of liver dysfunction (unusual fatigue, anorexia, nausea, vomiting, jaundice, dark urine, or pale stools) occur, if unusual bruising or bleeding occur, or if no improvement is seen within a few days of therapy.**
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Resolution of clinical and laboratory indications of fungal infections. Full course of therapy may require wk or mo of treatment after resolution of symptoms.
- Prevention of candidiasis in patients who have undergone bone marrow transplantation.
- Decrease in skin irritation and vaginal discomfort in patients with vaginal candidiasis. Diagnosis should be reconfirmed with smears or cultures before a second course of therapy to rule out other pathogens associated with vulvovaginitis. Recurrent vaginal infections may be a sign of systemic illness.

fludrocortisone

(floo-droe-kor-ti-son)

✳️ Florinef

Classification

Therapeutic: hormones

Pharmacologic: corticosteroids (mineralocorticoid)

Indications

Sodium loss and hypotension associated with adrenocortical insufficiency (given with hydrocortisone or cortisone). Management of sodium loss due to congenital adrenogenital syndrome (congenital adrenal hyperplasia). **Unlabeled Use:** Idiopathic orthostatic hypotension (with increased sodium intake). Type IV renal tubular acidosis.

Action

Causes sodium reabsorption, hydrogen and potassium excretion, and water retention by its effects on the distal renal tubule. **Therapeutic Effects:** Maintenance of

sodium balance and BP in patients with adrenocortical insufficiency.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Widely distributed; probably enters breast milk.

Protein Binding: High.

Metabolism and Excretion: Mostly metabolized by the liver.

Half-life: 3.5 hr.

TIME/ACTION PROFILE (mineralocorticoid activity)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	1–2 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: HF; Addison's disease (patients may have exaggerated response); **OB, Lactation, PEDI:** Safety not established.

Adverse Reactions/Side Effects

CNS: dizziness, headache. **CV:** HF, arrhythmias, edema, hypertension. **GI:** anorexia, nausea. **Endo:** adrenal suppression, weight gain. **F and E:** hypokalemia, hypokalemic alkalosis. **MS:** arthralgia, muscular weakness, tendon contractures. **Neuro:** ascending paralysis. **Misc:** hypersensitivity reactions.

Interactions

Drug-Drug: Use with **thiazide or loop diuretics, piperacillin, or amphotericin B** may ↑ risk of hypokalemia. Hypokalemia may ↑ risk of **digoxin** toxicity. May produce prolonged neuromuscular blockade following the use of **nondepolarizing neuromuscular blocking agents. Phenobarbital or rifampin** may ↑ metabolism and ↓ effectiveness.

Drug-Food: Large amounts of **salt or sodium-containing foods** may cause excessive sodium retention and potassium loss.

Route/Dosage

PO (Adults): *Adrenocortical insufficiency*—100 mcg/day (range 100 mcg 3 times weekly—200 mcg daily). Doses as small as 50 mcg daily may be required by some patients. Use with 10–37.5 mg cortisone daily or 10–30 mg hydrocortisone daily. *Adrenogenital syndrome*—100–200 mcg/day. *Idiopathic hypotension*—50–200 mcg/day (unlabeled).

PO (Children): 50–100 mcg/day.

Availability (generic available)

Tablets: 100 mcg (0.1 mg).

NURSING IMPLICATIONS

Assessment

- Monitor BP periodically during therapy. Report significant changes. Hypotension may indicate insufficient dose.
- Monitor for fluid retention (weigh daily, assess for edema, and auscultate lungs for rales/crackles).
- Monitor patients with Addison's disease closely and stop treatment if a significant increase in weight or BP, edema, or cardiac enlargement occurs. Patients with Addison's disease are more sensitive to the action of fludrocortisone and may have an exaggerated response.
- **Lab Test Considerations:** Monitor serum electrolytes periodically during therapy. Fludrocortisone causes ↓ serum potassium levels.

Potential Nursing Diagnoses

Deficient fluid volume (Indications)

Excess fluid volume (Side Effects)

Implementation

- **High Alert:** Do not confuse **Florinef** with **Floranex** or **Florastor**.
- **PO:** Tablets are scored and may be broken if dose adjustment is necessary.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as remembered but not just before next dose is due. Explain that lifelong therapy may be necessary and that abrupt discontinuation may lead to Addisonian Crisis. Patient should keep an adequate supply available at all times.
- Advise patient to follow dietary modification prescribed by health care professional. Instruct patient to follow a diet high in potassium (see Appendix K). Amount of sodium allowed in diet varies with pathophysiology.
- Instruct patient to inform health care professional if weight gain or edema, muscle weakness, cramps, nausea, anorexia, or dizziness occurs.
- Advise patient to carry identification at all times describing disease process and medication regimen.

Evaluation/Desired Outcomes

- Normalization of fluid and electrolyte balance without the development of hypokalemia or hypertension.

flumazenil (flu-maz-e-nil)

★ Anexate, Romazicon

Classification

Therapeutic: antidotes

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Indications

Complete/partial reversal of effects of benzodiazepines used as general anesthetics, or during diagnostic or therapeutic procedures. Management of intentional or accidental overdose of benzodiazepines.

Action

Flumazenil is a benzodiazepine derivative that antagonizes the CNS depressant effects of benzodiazepine compounds. It has no effect on CNS depression from other causes, including opioids, alcohol, barbiturates, or general anesthetics. **Therapeutic Effects:** Reversal of benzodiazepine effects.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Protein Binding: 50% primarily to albumin.

Metabolism and Excretion: Metabolism of flumazenil occurs primarily in the liver.

Half-life: Children: 20–75 min; Adults: 41–79 min.

TIME/ACTION PROFILE (reversal of benzodiazepine effects)

ROUTE	ONSET	PEAK	DURATION
IV	1–2 min	6–10 min	1–2 hr†

†Depends on dose/concentration of benzodiazepine and dose of flumazenil.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to flumazenil or benzodiazepines; Patients receiving benzodiazepines for life-threatening medical problems, including status epilepticus or ↑ intracranial pressure; Serious cyclic antidepressant overdosage.

Use Cautiously in: Mixed CNS depressant overdose (effects of other agents may emerge when benzodiazepine effect is removed); History of seizures (seizures are more likely to occur in patients who are experiencing sedative/hypnotic withdrawal, who have recently received repeated doses of benzodiazepines, or who have a previous history of seizure activity); Head injury (may ↑ intracranial pressure and risk of seizures); Severe hepatic impairment; **OB, Lactation:** Safety not established; **Pedi:** Children <1 yr (safety not established).

Adverse Reactions/Side Effects

CNS: SEIZURES, dizziness, agitation, confusion, drowsiness, emotional lability, fatigue, headache, sleep disorders. **EENT:** abnormal hearing, abnormal vision, blurred vision. **CV:** arrhythmias, chest pain, hypertension. **GI:** nausea, vomiting, hiccups. **Derm:** flushing, sweating. **Local:** pain/injection-site reactions, phlebitis. **Neuro:** paresthesia. **Misc:** rigors, shivering.

Interactions

Drug-Drug: None significant.

Route/Dosage

Reversal of Conscious Sedation or General Anesthesia

IV (Adults): 0.2 mg. Additional doses may be given at 1-min intervals until desired results are obtained, up to a total dose of 1 mg. If resedation occurs, regimen may be repeated at 20-min intervals, not to exceed 3 mg/hr.

IV (Children): 0.01 mg/kg (up to 0.2 mg); if the desired level of consciousness is not obtained after waiting an additional 45 sec, further injections of 0.01 mg/kg (up to 0.2 mg) can be administered and repeated at 60-sec intervals when necessary (up to a maximum of 4 additional times) to a maximum total dose of 0.05 mg/kg or 1 mg, whichever is lower. The dose should be individualized based on the patient's response.

Suspected Benzodiazepine Overdose

IV (Adults): 0.2 mg. Additional 0.3 mg may be given 30 sec later. Further doses of 0.5 mg may be given at 1-min intervals, if necessary, to a total dose of 3 mg. Usual dose required is 1–3 mg. If resedation occurs, additional doses of 0.5 mg/min for 2 min may be given at 20-min intervals (given no more than 1 mg at a time, not to exceed 3 mg per hr).

IV (Children): Unlabeled—0.01 mg/kg (maximum dose 0.2 mg) with repeat doses every minute up to a cumulative dose of 1 mg. As an alternative to repeat doses, continuous infusions of 0.005–0.01 mg/kg/hr have been used.

Availability (generic available)

Injection: 0.1 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess level of consciousness and respiratory status before and during therapy. Observe patient for at least 2 hr after administration for the appearance of resedation. Hypoventilation may occur.
- **Overdose:** Attempt to determine time of ingestion and amount and type of benzodiazepine taken. Knowledge of agent ingested allows an estimate of duration of CNS depression.

Potential Nursing Diagnoses

Risk for injury (Indications)

Risk for poisoning (Indications)

Implementation

- **Do not confuse flumazenil with influenza virus vaccine.**
- Ensure that patient has a patent airway before administration of flumazenil.
- Observe IV site frequently for redness or irritation. Administer through a free-flowing IV infusion into a large vein to minimize pain at the injection site.
- Optimal emergence should be undertaken slowly to decrease undesirable effects including confusion, agitation, emotional lability, and perceptual distortion.

- Institute seizure precautions. Seizures are more likely to occur in patients who are experiencing sedative/hypnotic withdrawal, patients who have recently received repeated doses of benzodiazepines, or those who have a previous history of seizure activity. Seizures may be treated with benzodiazepines, barbiturates, or phenytoin. Larger than normal doses of benzodiazepines may be required.
- **Suspected Benzodiazepine Overdose:** If no effects are seen after administration of flumazenil, consider other causes of decreased level of consciousness (alcohol, barbiturates, opioid analgesics).

IV Administration

- **IV Push:** *Diluent:* May be administered undiluted or diluted in syringe with D5W, 0.9% NaCl, or LR. Diluted solution should be discarded after 24 hr. *Concentration:* Up to 0.1 mg/mL. *Rate:* Administer each dose over 15–30 sec into free-flowing IV in a large vein. Do not exceed 0.2 mg/min in children or 0.5 mg/min in adults.

Patient/Family Teaching

- Flumazenil does not consistently reverse the amnesic effects of benzodiazepines. Provide patient and family with written instructions for postprocedure care. Inform family that patient may appear alert at the time of discharge but the sedative effects of the benzodiazepine may recur. Instruct patient to avoid driving or other activities requiring alertness for at least 24 hr after discharge.
- Instruct patient not to take any alcohol or nonprescription drugs for at least 18–24 hr after discharge.
- Resumption of usual activities should occur only when no residual effects of the benzodiazepine remain.

Evaluation/Desired Outcomes

- Improved level of consciousness.
- Decrease in respiratory depression caused by benzodiazepines.

flunisolide, See CORTICOSTEROIDS (INHALATION) and CORTICOSTEROIDS (NASAL).

fluocinolone, See CORTICOSTEROIDS (TOPICAL/LOCAL).

Avelox

ofloxacin† (oh-flox-a-sin)
Floxin

Classification

Therapeutic: anti-infectives
Pharmacologic: fluoroquinolones

†See Appendix C for ophthalmic use

Indications

PO, IV: Treatment of the following bacterial infections: Urinary tract infections including cystitis and prostatitis (ciprofloxacin, levofloxacin, ofloxacin) (should be used for acute uncomplicated cystitis only when there are no other alternative treatment options), Gonorrhea (may not be considered first-line agents due to increasing resistance), Gynecologic infections (ciprofloxacin, ofloxacin), Respiratory tract infections including acute sinusitis, acute exacerbations of chronic bronchitis, and pneumonia (should be used for acute sinusitis or acute bacterial exacerbations of chronic bronchitis only when there are no other alternative treatment options), Skin and skin structure infections (delafloxacin, levofloxacin, moxifloxacin, ciprofloxacin, ofloxacin), Bone and joint infections (ciprofloxacin), Infectious diarrhea (ciprofloxacin), Intra-abdominal infections (ciprofloxacin, moxifloxacin), Febrile neutropenia (ciprofloxacin). Postexposure treatment of inhalational anthrax (ciprofloxacin, levofloxacin). Treatment and prophylaxis of plague (ciprofloxacin, levofloxacin, moxifloxacin).

Action

Inhibit bacterial DNA synthesis by inhibiting DNA gyrase. **Therapeutic Effects:** Death of susceptible bacteria. **Spectrum:** Broad activity includes many gram-positive pathogens: Staphylococci including methicillin-resistant *Staphylococcus aureus*, *Staphylococcus epidermidis*, *Staphylococcus saprophyticus*, *Streptococcus pneumoniae*, *Streptococcus pyogenes*, and *Bacillus anthracis*. Gram-negative spectrum nota-

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

ble for activity against: *Escherichia coli*, *Klebsiella*, *Enterobacter*, *Salmonella*, *Sbigella*, *Proteus*, *Providencia*, *Morganella morganii*, *Pseudomonas aeruginosa*, *Serratia*, *Haemophilus*, *Acinetobacter*, *Neisseria gonorrhoeae*, *Moraxella catarrhalis*, *Campylobacter*, and *Yersinia pestis*. Additional spectrum includes: *Chlamydia pneumoniae*, *Legionella pneumoniae*, and *Mycoplasma pneumoniae*

Pharmacokinetics

Absorption: Well absorbed after oral administration (ciprofloxacin—70%; delafloxacin—59%; moxifloxacin—90%; gemifloxacin—71%; levofloxacin—99%; ofloxacin—98%).

Distribution: Widely distributed. High tissue and urinary levels are achieved. All agents appear to cross the placenta. Ciprofloxacin and ofloxacin enter breast milk.

Metabolism and Excretion: Ciprofloxacin—15% metabolized by the liver, 40–50% excreted unchanged by the kidneys; delafloxacin—primarily undergoes glucuronidation; 50–65% excreted unchanged by the kidneys; 28–48% excreted unchanged in feces; gemifloxacin—minimal metabolism, 61% excreted unchanged in feces, 36% excreted unchanged in urine; levofloxacin—87% excreted unchanged in urine, small amounts metabolized; moxifloxacin—mostly metabolized by the liver, 20% excreted unchanged in urine, 25% excreted unchanged in feces; ofloxacin—70–80% excreted unchanged by the kidneys.

Half-life: Ciprofloxacin—4 hr; delafloxacin—3.7 hr (IV); 4.2–8.5 hr (PO); gemifloxacin—7 hr; levofloxacin—8 hr; moxifloxacin—12 hr; ofloxacin—5–7 hr (all are ↑ in renal impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Ciprofloxacin—PO	rapid	1–2 hr	12 hr
Ciprofloxacin—PO-ER	rapid	1–4 hr	24 hr
Ciprofloxacin—IV	rapid	end of infusion	12 hr
Delafloxacin—PO	rapid	1 hr	12 hr
Delafloxacin—IV	rapid	end of infusion	12 hr
Gemifloxacin—PO	rapid	0.5–2 hr	24 hr
Levofloxacin—PO	rapid	1–2 hr	24 hr
Levofloxacin—IV	rapid	end of infusion	24 hr
Moxifloxacin—PO	within 1 hr	1–3 hr	24 hr
Moxifloxacin—IV	rapid	end of infusion	24 hr
Ofloxacin—PO	rapid	1–2 hr	12 hr
Ofloxacin—IV	rapid	end of infusion	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity. Cross-sensitivity among agents within class may occur; History of myasthenia gravis (may worsen symptoms including muscle weakness and breathing problems); **Gemifloxacin and moxifloxacin:** Concurrent use of Class IA antiarrhythmics (disopyramide, quinidine, procainamide) or Class III antiarrhythmics (amiodarone, sotalol) (↑ risk of QTc interval prolongation and torsade de pointes); Known QT interval prolongation or concurrent use of agents causing prolongation; **Ciprofloxacin:** Concurrent use with tizanidine; **Delafloxacin:** End-stage renal disease (eGFR <15 mL/min); **OB:** Do not use unless potential benefit outweighs potential fetal risk; **Pedi:** Use only for treatment of anthrax, plague, and complicated UTIs in children 1–17 yrs due to possible arthropathy.

Use Cautiously in: Seizure disorder; Depression; Renal impairment (dose ↓ if CCr ≤50 mL/min for ciprofloxacin, levofloxacin, ofloxacin; <40 mL/min for gemifloxacin); Cirrhosis (levofloxacin, moxifloxacin); **Gemifloxacin and moxifloxacin:** Concurrent use of erythromycin, antipsychotics, and tricyclic antidepressants (↑ risk of QTc prolongation and torsades de pointes); **Gemifloxacin and moxifloxacin:** Bradycardia; **Gemifloxacin and moxifloxacin:** Acute myocardial ischemia; **Delafloxacin:** Severe renal impairment (dose ↓ if eGFR 15–29 mL/min) (IV diluent may accumulate and ↑ SCr) (↑ risk of tendon rupture in renal failure); Concurrent use of corticosteroids (↑ risk of tendinitis/tendon rupture); Kidney, heart, or lung transplant patients (↑ risk of tendinitis/tendon rupture); Rheumatoid arthritis (↑ risk of tendon rupture); Diabetes; **Lactation:** Safety not established except for treatment of anthrax; **Geri:** ↑ risk of adverse reactions.

Adverse Reactions/Side Effects

CNS: ELEVATED INTRACRANIAL PRESSURE (including pseudotumor cerebri), SEIZURES, SUICIDAL THOUGHTS/BEHAVIORS, dizziness, headache, insomnia, acute psychoses, agitation, confusion, depression, drowsiness, hallucinations, lightheadedness, nightmares, paranoia, toxic psychosis. **CV:** gemifloxacin, levofloxacin, moxifloxacin—TORSADE DE POINTES, QT interval prolongation, vasodilation. **GI:** HEPATOTOXICITY (CIPROFLOXACIN), CLOSTRIDIUM DIFFICILE-ASSOCIATED DIARRHEA (CDAD), diarrhea, nausea, abdominal pain, ↑ liver enzymes (ciprofloxacin, moxifloxacin), vomiting. **GU:** vaginitis. **Derm:** STEVENS-JOHNSON SYNDROME, acute generalized exanthematous pustulosis, photosensitivity, rash. **Endo:** hyperglycemia, hypoglycemia. **Local:** phlebitis at IV site. **MS:** arthralgia, myalgia, tendinitis, tendon rupture. **Neuro:** peripheral neuropathy, tremor. **Misc:** hypersensitivity reactions including ANAPHYLAXIS, STEVENS-JOHNSON SYNDROME.

Interactions

Drug-Drug: Concurrent use of amiodarone, disopyramide, erythromycin, procainamide, dofetil-

ide, quinidine, some antipsychotics, sotalol, or tricyclic antidepressants ↑ risk of torsade de pointes in susceptible individuals (avoid concurrent use). Ciprofloxacin ↑ serum **theophylline** levels and may lead to toxicity. Administration with **magnesium and aluminum-containing antacids, iron salts, bismuth subsalicylate, sucralfate, didanosine, and zinc salts** ↓ absorption of fluoroquinolones. May ↑ the effects of **warfarin**. Ciprofloxacin may ↓ levels and effectiveness of **phenytoin**. Levels of fluoroquinolones may be ↓ by **antineoplastics**. **Cimetidine** may interfere with elimination of fluoroquinolones. Beneficial effects of ciprofloxacin may be antagonized by **nitrofurantoin**. **Probenecid** ↓ renal elimination of fluoroquinolones. May ↑ risk of nephrotoxicity from **cyclosporine**. Concurrent use of ciprofloxacin with **foscarnet** may ↑ risk of seizures. Concurrent therapy with **corticosteroids** may ↑ the risk of tendon rupture. May ↑ risk of hypoglycemia when used with **antidiabetic agents**.

Drug-Natural Products: **Fennel** ↓ the absorption of ciprofloxacin.

Drug-Food: Absorption is impaired by **concurrent tube feeding** (because of metal cations). Absorption is ↓ if taken with **dairy products** or calcium-fortified juices.

Route/Dosage

Ciprofloxacin

PO (Adults): *Most infections*—500–750 mg q 12 hr. *Complicated urinary tract infections*—500 mg q 12 hr for 7–14 days (immediate-release); or 1000 mg q 24 hr for 7–14 days (extended-release). *Uncomplicated urinary tract infections*—250 mg every 12 hr for 3 days (immediate-release) or 500 mg every 24 hr for 3 days (extended-release). *Gonorrhea*—250-mg single dose. *Inhalational anthrax (postexposure) or cutaneous anthrax*—500 mg every 12 hr for 60 days; *Plague*—500–750 mg q 12 hr for 14 days.

PO (Children 1–17 yr): *Complicated urinary tract infections*—10–15 mg/kg q 12 hr (not to exceed 750 mg/dose) for 10–21 days. *Inhalational anthrax (postexposure) or cutaneous anthrax*—10–15 mg/kg q 12 hr (not to exceed 500 mg/dose) for 60 days; *Plague*—15 mg/kg q 8–12 hr (maximum: 500 mg/dose) for 10–21 days.

IV (Adults): *Most infections*—400 mg q 12 hr. *Complicated urinary tract infections*—400 mg q 12 hr for 7–14 days. *Uncomplicated urinary tract infections*—200 mg q 12 hr for 7–14 days. *Inhalational anthrax (postexposure)*—400 mg q 12 hr for 60 days; *Plague*—400 mg q 8–12 hr for 14 days.

IV (Children 1–17 yr): *Inhalational anthrax (postexposure)*—10 mg/kg q 12 hr (not to exceed 400 mg/dose) for 60 days; *Complicated urinary tract infections*—6–10 mg/kg q 8 hr (not to exceed 400 mg/

dose) for 10–21 days; *Plague*—10 mg/kg q 8–12 hr (maximum: 400 mg/dose) for 10–21 days.

Renal Impairment

PO (Adults): *CCr 30–50 mL/min*—250–500 mg q 12 hr; *CCr 5–29 mL/min*—250–500 mg q 18 hr (immediate-release) or 500 mg q 24 hr (extended-release).

IV (Adults): *CCr 5–29 mL/min*—200–400 mg q 18–24 hr.

Delafloxacin

IV (Adults): 300 mg every 12 hr for 5–14 days or 300 mg every 12 hr followed by switching to oral regimen (at dose stated below) for a total of 5–14 days.

PO (Adults): 450 mg every 12 hr for 5–14 days.

Renal Impairment

IV (Adults): *eGFR 15–29 mL/min*—200 mg every 12 hr or 200 mg every 12 hr followed by switching to oral regimen (450 mg every 12 hr); *eGFR <15 mL/min*—Not recommended.

Gemifloxacin

PO (Adults): *Acute bacterial exacerbation of chronic bronchitis*—320 mg once daily for 5 days; *Community-acquired pneumonia (CAP) caused by Klebsiella pneumoniae, Moraxella catarrhalis, and multidrug resistant strains of S. pneumoniae*—320 mg once daily for 7 days. *Community-acquired pneumonia (CAP) caused by S. pneumoniae, Haemophilus influenzae, Mycoplasma pneumoniae, or Chlamydia pneumoniae, and multidrug resistant strains of S. pneumoniae*—320 mg once daily for 5 days.

Renal Impairment

PO (Adults): *CCr ≤40 mL/min*—160 mg once daily for 5 days.

Levofloxacin

PO, IV (Adults): *Most infections*—250–750 mg q 24 hr; *inhalational anthrax (postexposure)*—500 mg once daily for 60 days.

PO, IV (Children >50 kg): *Inhalational anthrax (postexposure)*—500 mg daily for 60 days; *Plague*—500 mg daily for 10–14 days.

PO, IV (Children <50 kg and ≥6 mo): *Inhalational anthrax (postexposure)*—8 mg/kg (max: 250 mg/dose) every 12 hr for 60 days. *Plague*—8 mg/kg (max: 250 mg/dose) every 12 hr for 10–14 days; *Other infections*—10 mg/kg/dose every 24 hr (max: 500 mg/dose).

Renal Impairment

PO, IV (Adults): *Normal renal function dosing of 750 mg/day:* *CCr 20–49 mL/min*—750 mg q 48 hr; *CCr 10–19 mL/min*—750 mg initially, then 500 mg q 48 hr; *Normal renal function dosing of 500 mg/day:*

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

CCr 20–49 mL/min—500 mg initially then 250 mg q 24 hr; *CCr 10–19 mL/min*—500 mg initially then 250 mg q 48 hr. **Normal renal function dosing of 250 mg/day:** *CCr 10–19 mL/min*—250 mg q 48 hr.

Moxifloxacin

PO, IV (Adults): *Bacterial sinusitis*—400 mg once daily for 10 days; *Community-acquired pneumonia*—400 mg once daily for 7–14 days. *Acute bacterial exacerbation of chronic bronchitis*—400 mg once daily for 5 days. *Complicated intra-abdominal infection*—400 mg once daily for 5–14 days. *Skin/skin structure infections*—400 mg/day for 7–21 days. *Treatment/prevention of plague*—400 mg once daily for 10–14 days.

Ofloxacin

PO (Adults): *Most infections*—400 mg q 12 hr. *Prostatitis*—300 mg q 12 hr for 6 wk. *Uncomplicated urinary tract infections*—200 mg q 12 hr for 3–7 days. *Complicated urinary tract infections*—200 mg q 12 hr for 10 days. *Gonorrhea*—400-mg single dose.

Renal Impairment

PO, IV (Adults): *CCr 20–50 mL/min*—100% of the usual dose q 24 hr; *CCr <20 mL/min*—50% of the usual dose q 24 hr.

Availability

Ciprofloxacin (generic available)

Tablets: 100 mg, 250 mg, 500 mg, 750 mg. **Cost:** *Generic*—100 mg \$20.22/6, 250 mg \$7.51/30, 500 mg \$15.38/30, 750 mg \$278.41/50. **Extended-release tablets:** 500 mg, 1000 mg. **Cost:** *Generic*—500 mg \$489.94/50, 1000 mg \$557.80/50. **Oral suspension (strawberry flavor):** 250 mg/5 mL, 500 mg/5 mL. **Cost:** *Generic*—250 mg/5 mL \$123.24/100 mL, 500 mg/5 mL \$144.28/100 mL. **Solution for injection:** 10 mg/mL. **Premixed infusion:** 200 mg/100 mL D5W, 400 mg/200 mL D5W. **In combination with:** hydrocortisone (Cipro HC) (see Appendix B).

Delafloxacin

Lyophilized powder for injection: 300 mg/vial. **Tablets:** 450 mg.

Gemifloxacin (generic available)

Tablets: 320 mg. **Cost:** \$239.20/5.

Levofloxacin (generic available)

Tablets: 250 mg, 500 mg, 750 mg. **Cost:** *Generic*—500 mg \$13.77/50, 750 mg \$24.22/20. **Oral solution:** 25 mg/mL. **Cost:** *Generic*—\$579.42/480 mL. **Solution for injection:** 25 mg/mL. **Premixed infusion:** 250 mg/50 mL D5W, 500 mg/100 mL D5W, 750 mg/150 mL D5W.

Moxifloxacin (generic available)

Tablets: 400 mg. **Cost:** \$769.58/30. **Premixed infusion:** 400 mg/250 mL 0.8% NaCl.

Ofloxacin (generic available)

Tablets: 200 mg, 300 mg, 400 mg. **Cost:** *Generic*—200 mg \$239.20/50, 300 mg \$284.66/50, 400 mg \$600.36/100.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC; urinalysis; frequency and urgency of urination; cloudy or foul-smelling urine) prior to and during therapy.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue drug and notify health care professional immediately if these problems occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in case of an anaphylactic reaction. Patients taking gemifloxacin who are at greater risk for rash are those receiving gemifloxacin for >7 days, <40 yr of age, females, and postmenopausal females receiving hormone replacement therapy.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of *Clostridium difficile*-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- Assess for signs and symptoms of peripheral neuropathy (pain, burning, tingling, numbness, and/or weakness or other alterations of sensation including light touch, pain, temperature, position sense, and vibratory sensation) periodically during therapy. Symptoms may be irreversible; discontinue fluoroquinolone if symptoms occur.
- Assess for suicidal tendencies, depression, or changes in behavior periodically during therapy.
- **Lab Test Considerations:** May cause ↑ serum AST, ALT, LDH, bilirubin, and alkaline phosphatase. May also cause ↑ or ↓ serum glucose. Moxifloxacin may cause hyperglycemia, hyperlipidemia, and altered prothrombin time. It may also cause ↑ WBC; ↑ serum calcium, chloride, albumin, and globulin; and ↓ hemoglobin, RBCs, neutrophils, eosinophils, and basophils. Monitor prothrombin time closely in patients receiving fluoroquinolones and warfarin; may enhance the anticoagulant effects of warfarin.

Potential Nursing Diagnoses

Risk for infection (Patient/Family Teaching)

Implementation

- **Do not confuse levofloxacin with levetiracetam.**
- **PO:** Administer *ofloxacin* on an empty stomach 1 hr before or 2 hr after meals, with a full glass of water. *Moxifloxacin*, *ciprofloxacin*, *levofloxacin*, and *gemifloxacin* may be administered without regard to meals. Should be taken at least 2 hr (3 hr for *gemifloxacin*, 4 hr for *moxifloxacin*) before or 2 hr (6 hr for *ciprofloxacin*, 8 hr for *moxifloxacin*) after antacids or other products containing calcium, iron, zinc, magnesium, or aluminum. *Gemifloxacin* should be taken at least 2 hr before sucralfate. *Delafloxacin* may be administered without regard to food and with a full glass of water, at the same time each day. Products or foods containing calcium, magnesium, aluminum, iron, or zinc should not be ingested for 2 hr before and 6 hr after administration.
- If gastric irritation occurs, *ciprofloxacin* may be administered with meals.
- *Ciprofloxacin* 5% and 10% oral suspension should not be administered through a feeding tube (may ↓ absorption). Shake solution for 15 seconds prior to administration.
- *Gemifloxacin* and *ciprofloxacin extended-release tablets*; swallow whole; do not break, crush, or chew.

Ciprofloxacin

IV Administration

- **Intermittent Infusion:** **Diluent:** Dilute with 0.9% NaCl or D5W. Stable for 14 days at refrigerated or room temperature. **Concentration:** 1–2 mg/mL. **Rate:** Administer over 60 min into a large vein to minimize venous irritation.
- **Y-Site Compatibility:** alemtuzumab, amifostine, amiodarone, anakinra, anidulafungin, argatroban, aztreonam, bivalirudin, bleomycin, calcium gluconate, carboplatin, carmustine, caspofungin, ceftaroline, ceftazidime, cisatracurium, cisplatin, cyclophosphamide, cytarabine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin, doxorubicin liposome, epirubicin, eptifibatid, ertapenem, etoposide, etoposide phosphate, fenoldopam, fludarabine, gemcitabine, gentamicin, granisetron, hetastarch, hydro-morphone, idarubicin, ifosfamide, irinotecan, leucovorin, lidocaine, linezolid, lorazepam, mechlorethamine, meperidine, mesna, methotrexate, metoclopramide, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, mycophenolate, naloxone, nesiritide, nicardipine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, potassium acetate, po-

tassium chloride, promethazine, quinupristin-dalfopristin, ranitidine, remifentanyl, rocuronium, tacrolimus, telavancin, teniposide, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zoledronic acid.

- **Y-Site Incompatibility:** Manufacturer recommends temporarily discontinuing other solutions when administering *ciprofloxacin*, acyclovir, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, ampicillin/sulbactam, cangrelor, cefepime, dexamethasone, esmolol, fluorouracil, foscarnet, furosemide, heparin, hydrocortisone, magnesium sulfate, meropenem, methylprednisolone, pantoprazole, pemetrexed, phenytoin, piperacillin/tazobactam, potassium phosphates, propofol, rituximab, sodium phosphates, warfarin.

Delafloxacin

- **Intermittent Infusion:** Reconstitute with 10.5 mL D5W or 0.9% NaCl for each 300 mg vial. Shake vigorously to completely dissolve. **Concentration:** 25 mg/mL. Solution is clear yellow to amber; do not administer solutions that are discolored or contain particulate matter. Reconstituted solution is stable if refrigerated or at room temperature for 24 hrs. **Diluent:** Dilute to volume of 250 mL with 0.9% NaCl or D5W. **Concentration:** 1.2 mg/mL. Diluted solution is stable if refrigerated or at room temperature for 24 hrs. **Rate:** Infuse over 60 min.
- **Y-Site Incompatibility:** Do not administer with other drugs; flush line before and after each dose.

Levofloxacin

IV Administration

- **Intermittent Infusion:** **Diluent:** Dilute with 0.9% NaCl, D5W, or dextrose/saline combinations. Also available in premixed bottles and flexible containers with D5W, which need no further dilution. **Concentration:** 5 mg/mL. Discard unused solution. Diluted solution is stable for 72 hr at room temperature and 14 days if refrigerated. **Rate:** Administer by infusion over at least 60 min for 250 mg or 500 mg doses and over 90 min for 750 mg dose. Avoid rapid bolus injection to prevent hypotension.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, atracurium, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, caffeine citrate, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, cefepime, cefotetan, ceftaroline, ceftazidime, ceftriaxone, cefuroxime, chlorpromazine, cisatracu-

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

rium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dactarabine, dacarbazine, dactomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, epifibotide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fosfarnet, fosphenytoin, gemcitabine, gentamicin, granisetron, haloperidol, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, irinotecan, isoproterenol, labetalol, leucovorin, levorphanol, lidocaine, linezolid, mannitol, mechlorethamine, meperidine, mesna, methylprednisolone, metoclopramide, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, mycophenolate, nalbuphine, naloxone, nesiritide, nicardipine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, penicillin G sodium, pentamidine, phenylephrine, potassium acetate, potassium chloride, promethazine, propranolol, quinapristin/dalfopristin, ranitidine, remifentanyl, rocuronium, sargramostim, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, alprostadil, amiodarone, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, cefazolin, cefoxitin, daunorubicin hydrochloride, diazepam, fluorouracil, furosemide, ganciclovir, heparin, indomethacin, ketorolac, methotrexate, micafungin, nitroglycerin, nitroprusside, pantoprazole, pentobarbital, phenytoin, piperacillin/tazobactam, prochlorperazine, propofol, rituximab, streptozocin, telavancin, thiopental, trastuzumab.

Moxifloxacin

IV Administration

- **Intermittent Infusion:** **Diluent:** Premixed bags are diluted in sodium chloride 0.8% and should not be further diluted. Use transfer set whose piercing pin does not require excessive force; insert with a gentle twisting motion until pin is firmly seated. **Concentration:** 1.6 mg/mL. **Rate:** Administer over 60 min. Avoid rapid or bolus infusion.
- **Y-Site Compatibility:** alemtuzumab, amifostine, aminocaproic acid, anidulafungin, argatroban, atracurium, bivalirudin, bleomycin, bumetanide, busulfan, calcium acetate, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine,

casopfungin, ceftaroline, chlorpromazine, cisartacurium, cisplatin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin, doxorubicin liposome, droperidol, enalaprilat, epinephrine, epirubicin, ertapenem, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fludarabine, gemcitabine, glycopyrrolate, hydralazine, hydrocortisone sodium succinate, idarubicin, ifosfamide, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, lidocaine, magnesium sulfate, mannitol, mechlorethamine, melphalan, mesna, methotrexate, methylprednisolone, methylprednisolone, metoclopramide, metoprolol, milrinone, mitomycin, mitoxantrone, mycophenolate, naloxone, nesiritide, nicardipine, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, phentolamine, phenylephrine, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, ranitidine, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, tacrolimus, teniposide, theophylline, thiotepa, tigecycline, tirofiban, topotecan, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, zoledronic acid.

- **Y-Site Incompatibility:** allopurinol, aminophylline, amphotericin B lipid complex, dantrolene, fluorouracil, fosphenytoin, furosemide, nitroprusside, pantoprazole, phenytoin, vancomycin, voriconazole.

Patient/Family Teaching

- Instruct patient to take medication as directed at evenly spaced times and to finish drug completely, even if feeling better. Take missed doses as soon as possible, unless almost time for next dose. Do not double doses. Advise patient that sharing of this medication may be dangerous.
- Advise patients to notify health care professional immediately if they are taking theophylline.
- Encourage patient to maintain a fluid intake of at least 1500–2000 mL/day to prevent crystalluria.
- Advise patient that antacids or medications containing iron or zinc will decrease absorption. *Ciprofloxacin*, *levofloxacin*, and *ofloxacin* should be taken at least 2 hr before (3 hr for *gemifloxacin*, 4 hr for *moxifloxacin*) or 2 hr after (6 hrs for *ciprofloxacin*, and *delafloxacin*, 8 hr for *moxifloxacin*) these products.
- May cause dizziness and drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.

- Advise patient to notify health care professional of any personal or family history of QTc prolongation or proarrhythmic conditions such as recent hypokalemia, significant bradycardia, or recent myocardial ischemia or if fainting spells or palpitations occur. Patients with this history should not receive gemifloxacin.
- Advise patient to stop taking fluoroquinolone and notify health care professional immediately if signs and symptoms of peripheral neuropathy occur.
- Caution patient to use sunscreen and protective clothing to prevent phototoxicity reactions during and for 5 days after therapy. Notify health care professional if a sunburn-like reaction or skin eruption occurs.
- Instruct patients being treated for gonorrhea that partners also must be treated.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to report signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools).
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.
- Instruct patient to notify health care professional immediately if rash, jaundice, signs of hypersensitivity, or tendon (shoulder, hand, Achilles, and other) pain, swelling, or inflammation occur. If tendon symptoms occur, avoid exercise and use of the affected area. Increased risk in >65 yrs old; kidney, heart, and lung transplant recipients; and patients taking corticosteroids concurrently. Therapy should be discontinued.
- Advise patient, family, and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide, new or worse depression or anxiety, agitation or restlessness, panic attacks, insomnia, new or worse irritability, aggressiveness, acting on dangerous impulses, mania, or other changes in mood or behavior.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Time for complete resolution depends on organism and site of infection.
- Post exposure treatment of inhalational anthrax or cutaneous anthrax (ciprofloxacin and levofloxacin).
- Prevention and treatment of plague (ciprofloxacin, levofloxacin, and moxifloxacin).

fluorouracil

(flure-oh-**yoor**-a-sill)

Carac, Efudex, Fluoroplex, Tolak

Classification

Therapeutic: antineoplastics

Pharmacologic: antimetabolites

Indications

IV: Used alone and in combination with other modalities (surgery, radiation therapy, other antineoplastics) in the treatment of: Colorectal adenocarcinoma, Breast adenocarcinoma, Gastric adenocarcinoma, Pancreatic adenocarcinoma. **Topical:** Management of multiple actinic (solar) keratoses and superficial basal cell carcinomas.

Action

Inhibits DNA and RNA synthesis by preventing thymidine production (cell-cycle S-phase-specific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: Minimal absorption (5–10%) after topical application.

Distribution: Widely distributed; concentrates and persists in tumors.

Metabolism and Excretion: Metabolized by dihydropyrimidine dehydrogenase to a less toxic compound; inactive metabolites are excreted primarily in urine.

Half-life: 20 hr.

TIME/ACTION PROFILE (IV = effects on blood counts, Top = dermatologic effects)

ROUTE	ONSET	PEAK	DURATION
IV	1–9 days	9–21 days (nadir)	30 days
Top	2–3 days	2–6 wk	1–2 mo

Contraindications/Precautions

Contraindicated in: Hypersensitivity; H Dihydropyrimidine dehydrogenase deficiency (patients at \uparrow risk of 5-FU toxicity); **OB, Lactation:** Pregnancy or lactation.

Use Cautiously in: Infections; Depressed bone marrow reserve; Other chronic debilitating illnesses; Obese patients, patients with edema or ascites (dose should be based on ideal body weight).

Adverse Reactions/Side Effects

More likely to occur with systemic use than with topical use.

CNS: acute cerebellar dysfunction. **CV:** **CARDIOTOXICITY.** **GI:** diarrhea, nausea, stomatitis, vomiting. **Derm:**

* = Canadian drug name. H = Genetic implication. ~~Strikethrough~~ = Discontinued.
 *CAPITALS indicates life-threatening; underlines indicate most frequent.

alopecia, maculopapular rash, local inflammatory reactions (topical only), melanosis of nails, nail loss, palmar-plantar erythrodysesthesia, phototoxicity. **Endo:** sterility. **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** thrombophlebitis. **Misc:** fever.

Interactions

Drug-Drug: Combination chemotherapy with **irinotecan** may produce unacceptable toxicity (dehydration, neutropenia, sepsis). Additive bone marrow depression with other **bone marrow depressants**, including other **antineoplastics** and **radiation therapy**. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions.

Route/Dosage

Doses may vary greatly, depending on tumor, patient condition, and protocol used.

Advanced Colorectal Cancer

IV (Adults): *In combination with leucovorin alone or leucovorin + oxaliplatin or irinotecan*—400 mg/m² as IV bolus on Day 1, then 2400–3000 mg/m² continuous infusion every 2 wk; *In combination with leucovorin*—500 mg/m² as IV bolus 1 hr after leucovorin on Days 1, 8, 15, 22, 29, and 36 every 8 wk.

Breast Cancer

IV (Adults): *In combination with cyclophosphamide + epirubicin or cyclophosphamide + methotrexate*—500 mg/m² or 600 mg/m² on Days 1 and 28 every 28 days for 6 cycles.

Gastric Adenocarcinoma

IV (Adults): *As part of platinum-containing regimen*—200–1000 mg/m² as IV infusion (frequency of administration and number of cycles depends on specific regimen used).

Pancreatic Adenocarcinoma

IV (Adults): *In combination with leucovorin or as part of multidrug regimen*—400 mg/m² as IV bolus on Day 1, then 2400 mg/m² continuous infusion every 2 wk.

Actinic (Solar) Keratoses

Topical (Adults): *Carac*—Apply 0.5% cream to lesions once daily for up to 4 wk; *Efudex*—Apply 2% or 5% solution or cream to lesions twice daily for 2–4 wk; *Fluoroplex*—Apply 1% cream to lesions twice daily for 2–6 wk.

Superficial Basal Cell Carcinomas

Topical (Adults): *Efudex*—Apply 5% solution or cream to lesions twice daily for 3–6 wk (up to 12 wk).

Availability (generic available)

Solution for injection: 50 mg/mL. **Cream:** 0.5%, 1%, 4%, 5%. **Solution:** 2%, 5%.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs before and frequently during therapy.
- Assess mucous membranes, number and consistency of stools, and frequency of vomiting. Assess for signs of infection (fever, chills, sore throat, cough, hoarseness, pain in lower back or side, difficult or painful urination). Assess for bleeding (bleeding gums; bruising; petechiae; and guaiac test stools, urine, and emesis). Avoid IM injections and taking rectal temperatures. Apply pressure to venipuncture sites for 10 min. Notify health care professional if symptoms of toxicity (stomatitis or esophagopharyngitis, uncontrollable vomiting, diarrhea, GI bleeding, myocardial ischemia, leukocyte count <3500/mm³, platelet count <100,000/mm³, or hemorrhage from any site) occur; drug will need to be discontinued. May be reinitiated at a lower dose when side effects have subsided.
- Assess IV site frequently for inflammation or infiltration. Patient should notify nurse if pain or irritation at injection site occurs. May cause thrombophlebitis. If extravasation occurs, infusion must be stopped and restarted in another vein to avoid damage to subcut tissue. Report immediately. Standard treatment includes application of ice compresses.
- Assess skin for palmar-plantar erythrodysesthesia (tingling of hands and feet followed by pain, erythema, swelling, desquamation) throughout therapy. Occurs more frequently with continuous infusion. Usually occurs after 8–9 wks of therapy, but may occur earlier. Withhold fluorouracil for Grades 2 or 3 and resume at lower dose when resolved or Grade 1.
- Monitor intake and output, appetite, and nutritional intake. GI effects usually occur on 4th day of therapy. Adjusting diet as tolerated may help maintain fluid and electrolyte balance and nutritional status and administering antidiarrheal agents. May cause severe diarrhea. Withhold therapy if Grade 3 or 4 diarrhea occurs and until resolved or decreased to Grade 1, then resume at reduced dose.
- Monitor patient for cerebellar dysfunction (ataxia, confusion, disorientation, visual disturbances). This may persist after discontinuation of therapy.
- Monitor for angina, myocardial infarction/ischemia, arrhythmia, and heart failure in patients with no history of coronary artery disease or myocardial dysfunction. Discontinue therapy if symptoms occur.
- Monitor for signs and symptoms of hyperammonemic encephalopathy (altered mental status, confusion, disorientation, coma, ataxia) with ↑ serum ammonia level within 72 hrs of start of infusion. Discontinue fluorouracil and initiate ammonia-lowering therapy.
- Assess for mucositis, stomatitis, and esophagopharyngitis during therapy. May lead to mucosal slough-

ing or ulceration. Occurs more frequently with IV bolus doses. If Grade 3 or 4 mucositis occurs, withhold doses and resume at reduced dose when resolved or reduced to Grade 1.

- **Topical:** Inspect involved skin before and throughout therapy.
- **Lab Test Considerations:** May cause ↓ in plasma albumin.
- Monitor hepatic (AST, ALT, LDH, and serum bilirubin), renal, and hematologic (hematocrit, hemoglobin, leukocyte, platelet count) functions before each treatment and periodically during therapy. Monitor CBC daily during IV therapy. Report WBC of $<3500/\text{mm}^3$ or platelets $<100,000/\text{mm}^3$ immediately; they are criteria for discontinuation. Nadir of leukopenia usually occurs in 9–14 days, with recovery by day 30. May also cause thrombocytopenia. Withhold doses if Grade 4 myelosuppression occurs. Resume at reduced dose when resolved or improved to Grade 1.
- May cause ↑ in urine excretion of 5-hydroxyindoleacetic acid (5-HIAA).

Potential Nursing Diagnoses

Risk for infection (Side Effects)

Imbalanced nutrition: less than body requirements (Side Effects)

Implementation

- **High Alert:** Fatalities have occurred with incorrect administration of chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings. The number 5 in 5-fluorouracil is part of the drug name and does not refer to the dose.
- Prepare solution in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers.

IV Administration

- **IV Push:** **Diluent:** May be administered undiluted. **Concentration:** 50 mg/mL. **Rate:** Rapid IV push administration (over 1–2 min) is most effective, but there is a more rapid onset of toxicity.
- **Intermittent Infusion:** **Diluent:** May be diluted with D5W or 0.9% NaCl.
- Use plastic IV tubing and IV bags to maintain greater stability of medication. Solution is stable for 24 hr at room temperature; do not refrigerate. Solution is colorless to faint yellow. Discard highly discolored or cloudy solution. If crystals form, dissolve by warming solution to 140°F, shaking vigorously, and

cooling to body temperature. **Concentration:** Up to 50 mg/mL. **Rate:** Onset of toxicity is greatly delayed by administering an infusion over 2–8 hr.

- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, butorphanol, calcium gluconate, carboplatin, carmustine, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, dacarbazine, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, docetaxel, dopamine, doxorubicin liposome, enalaprilat, ephedrine, ertapenem, erythromycin, esmolol, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, isoproterenol, ketorolac, labetalol, leucovorin, levorphanol, lidocaine, linezolid, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methohexital, methotrexate, methylprednisolone, metoprolol, metronidazole, milrinone, mitomycin, mitoxantrone, morphine, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, octreotide, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, propofol, propranolol, ranitidine, remifentanyl, rituximab, sargramostim, sodium acetate, sodium bicarbonate, sodium phosphates, succinylcholine, sufentanil, teniposide, theophylline, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, trastuzumab, vasopressin, vecuronium, vinblastine, vincristine, vitamin B complex with C, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** aldesleukin, amiodarone, amphotericin B colloidal, buprenorphine, calcium chloride, caspofungin, chlorpromazine, ciprofloxacin, diazepam, diltiazem, diphenhydramine, dobutamine, doxycycline, droperidol, epinephrine, epirubicin, filgrastim, haloperidol, hydroxyzine, idarubicin, irinotecan, levofloxacin, lorazepam, midazolam, minocycline, moxifloxacin, nicardipine, pentamidine, phenytoin, prochlorperazine, promethazine, quina-
pristin/dalfopristin, topotecan, vancomycin, verapamil, vinorelbine.
- **Topical:** Consult health care professional before administering topical preparations to determine which skin preparation regimen should be followed.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Tight occlusive dressings are not advised because of irritation to surrounding healthy tissue. A loose gauze dressing for cosmetic purposes is usually preferred. Wear gloves when applying medication. Do not use metallic applicator.

Patient/Family Teaching

- Instruct patient to notify health care professional if fever; chills; sore throat; signs of infection; yellowing of skin or eyes; abdominal pain; joint or flank pain; swelling of feet or legs; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Patients should be cautioned not to drink alcoholic beverages or take products containing aspirin or NSAIDs.
- Advise patient to rinse mouth with clear water after eating and drinking and to avoid flossing to minimize stomatitis. Viscous lidocaine may be used if mouth pain interferes with eating. Stomatitis pain may require treatment with opioid analgesics.
- Discuss with patient the possibility of hair loss. Explore methods of coping.
- Caution patient to use sunscreen and protective clothing to prevent phototoxicity reactions.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- **Rep:** May be teratogenic. Advise female patients of reproductive potential and male patients with partners of reproductive potential to use effective contraception during therapy and for at least 3 mo following completion of therapy and to avoid breast feeding during therapy. Inform patients that fertility may be impaired during therapy.
- Emphasize the importance of routine follow-up lab tests to monitor progress and to check for side effects.
- **Topical:** Instruct patient in correct application of solution or cream. Emphasize importance of avoiding the eyes; caution should also be used when applying medication near mouth and nose. If patient uses clean finger to self-administer, emphasize importance of washing hands thoroughly after application. Explain that erythema, scaling, and blistering with pruritus and burning sensation are expected. Advise patient to avoid sunlight or ultraviolet light (tanning booths) as much as possible; may increase side effects. Therapy is discontinued when erosion, ulceration, and necrosis occur in 2–6 wk (10–12 wk for basal cell carcinomas). Skin heals 4–8 wk later.

Evaluation/Desired Outcomes

- Tumor regression.
- Removal of solar keratoses or superficial basal cell skin cancers.

FLUoxetine (floo-ox-uh-teen)
PROzac, PROzac Weekly, Sarafem,
Selfemra

Classification

Therapeutic: antidepressants

Pharmacologic: selective serotonin reuptake inhibitors (SSRIs)

Indications

Major depressive disorder. Obsessive compulsive disorder (OCD). Bulimia nervosa. Panic disorder. Acute treatment of depressive episodes associated with bipolar I disorder (when used with olanzapine). Treatment-resistant depression (when used with olanzapine). **Sarafem and Selfemra:** Premenstrual dysphoric disorder (PMDD). **Unlabeled Use:** Anorexia nervosa; ADHD; Diabetic neuropathy, Fibromyalgia, Obesity, Raynaud's phenomenon, Social anxiety disorder (social phobia), Posttraumatic stress disorder (PTSD).

Action

Selectively inhibits the reuptake of serotonin in the CNS.

Therapeutic Effects: Antidepressant action. Decreased behaviors associated with: panic disorder, bulimia. Decreased mood alterations associated with PMDD.

Pharmacokinetics

Absorption: Well absorbed after oral administration.

Distribution: Crosses the blood-brain barrier.

Protein Binding: 94.5%.

Metabolism and Excretion: Converted by the liver to norfluoxetine (primarily by CYP2D6 isoenzyme), another antidepressant compound; H the CYP2D6 enzyme system exhibits genetic polymorphism (~7% of population may be poor metabolizers and may have significantly \uparrow fluoxetine concentrations and an \uparrow risk of adverse effects). Fluoxetine and norfluoxetine are mostly metabolized by the liver; 12% excreted by kidneys as unchanged fluoxetine, 7% as unchanged norfluoxetine.

Half-life: 1–3 days (norfluoxetine 5–7 days).

TIME/ACTION PROFILE (antidepressant effect)

ROUTE	ONSET	PEAK	DURATION
PO	1–4 wk	unknown	2 wk

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of MAO inhibitors or MAO-like drugs (linezolid or methylene blue); Concurrent use of pimozone; Concurrent use of thioridazine (fluoxetine should be discontinued at least 5 wk before thioridazine therapy is initiated).

Use Cautiously in: History of seizures; Debilitated patients (\uparrow risk of seizures); Diabetes mellitus; Patients with concurrent chronic illness or multiple drug ther-

apy (dose adjustments may be necessary); Hepatic impairment (↓ doses/↑ dosing interval may be necessary); May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; Congenital long QT syndrome, history of QT interval prolongation, family history of long QT syndrome or sudden cardiac death, concurrent use of QT interval prolonging drugs, hypokalemia, hypomagnesemia, recent MI, uncompensated HF, or bradycardia; Angle-closure glaucoma; **OB:** Use during first trimester may ↑ risk of cardiovascular malformations in infant. Use during third trimester may result in neonatal serotonin syndrome requiring prolonged hospitalization, respiratory and nutritional support. May cause sedation in infant. Use only if potential benefit justifies potential risk to fetus; **Lactation:** May cause sedation in infant; discontinue drug or bottle-feed; **Pedi:** Risk of suicide ideation or attempt may be greater in children or adolescents (safe use in children <7 yr not established); **Ger:** Appears on Beers list. Geriatric patients are at ↑ risk for excessive CNS stimulation, sleep disturbances, and agitation.

Adverse Reactions/Side Effects

CNS: **NEUROLEPTIC MALIGNANT SYNDROME, SEIZURES, SUICIDAL THOUGHTS, anxiety, drowsiness, headache, insomnia, nervousness, abnormal dreams, dizziness, fatigue, hypomania, mania, weakness.** **EENT:** mydriasis, stuffy nose, visual disturbances. **Resp:** cough. **CV:** **TORSADES DE POINTES**, chest pain, palpitations, QT interval prolongation. **GI:** diarrhea, abdominal pain, abnormal taste, anorexia, constipation, dry mouth, dyspepsia, nausea, vomiting, weight loss. **GU:** sexual dysfunction, urinary frequency. **Derm:** ↑ sweating, pruritus, erythema nodosum, flushing, rashes. **Endo:** dysmenorrhea. **F and E:** hyponatremia. **MS:** arthralgia, back pain, myalgia. **Neuro:** tremor. **Misc:** **SEROTONIN SYNDROME**, allergic reactions, fever, flu-like syndrome, hot flashes, sensitivity reaction.

Interactions

Drug-Drug: Discontinue use of **MAO inhibitors** for 14 days before fluoxetine therapy; combined therapy may result in confusion, agitation, seizures, hypertension, and hyperpyrexia (serotonin syndrome). Fluoxetine should be discontinued for at least 5 wk before MAO inhibitor therapy is initiated. Concurrent use with **MAO-inhibitor-like drugs, such as linezolid or methylene blue** may ↑ risk of serotonin syndrome; concurrent use contraindicated; do not start therapy in patients receiving **linezolid or methylene blue**; if **linezolid or methylene blue** need to be started in a patient receiving fluoxetine, immediately discontinue fluoxetine and monitor for signs/symptoms of serotonin syndrome for 2 wk or until 24 hr after last dose of linezolid or methylene blue, whichever comes first (may resume fluoxetine therapy 24 hr after last dose of linezolid or methylene blue). Concurrent use with **pimo-**

zide may ↑ risk of QT interval prolongation. ↑ levels of **thioridazine** may ↑ risk of QT interval prolongation (concurrent use contraindicated; fluoxetine should be discontinued for at least 5 wk before thioridazine is initiated). **QT interval prolonging drugs** may ↑ the risk of QT interval prolongation with arrhythmias; avoid concurrent use. Inhibits the activity of cytochrome P450 2D6 enzyme in the liver and ↑ effects of drugs metabolized by this enzyme system. **Medications that inhibit the P450 enzyme system** (including **ritonavir, saquinavir, and efavirenz**) may ↑ risk of developing the serotonin syndrome. For concurrent use with **ritonavir** ↓ fluoxetine dose by 70%; if initiating fluoxetine, start with 10 mg/day dose. ↓ metabolism and ↑ effects of **alprazolam** (decrease alprazolam dose by 50%). Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants, SNRIs, fentanyl, buspirone, tramadol, amphetamines, and triptans** ↑ risk of serotonin syndrome. ↑ CNS depression with **alcohol, antihistamines, other antidepressants, opioid analgesics, or sedative/hypnotics.** ↑ risk of side effects and adverse reactions with other **antidepressants, risperidone, or phenothiazines.** May ↑ effectiveness/risk of toxicity from **carbamazepine, clozapine, digoxin, haloperidol, phenytoin, lithium, or warfarin.** May ↓ the effects of **buspirone.** **Cyproheptadine** may ↓ or reverse effects of fluoxetine. May ↑ sensitivity to **adrenergics** and increase the risk of serotonin syndrome. May alter the activity of other **drugs that are highly bound to plasma proteins.** ↑ risk of serotonin syndrome with **5HT₁ agonists.** ↑ risk of bleeding with **NSAIDs, aspirin, clopidogrel, or warfarin.** **Drug-Natural Products:** ↑ risk of serotonin syndrome with **St. John's wort** and **SAME.**

Route/Dosage

PO (Adults): **Depression, OCD**—20 mg/day in the morning. After several weeks, may ↑ by 20 mg/day at weekly intervals. Doses greater than 20 mg/day should be given in 2 divided doses, in the morning and at noon (not to exceed 80 mg/day). Patients who have been stabilized on the 20 mg/day dose may be switched over to delayed-release capsules (Prozac Weekly) at dose of 90 mg weekly, initiated 7 days after the last 20-mg dose. **Panic disorder**—10 mg/day initially, may ↑ after 1 wk to 20 mg/day (usual dose is 20 mg, but may be ↑ as needed/tolerated up to 60 mg/day). **Bulimia nervosa**—60 mg/day (may need to titrate up to dosage over several days). **PMDD**—20 mg/day (not to exceed 80 mg/day) or 20 mg/day starting 14 days prior to expected onset on menses, continued through first full day of menstruation, repeated with each cycle. **Depressive episodes associated with bipolar I disorder**—20 mg/day with olanzapine 5 mg/day (both given in evening); may ↑ fluoxetine dose up to 50 mg/day and olan-

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

zapine dose up to 12.5 mg/day; *Treatment-resistant depression*—20 mg/day with olanzapine 5 mg/day (both given in evening); may ↑ fluoxetine dose up to 50 mg/day and olanzapine dose up to 20 mg/day.

PO (Geriatric Patients): *Depression*—10 mg/day in the morning initially, may be ↑ (not to exceed 60 mg/day).

PO (Children 7–17 yr): *Depression and OCD (adolescents and higher weight children)*—10 mg/day may be ↑ after 2 wk to 20 mg/day; additional increases may be made after several more wk (range 20–60 mg/day); *Depression and OCD (lower-weight children)*—10 mg/day initially, may be ↑ after several more wk (range 20–30 mg/day).

PO (Children 10–17 yr): *Depressive episodes associated with bipolar I disorder*—20 mg/day with olanzapine 2.5 mg/day (both given in evening); may ↑ fluoxetine dose up to 50 mg/day and olanzapine dose up to 12 mg/day.

Availability (generic available)

Tablets: 10 mg, 15 mg, 20 mg, 60 mg. **Cost:** *Generic*—20 mg \$73.03/100. **Capsules:** 10 mg, 20 mg, 40 mg. **Cost:** *Generic*—10 mg \$10.83/100, 20 mg \$8.62/100, 40 mg \$41.03/100. **Delayed-release capsules (Prozac Weekly):** 90 mg. **Cost:** *Generic*—\$147.96/4. **Oral solution (mint flavor):** 20 mg/5 mL. **Cost:** *Generic*—\$118.00/120 mL. **In combination with:** olanzapine (Symbyax; see Appendix B).

NURSING IMPLICATIONS

Assessment

- Monitor mood changes. Inform health care professional if patient demonstrates significant increase in anxiety, nervousness, or insomnia.
- Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yr. After starting therapy, children, adolescents, and young adults should be seen by health care professional at least weekly for 4 wk, every 3 wk for next 4 wk, and on advice of health care professional thereafter.
- Monitor appetite and nutritional intake. Weigh weekly. Notify health care professional of continued weight loss. Adjust diet as tolerated to support nutritional status.
- Assess for sensitivity reaction (urticaria, fever, arthralgia, edema, carpal tunnel syndrome, rash, hives, lymphadenopathy, respiratory distress) and notify health care professional if present; symptoms usually resolve by stopping fluoxetine but may require administration of antihistamines or corticosteroids.
- Assess for sexual side effects (erectile dysfunction; decreased libido).
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, arrhythmias, hypertension or

hypotension, pallor, tiredness, severe muscle stiffness, loss of bladder control). Report immediately.

- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyperreflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).
- **OCD:** Assess for frequency of obsessive-compulsive behaviors. Note degree to which these thoughts and behaviors interfere with daily functioning.
- **Bulimia Nervosa:** Assess frequency of binge eating and vomiting during therapy.
- **PMDD:** Monitor mood prior to and periodically during therapy.
- **Lab Test Considerations:** Monitor CBC and differential periodically during therapy. Notify health care professional if leukopenia, anemia, thrombocytopenia, or increased bleeding time occurs.
- Proteinuria and mild ↑ in AST may occur during sensitivity reactions.
- May cause ↑ in serum alkaline phosphatase, ALT, BUN, creatine phosphokinase, hypouricemia, hypocalcemia, hypoglycemia or hyperglycemia, and hyponatremia.
- May cause hypoglycemia in patient with diabetes.

Potential Nursing Diagnoses

Ineffective coping (Indications)

Risk for injury (Side Effects)

Sexual dysfunction (Side Effects)

Implementation

- Do not confuse fluoxetine with duloxetine, paroxetine, or Loxitane (loxapine). Do not confuse Prozac with Prilosec (omeprazole), Prograf (tacrolimus), or Provera (medroxyprogesterone). Do not confuse Sarafem (fluoxetine) with Serophene (clomiphene).
- **PO:** Administer as a single dose in the morning. Some patients may require increased amounts, in divided doses, with a 2nd dose at noon.
- May be administered with food to minimize GI irritation. Do not open, dissolve, chew, or crush delayed-release capsules.
- Doses of *PROzac Weekly* may be started after last dose of *PROzac* 20 mg. Dose may be increased after several wk if improvement not clinically significant.

Patient/Family Teaching

- Instruct patient to take fluoxetine as directed. Take missed doses as soon as remembered unless almost time for next dose, then omit and return to regular schedule. Do not double doses or discontinue without consulting health care professional; discontinuation may cause anxiety, insomnia, nervousness.
- May cause drowsiness, dizziness, impaired judgment, and blurred vision. Caution patient to avoid driving and other activities requiring alertness until response to the drug is known.

- Advise patient, family, and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide, new or worse depression or anxiety, agitation or restlessness, panic attacks, insomnia, new or worse irritability, aggressiveness, acting on dangerous impulses, mania, or other changes in mood or behavior, or if symptoms of serotonin syndrome occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications. Advise patient to avoid taking other CNS depressants or alcohol.
- Caution patient to change positions slowly to minimize dizziness.
- Inform patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may minimize dry mouth. If dry mouth persists for more than 2 wk, consult health care professional regarding use of saliva substitute.
- Caution patient to wear protective clothing and use sunscreen to prevent photosensitivity reactions.
- Inform patient that medication may cause decreased libido.
- Advise patient to notify health care professional if symptoms of sensitivity reaction occur or if headache, nausea, anorexia, anxiety, or insomnia persists.
- Instruct female patients to inform health care professional if pregnancy is planned or suspected, or if breast feeding.
- Emphasize the importance of follow-up exams to monitor progress.

Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings. May require 1–4 wk of therapy to obtain antidepressant effects.
- Decrease in obsessive-compulsive behaviors.
- Decrease in binge eating and vomiting in patients with bulimia nervosa.
- Decreased incidence frequency of panic attacks.
- Decreased mood alterations associated with PMDD.

flurandrenolide, See CORTICOSTEROIDS (TOPICAL/LOCAL).

fluticasone, See CORTICOSTEROIDS (INHALATION), CORTICOSTEROIDS (NASAL), and CORTICOSTEROIDS (TOPICAL/LOCAL).

fluvastatin, See HMG-CoA REDUCTASE INHIBITORS (statins).

fluvoxamine
(floo-voks-a-meen)
Luvox, Luvox CR

Classification

Therapeutic: antidepressants, antiobsessive agents
Pharmacologic: selective serotonin reuptake inhibitors (SSRIs)

Indications

Obsessive-compulsive disorder (OCD). **Unlabeled Use:** Depression. Generalized anxiety disorder (GAD). Social anxiety disorder (SAD). Post-traumatic stress disorder (PTSD).

Action

Inhibits the reuptake of serotonin in the CNS. **Therapeutic Effects:** Decrease in obsessive-compulsive behaviors.

Pharmacokinetics

Absorption: 53% absorbed after oral administration.

Distribution: Excreted in breast milk; enters the CNS. Remainder of distribution not known.

Metabolism and Excretion: Mostly metabolized by the liver (CYP2D6 isoenzyme); ~~the~~ CYP2D6 enzyme system exhibits genetic polymorphism; ~7% of population may be poor metabolizers (PMs) and may have significantly ↑ fluvoxamine concentrations and an ↑ risk of adverse effects.

Half-life: 13.6–15.6 hr.

TIME/ACTION PROFILE (improvement on obsessive-compulsive behaviors)

ROUTE	ONSET	PEAK	DURATION
PO	within 2–3 wk	several mo	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to fluvoxamine or other SSRIs; Concurrent use of MAOIs (or within 14 days of discontinuing fluvoxamine), MAOI-like drugs (linezolid or methylene blue), alosetron, pimozide, thioridazine, or tizanidine.

Use Cautiously in: Impaired hepatic function; Risk of suicide (may ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment); Angle-closure glaucoma; **OB:** Neonates exposed to SSRI in third trimester may develop drug discontinuation syndrome including respiratory distress, feeding difficulty,

* = Canadian drug name. ~~⊗~~ = Genetic implication. ~~⊗~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

and irritability; **Lactation:** Discontinue drug or bottle-feed; **Pedi:** May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; may be greater in children and adolescents (safety not established in children <18 yr [controlled release] and <8 yr [immediate-release]); **Pedi:** Safety not established in children <8 yr (for immediate-release); **Geri:** May have ↑ sensitivity; recommend lower initial dose and slower dosage titration.

Adverse Reactions/Side Effects

CNS: **NEUROLEPTIC MALIGNANT SYNDROME, SUICIDAL THOUGHTS**, sedation, dizziness, drowsiness, headache, insomnia, nervousness, weakness, agitation, anxiety, apathy, emotional lability, manic reactions, mental depression, psychotic reactions, syncope. **EENT:** sinusitis. **Resp:** cough, dyspnea. **CV:** edema, hypertension, palpitations, postural hypotension, tachycardia, vasodilation. **GI:** constipation, diarrhea, dry mouth, dyspepsia, nausea, anorexia, dysphagia, ↑ liver enzymes, flatulence, vomiting. **GU:** ↓ libido/sexual dysfunction.

Derm: ↑ sweating. **Metab:** weight gain, weight loss. **MS:** hypertonia, myoclonus/twitching. **Neuro:** hypokinesia/hyperkinesia, tremor. **Misc:** **SEROTONIN SYNDROME**, allergic reactions, chills, flu-like symptoms, tooth disorder/caries, yawning.

Interactions

Drug-Drug: Concurrent use with **MAO inhibitors** may result in serious potentially fatal reactions (MAO inhibitors should be stopped at least 14 days before fluvoxamine therapy. Fluvoxamine should be stopped at least 14 days before MAO inhibitor therapy). Concurrent use with **MAO-inhibitor-like drugs**, such as **linezolid** or **methylene blue** may ↑ risk of serotonin syndrome; concurrent use contraindicated; do not start therapy in patients receiving **linezolid** or **methylene blue**; if **linezolid** or **methylene blue** need to be started in a patient receiving fluvoxamine, immediately discontinue fluvoxamine and monitor for signs/symptoms of serotonin syndrome for 2 wk or until 24 hr after last dose of linezolid or methylene blue, whichever comes first (may resume fluvoxamine therapy 24 hr after last dose of linezolid or methylene blue). **Smoking** may ↓ effectiveness of fluvoxamine. Concurrent use with **tricyclic antidepressants** may ↑ plasma levels of fluvoxamine. Drugs that affect serotonergic neurotransmitter systems, including **SSRIs**, **SNRIs**, **fentanyl**, **bupropion**, **tramadol**, **amphetamines**, and **triptans** ↑ risk of serotonin syndrome. ↓ metabolism and may ↑ effects of some **beta blockers** (**propranolol**), **alosectron** (avoid concurrent use), some **benzodiazepines** (avoid concurrent **diazepam**), **carbamazepine**, **methadone**, **lithium**, **theophylline** (↓ dose to 33% of usual dose), **ramelteon** (avoid concurrent use), **warfarin**, and **L-tryptophan**. ↑ risk of bleeding with **NSAIDs**, **aspirin**, **clopidogrel**, or **warfarin**. ↑ blood levels and risk of toxicity from **clozapine** (dosage adjustments may be necessary).

Drug-Natural Products: Use with **St. John's wort** ↑ of serotonin syndrome.

Route/Dosage

PO (Adults): Immediate release— 50 mg daily at bedtime; ↑ by 50 mg q 4–7 days until desired effect is achieved. If daily dose >100 mg, give in 2 equally divided doses or give a larger dose at bedtime (not to exceed 300 mg/day); **Controlled release**— 100 mg at bedtime; ↑ by 50 mg q 7 days until desired effect is achieved, not to exceed 300 mg/day.

PO (Children 8–17 yr): Immediate release— 25 mg at bedtime, may ↑ by 25 mg/day q 4–7 days (not to exceed 200 mg/day; daily doses >50 mg should be given in divided doses with a larger dose at bedtime).

Hepatic Impairment

PO (Adults): Immediate release— 25 mg daily at bedtime initially, slower titration, and longer dosing intervals should be used.

Availability (generic available)

Tablets: 25 mg, 50 mg, 100 mg. **Controlled-release capsules:** 100 mg, 150 mg.

NURSING IMPLICATIONS

Assessment

- Monitor mood changes. Assess patient for frequency of obsessive-compulsive behaviors. Note degree to which these thoughts and behaviors interfere with daily functioning. Inform health care professional if patient demonstrates significant increase in anxiety, nervousness, or insomnia.
- Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yrs. After starting therapy, children, adolescents, and young adults should be seen by health care professional at least weekly for 4 wk, every 3 wk for next 4 wk, and on advice of health care professional thereafter.
- Monitor appetite and nutritional intake. Weigh weekly. Report significant changes in weight. Adjust diet as tolerated to support nutritional status.
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyperreflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).
- **Toxicity and Overdose:** Common symptoms of toxicity include drowsiness, vomiting, diarrhea, and dizziness. Coma, tachycardia, bradycardia, hypotension, ECG abnormalities, liver function abnormalities, and convulsions may also occur. Treatment is symptomatic and supportive.

Potential Nursing Diagnoses

Ineffective coping (Indications)
Risk for injury (Side Effects)

Implementation

- Do not confuse fluvoxamine with fluphenazine or flvoxate. Do not confuse Luvox with Lasix (furosemide).
- Taper to avoid withdrawal effects. Reduce dose by 50% for 3 days, then reduce by 50% for 3 days, then discontinue.
- **PO:** Initial therapy is administered as a single bedtime dose. May be increased every 4–7 days as tolerated.
- Fluvoxamine may be given without regard to meals. Do not open, break, crush, or chew controlled-release capsules.

Patient/Family Teaching

- Instruct patient to take fluvoxamine as directed. Do not skip or double up on missed doses. Improvement in symptoms may be noticed in 2–3 wk, but medication should be continued as directed.
- May cause drowsiness and dizziness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient, family, and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide, new or worse depression or anxiety, agitation or restlessness, panic attacks, insomnia, new or worse irritability, aggressiveness, acting on dangerous impulses, mania, or other changes in mood or behavior or if symptoms of serotonin syndrome occur.
- Advise patient to notify health care professional if rash or hives occur or if headache, nausea, anorexia, anxiety, or insomnia persists.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort. Advise patient to avoid taking other CNS depressants or alcohol.
- Advise patient to avoid use of caffeine (chocolate, tea, cola).
- Instruct female patients to notify health care professional if breast feeding or if pregnancy is planned or suspected.
- Emphasize the importance of follow-up exams to monitor progress.

Evaluation/Desired Outcomes

- Decrease in symptoms of obsessive-compulsive disorder.

fondaparinux
(fon-da-par-i-nux)
Arixtra

Classification

Therapeutic: anticoagulants
Pharmacologic: active factor X inhibitors

Indications

Prevention and treatment of deep vein thrombosis and pulmonary embolism. **Unlabeled Use:** Systemic anticoagulation for other diagnoses.

Action

Binds selectively to antithrombin III (AT III). This binding potentiates the neutralization (inactivation) of active factor X (Xa). **Therapeutic Effects:** Interruption of the coagulation cascade resulting in inhibition of thrombus formation. Prevention of thrombus formation decreases the risk of pulmonary emboli.

Pharmacokinetics

Absorption: 100% absorbed following subcutaneous administration.

Distribution: Distributes mainly throughout the intravascular space.

Metabolism and Excretion: Eliminated mainly unchanged in urine.

Half-life: 17–21 hr.

TIME/ACTION PROFILE (anticoagulant effect)

ROUTE	ONSET	PEAK	DURATION
Subcut	rapid	3 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Severe renal impairment (CCr <30 mL/min; ↑ risk of bleeding); Body weight <50 kg (for prophylaxis) (markedly ↑ risk of bleeding); Active major bleeding; Bacterial endocarditis; Thrombocytopenia due to fondaparinux antibodies.

Use Cautiously in: Mild-to-moderate renal impairment (CCr 30–50 mL/min); Untreated hypertension; Recent history of ulcer disease; Body weight <50 kg (for treatment of DVT or PE) (may ↑ risk of bleeding); **Geri:** Patients >65 yr (↑ risk of bleeding); Malignancy; History of heparin-induced thrombocytopenia; **OB:** Use during pregnancy only if clearly needed; **Lactation, Pedi:** Safety not established.

Exercise Extreme Caution in: History of congenital or acquired bleeding disorder; Severe uncontrolled hypertension; Hemorrhagic stroke; Recent CNS or ophthalmologic surgery; Active GI bleeding/ulceration; Retinopathy (hypertensive or diabetic); Neuroaxial spinal

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

anesthesia or spinal puncture, especially if concurrent with an indwelling epidural catheter, drugs affecting hemostasis, history of traumatic/repeated spinal puncture or spinal deformity (↑ risk of spinal/epidural hematoma that may lead to long-term or permanent paralysis).

Adverse Reactions/Side Effects

CNS: confusion, dizziness, headache, insomnia. **CV:** edema, hypotension. **GI:** constipation, diarrhea, dyspepsia, ↑ liver enzymes, nausea, vomiting. **GU:** urinary retention. **Derm:** bullous eruption, hematoma, purpura, rash. **Hemat:** bleeding, thrombocytopenia. **F and E:** hypokalemia. **Misc:** hypersensitivity reactions including ANGIOEDEMA, fever, ↑ wound drainage.

Interactions

Drug-Drug: Risk of bleeding may be ↑ by concurrent use of warfarin or drugs that affect platelet function, including aspirin, NSAIDs, dipyridamole, some cephalosporins, valproates, clopidogrel, abciximab, eptifibatid, tirofiban, and dextran.

Drug-Natural Products: ↑ risk of bleeding with arnica, chamomile, clove, dong quai, feverfew, garlic, ginger, ginkgo, *Panax ginseng*, and others.

Route/Dosage

Treatment of DVT/PE

Subcut (Adults): <50 kg—5 mg once daily for at least 5 days until therapeutic anticoagulation with warfarin is achieved (INR >2 for 2 consecutive days); warfarin may be started within 72 hr of fondaparinux (has been used for up to 26 days); 50–100 kg—7.5 mg once daily for at least 5 days until therapeutic anticoagulation with warfarin is achieved (INR >2 for 2 consecutive days); >100 kg—10 mg once daily for at least 5 days until therapeutic anticoagulation with warfarin is achieved (INR >2 for 2 consecutive days); warfarin may be started within 72 hr of fondaparinux.

Prevention of DVT/PE

Subcut (Adults): 2.5 mg once daily, starting 6–8 hr after surgery, continuing for 5–9 days (up to 11 days) following abdominal surgery or knee/hip replacement or continuing for 24 days following hip fracture surgery (up to 32 days).

Availability (generic available)

Solution for subcut injection (prefilled syringes): 2.5 mg/0.5 mL, 5 mg/0.4 mL, 7.5 mg/0.6 mL, 10 mg/0.8 mL.

NURSING IMPLICATIONS

Assessment

- Assess for signs of bleeding and hemorrhage (bleeding gums; nosebleed; unusual bruising; black, tarry stools; hematuria; fall in hematocrit; sudden drop in BP; guaiac positive stools); bleeding from surgical site. Notify health care professional if these occur.

- Assess for evidence of additional or increased thrombosis. Symptoms will depend on area of involvement. Monitor neurological status frequently for signs of impairment, especially in patients with indwelling epidural catheters for administration of analgesia or with concomitant use of drugs affecting hemostasis (NSAIDs, platelet inhibitors, other anticoagulants). Risk is increased by traumatic or repeated epidural or spinal puncture. May require urgent treatment.

- **Lab Test Considerations:** Monitor platelet count closely; may cause thrombocytopenia. If platelet count is <100,000/mm³, discontinue fondaparinux.
- Fondaparinux is not accurately measured by prothrombin time (PT), activated thromboplastin time (aPTT), or international standards of heparin or low-molecular-weight heparins. If unexpected changes in coagulation parameters or major bleeding occurs, discontinue fondaparinux.
- Monitor CBC, serum creatinine levels, and stool occult blood tests routinely during therapy.
- May cause asymptomatic ↑ in AST and ALT. Elevations are fully reversible and not associated with ↑ in bilirubin.
- May cause ↑ aPTT temporally associated with bleeding with or without concomitant administration of other anticoagulants and thrombocytopenia with thrombosis similar to heparin-induced thrombocytopenia, with or without exposure to heparin or low-molecular-weight heparins.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)

Risk for injury (Side Effects)

Implementation

- **High Alert:** Do not confuse Arixtra with Arista AH (absorbable hemostatic agent).
- Fondaparinux cannot be used interchangeably with heparin, low-molecular-weight heparins, or heparinoids as they differ in manufacturing process, anti-Xa and anti-IIa activity, units, and dose. Each of these medications has its own instructions for use.
- Initial dose should be administered 6–8 hr after surgery. Administration before 6 hr after surgery has been associated with risk of major bleeding.
- **Subcut:** Administer subcut only into fatty tissue, alternating sites between right and left anterolateral or posterolateral abdominal wall. Inject entire length of needle at a 45° or 90° angle into a skin fold held between thumb and forefinger; hold skin fold throughout injection. Do not aspirate or massage. Rotate sites frequently. Do not administer IM because of danger of hematoma formation. Solution should be clear; do not inject solution containing particulate matter. Do not mix with other injections.
- Fondaparinux is provided in a single-dose prefilled syringe with an automatic needle protection system. Do not expel air bubble from prefilled syringe before injection to prevent loss of drug.

Patient/Family Teaching

- Advise patient to report any symptoms of unusual bleeding or bruising, dizziness, itching, rash, fever, swelling, or difficulty breathing to health care professional immediately.
- Instruct patient not to take aspirin or NSAIDs without consulting health care professional during therapy.

Evaluation/Desired Outcomes

- Prevention and treatment of deep vein thrombosis and pulmonary embolism.

formoterol (for-mo-te-role)

- ★ Foradil Aerolizer,
- ★ Oxeze Turbuhaler, Perforomist

Classification

Therapeutic: bronchodilators
Pharmacologic: adrenergics

Indications

Maintenance treatment to prevent bronchospasm in chronic obstructive pulmonary disease (COPD) including chronic bronchitis and emphysema.

Action

Produces accumulation of cyclic adenosine monophosphate (cAMP) at beta-adrenergic receptors, resulting in relaxation of airway smooth muscle. Relatively specific for beta₂ (pulmonary) receptors. **Therapeutic Effects:** Bronchodilation.

Pharmacokinetics

Absorption: Following inhalation, majority of inhaled drug is swallowed and absorbed.

Distribution: Unknown.

Metabolism and Excretion: Mostly metabolized by the liver; 10–18% excreted unchanged in urine.

Half-life: 10 hr.

TIME/ACTION PROFILE (bronchodilation)

ROUTE	ONSET	PEAK	DURATION
Inhln	15 min	1–3 hr	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Acute attack of asthma (onset of action is delayed); Patients not receiving a long-term asthma-control medication (e.g. inhaled corticosteroid).

Use Cautiously in: Cardiovascular disease (including angina, hypertension, and arrhythmias); Diabetes; Seizure disorders; Glaucoma; Hyperthyroidism; Pheochromocytoma; Excessive use (may lead to tolerance and paradoxical bronchospasm); **OB, Lactation, Pedi:** Pregnancy, lactation, or children <5 yr (may inhibit contractions during labor; use only if potential benefits

outweigh risks; in children, a fixed-dose combination product containing formoterol and an inhaled corticosteroid should be strongly considered to ensure adherence).

Adverse Reactions/Side Effects

CNS: dizziness, fatigue, headache, insomnia, malaise, nervousness. **Resp:** **ASTHMA-RELATED DEATH, PARADOXICAL BRONCHOSPASM.** **CV:** angina, arrhythmias, hypertension, hypotension, palpitations, tachycardia. **GI:** dry mouth, nausea. **F and E:** hypokalemia. **Metab:** hyperglycemia, metabolic acidosis. **MS:** muscle cramps. **Neuro:** tremor. **Derm:** rash. **Misc:** allergic reactions including **ANAPHYLAXIS.**

Interactions

Drug-Drug: Concurrent use with **MAO inhibitors, tricyclic antidepressants, or other agents that may prolong the QTc interval** may result in serious arrhythmias and should be undertaken with extreme caution. ↑ risk of hypokalemia with **theophylline, corticosteroids, potassium-losing diuretics.** **Beta blockers** may ↓ therapeutic effects. ↑ adrenergic effects may occur with concurrent use of **adrenergics.**

Route/Dosage

Inhln (Adults): 20 mcg/2 mL-unit-dose vial twice daily via jet nebulizer.

Availability

Dry powder capsules for inhalation (Foradil Aerolizer): ★ 12 mcg. **Inhalation solution for nebulization (Perforomist):** 20 mcg/2 mL. **Powder for oral inhalation (Oxeze Turbuhaler):** ★ 6 mcg/inhalation (60 metered doses), ★ 12 mcg/inhalation (60 metered doses). **In combination with:** budesonide (Symbicort); glycopyrrolate (Bevespi Aerosphere); mometasone (Dulera); see Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess lung sounds, pulse, and BP before administration and during peak of medication. Note amount, color, and character of sputum produced. Closely monitor patients on higher dose for adverse effects.
- Monitor pulmonary function tests before initiating and periodically during therapy to determine effectiveness.
- Observe for paradoxical bronchospasm (wheezing, dyspnea, tightness in chest) and hypersensitivity reaction (rash; urticaria; swelling of the face, lips, or eyelids). If condition occurs, withhold medication and notify physician or other health care professional immediately.
- Monitor ECG periodically during therapy. May cause prolonged QTc interval.
- Monitor patient for signs of anaphylaxis (dyspnea, rash, laryngeal edema) throughout therapy.

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- **Lab Test Considerations:** May cause ↑ serum glucose and decreased serum potassium.

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)

Implementation

- Formoterol should be used along with an inhaled corticosteroid, not as monotherapy.
- **Inhale:** For use with nebulizer: Administer via standard jet nebulizer via mouthpiece or face mask. Remove vial from foil immediately prior to use and discard vial after use. May be stored in refrigerator for up to 3 mo.

Patient/Family Teaching

- Instruct patient to take formoterol as directed. Do not discontinue therapy without discussing with health care professional, even if feeling better. If a dose is missed skip dose and take next dose at regularly scheduled time. Do not double doses. Use a rapid-acting bronchodilator if symptoms occur before next dose is due. Caution patient not to use more than 2 times a day or less than 12 hr apart; may cause adverse effects, paradoxical bronchospasm, or loss of effectiveness of medication. Instruct patient to review medication guide with each Rx refill in case of changes.
- **Instruct patient to contact health care professional immediately if shortness of breath is not relieved by medication or nausea, vomiting, shakiness, headache, fast or irregular heartbeat, or sleeplessness occur.**
- Advise patient to consult health care professional before taking any Rx, OTC, or herbal products or alcohol concurrently with this therapy. Caution patient also to avoid smoking and other respiratory irritants.
- Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Bronchodilation.

foscarnet (foss-kar-net)

Foscavir

Classification

Therapeutic: antivirals

Indications

Treatment of cytomegalovirus (CMV) retinitis in HIV-infected patients (alone or with ganciclovir). Treatment of acyclovir-resistant mucocutaneous herpes simplex virus (HSV) infections in immunocompromised patients.

Action

Prevents viral replication by inhibiting viral DNA-polymerase and reverse transcriptase. **Therapeutic Effects:**

Virustatic action against susceptible viruses including CMV.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Variable penetration into CSF. May concentrate in and be slowly released from bone.

Metabolism and Excretion: 80–90% excreted unchanged in urine.

Half-life: 3 hr (in patients with normal renal function); longer half-life of 90 hr may reflect release of drug from bone.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	8–24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; HF (due to sodium content); Patients on sodium-restricted diets; Hemodialysis; **Lactation:** Avoid breast feeding.

Use Cautiously in: Renal impairment (dose ↓ required if CCr ≤ 1.4–1.6 mL/min/kg; see product information); History of seizures; History of QT interval prolongation or cardiovascular disease; Concurrent use of other QT interval prolonging medications; Hypokalemia or hypomagnesemia (must be corrected prior to therapy); **OB, Pedi:** Safety not established.

Adverse Reactions/Side Effects

CNS: SEIZURES, headache, anxiety, confusion, dizziness, fatigue, malaise, mental depression, weakness.

EENT: conjunctivitis, eye pain, vision abnormalities.

Resp: coughing, dyspnea. **CV:** TORSADE DE POINTES, chest pain, edema, palpitations, QT interval prolongation.

GI: diarrhea, nausea, vomiting, abdominal pain, abnormal taste sensation, anorexia, constipation, dyspepsia. **GU:** renal failure, albuminuria, dysuria, nocturia, polyuria, urinary retention. **Derm:** ↑ sweating, pruritus, rash, skin ulceration. **F and E:** hypocalcemia, hypokalemia, hypomagnesemia, hyperphosphatemia, hypophosphatemia. **Hemat:** anemia, granulocytopenia, leukopenia, neutropenia. **Local:** pain/inflammation at injection site. **MS:** arthralgia, myalgia, back pain, involuntary muscle contraction. **Neuro:**

ataxia, hypoesthesia, neuropathy, paresthesia, tremor. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis, urticaria, and angioedema), fever, chills, flu-like syndrome, lymphoma, sarcoma.

Interactions

Drug-Drug: Avoid use of drugs known to prolong the QTc interval including quinidine, procainamide, amiodarone, sotalol, chlorpromazine, thioridazine, moxifloxacin, pentamidine, and methadone. Concurrent use with parenteral pentamidine may result in severe, life-threatening hypocalcemia. Risk of

nephrotoxicity may be ↑ by concurrent use of other nephrotoxic agents (**amphotericin B**, **aminoglycosides**, **cyclosporine**, **acyclovir**, **methotrexate**, **tacrolimus**, **pentamidine (IV)**).

Route/Dosage

IV (Adults): *CMV retinitis*—60 mg/kg q 8 hr or 90 mg/kg q 12 hr for 2–3 wk, then 90–120 mg/kg/day as a single dose. Dose ↓ required for any degree of renal impairment; *HSV*—40 mg/kg q 8–12 hr for 2–3 wk or until healing occurs.

Availability (generic available)

Solution for injection: 24 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor ECG periodically during therapy for QT interval prolongation.
- **CMV Retinitis:** Diagnosis of CMV retinitis should be determined by ophthalmoscopy before treatment with foscarnet. Ophthalmologic examinations should also be performed at the conclusion of induction and every 4 wk during maintenance therapy.
- Culture for CMV (urine, blood, throat) may be taken before administration. However, a negative CMV culture does not rule out CMV retinitis.
- **HSV Infections:** Assess lesions before and daily during therapy.
- **Lab Test Considerations:** Monitor serum creatinine before and 2–3 times weekly during induction therapy and at least once every 1–2 wk during maintenance therapy. Monitor 24-hr CCR before and periodically throughout therapy. If CCR drops below 0.4 mL/min/kg, discontinue foscarnet.
- Monitor serum calcium, magnesium, potassium, and phosphorus before and 2–3 times weekly during induction therapy and at least weekly during maintenance therapy. May cause ↓ concentrations.
- May cause anemia, granulocytopenia, leukopenia, and thrombocytopenia. May cause ↑ AST and ALT levels and abnormal A-G ratios.

Potential Nursing Diagnoses

Risk for infection (Indications)

Implementation

- Adequately hydrate patient with 750–1000 mL of 0.9% NaCl or D5W before first infusion to establish diuresis, then administer 750–1000 mL with 120 mg/kg of foscarnet or 500 mL with 40–60 mg/kg of foscarnet with each dose to prevent renal toxicity.

IV Administration

- **Intermittent Infusion:** **Diluent:** May be administered via central line undiluted. If administered via peripheral line, *must* be diluted with D5W or 0.9% NaCl to prevent vein irritation. Do not administer so-

lution that is discolored or contains particulate matter. Do not refrigerate or freeze; stable for 24 hrs at room temperature. Use diluted solution within 24 hr. **Concentration:** Undiluted: 24 mg/mL; Diluted: 12 mg/mL.

- Dose is based on patient weight; excess solution may be discarded from bottle before administration to prevent overdosage.
- Patients who experience progression of CMV retinitis during maintenance therapy may be retreated with induction therapy followed by maintenance therapy. **Rate:** Administer at a rate not to exceed 1 mg/kg/min.
- Infuse solution via infusion pump to ensure accurate infusion rate.
- **Y-Site Compatibility:** aldesleukin, alemtuzumab, alfentanil, amifostine, amikacin, aminophylline, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, carboplatin, carmustine, ceftazidime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, cisatracurium, cisplatin, cladribine, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, dexamethasone sodium phosphate, dexmedetomidine, dexrazoxane, diltiazem, docetaxel, dopamine, doxorubicin, enalaprilat, ephedrine, epinephrine, epifibatid, eripapenem, erythromycin lactobionate, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, flucytosine, fludarabine, fluorouracil, fosphenytoin, furosemide, gemcitabine, gentamicin, glycopyrrolate, griseofulvin, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, imipenem-cilastatin, insulin, irinotecan, isoproterenol, ketorolac, levofloxacin, lidocaine, linezolid, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meprobamate, mesna, methotrexate, metoclopramide, metoprolol, metronidazole, milrinone, mitomycin, morphine, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, octreotide, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, penicillin G potassium, pentobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, propranolol, ranitidine, remifentanyl, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiopental, tigecycline, tirofiban, tobramycin, vancomycin, vecuronium, vinblastine, vincristine, voriconazole, zidovudine, zoledronic acid.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- **Y-Site Incompatibility:** Manufacturer recommends that fosphenytoin not be administered concurrently with other drugs or solutions in the same IV catheter except D5W or 0.9% NaCl, acyclovir, allopurinol, amphotericin B colloidal, amphotericin B lipid complex, calcium chloride, calcium gluconate, caspofungin, chlorpromazine, ciprofloxacin, dantrolene, daunorubicin, diazepam, digoxin, diphenhydramine, dobutamine, dolasetron, doxorubicin, droperidol, epirubicin, ganciclovir, haloperidol, idarubicin, labetalol, leucovorin, methylprednisolone, midazolam, mitoxantrone, mycophenolate, nifedipine, norepinephrine, ondansetron, pentamidine, pentazocine, prochlorperazine, promethazine, quinupristin/dalfopristin, thiopental, topotecan, verapamil, vinorelbine.

Patient/Family Teaching

- Inform patient that fosphenytoin is not a cure for CMV retinitis. Progression of retinitis may continue in immunocompromised patients during and after therapy. Advise patients to have regular ophthalmologic exams.
- May cause dizziness and seizures. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional immediately if perioral tingling or numbness in the extremities or paresthesia occurs during or after infusion. If these signs of electrolyte imbalance occur during administration, infusion should be stopped and lab samples for serum electrolyte concentrations obtained immediately.
- Emphasize the importance of frequent follow-up exams to monitor renal function and electrolytes.

Evaluation/Desired Outcomes

- Management of the symptoms of CMV retinitis in patients with AIDS.
- Crusting over and healing of skin lesions in HSV infections.

fosinopril. See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.

fosphenytoin (foss-fen-i-toyn) Cerebyx

Classification

Therapeutic: anticonvulsants

Indications

Short-term (<5 day) parenteral management of generalized, tonic-clonic status epilepticus when use of phenytoin is not feasible. Treatment and prevention of sei-

zures during neurosurgery when use of phenytoin is not feasible.

Action

Limits seizure propagation by altering ion transport. May also decrease synaptic transmission. Fosphenytoin is rapidly converted to phenytoin, which is responsible for its pharmacologic effects. **Therapeutic Effects:** Diminished seizure activity.

Pharmacokinetics

Absorption: Rapidly converted to phenytoin after IV administration and completely absorbed after IM administration.

Distribution: Distributes into CSF and other body tissues and fluids. Enters breast milk; crosses the placenta, achieving similar maternal/fetal levels. Preferentially distributes into fatty tissue.

Protein Binding: Fosphenytoin—95–99%; phenytoin—90–95%.

Metabolism and Excretion: Mostly metabolized by the liver; minimal amounts excreted in the urine.

Half-life: Fosphenytoin—15 min; phenytoin—22 hr (range 7–42 hr).

TIME/ACTION PROFILE (anticonvulsant effect)

ROUTE	ONSET	PEAK	DURATION
IM	unknown	30 min	up to 24 hr
IV	15–45 min	15–60 min	up to 24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Sinus bradycardia, sinoatrial block, 2nd- or 3rd-degree AV heart block or Adams-Stokes syndrome; Concurrent use of delavirdine; Prior acute hepatotoxicity due to fosphenytoin or phenytoin.

Use Cautiously in: Hepatic or renal disease (↑ risk of adverse reactions; dose reduction recommended for hepatic impairment); **OB:** May cause fetal harm (↑ risk of congenital anomalies; ↑ risk of hemorrhage in newborn if used at term); **Lactation:** Present in breast milk; should weigh risk of potential adverse effects on infant versus potential benefit to mother.

Exercise Extreme Caution in:  Patients positive for HLA-B*1502 allele (unless exceptional circumstances exist where benefits clearly outweigh the risks).

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, nystagmus, agitation, brain edema, headache, stupor, vertigo. **EENT:** amblyopia, deafness, diplopia, tinnitus. **CV:** hypotension (with rapid IV administration), tachycardia. **GI:** dry mouth, nausea, taste perversion, tongue disorder, vomiting.

Derm: pruritus, purple glove syndrome, rash, **STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS.**

MS: back pain. **Neuro:** ataxia, dysarthria, extrapyramidal syndrome, hypesthesia, incoordination, paresthesia, tremor. **Misc:** **DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS),** pelvic pain.

Interactions

Drug-Drug: May ↓ the effects of **delavirdine**, resulting in loss of virologic response and potential resistant (concurrent use contraindicated). **Disulfiram**, acute ingestion of **alcohol**, **amiodarone**, **capecitabine**, **chloramphenicol**, **chlorthalidone**, **cimetidine**, **diazepam**, **estrogens**, **ethosuximide**, **felbamate**, **fluconazole**, **flurouracil**, **flouxetine**, **fluvastatin**, **flvoxamine**, **halothane**, **isoniazid**, **itraconazole**, **ketoconazole**, **methylphenidate**, **miconazole**, **omeprazole**, **oxcarbazepine**, **phenothiazines**, **salicylates**, **sertraline**, **succinamides**, **sulfonamides**, **topiramate**, **trazodone**, **voriconazole**, and **warfarin** may ↑ phenytoin blood levels. **Barbiturates**, **bleomycin**, **carbamazepine**, **carboplatin**, **cisplatin**, **diazoxide**, **doxorubicin**, **folic acid**, **fosamprenavir**, **methotrexate**, **nelfinavir**, **reserpine**, **rifampin**, **ritonavir**, **theophylline**, **vigabatrin**, and chronic ingestion of **alcohol** may ↓ phenytoin blood levels. Phenytoin may ↓ the effects of **albendazole**, **amiodarone**, **atorvastatin**, **benzodiazepines**, **carbamazepine**, **chloramphenicol**, **chlorpropamide**, **clozapine**, **corticosteroids**, **cyclosporine**, **digoxin**, **disopyramide**, **doxycycline**, **efavirenz**, **estrogens**, **felbamate**, **fluconazole**, **fluvastatin**, **folic acid**, **furosemide**, **indinavir**, **irinotecan**, **itraconazole**, **ketoconazole**, **lamotrigine**, **lopinavir/ritonavir**, **methadone**, **mexiletine**, **nelfinavir**, **nifedipine**, **nimodipine**, **nisoldipine**, **oral contraceptives**, **oxcarbazepine**, **paclitaxel**, **paroxetine**, **posaconazole**, **propafenone**, **quetiapine**, **quinidine**, **rifampin**, **ritonavir**, **saquinavir**, **sertraline**, **simvastatin**, **tacrolimus**, **teniposide**, **theophylline**, **topiramate**, **tricyclic antidepressants**, **verapamil** vitamin D, **voriconazole**, **warfarin**, and **zonisamide**.

Drug-Natural Products: **St. John's wort** may ↓ levels.

Route/Dosage

Note: Doses of fosphenytoin are expressed as phenytoin sodium equivalents [PE].

Status Epilepticus

IV (Adults and Children): 15–20 mg PE/kg.

Nonemergent and Maintenance Dosing

IV, IM (Adults and Children >16 yr): *Loading dose*—10–20 mg PE/kg. *Maintenance dose*—4–6 mg PE/kg/day.

IV (Children Birth to <17 yr): *Loading dose*—10–15 mg PE/kg. *Maintenance dose*—2–4 mg PE/kg/day.

Availability (generic available)

Injection: 50 mg PE/mL.

NURSING IMPLICATIONS

Assessment

- Assess location, duration, frequency, and characteristics of seizure activity. EEG may be monitored periodically during therapy.
- Monitor BP, ECG, and respiratory function continuously during administration of fosphenytoin and during period when peak serum phenytoin levels occur (15–30 min after administration).
- **Observe patient for development of rash. Discontinue fosphenytoin at the first sign of skin reactions. Serious adverse reactions such as exfoliative, purpuric, or bullous rashes or the development of lupus erythematosus, Stevens-Johnson syndrome, or toxic epidermal necrolysis preclude further use of phenytoin or fosphenytoin.** ⚠ Stevens-Johnson syndrome and toxic epidermal necrolysis are significantly more common in patients with a particular human leukocyte antigen (HLA) allele, HLA-B*1502 (occurs almost exclusively in patients with Asian ancestry, including Han Chinese, Filipinos, Malaysians, South Asian Indians, and Thais). Avoid using phenytoin or fosphenytoin as alternatives to carbamazepine for patients who test positive. If less serious skin eruptions (measles-like or scarlatiniform) occur, fosphenytoin may be resumed after complete clearing of the rash. If rash reappears, further use of fosphenytoin or phenytoin should be avoided.
- **Assess mental status (orientation, mood, behavior) before and periodically during therapy. Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.**
- Monitor injection site frequently during therapy for edema, discoloration, and pain distal to the site of injection (described as “purple glove syndrome”). May or may not be associated with extravasation. The syndrome may not develop for several days after injection of phenytoin or fosphenytoin.
- **Lab Test Considerations:** Fosphenytoin contains 0.0037 mmol phosphate per mg PE. Monitor serum phosphate concentrations in patients with renal insufficiency; may cause ↑ phosphate concentrations.
- May cause ↑ serum alkaline phosphatase, GTT, and glucose levels.
- Fosphenytoin therapy may be monitored using phenytoin levels. Optimal total plasma phenytoin concentrations are typically 10–20 mcg/mL (unbound plasma phenytoin concentrations of 1–2 mcg/mL).
- **Toxicity and Overdose:** Serum phenytoin levels should not be monitored until complete conversion from fosphenytoin to phenytoin has occurred (2 hr after IV or 4 hr after IM administration).
- Initial signs and symptoms of phenytoin toxicity include nystagmus, ataxia, confusion, nausea, slurred speech, and dizziness.

* = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Potential Nursing Diagnoses

Risk for injury (Indications)

Implementation

- Do not confuse Cerebryx (fosphenytoin) with Celebrex (celecoxib) or Celexa (citalopram).
- Do not confuse concentration of fosphenytoin with total amount of drug in vial.
- Implement seizure precautions.
- When substituting *fosphenytoin* for oral *phenytoin* therapy, the same total daily dose may be given as a single dose. Unlike parenteral phenytoin, fosphenytoin may be given safely by the IM route.
- The anticonvulsant effect of fosphenytoin is not immediate. Additional measures (including parenteral benzodiazepines) are usually required in the immediate management of status epilepticus. Loading dose of *fosphenytoin* should be followed with the institution of maintenance anticonvulsant therapy.

IV Administration

- **IV Push:** **Diluent:** D5W or 0.9% NaCl. **Concentration:** 1.5–25 mg PE/mL. May be refrigerated for up to 48 hr. **Rate:** Administer at a rate of <150 mg PE/min in adults and <3 mg/kg/min in children to minimize risk of hypotension and arrhythmias.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butefanolan, carboplatin, carmustine, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, docetaxel, doxacurium, doxorubicin liposomal, enalaprilat, ephedrine, epinephrine, epifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, imipenem, insulin, isoproterenol, ketotolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, mephalan, meperidine, meropenem, mesna, methotrexate, methylodopate, methylprednisolone, metoprolol, metronidazole, milrinone, mitomycin, morphine, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, pentobarbital, phenobar-

bital, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, propranolol, ranitidine, remifentanyl, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** amiodarone, amphotericin B colloidal, calcium chloride, calcium gluconate, caspofungin, chlorpromazine, dantrolene, daunorubicin hydrochloride, diazepam, dobutamine, dolasetron, doxorubicin hydrochloride, droperidol, epidurubicin, fenoldopam, haloperidol, hydralazine, idarubicin, irinotecan, midazolam, mitoxantrone, moxifloxacin, mycophenolate, nicardipine, pentamidine, pentazocine, phenytoin, prochlorperazine, quinupristin/dalfopristin, thiopental, toptecan, verapamil.

Patient/Family Teaching

- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known. Do not resume driving until physician gives clearance based on control of seizure disorder.
- Instruct patients that behavioral changes, skin rash, fever, sore throat, mouth ulcers, easy bruising, petechiae, unusual bleeding, abdominal pain, chills, pale stools, dark urine, jaundice, severe nausea or vomiting, drowsiness, slurred speech, unsteady gait, swollen glands, or persistent headache should be reported to health care professional immediately. Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking, other unusual changes in behavior or mood occur.
- **Rep:** Advise female patients to use an additional non-hormonal method of contraception during therapy and until next menstrual period. Instruct patient to notify health care professional if pregnancy is planned or suspected. Encourage patients who become pregnant to enroll in the North American Antiepileptic Drug (NAAED) Pregnancy Registry by calling 1-888-233-2334 or on the web at www.aedpregnancyregistry.org. Enrollment must be done by patients themselves.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- Emphasize the importance of routine exams to monitor progress. Patient should have routine physical exams, especially monitoring skin and lymph nodes, and EEG testing.

Evaluation/Desired Outcomes

- Decrease or cessation of seizures without excessive sedation.

frovatriptan (froe-va-trip-tan)

Frova

Classification

Therapeutic: vascular headache suppressants

Pharmacologic: 5-HT₁ agonists

Indications

Acute treatment of migraine headache.

Action

Acts as an agonist at specific 5-HT receptor sites in intracranial blood vessels and sensory trigeminal nerves.

Therapeutic Effects: Cranial vessel vasoconstriction with associated decrease in release of neuropeptides and resultant decrease in migraine headache.

Pharmacokinetics

Absorption: 20–30% following oral administration.

Distribution: Unknown.

Metabolism and Excretion: Mostly metabolized by the liver (P450 1A2 enzyme system); some metabolites eliminated in urine, <10% excreted unchanged.

Half-life: 26 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–4 hr	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; History, symptoms or findings consistent with; Cerebrovascular syndromes including; Uncontrolled hypertension; Hemiplegic or basilar migraine; Peripheral vascular disease, including ischemic bowel disease; Should not be used within 24 hr of any other 5-HT agonist or ergot-type compounds (e.g. dihydroergotamine, ergotamine); **Pedi:** Children <18 yr.

Use Cautiously in: Concurrent use of SSRIs or SNRIs (↑ risk of serotonin syndrome); **Geri:** May be more susceptible to adverse cardiovascular effects; **OB, Lactation:** Safety not established.

Exercise Extreme Caution in: Cardiovascular risk factors (hypertension, hypercholesterolemia, cigarette smoking, obesity, diabetes, strong family history, menopausal women or men >40 yr); use only if cardiovascular status has been evaluated and determined to be safe and first dose is administered under supervision.

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, fatigue. **CV:** CORONARY ARTERY VASOSPASM, MI, VENTRICULAR FIBRILLATION, VENTRICULAR TACHYCARDIA, chest pain, myocardial ischemia.

GI: dry mouth, dyspepsia, nausea. **Derm:** flushing.

MS: skeletal pain. **Neuro:** paresthesia. **Misc:** pain.

Interactions

Drug-Drug: Hormonal contraceptives or propranolol may ↑ levels. ↑ risk of serious vasospastic reactions with dihydroergotamine or ergotamine (concurrent use contraindicated). ↑ risk of serotonin syndrome when used with fluoxetine, paroxetine, sertraline, fluvoxamine, citalopram, escitalopram, venlafaxine, or duloxetine.

Route/Dosage

PO (Adults): 2.5 mg; if there has been initial relief, a second tablet may be taken after at least 2 hr (daily dose should not exceed 3 tablets and should not be used to treat more than 4 attacks/30 day period).

Availability (generic available)

Tablets: 2.5 mg.

NURSING IMPLICATIONS

Assessment

- Assess pain location, intensity, duration, and associated symptoms (photophobia, phonophobia, nausea, vomiting) during migraine attack.

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- **PO:** Tablets may be administered at any time after the headache starts.

Patient/Family Teaching

- Inform patient that frovatriptan should be used only during a migraine attack. It is meant to be used to relieve migraine attack but not to prevent or reduce the number of attacks.
- Instruct patient to administer frovatriptan as soon as symptoms appear, but it may be administered any time during an attack. If migraine symptoms return, a second dose may be used. Allow at least 2 hr between doses, and do not use more than 3 tablets in any 24-hr period.
- If dose does not relieve headache, additional frovatriptan doses are not likely to be effective; notify health care professional.
- Caution patient not to take frovatriptan within 24 hr of another vascular headache suppressant.
- Advise patient that lying down in a darkened room following frovatriptan administration may further help relieve headache.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- May cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient that overuse (use more than 10 days/month) may lead to exacerbation of headache (migraine-like daily headaches, or as a marked increase in frequency of migraine attacks). May require gradual withdrawal of frovatriptan and treatment of symptoms (transient worsening of headache).
- Advise patient to notify health care professional prior to next dose of frovatriptan if pain or tightness in the chest occurs during use. If pain is severe or does not subside, notify health care professional immediately. If wheezing; heart throbbing; swelling of eyelids, face, or lips; skin rash; skin lumps; or hives occur, notify health care professional immediately and do not take more frovatriptan without approval of health care professional. If feelings of tingling, heat, flushing, heaviness, pressure, drowsiness, dizziness, tiredness, or sickness develop, discuss with health care professional at next visit.
- Advise patient to avoid alcohol, which aggravates headaches, during frovatriptan use.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to notify health care professional immediately if signs or symptoms of serotonin syndrome occur.
- Caution patient not to use frovatriptan if pregnancy is planned or suspected, or if breast feeding. Adequate contraception should be used during therapy.

Evaluation/Desired Outcomes

- Relief of migraine attack.

furosemide (fur-oh-se-mide)

Lasix

Classification

Therapeutic: diuretics

Pharmacologic: loop diuretics

Indications

Edema due to heart failure, hepatic impairment, or renal disease. Hypertension.

Action

Inhibits the reabsorption of sodium and chloride from the loop of Henle and distal renal tubule. Increases renal excretion of water, sodium, chloride, magnesium, potassium, and calcium. Effectiveness persists in impaired renal function. **Therapeutic Effects:** Diuresis and subsequent mobilization of excess fluid (edema, pleural effusions). Decreased BP.

Pharmacokinetics

Absorption: 60–67% absorbed after oral administration (↓ in acute HF and in renal failure); also absorbed from IM sites.

Distribution: Crosses placenta, enters breast milk.

Protein Binding: 91–99%.

Metabolism and Excretion: Minimally metabolized by liver, some nonhepatic metabolism, some renal excretion as unchanged drug.

Half-life: 30–60 min (↑ in renal impairment).

TIME/ACTION PROFILE (diuretic effect)

ROUTE	ONSET	PEAK	DURATION
PO	30–60 min	1–2 hr	6–8 hr
IM	10–30 min	unknown	4–8 hr
IV	5 min	30 min	2 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with thiazides and sulfonamides may occur; Hepatic coma or anuria; Some liquid products may contain alcohol, avoid in patients with alcohol intolerance.

Use Cautiously in: Severe liver disease (may precipitate hepatic coma; concurrent use with potassium-sparing diuretics may be necessary); Electrolyte depletion; Diabetes mellitus; Hypoproteinemia (↑ risk of ototoxicity); Severe renal impairment (↑ risk of ototoxicity); **OB, Lactation:** Safety not established; **Pedi:** ↑ risk for renal calculi and patent ductus arteriosus in premature neonates; **Geri:** May have ↑ risk of side effects, especially hypotension and electrolyte imbalance, at usual doses.

Adverse Reactions/Side Effects

CNS: blurred vision, dizziness, headache, vertigo.

EENT: hearing loss, tinnitus. **CV:** hypotension. **GI:** anorexia, constipation, diarrhea, dry mouth, dyspepsia,

↑ liver enzymes, nausea, pancreatitis, vomiting. **GU:** ↑ BUN, excessive urination, nephrocalcinosis. **Derm:**

ERYTHEMA MULTIFORME, STEVENS-JOHNSON SYNDROME,

TOXIC EPIDERMAL NECROLYSIS, photosensitivity, pruritis, rash, urticaria. **Endo:** hypercholesterolemia, hyperglycemia, hypertriglyceridemia, hyperuricemia. **F and E:**

dehydration, hypocalcemia, hypochloremia, hypokalemia, hypomagnesemia, hyponatremia, hypovolemia,

metabolic alkalosis. **Hemat:** **APLASTIC ANEMIA, AGRANUCYTOSIS,** hemolytic anemia, leukopenia, thrombocytopenia. **MS:** muscle cramps. **Neuro:** paresthesia.

MS: muscle cramps. **Neuro:** paresthesia.

Misc: fever.

Interactions

Drug-Drug: ↑ risk of hypotension with **anti-hypertensives, nitrates,** or acute ingestion of **alcohol.** ↑ risk of hypokalemia with other **diuretics, amphotericin B, stimulant laxatives,** and **corticosteroids.** Hypokalemia may ↑ risk of **digoxin** toxicity and ↑ risk of arrhythmia in patients taking drugs that prolong the QT interval. ↓ **lithium** excretion, may cause **lithium** toxicity. ↑ risk of ototoxicity

with **aminoglycosides** or **cisplatin**. ↑ risk of nephrotoxicity with **cisplatin**. **NSAIDs** ↓ effects of furosemide. May ↑ risk of **methotrexate** toxicity. ↓ effects of furosemide when given at same time as **sucralfate**, **cholestyramine**, or **colestipol**. ↑ risk of **salicylate** toxicity (with use of high-dose **salicylate** therapy). Concurrent use with **cyclosporine** may ↑ risk of gouty arthritis.

Route/Dosage

Edema

PO (Adults): 20–80 mg/day as a single dose initially, may repeat in 6–8 hr; may ↑ dose by 20–40 mg q 6–8 hr until desired response. Maintenance doses may be given once or twice daily (doses up to 2.5 g/day have been used in patients with HF or renal disease). **Hypertension**—40 twice daily initially (when added to regimen, ↓ dose of other antihypertensives by 50%); adjust further dosing based on response; **Hypercalcemia**—120 mg/day in 1–3 doses.

PO (Children >1 mo): 2 mg/kg as a single dose; may be ↑ by 1–2 mg/kg q 6–8 hr (maximum dose = 6 mg/kg).

PO (Neonates): 1–4 mg/kg/dose 1–2 times/day.

IM, IV (Adults): 20–40 mg, may repeat in 1–2 hr and ↑ by 20 mg every 1–2 hr until response is obtained, maintenance dose may be given q 6–12 hr; **Continuous infusion**—Bolus 0.1 mg/kg followed by 0.1 mg/kg/hr, double q 2 hr to a maximum of 0.4 mg/kg/hr.

IM, IV (Children): 1–2 mg/kg/dose q 6–12 hr; **Continuous infusion**—0.05 mg/kg/hr, titrate to clinical effect.

IM, IV (Neonates): 1–2 mg/kg/dose q 12–24 hr.

Hypertension

PO (Adults): 40 twice daily initially (when added to regimen, ↓ dose of other antihypertensives by 50%); adjust further dosing based on response.

Availability (generic available)

Tablets: 20 mg, 40 mg, 80 mg, *500 mg. **Cost:** *Generic*—20 mg \$6.50/100, 40 mg \$7.11/100, 80 mg \$10.83/100. **Oral solution (10 mg/mL—orange flavor, 8 mg/mL—pineapple—peach flavor):** 8 mg/mL, 10 mg/mL. **Cost:** *Generic*—10 mg/mL \$10.40/60 mL. **Solution for injection:** 10 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess fluid status. Monitor daily weight, intake and output ratios, amount and location of edema, lung sounds, skin turgor, and mucous membranes. Notify health care professional if thirst, dry mouth, lethargy, weakness, hypotension, or oliguria occurs.
- Monitor BP and pulse before and during administration. Monitor frequency of prescription refills to de-

termine compliance in patients treated for hypertension.

- **Ger:** Diuretic use is associated with increased risk for falls in older adults. Assess falls risk and implement fall prevention strategies.
- Assess patients receiving digoxin for anorexia, nausea, vomiting, muscle cramps, paresthesia, and confusion. Patients taking digoxin are at increased risk of digoxin toxicity because of the potassium-depleting effect of the diuretic. Potassium supplements or potassium-sparing diuretics may be used concurrently to prevent hypokalemia.
- Assess patient for tinnitus and hearing loss. Audiometry is recommended for patients receiving prolonged high-dose IV therapy. Hearing loss is most common after rapid or high-dose IV administration in patients with decreased renal function or those taking other ototoxic drugs.
- Assess for allergy to sulfonamides.
- **Assess patient for skin rash frequently during therapy. Discontinue furosemide at first sign of rash; may be life-threatening. Stevens-Johnson syndrome, toxic epidermal necrolysis, or erythema multiforme may develop. Treat symptomatically; may recur once treatment is stopped.**
- **Lab Test Considerations:** Monitor electrolytes, renal and hepatic function, serum glucose, and uric acid levels before and periodically throughout therapy. Commonly ↓ serum potassium. May cause ↓ serum sodium, calcium, and magnesium concentrations. May also cause ↑ BUN, serum glucose, creatinine, and uric acid levels.

Potential Nursing Diagnoses

Excess fluid volume (Indications)

Deficient fluid volume (Side Effects)

Implementation

- **Do not confuse Lasix with Luvox.**
- If administering twice daily, give last dose no later than 5 PM to minimize disruption of sleep cycle.
- IV route is preferred over IM route for parenteral administration.
- **PO:** May be taken with food or milk to minimize gastric irritation. Tablets may be crushed if patient has difficulty swallowing.
- Do not administer discolored solution or tablets.

IV Administration

- **IV Push:** **Diluent:** Administer undiluted (larger doses may be diluted and administered as intermittent infusion [see below]). **Concentration:** 10 mg/mL. **Rate:** Administer at a rate of 20 mg/min. **Pedi:** Administer at a maximum rate of 0.5–1 mg/kg/min (for doses <120 mg) with infusion not exceeding 10 min.
- **Intermittent Infusion:** **Diluent:** Dilute larger doses in 50 mL of D5W, D10W, D20W, D5/0.9%

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

NaCl, D5/LR, 0.9% NaCl, 3% NaCl, or LR. Infusion stable for 24 hr at room temperature. Do not refrigerate. Protect from light. **Concentration:** 1 mg/mL. **Rate:** Administer at a rate not to exceed 4 mg/min (for doses > 120 mg) in adults to prevent ototoxicity. **Pedi:** not to exceed 1 mg/kg/min with infusion not exceeding 10 min. Use an infusion pump to ensure accurate dose.

- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, alprostadil, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B cholesterol, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, atropine, azathioprine, aztreonam, bivalirudin, bleomycin, bumetanide, calcium chloride, calcium gluconate, carboplatin, carmustine, ceftazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, digoxin, docetaxel, doxacurium, doxorubicin liposome, enalaprilat, ephedrine, epinephrine, epoetin alfa, ertapenem, esomeprazole, etoposide, etoposide phosphate, fentanyl, fludarabine, fluorouracil, folic acid, foscarnet, ganciclovir, granisetron, hydrocortisone sodium succinate, hydromorphone, ibuprofen, ifosfamide, imipenem/cilastatin, indomethacin, ketorolac, leucovorin calcium, lidocaine, linezolid, lorazepam, mannitol, mechlorethamine, melphalan, meropenem, methotrexate, methylprednisolone, metoprolol, metronidazole, micafungin, mitomycin, multivitamins, nafcillin, naloxone, nitroprusside, octreotide, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pemetrexed, penicillin G, pentobarbital, phenobarbital, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, propofol, propranolol, ranitidine, remifentanyl, sargramostim, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, teniposide, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, vitamin B complex with C, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** alemtuzumab, amsacrine, atracurium, bupropion, butorphanol, caspofungin, chlorpromazine, ciprofloxacin, dantrolene, dexrazoxane, diazepam, diazoxide, diltiazem, diphenhydramine, dolasetron, doxycycline, droperidol, epirubicin, eptifibatid, erythromycin, esmolol, fenoldopam, filgrastim, gemcitabine, gentamicin, glycopyrrolate, haloperidol, hydroxyzine, idarubicin, irinotecan, ketamine, levofloxacin, metaraminol, methyldopate, midazolam, milrinone, mitoxantrone, moxifloxacin, mycophenolate, nalbuphine, nesiritide, nicardipine, ondansetron, pancuronium, pa-

paverine, pentamidine, pentazocine, phentolamine, phenylephrine, phenytoin, prochlorperazine, promethazine, protamine, pyridoxime, quinupristin/dalfopristin, rituximab, rocuronium, telavancin, thiamine, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vecuronium, verapamil, vinblastine, vinorelbine.

Patient/Family Teaching

- Instruct patient to take furosemide as directed. Take missed doses as soon as possible; do not double doses.
- Caution patient to change positions slowly to minimize orthostatic hypotension. Caution patient that the use of alcohol, exercise during hot weather, or standing for long periods during therapy may enhance orthostatic hypotension.
- Instruct patient to consult health care professional regarding a diet high in potassium (see Appendix K).
- Advise patient to contact health care professional if weight gain more than 3 lbs in 1 day.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any OTC medications concurrently with this therapy.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to contact health care professional immediately if rash, muscle weakness, cramps, nausea, dizziness, numbness, or tingling of extremities occurs.
- Advise diabetic patients to monitor blood glucose closely; may cause increased blood glucose levels.
- Emphasize the importance of routine follow-up examinations.
- **Geri:** Caution older patients or their caregivers about increased risk for falls. Suggest strategies for fall prevention.
- **Hypertension:** Advise patients on antihypertensive regimen to continue taking medication even if feeling better. Furosemide controls but does not cure hypertension.
- Reinforce the need to continue additional therapies for hypertension (weight loss, exercise, restricted sodium intake, stress reduction, regular exercise, moderation of alcohol consumption, cessation of smoking).

Evaluation/Desired Outcomes

- Decrease in edema.
- Decrease in abdominal girth and weight.
- Increase in urinary output.
- Decrease in BP.

gabapentin (ga-ba-pen-tin)

Gralise, Horizant, Neurontin

Classification

Therapeutic: analgesic adjuncts, therapeutic, anticonvulsants, mood stabilizers

Indications

Partial seizures (adjunct treatment) (immediate-release only). Postherpetic neuralgia. Restless legs syndrome (Horizant only). **Unlabeled Use:** Neuro-pathic pain. Prevention of migraine headache. Bipolar disorder. Anxiety. Diabetic peripheral neuropathy.

Action

Mechanism of action is not known. May affect transport of amino acids across and stabilize neuronal membranes. **Therapeutic Effects:** Decreased incidence of seizures. Decreased postherpetic pain. Decreased leg restlessness.

Pharmacokinetics

Absorption: Well absorbed after oral administration by active transport. At larger doses, transport becomes saturated and absorption ↓ (bioavailability ranges from 60% for a 300-mg dose to 35% for a 1600-mg dose).

Distribution: Crosses blood-brain barrier; enters breast milk.

Metabolism and Excretion: Eliminated mostly by renal excretion of unchanged drug.

Half-life: *Adults*—5–7 hr (normal renal function); up to 132 hr in anuria; *Children*—4.7 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO-IR	rapid	2–4 hr	8 hr
PO-SR	unknown	5–8 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: All patients (may ↑ risk of suicidal thoughts/behaviors); Renal insufficiency (↓ dose and/or ↑ dosing interval if $CCr \leq 60$ mL/min); **OB:** Pregnancy; **Pedi:** Children < 18 yr (sustained-/extended-release) or < 3 yr (immediate-release) (safety not established); **Lactation:** Discontinue drug or bottle-feed; **Ger:** May be more susceptible to toxicity due to age-related ↓ in renal function.

Adverse Reactions/Side Effects

CNS: **SUICIDAL THOUGHTS**, confusion, depression, dizziness, drowsiness, sedation, anxiety, concentration difficulties (children), emotional lability (children), hostility, hyperkinesia (children), malaise, vertigo, weakness. **EENT:** abnormal vision, nystagmus. **CV:** hypertension. **GI:** weight gain, anorexia, flatulence,

gingivitis. **MS:** **RHABDOMYOLYSIS**, arthralgia, ↑ creatine kinase. **Neuro:** ataxia, altered reflexes, hyperkinesia, paresthesia. **Misc:** **ANAPHYLAXIS, ANGIOEDEMA, MULTIORGAN HYPERSENSITIVITY REACTIONS.**

Interactions

Drug-Drug: **Antacids** may ↓ absorption of gabapentin. ↑ risk of CNS depression with other CNS depressants, including alcohol, antihistamines, opioids, and sedative/hypnotics. May ↓ hydromedone levels.

Drug-Natural Products: Kava-kava, valerian, or chamomile can ↑ CNS depression.

Route/Dosage

The sustained-/extended-release formulations should not be interchanged with the immediate-release products.

Epilepsy

PO (Adults and Children > 12 yr): 300 mg 3 times daily initially. Titration may be continued until desired (range is 900–1800 mg/day in 3 divided doses; doses should not be more than 12 hr apart). Doses up to 2400–3600 mg/day have been well tolerated.

PO (Children ≥ 5–12 yr): 10–15 mg/kg/day in 3 divided doses initially titrated upward over 3 days to 25–35 mg/kg/day in 3 divided doses; dosage interval should not exceed 12 hr (doses up to 50 mg/kg/day have been used).

PO (Children 3–4 yrs): 10–15 mg/kg/day in 3 divided doses initially titrated upward over 3 days to 40 mg/kg/day in 3 divided doses; dosage interval should not exceed 12 hr (doses up to 50 mg/kg/day have been used).

Renal Impairment

PO (Adults and Children > 12 yr): *CCr 30–59 mL/min*—200–700 mg twice daily; *CCr 15–29 mL/min*—200–700 mg once daily; *CCr 15 mL/min*—100–300 mg once daily; *CCr < 15 mL/min*—Reduce daily dose in proportion to *CCr*.

Postherpetic Neuralgia

PO (Adults): **Immediate-release**—300 mg once daily on first day, then 300 mg 2 times daily on second day, then 300 mg 3 times/day on day 3, may then be titrated upward as needed up to 600 mg 3 times/day; **Sustained-release (Gralise)**—300 mg once daily on first day, then 600 mg once daily on second day, then 900 mg once daily on days 3–6, then 1200 mg once daily on days 7–10, then 1500 mg once daily on days 11–14, then 1800 mg once daily thereafter; **Extended-release (Horizant)**—600 mg once daily in the morning on days 1–3, then 600 mg twice daily thereafter.

Renal Impairment

PO (Adults): *CCr 30–59 mL/min*—200–700 mg twice daily (immediate-release); 600–1800 mg once

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

daily (sustained-release [Gralise]); 300 mg once daily in the morning on days 1–3, then 300 mg twice daily thereafter (may ↑ to 600 mg twice daily, as needed) (extended-release [Horizant]); *CCr* 15–29 mL/min—200–700 mg once daily (immediate-release); sustained release (Gralise) not recommended; 300 mg in the morning on days 1 and 3, then 300 mg once daily in the morning thereafter (may ↑ to 300 mg twice daily, as needed) (extended-release [Horizant]); *CCr* 15 mL/min—100–300 mg once daily (immediate-release); sustained release (Gralise) not recommended; *CCr* <15 mL/min—↓ daily dose in proportion to *CCr* (immediate release); sustained release (Gralise) not recommended; 300 mg every other day in the morning (may ↑ to 300 mg once daily in the morning, as needed) (extended-release [Horizant]); *CCr* <15 mL/min (on hemodialysis)—300 mg after each dialysis session (may ↑ to 600 mg after each dialysis session, as needed) (extended-release [Horizant]).

Restless Legs Syndrome

PO (Adults): *Extended-release (Horizant)*—600 mg once daily at 5 PM.

Renal Impairment

(Adults): *CCr* 30–59 mL/min—300 mg once daily at 5 PM; may ↑ to 600 mg once daily at 5 PM as needed; *CCr* 15–29 mL/min—300 mg once daily at 5 PM; *CCr* <15 mL/min—300 mg every other day; *CCr* <15 mL/min (on hemodialysis)—Not recommended.

Neuropathic Pain (unlabeled use)

PO (Adults): 100 mg 3 times daily initially. Titrate weekly by 300 mg/day up to 900–2400 mg/day (maximum: 3600 mg/day).

PO (Children): 5 mg/kg/dose at bedtime initially then ↑ to 5 mg/kg twice daily on day 2 and 5 mg/kg 3 times daily on day 3. Titrate to effect up to 8–35 mg/kg/day in 3 divided doses.

Availability (generic available)

Capsules: 100 mg, 300 mg, 400 mg. **Cost:** *Generic*—100 mg \$11.45/100, 300 mg \$15.18/100, 400 mg \$12.36/100. **Tablets:** 600 mg, 800 mg. **Cost:** *Generic*—600 mg \$33.96/100, 800 mg \$49.20/100. **Extended-release tablets (Horizant):** 300 mg, 600 mg. **Sustained-release tablets (Gralise):** 300 mg, 600 mg. **Cost:** 300 mg \$99.00/30, 600 mg \$329.40/90. **Oral solution (cool strawberry anise flavor):** 250 mg/5 mL. **Cost:** *Generic*—\$148.91/470 mL.

NURSING IMPLICATIONS

Assessment

- Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- **Seizures:** Assess location, duration, and characteristics of seizure activity.
- **Postherpetic Neuralgia & Neuropathic Pain:** Assess location, characteristics, and intensity of pain periodically during therapy.

- **Migraine Prophylaxis:** Monitor frequency and intensity of pain on pain scale.
- **Restless Leg Syndrome:** Assess frequency and intensity of restless leg syndrome prior to and periodically during therapy.
- **Lab Test Considerations:** May cause false-positive readings when testing for urinary protein with *Ames N-Multistix SG* dipstick test; use sulfosalicylic acid precipitation procedure.
- May cause leukopenia.

Potential Nursing Diagnoses

Risk for injury (Side Effects)

Chronic pain (Indications)

Ineffective coping (Indications)

Implementation

- Doses of *Gralise* and *Horizant* are not interchangeable with other dose forms of gabapentin.
- **PO:** May be administered without regard to meals.
- 600-mg and 800-mg tablets are scored and can be broken to administer a half-tablet. If half-tablet is used, administer other half at the next dose. Discard half-tablets not used within several days.
- Administer *Gralise* with evening meal. Swallow tablet whole; do not crush, break, or chew.
- Administer *Horizant* for *Restless Leg Syndrome* with evening meal at 5 PM. *Horizant* for *Postherpetic Neuralgia* is administered twice daily. Swallow tablet whole; do not crush, break, or chew.
- Gabapentin should be discontinued gradually over at least 1 wk. If dose is 600 mg/day, may discontinue without tapering. If >600 mg/day, titrate daily to 600 mg for 1 week, then discontinue. If patient is taking 600 mg twice daily, taper to once daily before discontinuing. Abrupt discontinuation may cause increase in seizure frequency.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed. Patients on 3 times daily dosing should not exceed 12 hr between doses. Take missed doses as soon as possible; if less than 2 hr until next dose, take dose immediately and take next dose 1–2 hr later, then resume regular dosing schedule. Do not double dose. Do not discontinue abruptly; may cause increase in frequency of seizures. Instruct patient to read the *Medication Guide* before starting and with each Rx refill, as changes may occur.
- Advise patient not to take gabapentin within 2 hr of an antacid.
- Gabapentin may cause dizziness and drowsiness. Caution patient to avoid driving or activities requiring alertness until response to medication is known. Seizure patients should not resume driving until physician gives clearance based on control of seizure disorder.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or

worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; or other unusual changes in behavior or mood occur.

- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Advise patient to carry identification describing disease process and medication regimen at all times.

Evaluation/Desired Outcomes

- Decreased frequency of or cessation of seizures.
- Decreased postherpetic neuralgia pain.
- Decreased intensity of neuropathic pain.
- Decreased frequency of migraine headaches.
- Increased mood stability.
- Decreased effects of restless leg syndrome.

galantamine

(ga-lant-a-meen)

Razadyne, Razadyne ER

Classification

Therapeutic: anti-Alzheimer's agents

Pharmacologic: cholinergics (cholinesterase inhibitors)

Indications

Mild to moderate dementia/neurocognitive disorder of the Alzheimer's type.

Action

Enhances cholinergic function by reversible inhibition of cholinesterase. **Therapeutic Effects:** Decreased dementia/cognitive decline (temporary) associated with Alzheimer's disease. Cognitive enhancer.

Pharmacokinetics

Absorption: Well absorbed (90%) following oral administration.

Distribution: Unknown.

Metabolism and Excretion: Mostly metabolized by the liver (primarily by CYP2D6 and CYP3A4 isoenzymes); H the CYP2D6 enzyme system exhibits genetic polymorphism; ~7% of population may be poor metabolizers (PMs) and may have significantly \uparrow galantamine concentrations and an \uparrow risk of adverse effects. 20% excreted unchanged in urine.

Half-life: 7 hr.

TIME/ACTION PROFILE (anticholinesterase activity)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1 hr	12 hr
PO-ER	unknown	1 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Severe hepatic or renal impairment; **Pedi, Lactation:** Children or lactation.

Use Cautiously in: Patients with supraventricular cardiac conduction defects or concurrent use of drugs that may slow heart rate (\uparrow risk of bradycardia); History of ulcer disease/GI bleeding/concurrent NSAID use; Severe asthma or obstructive pulmonary disease; Mild to moderate renal impairment (avoid use if CCr <9 mL/min); Mild to moderate hepatic impairment (cautious dose titration recommended); May \uparrow risk of cardiovascular mortality; **OB:** Use only if potential benefit outweighs potential risk to fetus.

Adverse Reactions/Side Effects

CNS: dizziness, fatigue, headache, syncope. **CV:** bradycardia, chest pain. **GI:** nausea, vomiting, anorexia, \downarrow weight, diarrhea, dyspepsia, flatulence. **GU:** bladder outflow obstruction, incontinence. **Neuro:** tremor. **Derm:** ACUTE GENERALIZED EXANTHEMATOUS PUSTULOSIS, STEVENS-JOHNSON SYNDROME.

Interactions

Drug-Drug: Will \uparrow neuromuscular blockade from succinylcholine-type neuromuscular blocking agents. May \uparrow effects of other cholinesterase inhibitors or other cholinergic agonists, including bethanechol. May \downarrow effectiveness of anticholinergic medications. Blood levels and effects may be \uparrow by ketoconazole, paroxetine, amitriptyline, fluvoxamine, or quinidine.

Route/Dosage

PO (Adults): Immediate-release tablets—4 mg twice daily initially, dose increments of 4 mg should be made at 4 wk intervals, up to 12 mg twice daily. Doses up to 16 mg twice daily have been used (range 16–32 mg/day); Extended-release capsules—8 mg/day as a single dose in the morning, may be \uparrow to 16 mg/day after 4 wk, then up to 24 mg/day after 4 wk; increments based on benefit/tolerability.

Renal Impairment

PO (Adults): Moderate renal impairment—Daily dose should not exceed 16 mg.

Hepatic Impairment

PO (Adults): Moderate hepatic impairment—Daily dose should not exceed 16 mg.

* = Canadian drug name. H = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Availability (generic available)

Immediate-release tablets: 4 mg, 8 mg, 12 mg. **Extended-release capsules:** 8 mg, 16 mg, 24 mg. **Oral solution:** 4 mg/mL.

NURSING IMPLICATIONS**Assessment**

- Assess cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) periodically during therapy.
- Monitor heart rate periodically during therapy. May cause bradycardia.

Potential Nursing Diagnoses

Disturbed thought process (Indications)

Risk for injury (Indications)

Impaired environmental interpretation syndrome (Indications)

Implementation

- **Do not confuse Razadyne with Rozerem (ramelteon).**
- Patient should be maintained on a stable dose for a minimum of 4 wk prior to increasing dose.
- If dose has been interrupted for several days or longer, restart at the lowest dose and escalate to the current dose.
- **PO:** Administer twice daily, preferably with morning and evening meal. Administration with food, the use of antiemetic medications, and ensuring adequate fluid intake may decrease nausea and vomiting.
- Administer extended-release capsules in the morning, preferably with food. Swallow whole; do not open, crush, or chew.
- Use pipette provided with oral solution to administer accurate amount.

Patient/Family Teaching

- Emphasize the importance of taking galantamine daily, as directed. Instruct patient and/or caregiver in correct use of pipette if using oral solution; review *Oral Solution Instruction Sheet* included with product prior to use. Skip missed doses and return to regular schedule the following day; do not double doses. If >3 days doses are missed, restart at lowest dose. Do not discontinue abruptly; although no increase in frequency of adverse events may occur, beneficial affects of galantamine are lost when the drug is discontinued.
- Caution patient and caregiver that galantamine may cause dizziness. Monitor and assist with ambulation and caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Instruct patient to maintain adequate fluid intake during therapy.
- **Advise patient and caregiver to stop taking galantamine and notify health care professional immediately if rash occurs.**

- Advise patient and caregiver to notify health care professional if nausea or vomiting persists beyond 7 days or if new symptoms occur or previously noted symptoms increase in severity.
- Advise patient and caregiver to notify health care professional of medication regimen prior to treatment or surgery.
- Teach patient and caregivers that improvements in cognitive functioning may take wk to mo to stabilize.
- Caution that disease is not cured and degenerative process is not reversed.
- Emphasize the importance of follow-up exams to monitor progress.

Evaluation/Desired Outcomes

- Improvement in cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) in patients with Alzheimer's disease.

ganciclovir (gan-sye-kloe-vir)

Cytovene

Classification

Therapeutic: antivirals

Indications

IV: Treatment of cytomegalovirus (CMV) retinitis in immunocompromised patients, including HIV-infected patients (may be used with foscarnet). Prevention of CMV infection in transplant patients at risk. Congenital CMV infection in neonates.

Action

CMV converts ganciclovir to its active form (ganciclovir phosphate) inside the host cell, where it inhibits viral DNA polymerase. **Therapeutic Effects:** Antiviral effect directed preferentially against CMV-infected cells.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Widely distributed; enters CSF.

Protein Binding: 1–2%.

Metabolism and Excretion: 90% excreted unchanged by the kidneys.

Half-life: *Adults:* 2.9 hr; *Children 9 mo–12 yr:* 2.4 ± 0.7 hr; *Neonates:* 2.4 hr (↑ in renal impairment).

TIME/ACTION PROFILE (antiviral levels)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	12–24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to ganciclovir or acyclovir; Bone marrow depression or immunosuppression or thrombocytopenia (do not administer if ANC <500/mm³ or platelet count <25,000/mm³).

Use Cautiously in: Renal impairment (dose ↓ required if CCr <80 mL/min); **Geri:** Dose ↓ recommended.

Adverse Reactions/Side Effects

CNS: SEIZURES, abnormal dreams, coma, confusion, dizziness, drowsiness, headache, malaise, nervousness.

Resp: dyspnea. **CV:** arrhythmias, edema, hypertension, hypotension. **GI:** GI BLEEDING, abdominal pain, ↑ liver enzymes, nausea, vomiting. **GU:** gonadal suppression, hematuria, renal toxicity. **Derm:** alopecia, photosensitivity, pruritus, rash, urticaria. **Endo:** hypoglycemia. **Hemat:** neutropenia, thrombocytopenia, anemia, eosinophilia. **Local:** pain/phlebitis at IV site. **Neuro:** ataxia, tremor. **Misc:** fever.

Interactions

Drug-Drug: ↑ risk of bone marrow depression with **antineoplastics, radiation therapy, or zidovudine**. Toxicity may be ↑ by **probenecid**. ↑ risk of seizures with **imipenem/cilastatin**. Concurrent use of other **nephrotoxic drugs, cyclosporine, or amphotericin B** ↑ risk of nephrotoxicity.

Route/Dosage

IV (Adults and Children >3 mo): *Induction*—5 mg/kg q 12 hr for 14–21 days. *Maintenance regimen*—5 mg/kg/day or 6 mg/kg for 5 days of each week. If progression occurs, ↑ to q 12 hr regimen. *Prevention*—5 mg/kg q 12 hr for 7–14 days, then 5 mg/kg/day or 6 mg/kg for 5 days of each week.

IV (Neonates): *Congenital CMV infection*—12 mg/kg/day divided q 12 hr x 6 weeks.

Renal Impairment

IV (Adults and Children): *Induction*—CCr 50–69 mL/min: 2.5 mg/kg/dose q 12 hr; CCr 25–49 mL/min: 2.5 mg/kg/dose q 24 hr; CCr 10–24 mL/min: 1.25 mg/kg/dose q 24 hr; CCr <10 mL/min: 1.25 mg/kg 3 times/week after hemodialysis; *Maintenance*—CCr 50–69 mL/min: 2.5 mg/kg/dose q 24 hr; CCr 25–49 mL/min: 1.25 mg/kg/dose q 24 hr; CCr 10–24 mL/min: 0.625 mg/kg/dose q 24 hr; CCr <10 mL/min: 0.625 mg/kg 3 times/week after hemodialysis.

Availability (generic available)

Powder for injection: 500 mg/vial. **Premixed infusion:** 500 mg/250 mL.

NURSING IMPLICATIONS

Assessment

- Diagnosis of CMV retinitis should be determined by ophthalmoscopy before treatment with ganciclovir.
- Culture for CMV (urine, blood, throat) may be taken before administration. However, a negative CMV culture does not rule out CMV retinitis. If symptoms do not respond after several weeks, resistance to ganciclovir may have occurred. Ophthalmologic exams

should be performed weekly during induction and every 2 wk during maintenance or more frequently if the macula or optic nerve is threatened. Progression of CMV retinitis may occur during or after ganciclovir treatment.

- Assess for signs of infection (fever, chills, cough, hoarseness, lower back or side pain, sore throat, difficult or painful urination). Notify health care professional if these symptoms occur.
- Assess for bleeding (bleeding gums, bruising, petechiae; guaiac stools, urine, and emesis). Avoid IM injections and taking rectal temperatures. Apply pressure to venipuncture sites for 10 min.
- **Lab Test Considerations:** Obtain a negative pregnancy test prior to starting therapy.
- Monitor neutrophil and platelet count at least every 2 days during bid therapy and weekly thereafter. Granulocytopenia usually occurs during the first 2 wk of treatment but may occur anytime during therapy. Do not administer if neutrophil count <500/mm³ or platelet count <25,000/mm³. Recovery begins within 3–7 days of discontinuation of therapy.
- Monitor BUN and serum creatinine at least once every 2 wk throughout therapy.
- Monitor liver function tests (AST, ALT, serum bilirubin, alkaline phosphatase) periodically during therapy. May cause ↑ levels.
- May cause ↓ blood glucose.

Potential Nursing Diagnoses

Risk for infection (Indications, Patient/Family Teaching)

Implementation

- Do not confuse **Cytovene (ganciclovir)** with **Cytosar (cytarabine)**.
- Prepare solution in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard IV equipment in specially designated containers.
- Do not administer subcut or IM; severe tissue irritation may result.
- **IV:** Observe infusion site for phlebitis. Rotate infusion site to prevent phlebitis.
- Maintain adequate hydration throughout therapy.

IV Administration

- **Intermittent Infusion:** Reconstitute 500 mg with 10 mL of sterile water for injection for a concentration of 50 mg/mL. Do not reconstitute with bacteriostatic water with parabens; precipitation will occur. Shake well to dissolve completely. Discard vial if particulate matter or discoloration occurs. Reconstituted solution is stable for 12 hr at room temperature; do not refrigerate.
- **Diluent:** Dilute in 100 mL of D5W, 0.9% NaCl, Ringer's or LR. Once diluted for infusion, solution should be used within 24 hr. Refrigerate but do not freeze. **Concentration:** 10 mg/mL. **Rate:** Admin-

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

ister slowly, via infusion pump, over 1 hr using an in-line filter. Rapid administration may increase toxicity.

- **Y-Site Compatibility:** alemtuzumab, alfentanil, allopurinol, amphotericin B cholesteryl, amphotericin B lipid complex, anidulafungin, argatroban, atropine, azithromycin, bivalirudin, bleomycin, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cisplatin, cyanocobalamin, cyclophosphamide, cyclosporine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, digoxin, docetaxel, doxacurium, doxorubicin liposome, enalaprilat, epoetin alfa, eptifibatid, ertapenem, etoposide, etoposide phosphate, fentanyl, filgrastim, flucanazole, fluorouracil, folic acid, furosemide, glycopyrrolate, granisetron, heparin, hetastarch, hydromorphone, ifosfamide, indomethacin, insulin, labetalol, leucovorin calcium, linezolid, lorazepam, mannitol, mechlorethamine, melphalan, methotrexate, metoprolol, milrinone, mitoxantrone, nafcillin, naloxone, nesiritide, nitroglycerin, nitroprusside, octreotide, oxytocin, paclitaxel, pancuronium, pantoprazole, pemetrexed, pentobarbital, phenobarbital, phytonadione, potassium chloride, propofol, propranolol, protamine, ranitidine, remifentanyl, rituximab, rocuronium, sodium acetate, sufentanil, teniposide, thiotepa, tigecycline, tirofiban, trastuzumab, vasopressin, vinblastine, vincristine, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** aldesleukin, amifostine, amikacin, aminophylline, amphotericin B colloidal, ampicillin, ampicillin/sulbactam, amsacrine, ascorbic acid, atracurium, azathioprine, aztreonam, benzotropine, bumetanide, butorphanol, cefazolin, cefepime, cefotaxime, cefotetan, ceftaxime, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, clindamycin, cytarabine, dantrolene, dexrazoxane, diazepam, diazoxide, diltiazem, diphenhydramine, dobutamine, dolasetron, dopamine, doxorubicin, doxycycline, ephedrine, epinephrine, epirubicin, erythromycin, esmolol, famotidine, fenoldopam, fludarabine, foscarnet, gemcitabine, gentamicin, haloperidol, hydralazine, hydrocortisone, hydroxyzine, idarubicin, imipenem/cilastatin, irinotecan, isoproterenol, ketorolac, levofloxacin, lidocaine, magnesium sulfate, meperidine, metaraminol, methylodopa, methylprednisolone, metoclopramide, metronidazole, midazolam, morphine, multivitamins, mycophenolate, nalbuphine, nicardipine, norepinephrine, ondansetron, oxacillin, palonosetron, papaverine, penicillin G, pentamidine, pentazocine, phentolamine, phenylephrine, phenytoin, piperacillin/tazobactam, potassium acetate, procainamide, prochlorperazine, promethazine, pyridoxime, quinuapristin/dalfopristin, sargramostim, sodium bicarbonate, streptokinase, succinylcholine, tacrolimus, theophylline, thiamine, tobramycin, tolazoline, trimethoprim/sulfamethoxazole, vancomycin, vecuronium, verapamil, vinorelbine.

Patient/Family Teaching

- Inform patient that ganciclovir is not a cure for CMV retinitis. Progression of retinitis may continue in immunocompromised patients during and after therapy. Advise patients to have regular ophthalmic exams at least every 6 wk. Duration of therapy for CMV prevention is based on the duration and degree of immunosuppression.
- Advise patient to notify health care professional if fever; chills; sore throat; other signs of infection; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Patient should be cautioned not to drink alcoholic beverages or take products containing aspirin or NSAIDs.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- **Rep:** May have teratogenic effects. Advise female patients of reproductive potential to use a nonhormonal method of contraception during and for at least 30 days after end of therapy and to avoid breast feeding during therapy. Advise male patients to use condoms during and for at least 90 days after therapy. Inform patients that ganciclovir may cause temporary or permanent female and male infertility.
- Emphasize the importance of frequent follow-up exams to monitor blood counts.

Evaluation/Desired Outcomes

- Treatment of the symptoms of CMV retinitis in immunocompromised patients.
- Prevention of CMV retinitis in transplant patients at risk.

 **gefitinib** (je-fit-in-ib)
Iressa

Classification

Therapeutic: antineoplastics
Pharmacologic: enzyme inhibitors

Indications

 First-line treatment of patients with metastatic non-small-cell lung cancer (NSCLC) whose tumors have epidermal growth factor receptor (EGFR) exon 19 deletions or exon 21 (L858R) substitution mutations.

Action

 Inhibits activation of kinases found in transmembrane cell surface receptors, including EGFR. **Therapeutic Effects:** Prolonged progression-free survival.

Pharmacokinetics

Absorption: 60% absorbed following oral administration.

Distribution: Extensively distributed.

Metabolism and Excretion: Mostly metabolized by the liver (CYP3A4 enzyme system); excreted in feces, <4% excreted in urine.

Half-life: 48 hr.

TIME/ACTION PROFILE (plasma levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	3–7 hr	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **OB:** May cause fetal harm; **Lactation:** Safety not established; **Pedi:** Safety and effectiveness not established.

Use Cautiously in: Idiopathic pulmonary fibrosis (↑ risk of pulmonary toxicity); Concurrent use of strong inhibitors of the CYP3A4 enzyme system (may ↑ risk of toxicity); **OB:** Women with childbearing potential.

Adverse Reactions/Side Effects

EENT: aberrant eyelash growth, blepharitis, conjunctivitis, corneal erosion/ulcer, dry eye, nose bleeding.

Resp: INTERSTITIAL LUNG DISEASE, dyspnea. **GI:** GI PERFORATION, HEPATOTOXICITY, anorexia, diarrhea, nausea, vomiting, dry mouth, mouth ulceration. **GU:** ↓ fertility (females), hematuria, ↑ serum creatinine. **Derm:** ER-
YTHEMA MULTIFORME, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, rash, alopecia, pruritus. **F and E:** dehydration. **Metab:** weight loss. **Misc:** allergic reactions including ANGIOEDEMA, fever.

Interactions

Drug-Drug: Strong inducers of the CYP3A4 enzyme system, including rifampin and phenytoin, ↓ blood levels and effects (↑ dose of gefitinib to 500 mg/day). Strong inhibitors of the CYP3A4 enzyme system, including ketoconazole and itraconazole, ↑ blood levels and effects. Absorption and efficacy may be ↓ by drugs that ↑ gastric pH including H₂ receptor antagonist, proton pump inhibitors, and antacids; take gefitinib 12 hr after last dose or 12 hr before the next dose of proton pump inhibitor; take gefitinib 6 hr after last dose or 6 hr before next dose H₂ receptor antagonist or antacid. May ↑ the risk of bleeding with warfarin.

Route/Dosage

PO (Adults): 250 mg once daily; *Concurrent use of rifampin or phenytoin*—500 mg once daily (resume 250 mg once daily dose 7 days after discontinuing strong CYP3A4 inducer).

Availability

Tablets: 250 mg.

NURSING IMPLICATIONS

Assessment

- Assess for signs of pulmonary toxicity (dyspnea, cough, fever). Withhold gefitinib during diagnosis. If

interstitial lung disease is confirmed, discontinue gefitinib and treat appropriately.

- Assess patient for eye symptoms such as pain during therapy. May require interruption of therapy and removal of aberrant eyelash. After symptoms and eye changes have resolved, may reinstate therapy.
- Monitor for rash. Interrupt or discontinue therapy if severe bullous, blistering or exfoliating conditions develop.
- **Lab Test Considerations:** Monitor liver function tests periodically. May cause ↑ transaminases, bilirubin, and alkaline phosphatase. Withhold gefitinib in patients with worsening liver function tests; discontinue gefitinib if elevations are severe.
- Monitor for changes in prothrombin time and INR in patients taking warfarin. May cause ↑ levels.

Potential Nursing Diagnoses

Diarrhea (Adverse Reactions)

Impaired skin integrity (Side Effects)

Ineffective breathing pattern (Adverse Reactions)

Implementation

- Available only through the *Iressa Access Program*. Patients must be currently on the medication or in an approved study and must sign the Patient Consent Form. Physicians and prescribers must enroll in program.
- ~~Ⓝ~~ FDA-approved test must be used to detect EGFR mutations in NSCLC. Patients must have EGFR exon 19 deletions or exon 21 substitutions to use gefitinib.
- **PO:** Administer one tablet daily without regard to food. Tablets can also be dispersed in half a glass of drinking water (noncarbonated). No other liquids should be used. Drop the tablet in the water, without crushing it, stir until the tablet is dispersed (approximately 10 min), and drink the liquid immediately. Rinse the glass with half a glass of water and drink. The liquid can also be administered through a nasogastric tube.
- May interrupt therapy briefly (14 days) for patients with poorly tolerated diarrhea with dehydration or skin adverse reactions. Follow by restarting 250 mg dose.

Patient/Family Teaching

- Instruct patient to take gefitinib as directed. Take missed doses up to 12 hrs of next dose. Advise patient to read the *Instruction Sheet* with each Rx refill; new information may be available.
- Advise patient to notify health care professional promptly if severe persistent diarrhea, nausea, vomiting, or anorexia occur; if shortness of breath or cough occur or worsen; or if eye irritation or other new symptoms develop.
- **Rep:** Instruct female patient to use effective contraception during and for 2 wks after last dose and no-

* = Canadian drug name. ~~Ⓝ~~ = Genetic implication. ~~Ⓝ~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

tify health care professional if pregnancy is suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in size and spread of tumors in non–small-cell lung cancer.

HIGH ALERT

gemcitabine (jem-site-a-been)

Gemzar

Classification

Therapeutic: antineoplastics

Pharmacologic: antimetabolites, nucleoside analogues

Indications

Pancreatic cancer (locally advanced or metastatic). Inoperable locally advanced/metastatic non–small-cell lung cancer (with cisplatin). Metastatic breast cancer (with paclitaxel). Advanced ovarian cancer that has relapsed 6 mo after completion of platinum-based therapy (with carboplatin).

Action

Interferes with DNA synthesis (cell-cycle phase–specific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Converted in cells to active diphosphate and triphosphate metabolites; these are excreted primarily by the kidneys.

Half-life: 32–94 min.

TIME/ACTION PROFILE (effect on blood counts)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **OB:** Can cause fetal malformation; **Lactation:** Can expose infant to serious adverse effects. Bottle-feed if gemcitabine therapy is necessary.

Use Cautiously in: History of cardiovascular disease; Impaired hepatic or renal function (↑ risk of toxicity); Other chronic debilitating illness; **Rep:** Patients with childbearing potential.

Adverse Reactions/Side Effects

CNS: POSTERIOR REVERSIBLE ENCEPHALOPATHY SYNDROME (PRES). **Resp:** PULMONARY TOXICITY, dyspnea, bronchospasm. **CV:** ARRHYTHMIAS, CAPILLARY LEAK SYNDROME, CEREBROVASCULAR ACCIDENT, MI, edema, hypertension. **GI:** HEPATOTOXICITY, diarrhea, ↑ liver enzymes, nausea, stomatitis, vomiting. **GU:** HEMOLYTIC UREMIC

SYNDROME, hematuria, proteinuria. **Derm:** alopecia, rash. **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** injection site reactions. **Neuro:** paresthesias. **Misc:** flu-like symptoms, fever, anaphylactoid reactions.

Interactions

Drug-Drug: ↑ bone marrow depression with other antineoplastics or radiation therapy. May ↓ antibody response to live virus vaccines and ↑ risk of adverse reactions.

Route/Dosage

Other regimens are used.

Pancreatic Cancer

IV (Adults): 1000 mg/m² once weekly for 7 wk, followed by a wk of rest. May be followed by cycles of once-weekly administration for 3 wk followed by a wk of rest.

Non–Small-Cell Lung Cancer (with Cisplatin)

IV (Adults): 1000 mg/m² on days 1, 8, and 15 of each 28-day cycle (cisplatin is also given on day 1) or 1250 mg/m² on days 1 and 8 of each 21-day cycle (cisplatin is also given on day 1).

Breast Cancer

IV (Adults): 1250 mg/m² on days 1 and 8 of each 21-day cycle (paclitaxel is also given on day 1).

Ovarian Cancer

IV (Adults): 1000 mg/m² on days 1 and 8 of each 21-day cycle.

Availability (generic available)

Powder for injection: 200 mg/vial, 1 g/vial, ★ 2 g/vial.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs before and frequently during therapy.
- Assess injection site during administration. Although gemcitabine is not considered a vesicant, local reactions may occur.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae; guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor intake and output, appetite, and nutritional intake. Mild to moderate nausea and vomiting occur frequently. Antiemetics may be used prophylactically.
- Assess for signs and symptoms of capillary leak syndrome (severe hypotension, hypoalbuminemia,

hemoconcentration). Discontinue therapy if symptoms occur.

- Monitor respiratory status during therapy. Discontinue gemcitabine if unexplained dyspnea or other evidence of severe pulmonary toxicity occurs. May occur up to 2 wks after last dose.
- Monitor for signs and symptoms of posterior reversible encephalopathy syndrome (PRES) (headache, seizure, lethargy, hypertension, confusion, blindness, and other visual and neurologic disturbances) during therapy. Confirm diagnosis of PRES with magnetic resonance imaging (MRI). Discontinue gemcitabine if PRES develops during therapy.
- **Lab Test Considerations:** Monitor CBC, including differential and platelet count, before each dose. Dose guidelines are based on CBC. **For single-agent use:** *If absolute granulocyte count is >1000 and platelet count is >100,000*, full dose may be administered. *If absolute granulocyte count is 500–999 or platelet count is 50,000–99,000*, 75% of dose may be given. *If absolute granulocyte count is <500 or platelet count is <50,000*, withhold further doses. **For gemcitabine with paclitaxel (breast cancer):** *If absolute granulocyte count is >1200 and platelet count is >75,000*, full dose may be administered. *If absolute granulocyte count is 1000–1199 or platelet count is 50,000–75,000*, 75% of dose may be given. *If absolute granulocyte count is 700–999 or platelet count is ≥50,000*, 50% of dose may be given. *If absolute granulocyte count is <700 or platelet count is <50,000*, withhold further doses. **For gemcitabine with carboplatin (ovarian cancer):** *If absolute granulocyte count is >1500 and platelet count is >100,000*, full dose may be administered. *If the absolute granulocyte count is 1000–1499 or platelet count is 75,000–99,000*, 75% of dose may be given. *If the absolute granulocyte count is <1000 or the platelet count is <75,000*, withhold further doses.
- Monitor serum creatinine, potassium, calcium, and magnesium in patients taking cisplatin with gemcitabine.
- Monitor hepatic and renal function before and periodically during therapy. May cause transient ↑ in serum AST, ALT, alkaline phosphatase, and bilirubin concentrations. Discontinue gemcitabine for severe hepatic toxicity or hemolytic-uremic syndrome.
- May also cause ↑ BUN and serum creatinine concentrations, proteinuria, and hematuria.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)

Implementation

- **High Alert:** Fatalities have occurred with incorrect administration of chemotherapeutic agents. Before

administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings.

- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers.

IV Administration

- **Intermittent Infusion:** To reconstitute, add 5 mL of 0.9% NaCl without preservatives to 200-mg vial or 25 mL of 0.9% NaCl to the 1-g vial of gemcitabine for a concentration of 40 mg/mL. Incomplete dissolution may result in concentrations greater than 40 mg/mL. **Diluent:** May be further diluted with 0.9% NaCl. Solution is colorless to light straw color. Do not administer solutions that are discolored or contain particulate matter. Solution is stable for 24 hr at room temperature. Discard unused portions. Do not refrigerate; crystallization may occur. **Concentration:** 0.1–38 mg/mL. **Rate:** Administer dose over 30 min. Infusions longer than 60 min have a greater incidence of toxicity.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, butrenorphine, butorphanol, calcium acetate, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefotetan, cefoxitin, cefazidime, ceftriaxone, cefuroxime, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daunorubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxacurium, doxorubicin, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, floxuridine, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, insulin, isoproterenol, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem, mesna, metamizolol, methyldopate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxalipl-

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

tin, paclitaxel, palonosetron, pamidronate, pancuronium, pentamidine, pentazocine, pentobarbital, phenobarbital, potassium acetate, potassium chloride, potassium phosphates, procainamide, promethazine, propranolol, quinupristin/dalfopristin, ranitidine, remifentanyl, rituximab, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, tolazoline, topotecan, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vincorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, cefepime, cefotaxime, chloramphenicol, dantrolene, daptomycin, diazepam, doxorubicin liposomal, furosemide, ganciclovir, imipenem-cilastatin, irinotecan, ketorolac, methotrexate, methoprednisolone, mitomycin, nafcillin, pantoprazole, pemetrexed, phenytoin, piperacillin/tazobactam, prochlorperazine, thiopental.

Patient/Family Teaching

- Instruct patient to notify health care professional if fever; chills; sore throat; signs of infection; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Patient should be cautioned not to drink alcoholic beverages or take products containing aspirin or NSAIDs.
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to use sponge brush and rinse mouth with water after eating and drinking. Stomatitis pain may require management with opioid analgesics.
- Instruct patient to notify health care professional if flu-like symptoms (fever, anorexia, headache, cough, chills, myalgia), swelling of feet or legs, signs and symptoms of pulmonary toxicity (shortness of breath, wheezing, cough), hemolytic-uremic syndrome (changes in color or volume of urine output, increased bruising or bleeding), or hepatic toxicity (jaundice, pain/tenderness in right upper abdominal quadrant) occur.
- Discuss with patient the possibility of hair loss. Explore methods of coping.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- **Rep:** Advise patient that medication may have teratogenic effects. Contraception should be used during therapy.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Palliative, symptomatic improvement in patients with pancreatic cancer.
- Decrease in size and spread of malignancy in lung, ovarian, and breast cancer.

gemfibrozil (gem-fye-broe-zil)

Lipid

Classification

Therapeutic: lipid-lowering agents
Pharmacologic: fibric acid derivatives

Indications

Management of type II-b hyperlipidemia (decreased HDL, increased LDL, increased triglycerides) in patients who do not yet have clinical coronary artery disease and have failed therapy with diet, exercise, weight loss, or other agents (niacin, bile acid sequestrants).

Action

Inhibits peripheral lipolysis. Decreases triglyceride production by the liver. Decreases production of the triglyceride carrier protein. Increases HDL. **Therapeutic Effects:** Decreased plasma triglycerides and increased HDL.

Pharmacokinetics

Absorption: Well absorbed after oral administration.

Distribution: Unknown.

Metabolism and Excretion: Some metabolism by the liver, 70% excreted by the kidneys (mostly unchanged), 6% excreted in feces.

Half-life: 1.3–1.5 hr.

TIME/ACTION PROFILE (triglyceride-VLDL-lowering effect)

ROUTE	ONSET	PEAK	DURATION
PO	2–5 days	4 wk	several mo

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hepatic impairment; Severe renal impairment; Primary biliary cirrhosis; Gallbladder disease; Concurrent use of simvastatin, repaglinide, or dasabuvir.

Use Cautiously in: OB, Lactation, PEDI: Safety not established.

Adverse Reactions/Side Effects

CNS: dizziness, headache. **EENT:** blurred vision. **GI:** abdominal pain, diarrhea, epigastric pain, flatulence, gallstones, heartburn, nausea, vomiting. **Derm:** alopecia, rash, urticaria. **Hemat:** anemia, leukopenia. **MS:** myositis.

Interactions

Drug-Drug: May ↑ levels of CYP2C8 substrates, including dabrafenib, dasabuvir, enzalutamide, loperamide, montelukast, paclitaxel, pioglitazone,

or **rosiglitazone**; concurrent use with **dasabuvir** contraindicated. May ↑ levels of **OATP1B1 substrates**, including **atorvastatin**, **bosentan**, **ezetimibe**, **fluvastatin**, **glyburide**, **olmesartan**, **pitavastatin**, **pravastatin**, **repaglinide**, **rifampin**, **rosuvastatin**, **simvastatin**, and **valsartan**; concurrent use with **simvastatin** or **repaglinide** is contraindicated; avoid concurrent use with other **HMG-CoA reductase inhibitors**. May ↑ levels and the risk of bleeding with **warfarin**. Concurrent use with **colchicine** may ↑ risk of rhabdomyolysis, especially in patients with renal dysfunction or elderly. May ↓ the effect of **cyclosporine**. **Cholestyramine** and **colestipol** may ↓ absorption; separate administration by ≥2 hr.

Route/Dosage

PO (Adults): 600 mg twice daily 30 min before breakfast and dinner.

Availability (generic available)

Tablets: 600 mg. **Cost:** *Generic*—\$24.07/100. **Capsules:** * 300 mg.

NURSING IMPLICATIONS

Assessment

- Obtain patient's diet history, especially regarding fat and alcohol consumption.
- **Lab Test Considerations:** Monitor serum triglyceride and cholesterol levels before and periodically during therapy. Assess LDL and VLDL levels before and periodically during therapy. Discontinue gemfibrozil if paradoxical ↑ in lipid levels occurs.
- Assess liver function tests before and periodically during therapy. May cause ↑ serum bilirubin, alkaline phosphatase, CK, LDH, AST, and ALT. If hepatic function tests rise significantly, discontinue therapy and do not resume.
- Evaluate CBC and electrolytes every 3–6 mo and then yearly during therapy. May cause mild ↓ in hemoglobin, hematocrit, and leukocyte counts. May cause ↓ serum potassium concentrations.
- May cause slight ↑ in serum glucose.

Potential Nursing Diagnoses

Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** Administer 30 min before breakfast or dinner.

Patient/Family Teaching

- Instruct patient to take medication as directed, not to skip doses or double up on missed doses. Take missed doses as soon as remembered unless almost time for next dose.
- Advise patient that gemfibrozil should be used in conjunction with dietary restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, and cessation of smoking.

- Instruct patient to notify health care professional promptly if severe stomach pains with nausea and vomiting, fever, chills, sore throat, rash, diarrhea, muscle cramping, general abdominal discomfort, or persistent flatulence occur.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in serum triglyceride and cholesterol levels and improved HDL to total cholesterol ratios. If response is not seen within 3 mo, medication is usually discontinued.

gentamicin, See AMINOGLYCOSIDES.

glecaprevir/pibrentasvir
(glek-a-pre-vir/pi-brent-as-vir)
Mavyret

Classification

Therapeutic: antivirals

Pharmacologic: NS5A inhibitors, protease inhibitors

Indications

⊠ Chronic hepatitis C virus (HCV) genotypes 1, 2, 3, 4, 5, or 6 infection without cirrhosis or with compensated cirrhosis. ⊠ Chronic HCV genotype 1 infection in patients who have previously received treatment with a regimen containing an HCV NS5A inhibitor or an NS3/4A protease inhibitor, but not both.

Action

Glecaprevir—inhibits the HCV NS3/4A protease, resulting in inhibition of viral replication; *Pibrentasvir*—inhibits the HCV NS5A protein, resulting in inhibition of viral replication. **Therapeutic Effects:** Decreased levels of HCV with sustained virologic response and lessened sequelae of chronic HCV infection.

Pharmacokinetics

Glecaprevir

Absorption: Well absorbed following oral administration; absorption ↑ by high-fat meal.

Distribution: Unknown.

Protein Binding: 97.5%.

Metabolism and Excretion: Partially metabolized by CYP3A4; 92% excreted in feces and <1% eliminated in urine.

Half-life: 6 hr.

* = Canadian drug name. ⊠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Pibrentasvir

Absorption: Well absorbed following oral administration.

Distribution: Unknown.

Protein Binding: >99.9%.

Metabolism and Excretion: Not metabolized; 97% excreted in feces.

Half-life: 13 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
glecaprevir (PO)	unknown	5 hr	24 hr
pibrentasvir (PO)	unknown	5 hr	24 hr

Contraindications/Precautions

Contraindicated in: Severe hepatic impairment (Child-Pugh C); Concurrent use of atazanavir, carbamazepine, dabigatran, darunavir, efavirenz, lopinavir, oral contraceptives containing ethinyl estradiol, rifampin, ritonavir, or St. John's wort.

Use Cautiously in: Receiving immunosuppressant or chemotherapy medications (↑ risk of hepatitis B virus reactivation); Moderate hepatic impairment (safety and effectiveness not established); **OB:** Safety not established; **Lactation:** Weigh benefits of breast feeding against possible adverse effects; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: fatigue, headache. **Derm:** pruritus. **GI:** diarrhea, hyperbilirubinemia, nausea. **Misc:** hepatitis B virus reactivation.

Interactions

Drug-Drug: Atazanavir may ↑ levels of glecaprevir/pibrentasvir and ↑ risk of liver enzyme elevation; concurrent use contraindicated. Rifampin may ↓ levels/effectiveness of glecaprevir/pibrentasvir; concurrent use contraindicated. Strong CYP3A inducers, including carbamazepine or efavirenz may ↓ levels/effectiveness of glecaprevir/pibrentasvir; concurrent use not recommended. Darunavir, lopinavir, or ritonavir may ↑ levels of glecaprevir/pibrentasvir; concurrent use not recommended. May ↑ levels of atorvastatin, fluvastatin, lovastatin, pitavastatin, pravastatin, rosuvastatin, and simvastatin and ↑ risk of myopathy; concurrent use with atorvastatin, lovastatin, and simvastatin not recommended; ↓ dose of pravastatin by 50%; do not exceed rosuvastatin dose of 10 mg/day; use lowest possible dose of fluvastatin or pitavastatin. May ↑ dabigatran levels; avoid concurrent use. May ↑ digoxin levels; ↓ digoxin dose by 50% when initiating glecaprevir/pibrentasvir therapy. Concurrent use with ethinyl estradiol-containing oral contraceptives may ↑ risk of liver enzyme elevation; concurrent use not recommended. Cyclosporine may ↑ levels/toxicity of glecaprevir/pibrentasvir; concurrent use not recom-

mended if patients require cyclosporine dose >100 mg/day.

Drug-Natural Products: St. John's wort may ↓ levels/effectiveness of glecaprevir/pibrentasvir; concurrent use not recommended.

Route/Dosage

PO (Adults): Genotype 1, 2, 3, 4, 5, or 6: Treatment-naïve with no cirrhosis—3 tablets (glecaprevir 300 mg/pibrentasvir 120 mg) once daily for 8 wk; Genotype 1, 2, 3, 4, 5, or 6: Treatment-naïve with compensated cirrhosis (Child-Pugh A)—3 tablets (glecaprevir 300 mg/pibrentasvir 120 mg) once daily for 12 wk; Genotype 1: Treatment-experienced with NS5A inhibitor (with no cirrhosis or with compensated cirrhosis [Child-Pugh A])—3 tablets (glecaprevir 300 mg/pibrentasvir 120 mg) once daily for 16 wk; Genotype 1: Treatment-experienced with NS3/4A protease inhibitor (with no cirrhosis or with compensated cirrhosis [Child-Pugh A])—3 tablets (glecaprevir 300 mg/pibrentasvir 120 mg) once daily for 12 wk; Genotype 1, 2, 4, 5, or 6: Treatment-experienced with regimens containing interferon, pegylated interferon, ribavirin, and/or sofosbuvir (no cirrhosis)—3 tablets (glecaprevir 300 mg/pibrentasvir 120 mg) once daily for 8 wk; Genotype 1, 2, 4, 5, or 6: Treatment-experienced with regimens containing interferon, pegylated interferon, ribavirin, and/or sofosbuvir (with compensated cirrhosis [Child-Pugh A])—3 tablets (glecaprevir 300 mg/pibrentasvir 120 mg) once daily for 12 wk; Genotype 3: Treatment-experienced with regimens containing interferon, pegylated interferon, ribavirin, and/or sofosbuvir (with no cirrhosis or with compensated cirrhosis [Child-Pugh A])—3 tablets (glecaprevir 300 mg/pibrentasvir 120 mg) once daily for 16 wk.

Availability

Tablets: glecaprevir 100 mg/pibrentasvir 40 mg.

NURSING IMPLICATIONS

Assessment

- Monitor for signs and symptoms of hepatitis B reactivation or hepatitis (jaundice, dark urine, light colored stools, fatigue, weakness, loss of appetite, nausea, vomiting, stomach pain) during therapy.
- **Lab Test Considerations:** Test all patients for current or prior hepatitis B virus (HBV) infection before starting hepatitis C virus therapy; may cause hepatitis B virus reactivation. Measure hepatitis B surface antigen (HBsAg) and hepatitis core antibody (anti-HBc). Monitor for clinical and laboratory signs of hepatitis flare (↑ AST, ALT, bilirubin, liver failure, death) or HBV reactivation (rapid ↑ in serum HBV DNA level) during HCV treatment and post-treatment follow-up.
- ❗ Test patient with HCV genotype 1a infection for presence of virus with NS5A resistance-associated polymorphisms prior to starting therapy with Mavyret™ to determine dose regimen and duration.

Potential Nursing Diagnoses

Risk for infection (Indications)

Implementation

- **PO:** Administer once daily with food.

Patient/Family Teaching

- Instruct patient to take medication as directed. Do not skip or miss dose. If dose is missed, take if <18 hrs from usual time taken, then take next dose at usual time. If >18 hrs from usual time of dose, omit dose and take next dose at usual time. Do not stop medication without consulting health care professional. Advise patient to read Patient Information before starting therapy and with each Rx refill in case of changes.
- Advise patient to notify health care professional if they have a history of HBV. May cause reactivation.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's Wort.
- **Rep:** Advise all patients to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decreased levels of HCV with sustained virologic response and lessened sequelae of chronic HCV infection.

glimepiride, See SULFONYLUREAS.

glipizide, See SULFONYLUREAS.

glucagon (gloo-ka-gon)

GlucaGen

Classification

Therapeutic: hormones

Pharmacologic: pancreatic

Indications

Acute management of severe hypoglycemia when administration of glucose is not feasible. Facilitation of radiographic examination of the GI tract. **Unlabeled**

Use: Antidote to: Beta blockers, Calcium channel blockers.

Action

Stimulates hepatic production of glucose from glycogen stores (glycogenolysis). Relaxes the musculature of the GI tract (stomach, duodenum, small bowel, and colon), temporarily inhibiting movement. Has positive

inotropic and chronotropic effects. **Therapeutic Effects:** Increase in blood glucose. Relaxation of GI musculature, facilitating radiographic examination.

Pharmacokinetics

Absorption: Well absorbed following IM and subcut administration.

Distribution: Unknown.

Metabolism and Excretion: Extensively metabolized by the liver, plasma, and kidneys.

Half-life: 8–18 min.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IM (hyperglycemic action)	within 10 min	30 min	12–27 min
IV (hyperglycemic action)	1 min	5 min	9–17 min
Subcut (hyperglycemic action)	within 10 min	30–45 min	60–90 min
IV (effect on GI musculature)	45 sec (for 0.25–2-mg dose)	unknown	9–17 min (0.25–0.5-mg dose); 22–25 min (2-mg dose)
IM (effect on GI musculature)	8–10 min (1-mg dose); 4–7 min (2-mg dose)	unknown	9–27 min (1-mg dose); 21–32 min (2-mg dose)

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Pheochromocytoma; Some products contain glycerin and phenol—avoid use in patients with hypersensitivities to these ingredients.

Use Cautiously in: History suggestive of insulinoma or pheochromocytoma; Prolonged fasting, starvation, adrenal insufficiency, or chronic hypoglycemia (low levels of releasable glucose); When used to inhibit GI motility, use cautiously in geriatric patient with cardiac disease or diabetics; **OB:** Should be used during pregnancy only if clearly needed; **Lactation:** Safety not established.

Adverse Reactions/Side Effects

CV: hypotension. **GI:** nausea, vomiting. **Misc:** hypersensitivity reactions including **ANAPHYLAXIS**.

Interactions

Drug-Drug: Large doses may enhance the effect of **warfarin**. Negates the response to **insulin** or **oral hypoglycemic agents**. **Phenytoin** inhibits the stimulant effect of glucagon on insulin release. Hyperglycemic ef-

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

fect is intensified and prolonged by **epinephrine**. Patients on concurrent **beta blocker** therapy may have a greater increase in heart rate and BP.

Route/Dosage

Hypoglycemia

IV, IM, Subcut (Adults and Children >25 kg): 1 mg; may be repeated in 15 min if necessary.

IV, IM, Subcut (Children <25 kg): 0.5 mg or 0.02–0.03 mg/kg; may be repeated in 15 min if necessary.

IV, IM, Subcut (Children >6 yr and unknown weight): 1 mg; may be repeated in 15 min if necessary.

IV, IM, Subcut (Children <6 yr and unknown weight): 0.5 mg or 0.02–0.03 mg/kg; may be repeated in 15 min if necessary.

Radiographic Examination of the GI Tract

IM, IV (Adults): 0.25–2 mg; depending on location and duration of examination (0.5 mg IV or 2 mg IM for relaxation of stomach; for examination of the colon 2 mg IM 10 min before procedure).

Antidote (unlabeled)

IV (Adults): *To beta blockers*—50–150 mcg (0.05–0.15 mg)/kg, followed by 1–5 mg/hr infusion. *To calcium channel blockers*—2 mg; additional doses determined by response.

Availability

Powder for injection: 1-mg (equivalent to 1 unit) vials as an emergency kit for low blood glucose and as a diagnostic kit.

NURSING IMPLICATIONS

Assessment

- Assess for signs of hypoglycemia (sweating, hunger, weakness, headache, dizziness, tremor, irritability, tachycardia, anxiety) prior to and periodically during therapy.
- Assess neurologic status throughout therapy. Institute safety precautions to protect patient from injury caused by seizures, falling, or aspiration. For insulin shock therapy, 0.5–1 mg is administered after 1 hr of coma; patient usually awakens in 10–25 min. If no response occurs, repeat the dose. Feed patient supplemental carbohydrates orally to replenish liver glycogen and prevent secondary hypoglycemia as soon as possible after awakening, especially pediatric patients.
- Assess nutritional status. Patients who lack liver glycogen stores (starvation, chronic hypoglycemia, adrenal insufficiency) will require glucose instead of glucagon.
- Assess for nausea and vomiting after administration of dose. Protect patients with depressed level of consciousness from aspiration by positioning on side; ensure that a suction unit is available. Notify health care professional if vomiting occurs; patient will re-

quire parenteral glucose to prevent recurrent hypoglycemia.

- **Lab Test Considerations:** Monitor serum glucose levels throughout episode, during treatment, and for 3–4 hr after patient regains consciousness. Use of bedside fingerstick blood glucose determination methods is recommended for rapid results. Follow-up lab results may be ordered to validate fingerstick values, but do not delay treatment while awaiting lab results, as this could result in neurologic injury or death.
- Large doses of glucagon may cause a ↓ in serum potassium concentrations.

Potential Nursing Diagnoses

Risk for injury (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- May be given subcut, IM, or IV. Reconstitute with diluent supplied in kit by manufacturer. Inspect solution prior to use; use only clear, water-like solution. Solution is stable for 48 hr if refrigerated, 24 hr at room temperature. Unmixed medication should be stored at room temperature.
- Administer supplemental carbohydrates IV or orally to facilitate increase of serum glucose levels.

IV Administration

- **IV Push: Diluent:** Reconstitute each vial with 1 mL of an appropriate diluent. For doses ≤2 mg, use diluent provided by manufacturer. For doses >2 mg, use sterile water for injection instead of diluent supplied by manufacturer to minimize risk of thrombophlebitis, CNS toxicity, and myocardial depression from phenol preservative in diluent supplied by manufacturer. Reconstituted vials should be used immediately. **Concentration:** Not exceed 1 mg/mL. **Rate:** Administer at a rate not exceeding 1 mg/min. May be administered through IV line containing D5W.
- **Continuous Infusion: Diluent:** Reconstitute vials as per directions above (use sterile water for injection). Further dilute 10 mg of glucagon in 100 mL of D5W. **Concentration:** 0.1 mg/mL. **Rate:** See Route/Dosage section.
- **Y-Site Compatibility:** naloxone.

Patient/Family Teaching

- Teach patient and family signs and symptoms of hypoglycemia. Instruct patient to take oral glucose as soon as symptoms of hypoglycemia occur—glucagon is reserved for episodes when patient is unable to swallow because of decreased level of consciousness.
- **Home Care Issues** Instruct family on correct technique to prepare, draw up, and administer injection. Health care professional must be contacted immediately after each dose for orders regarding further therapy or adjustment of insulin dose or diet.

- Advise family that patient should receive oral glucose when alertness returns.
- Instruct family to position patient on side until fully alert. Explain that glucagon may cause nausea and vomiting. Aspiration may occur if patient vomits while lying on back.
- Instruct patient to check expiration date monthly and to replace outdated medication immediately.
- Review hypoglycemic medication regimen, diet, and exercise programs.
- Patients with diabetes mellitus should carry a source of sugar (such as a packet of sugar or candy) and identification describing disease process and treatment regimen at all times.

Evaluation/Desired Outcomes

- Increase of serum glucose to normal levels with improved level of consciousness.
- Smooth muscle relaxation of the stomach, duodenum, and small and large intestine in patients undergoing radiologic examination of the GI tract.

glyBURIDE, See SULFONYLUREAS.

glycopyrrolate

(glye-koe-pye-roe-late)

Cuvposa, Robinul, Robinul-Forte

Classification

Therapeutic: antispasmodics

Pharmacologic: anticholinergics

Indications

Inhibits salivation and excessive respiratory secretions when given preoperatively. Reverses some of the secretory and vagal actions of cholinesterase inhibitors used to treat nondepolarizing neuromuscular blockade (cholinergic adjunct). Adjunctive management of peptic ulcer disease. **Oral solution:** Reduce chronic severe drooling in children with neurologic conditions associated with drooling.

Action

Inhibits the action of acetylcholine at postganglionic sites located in smooth muscle, secretory glands, and the CNS (antimuscarinic activity). Low doses decrease sweating, salivation, and respiratory secretions. Intermediate doses result in increased heart rate. Larger doses decrease GI and GU tract motility. **Therapeutic Effects:** Decreased GI and respiratory secretions.

Pharmacokinetics

Absorption: Incompletely absorbed (<10%) after oral administration. Well absorbed after IM administration.

Distribution: Distribution not fully known. Does not significantly cross the blood-brain barrier or eye. Crosses the placenta.

Metabolism and Excretion: Eliminated primarily unchanged in the urine and bile.

Half-life: 1.7 hr (0.6–4.6 hr).

TIME/ACTION PROFILE (anticholinergic effects)

ROUTE	ONSET	PEAK	DURATION
PO	1 hr	unknown	8–12 hr
IM	15–30 min	30–45 min	2–7 hr*
IV	1–10 min	unknown	2–7 hr*

*Antisecretory effect lasts up to 7 hr; vagal blockade lasts 2–3 hr.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Angle-closure glaucoma; Acute hemorrhage; Tachycardia secondary to cardiac insufficiency or thyrotoxicosis; Severe ulcerative colitis; Toxic megacolon; Myasthenia gravis; Obstructive uropathy; Paralytic ileus; Concurrent use of oral potassium chloride dosage forms (oral solution only); **Pedi:** Injection contains benzyl alcohol and should not be given to neonates.

Use Cautiously in: Patients who may have intra-abdominal infections; Prostatic hyperplasia; Chronic renal, hepatic, pulmonary, or cardiac disease; Hyperthyroidism; Down syndrome and children with spastic paralysis or brain damage (may be hypersensitive to antimuscarinic effects); **OB, Lactation:** Safety not established; **Pedi:** ↑ sensitivity to anticholinergic effects and adverse reactions; **Geri:** ↑ sensitivity to anticholinergic effects and adverse reactions.

Adverse Reactions/Side Effects

CNS: headache, confusion, drowsiness. **EENT:** nasal congestion, blurred vision, cycloplegia, dry eyes, mydriasis. **CV:** tachycardia, orthostatic hypotension, palpitations. **GI:** dry mouth, vomiting, constipation. **GU:** urinary hesitancy, urinary retention. **Derm:** flushing.

Interactions

Drug-Drug: May ↑ GI mucosal lesions in patients taking oral **potassium chloride** tablets; concurrent use with oral glycopyrrolate solution contraindicated. Additive anticholinergic effects with other **anticholinergics**, including **antihistamines**, **phenothiazines**, **mepiperidine**, **amantadine**, **tricyclic antidepressants**, **quinidine**, and **disopyramide**. May alter the absorption of other orally administered drugs by slowing motility of the GI tract. May ↑ GI transit time of oral **digoxin** and ↑ digoxin levels. **Antacids** or **adsorbent antidiarrheal agents** ↓ absorption of anticholinergics. May ↑ GI mucosal lesions in patients taking oral **potassium chloride** tablets. May ↑ **atenolol** and

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

metformin levels. May ↓ levels of **haloperidol** and **levodopa**. Concurrent use may ↓ absorption of **ketoconazole** (administer 2 hr after ketoconazole).

Route/Dosage

Control of Secretions during Surgery

IM (Adults): 4.4 mcg/kg 30–60 min preop (not to exceed 0.1 mg).

IM (Children >2 yr): 4.4 mcg/kg 30–60 min preop.

IM (Children <2 yr): 4.4–8.8 mcg/kg 30–60 min preop.

Control of Secretions (chronic)

IM, IV (Children): 4–10 mcg/kg/dose q 3–4 hr.

PO (Children): 40–100 mcg/kg/dose 3–4 times/day.

Cholinergic Adjunct

IV (Adults and Children): 200 mcg for each 1 mg of neostigmine or 5 mg of pyridostigmine given at the same time.

Antiarrhythmic

IV (Adults): 100 mcg, may be repeated q 2–3 min.

IV (Children): 4.4 mcg/kg (up to 100 mcg); may be repeated q 2–3 min.

Peptic Ulcer

PO (Adults): 1–2 mg 2–3 times daily. An additional 2 mg may be given at bedtime; may be ↓ to 1 mg twice daily (not to exceed 8 mg/day).

IM, IV (Adults): 100–200 mcg q 4 hr up to 4 times daily.

Chronic Severe Drooling

PO (Children 3–16 yr): Oral solution—0.02 mg/kg 3 times daily; may ↑ by 0.02 mg/kg 3 times daily every 5–7 days (not to exceed 0.1 mg/kg 3 times daily or 1.5–3 mg/dose).

Availability (generic available)

Tablets: 1 mg, 2 mg. **Injection:** 200 mcg (0.2 mg)/mL. **Oral solution (cherry-flavor):** 1 mg/5 mL.

NURSING IMPLICATIONS

Assessment

- Assess heart rate, BP, and respiratory rate before and periodically during parenteral therapy.
- Monitor intake and output ratios in geriatric or surgical patients; glycopyrrolate may cause urinary retention. Instruct patient to void before parenteral administration.
- Assess patient routinely for abdominal distention and auscultate for bowel sounds. If constipation becomes a problem, increasing fluids and adding bulk to the diet may help alleviate the constipating effects of the drug.
- Periodic intraocular pressure determinations should be made for patients receiving long-term therapy.
- **Pedi:** Monitor amount and frequency of drooling periodically during therapy.

- Assess for hyperexcitability, a paradoxical response that may occur in children.

- **Lab Test Considerations:** Antagonizes effects of pentagastrin and histamine during the gastric acid secretion test. Avoid administration for 24 hr preceding the test.

- May cause ↓ uric acid levels in patients with gout or hyperuricemia.

- **Toxicity and Overdose:** If overdose occurs, neostigmine is the antidote.

Potential Nursing Diagnoses

Impaired oral mucous membrane (Side Effects)

Constipation (Side Effects)

Implementation

- Do not administer cloudy or discolored solution.
- **PO:** Administer 30–60 min before meals to maximize absorption.
- For drooling: Administer at least 1 hr before or 2 hr after meals.
- Do not administer within 1 hr of antacids or antiarrhythmic medications.
- Oral dose is 10 times the parenteral dose.
- **IM:** May be administered undiluted (200 mcg/mL).

IV Administration

- **IV Push:** **Diluent:** May be given undiluted through Y-site. **Concentration:** 200 mcg/mL. **Rate:** Administer at a maximum rate of 20 mcg over 1 min.
- **Y-Site Compatibility:** acyclovir, alfentanil, amikacin, aminophylline, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, azithromycin, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carmustine, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cisplatin, clindamycin, cyanocobalamin, cyclosporine, dactinomycin, daptomycin, dexmethasone, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxycycline, enalaprilat, ephedrine, epinephrine, epoetin alfa, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, folic acid, ganciclovir, gemcitabine, gentamicin, granisetron, heparin, hydrocortisone, hydromorphone, idarubicin, imipenem/cilastatin, isoproterenol, ketorolac, labetalol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, metaraminol, methoxamine, methylodopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine,

- pentazocine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, potassium acetate, potassium chloride, procainamide, promethazine, propofol, propranolol, protamine, pyridoxime, ranitidine, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepea, tigecycline, tirofiban, tobramycin, tolazoline, trimetaphan, vancomycin, vasopressin, vecuronium, verapamil, vinorelbine, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** amphotericin B colloidal, amphotericin B lipid complex, dantrolene, diazepam, diazoxide, indomethacin, irinotecan, pantoprazole, phenytoin, piperacillin/tazobactam, trimethoprim/sulfamethoxazole.
 - **Solution Compatibility:** D5/0.45% NaCl, D5W, 0.9% NaCl, Ringer's solution. Administer immediately after admixing.
 - **Additive Incompatibility:** methylprednisolone sodium succinate.

Patient/Family Teaching

- Instruct patient to take glycopyrrolate as directed and not to take more than the prescribed amount. Take missed doses as soon as remembered if not just before next dose.
- Medication may cause drowsiness and blurred vision. Caution patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Inform patient that frequent oral rinses, sugarless gum or candy, and good oral hygiene may help relieve dry mouth. Consult health care professional regarding use of saliva substitute if dry mouth persists for more than 2 wk.
- Advise patient to change positions slowly to minimize the effects of drug-induced orthostatic hypotension.
- Caution patient to avoid extremes of temperature. This medication decreases the ability to sweat and may increase the risk of heat stroke.
- Advise patient to notify health care professional immediately if eye pain or increased sensitivity to light occurs. Emphasize the importance of routine eye exams throughout therapy.
- Advise patient to consult health care professional before taking any OTC medications concurrently with this therapy.
- **Geri:** Advise geriatric patients about increased susceptibility to side effects and to call health care professional immediately if they occur.
- **Pedi:** Instruct parents to use a calibrated measuring device with solution for accurate dosing.
- Advise parents to stop glycopyrrolate and notify health care professional if constipation; signs of urinary retention (inability to urinate, dry diapers or undergarments, irritability, or crying); or rash, hives, or an allergic reaction occurs.

- Glycopyrrolate reduces sweating. Advise parents to avoid exposure of the patient to hot or very warm environmental temperatures to avoid overheating and heat exhaustion or heat stroke.

Evaluation/Desired Outcomes

- Mouth dryness preoperatively.
- Reversal of cholinergic medications.
- Decrease in GI motility and pain in patients with peptic ulcer disease.
- Reduce chronic severe drooling in children with neurologic conditions associated with drooling.

golimumab (go-li-mu-mab)

Simponi, Simponi Aria, ★ Simponi IV

Classification

Therapeutic: antirheumatics

Pharmacologic: DMARDs, monoclonal antibodies, anti-TNF agents

Indications

Simponi and Simponi Aria: Treatment of moderately to severely active rheumatoid arthritis (with methotrexate). **Simponi:** Treatment of active psoriatic arthritis (alone or with methotrexate). **Simponi:** Treatment of active ankylosing spondylitis. **Simponi:** Moderately to severely active ulcerative colitis in patients who have demonstrated corticosteroid dependence or have responded inadequately to immunosuppressants such as aminosalicylates, corticosteroids, azathioprine, or 6-mercaptopurine.

Action

Inhibits binding of TNF α to receptors inhibiting activity and resulting in anti-inflammatory and antiproliferative activity. **Therapeutic Effects:** Decreased pain and swelling with decreased joint destruction in patients with rheumatoid arthritis, psoriatic arthritis, and ankylosing spondylitis. Induction and maintenance of clinical remission of ulcerative colitis.

Pharmacokinetics

Absorption: Well absorbed following subcutaneous administration. IV administration results in complete bioavailability.

Distribution: Distributed primarily in the circulatory system with limited extravascular distribution.

Metabolism and Excretion: Unknown.

Half-life: 2 wk.

TIME/ACTION PROFILE (improvement)

ROUTE	ONSET	PEAK	DURATION
Subcut	within 3 mo	2–7 days [†]	unknown
IV	within 3 mo	unknown	unknown

[†] Blood levels.

★ = Canadian drug name. ⚡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Contraindications/Precautions

Contraindicated in: Active infection (including localized); Concurrent use of abatacept or anakinra (↑ risk of infections); **Lactation:** Avoid during breast feeding.

Use Cautiously in: History of chronic or recurrent infection or underlying illness/treatment predisposing to infection; History of exposure to tuberculosis; History of opportunistic infection; Patients residing, or who have resided, where tuberculosis, histoplasmosis, coccidioidomycosis, or blastomycosis is endemic; History of HF (may worsen); Pre-existing or recent-onset CNS demyelinating disorders; History of cytopenias (may worsen); History of psoriasis (may exacerbate); Hepatitis B virus carriers (risk of reactivation); **Geri:** Use cautiously in elderly patients due to ↑ risk of infection; **OB:** Use during pregnancy only if clearly needed; **Pedi:** Safety not established; ↑ risk of lymphoma (including HSTCL), leukemia, and other malignancies.

Adverse Reactions/Side Effects

CNS: CENTRAL NERVOUS SYSTEM DEMYELINATING DISORDERS, Guillain-Barre syndrome, multiple sclerosis.

EENT: nasopharyngitis, optic neuritis. **Resp:** upper respiratory tract infection. **CV:** HF, hypertension. **GI:** ↑ liver enzymes. **Derm:** psoriasis. **Hemat:** aplastic anemia, leukopenia, neutropenia, pancytopenia, thrombocytopenia. **Local:** injection site reactions.

Neuro: paresthesia. **Misc:** ANAPHYLAXIS, HYPERSENSITIVITY REACTIONS, INFECTIONS (including reactivation tuberculosis and other opportunistic infections due to bacterial, invasive fungal, viral, mycobacterial, and parasitic pathogens), MALIGNANCY (including lymphoma, HSTCL, leukemia, and skin cancer), fever, lupus-like syndrome.

Interactions

Drug-Drug: Abatacept, anakinra, corticosteroids, or methotrexate ↑ risk of serious infections; concurrent use with anakinra or abatacept is not recommended. Use of live virus vaccines or therapeutic infectious agents may ↑ risk of infection; avoid concurrent use. Concurrent use with azathioprine and/or 6-mercaptopurine may ↑ risk of HSTCL. May normalize previously suppressed levels of CYP450 enzymes, following initiation or discontinuation of golimumab, effects of substrates of this system may be altered and should be monitored, including warfarin, theophylline, and cyclosporine.

Route/Dosage

Rheumatoid Arthritis

Subcut (Adults): 50 mg once monthly.

IV (Adults): 2 mg/kg initially and 4 wk later, then 2 mg/kg every 8 wk.

Psoriatic Arthritis and Ankylosing Spondylitis

Subcut (Adults): 50 mg once monthly.

Ulcerative Colitis

Subcut (Adults): 200 mg initially, then 100 mg 2 wk later, then 100 mg every 4 wk.

Availability

Solution for subcutaneous injection: 50 mg/0.5 mL in single-dose prefilled syringes and Smartject autoinjectors, 100 mg/mL in single-dose prefilled syringes and Smartject autoinjectors. **Solution for intravenous injection (Simponi Aria):** 12.5 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess for signs and symptoms of infection (fever, dyspnea, flu-like symptoms, frequent or painful urination, redness or swelling at the site of a wound) prior to, during, and after therapy. Discontinue therapy if serious or opportunistic infection or sepsis occurs. If new infection develops during therapy, assess patient and institute antimicrobial therapy. Patients who tested negative for latent tuberculosis (TB) prior to therapy may develop TB during therapy. Initiate treatment for latent TB prior to initiating therapy.
- Test for HBV prior to therapy and monitor carriers of HBV for signs of reactivation during and for several mo after therapy. If reactivation occurs, discontinue golimumab and institute antiviral therapy.
- Monitor patients with HF for new or worsening symptoms. Discontinue therapy if symptoms occur.
- Assess for exacerbations and new onset psoriasis. Discontinue therapy if these occur.
- Assess patient for latex allergy. Needle cover of syringe contains latex and should not be handled by persons sensitive to latex.
- Assess for signs and symptoms of systemic fungal infections (fever, malaise, weight loss, sweats, cough, dyspnea, pulmonary infiltrates, serious systemic illness with or without concomitant shock). Ascertain if patient lives in or has traveled to areas of endemic mycoses. Consider empiric antifungal treatment for patients at risk of histoplasmosis and other invasive fungal infections until the pathogens are identified. Consult with an infectious diseases specialist. Consider stopping golimumab until the infection has been diagnosed and adequately treated.
- Observe for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue drug and notify health care professional immediately if these problems occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in case of an anaphylactic reaction.
- **Rheumatoid Arthritis:** Assess pain and range of motion prior to and periodically during therapy.
- **Ulcerative Colitis:** Assess for signs and symptoms before, during, and after therapy.
- **Lab Test Considerations:** Monitor liver function tests periodically during therapy. May cause ↑ serum AST and ALT.

- **Monitor CBC with differential periodically during therapy.** May cause leukopenia, neutropenia, thrombocytopenia, and pancytopenia. Discontinue golimumab if symptoms of blood dyscrasias (persistent fever) occur.
- Monitor for HBV blood tests before starting, during, and for several mo after therapy is completed.

Potential Nursing Diagnoses

Chronic pain (Indications)

Risk for infection (Adverse Reactions)

Implementation

- Administer a tuberculin skin test prior to administration of golimumab. Assess if treatment for latent tuberculosis is needed; an induration of 5 mm or greater is a positive tuberculin skin test, even for patients previously vaccinated with Bacille Calmette-Guerin (BCG). Consider antituberculosis therapy prior to therapy in patients with a history of latent or active tuberculosis if an adequate course of treatment cannot be confirmed, and for patients with risk factors for tuberculosis infection.
- Initial injection should be supervised by health care professional.
- Refrigerate solution; do not freeze. Allow prefilled syringe or autoinjector to sit at room temperature for 30 min prior to injection; do not warm in any other way. Do not shake. Solution is clear to slightly opalescent and colorless to light yellow. Do not administer solutions that are discolored, cloudy, or contain particulate matter. Discard unused solution.
- **Subcut:** Remove the needle cover or autoinjector cap just prior to injection. Inject into front of middle thigh, lower part of abdomen 2 inches from navel, or caregiver may administer into outer area of upper arm. Do not inject in areas where skin is tender, bruised, red, scaly, or hard; avoid scars or stretch marks. Press a cotton ball or gauze over injection site for 10 sec; do not rub.
- **Autoinjector:** Press open end of autoinjector against skin at 90° angle. Use free hand to pinch and hold skin at injection site. Press button with fingers or thumb; button will stay pressed and does not need to be held. Injection will begin following a loud click. Keep holding the autoinjector against skin until a second loud click is heard (usually 3–6 sec, but may take up to 15 sec). Lift autoinjector from skin following second click. Yellow indicator in viewing window indicates autoinjector worked correctly. If yellow does not appear in viewing window call 1-800-457-6399 for help.
- **Prefilled syringe:** Hold body of syringe between thumb and index finger. Do not pull back on plunger at any time. Pinch skin. Using a dart-like motion, insert needle into pinched skin at 45° angle. Inject all medication by pushing plunger until

plunger head is between needle guard wings. Take needle out of skin and let go of skin. Slowly take thumb off plunger to allow empty syringe to move up until entire needle is covered by needle guard.

IV Administration

- **Intermittent Infusion:** Solution in vial is colorless to light yellow; may contain a few fine translucent particles of protein. Do not use if opaque particles, discoloration, or other particles present. **Diluent:** Withdraw volume of dose from 100 mL bag of 0.9% NaCl or 0.45% NaCl and discard. Add golimumab dose to infusion bag; mix gently. Solution is stable for 4 hrs at room temperature. **Rate:** Infuse through an in-line, sterile, non-pyrogenic, low protein-binding filter with ≤ 0.22 micrometer pore size over 30 min.

Patient/Family Teaching

- Instruct patient on correct technique for administration. Review patient information sheet, preparation of dose, administration sites and technique, and disposal of equipment into a puncture-resistant container. Advise patient of risks and benefits of golimumab therapy. Inject missed doses as soon as remembered, then return to regular schedule. Instruct patient to read *Medication Guide* before starting therapy and with each Rx refill; new information may be available.
- Caution patient not to share this medication with others, even with the same symptoms; may be harmful.
- Inform patient of increased risk of infections, malignancies, cardiac and nervous system disorders during therapy.
- **Caution patient to notify health care professional promptly if any signs of infection, including TB, invasive fungal infections (fever, malaise, weight loss, sweats, cough, dyspnea, pulmonary infiltrates, serious systemic illness with or without concomitant shock), reactivation of HBV (muscle aches, clay-colored bowel movements, feeling very tired, fever, dark urine, chills, skin or eyes look yellow, stomach discomfort, little or no appetite, skin rash, vomiting), hypersensitivity reactions, or nervous system problems (vision changes, weakness in arms or legs, numbness or tingling in any part of the body) develop.**
- Advise patient to examine skin periodically during therapy and notify health care professional of any changes in appearance of skin or growths on skin.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Inform patient to avoid receiving live vaccinations; other vaccinations may be given.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Inform patient of increased risk of cancer. Advise patient of need for screening for dysplasia (colonoscopy, skin cancer examinations, biopsy) periodically during therapy.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding. Notify health care professional if you have recently had a baby while taking golumumab. Infants may have an increased chance of getting an infection for up to 6 mo after birth; vaccinations may be delayed.

Evaluation/Desired Outcomes

- Decreased pain and swelling with decreased rate of joint destruction in patients with rheumatoid arthritis.
- Decreased signs and symptoms, slowed progression of joint destruction, and improved physical function in patients with psoriatic arthritis.
- Reduced signs and symptoms of ankylosing spondylitis.
- Decreased symptoms, maintaining remission, and mucosal healing with decreased corticosteroid use in ulcerative colitis.

goserelin (goe-se-rel-lin) Zoladex

Classification

Therapeutic: antineoplastics, hormones
Pharmacologic: gonadotropin-releasing hormones

Indications

Prostate cancer in patients who cannot tolerate orchiectomy or estrogen therapy (palliative). With flutamide and radiation therapy in the treatment of locally confined stage T2b–T4 (stage B2–C) prostate cancer. Advanced breast cancer in peri- and postmenopausal women (palliative). Endometriosis. Produces thinning of the endometrium before endometrial ablation for dysfunctional uterine bleeding.

Action

Acts as a synthetic form of luteinizing hormone–releasing hormone (LHRH, GnRH). Inhibits the production of gonadotropins by the pituitary gland. Initially, levels of luteinizing hormone (LH), follicle-stimulating hormone (FSH), and testosterone increase. Continued administration leads to decreased production of testosterone and estradiol. **Therapeutic Effects:** Decreased spread of cancer of the prostate or breast. Regression of endometriosis with decreased pain. Thinning of the endometrium.

Pharmacokinetics

Absorption: Well absorbed from subcut implant. Absorption is slower in first 8 days, then is faster and continuous for remainder of 28-day dosing cycle.

Distribution: Unknown.

Metabolism and Excretion: Some metabolism by the liver (<10%), some excretion by kidneys (>90%, only 20% as unchanged drug).

Half-life: 4.2 hr.

TIME/ACTION PROFILE (↓ in serum testosterone levels)

ROUTE	ONSET	PEAK	DURATION
Subcut	unknown	2–4 wk	length of therapy

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Undiagnosed vaginal bleeding; **OB, Lactation:** Pregnancy or lactation.

Use Cautiously in: Congenital long QT syndrome, HF, hypokalemia, or hypomagnesemia; Concurrent use of other drugs known to prolong the QTc interval; Low BMI (↑ risk of bleeding complications); Concurrent use of anticoagulant therapy (↑ risk of bleeding complications); **Pedi:** Safety not established.

Adverse Reactions/Side Effects

CNS: **STROKE**, headache, anxiety, depression, dizziness, fatigue, insomnia, mood swings, seizures, weakness.

Resp: dyspnea. **CV:** **MYOCARDIAL INFARCTION**, **QT INTERVAL PROLONGATION**, vasodilation, chest pain, hypertension, palpitations. **GI:** anorexia, constipation, diarrhea, nausea, ulcer, vomiting. **GU:** renal insufficiency, urinary obstruction. **Derm:** sweating, acne, rash.

Endo: ↓ libido, erectile dysfunction, breast swelling, breast tenderness, infertility, ovarian cysts, ovarian hyperstimulation syndrome (with gonadotropins). **F and E:** peripheral edema. **Hemat:** anemia. **Metab:** gout, hyperglycemia, ↑ lipids. **MS:** ↑ bone pain, arthralgia, ↓ bone density. **Misc:** hot flashes, chills, fever, injection site/vascular injury, weight gain.

Interactions

Drug-Drug: None significant.

Route/Dosage

Subcut (Adults): 3.6 mg every 4 wk or 10.8 mg q 12 wk. **Endometrial thinning**—1 or 2 depots given 4 wk apart; if 1 depot used, surgery is performed at 4 wk; if 2 depots used, surgery is performed 2–4 wk after 2nd depot.

Availability

Implant: 3.6 mg, 10.8 mg.

NURSING IMPLICATIONS

Assessment

- Monitor for signs and symptoms of injection site injury/abdominal hemorrhage (abdominal pain, abdominal distension, dyspnea, dizziness, hypotension, and/or any altered levels of consciousness) following administration. Advise patient to report symptoms immediately to health care professional.

- **Cancer:** Monitor patients with vertebral metastases for increased back pain and decreased sensory/motor function.
- Monitor intake and output ratios and assess for bladder distention in patients with urinary tract obstruction during initiation of therapy.
- **Endometriosis:** Assess patient for signs and symptoms of endometriosis before and periodically during therapy. Amenorrhea usually occurs within 8 wk of initial administration and menses usually resume 8 wk after completion.
- **Lab Test Considerations:** Initially ↑, then ↓ LH and FSH. This leads to castration levels of testosterone in men 2–4 wk after initial increase in concentrations.
- Monitor serum acid phosphatase and prostate-specific antigen concentrations periodically during therapy. May cause transient ↑ in serum acid phosphatase concentrations, which usually return to baseline by the 4th wk of therapy and may ↓ to below baseline or return to baseline if elevated before therapy.
- May cause hypercalcemia in patients with breast or prostate cancer with bony metastases.
- May cause an ↑ in serum HDL, LDL, and triglycerides.
- May cause hyperglycemia. Monitor blood glucose and HbA1c periodically during therapy.

Potential Nursing Diagnoses

Sexual dysfunction (Side Effects)

Implantation

- **Subcut:** Implant is inserted in upper subcut tissue of upper abdominal wall every 28 days. Local anesthesia may be used before injection.
- If the implant needs to be removed for any reason, it can be located by ultrasound.

Patient/Family Teaching

- Explain purpose of goserelin to patient. Emphasize importance of adhering to the schedule of monthly or every-3-mo administration.
- Advise patient that bone pain may increase at initiation of therapy. This will resolve with time. Patient should discuss use of analgesics to control pain with health care professional.
- Advise female patients to notify health care professional if regular menstruation persists.
- Inform diabetic patients of potential for hyperglycemia. Encourage close monitoring of serum glucose.
- Advise patient that medication may cause hot flashes. Notify health care professional if these become bothersome. Hormone replacement therapy may be added to decrease vasomotor symptoms and vaginal dryness without compromising beneficial effect.
- Instruct patient to notify health care professional promptly if difficulty urinating or if **symptoms of**

myocardial infarction or stroke (chest pain, difficulty breathing, weakness, loss of consciousness) occur.

- **Rep:** Advise premenopausal women to notify health care professional if pregnancy is planned or suspected or if breast feeding. Effective contraception should be used during and for 12 wk after treatment ends.

Evaluation/Desired Outcomes

- Decrease in the spread of prostate cancer.
- Reduction of symptoms of advanced breast cancer in peri- and postmenopausal women.
- Decrease in the signs and symptoms of endometriosis. Symptoms are usually reduced within 4 wk of implantation.
- Thinning of the endometrium before endometrial ablation for dysfunctional uterine bleeding.

granisetron (gra-nees-e-tron)

Kytril, Sustol,  Kytril

granisetron (transdermal)

Sancuso

Classification

Therapeutic: antiemetics

Pharmacologic: 5-HT₃ antagonists

Indications

PO: Prevention of nausea and vomiting due to emetogenic chemotherapy or radiation therapy. Prevention and treatment of postoperative nausea and vomiting.

Subcut: Prevention of acute and delayed nausea and vomiting due to moderately emetogenic chemotherapy or anthracycline/cyclophosphamide combination chemotherapy (with dexamethasone). **Transdermal:** Prevention of nausea and vomiting due to moderately/highly emetogenic chemotherapy.

Action

Blocks the effects of serotonin at receptor sites (selective antagonist) located in vagal nerve terminals and in the chemoreceptor trigger zone in the CNS. **Therapeutic Effects:** Decreased incidence and severity of nausea and vomiting following emetogenic chemotherapy, radiation therapy, or surgery.

Pharmacokinetics

Absorption: 50% absorbed following oral administration; transdermal enters systemic circulation via passive diffusion through intact skin.

Distribution: Distributes into erythrocytes; remainder of distribution is unknown.

Protein Binding: 65%.

Metabolism and Excretion: Mostly metabolized by the liver; 12% excreted unchanged in urine.

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Half-life: *Patients with cancer*—10–12 hr (range 0.9–31.1 hr); *healthy volunteers*—3–4 hr (range 0.9–15.2 hr); *geriatric patients*—7.7 hr (range 2.6–17.7 hr); *subcutaneous*—24 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	rapid	60 min	24 hr
IV	1–3 min	30 min	up to 24 hr
TD*	unknown	48 hr	unknown
Subcut*	unknown	12 hr	7 days

*Blood levels.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Some products contain benzyl alcohol; avoid use in neonates; Severe renal impairment (subcut).

Use Cautiously in: History of arrhythmias or conduction disorders; Recent abdominal surgery (subcutaneous); Moderate renal impairment (↓ frequency of administration); **OB, Lactation:** Safety not established; **Pedi:** Safety and effectiveness not established in children <18 yr (oral, subcut, or transdermal) or <2 yr (IV).

Adverse Reactions/Side Effects

CNS: headache, agitation, anxiety, CNS stimulation, dizziness, drowsiness, headache, insomnia, weakness.

CV: hypertension, QT interval prolongation. **GI:** constipation, abdominal pain, diarrhea, dyspepsia, ↑ liver enzymes, taste disorder. **Derm:** Topical—application site reactions, photosensitivity. **Misc:** **HYPERSENSITIVITY REACTIONS** (including anaphylaxis), **SEROTONIN SYNDROME**, injection site reactions (subcutaneous) (including infection, bruising, hematoma, bleeding, pain, or nodules), fever.

Interactions

Drug-Drug: ↑ risk of extrapyramidal reactions with other agents causing extrapyramidal reactions. ↑ risk of QT interval prolongation with other agents causing QT interval prolongation. Drugs that affect serotonergic neurotransmitter systems, including **SSRIs, SNRIs, tricyclic antidepressants, MAOIs, fentanyl, lithium, buspirone, tramadol, methylene blue**, and **triptans** ↑ risk of serotonin syndrome.

Route/Dosage

Prevention of Nausea and Vomiting Due to Emetogenic Chemotherapy

PO (Adults): 1 mg twice daily; 1st dose given at least 60 min prior to chemotherapy and 2nd dose 12 hr later only on days when chemotherapy is administered; may also be given as 2 mg once daily at least 60 min prior to chemotherapy.

IV (Adults and Children 2–16 yr): 10 mcg/kg given within 30 min prior to chemotherapy or 20–40 mcg/kg/day divided once or twice daily (maximum: 3 mg/dose or 9 mg/day).

Transdermal (Adults): One 34.3-mg patch (delivers 3.1 mg/24 hr) applied up to 48 hr prior to chemotherapy, leave in place for at least 24 hr following chemotherapy, may be left in place for a total of 7 days.

Prevention of Nausea and Vomiting Associated with Radiation Therapy

PO (Adults): 2 mg taken once daily within 1 hr of radiation therapy.

Prevention and Treatment of Postoperative Nausea and Vomiting

IV (Adults): *Prevention*—1 mg prior to induction of anesthesia or just prior to reversal of anesthesia; *Treatment*—1 mg.

IV (Children ≥4 yr): 20–40 mcg/kg as a single dose (maximum: 1 mg).

Prevention of Acute and Delayed Nausea and Vomiting Due to Emetogenic Chemotherapy

Subcut (Adults): 10 mg given at least 30 min prior to chemotherapy (with dexamethasone) on Day 1 of chemotherapy; do not administer more frequently than every 7 days.

Renal Impairment

Subcut (Adults): *CCr 30–59 mL/min*—Do not administer more frequently than every 14 days.

Availability (generic available)

Tablets: 1 mg. **Solution for intravenous injection:** 0.1 mg/mL, 1 mg/mL. **Solution for subcutaneous injection (in prefilled syringes):** 10 mg/0.4 mL. **Transdermal patch:** 3.1 mg/24 hr.

NURSING IMPLICATIONS

Assessment

- Assess patient for nausea, vomiting, abdominal distention, and bowel sounds prior to and following administration.
- Assess for extrapyramidal symptoms (involuntary movements, facial grimacing, rigidity, shuffling walk, trembling of hands) during therapy. This occurs rarely and is usually associated with concurrent use of other drugs known to cause this effect.
- Monitor ECG in patients with HF, bradycardia, underlying heart disease, renal impairment, and elderly patients.
- Monitor for signs and symptoms of serotonin syndrome (mental status changes [agitation, hallucinations, delirium, and coma], autonomic instability [tachycardia, labile BP, dizziness, diaphoresis, flushing, hyperthermia], neuromuscular symptoms [tremor, rigidity, myoclonus, hyperreflexia, incoordination], seizures, with or without gastrointestinal symptoms [nausea, vomiting, diarrhea]). If symptoms occur discontinue granisetron and treat symptomatically.

- **Transdermal:** Monitor application site. If allergic, erythematous, macular, or papular rash or pruritus occurs, remove patch.
- **Lab Test Considerations:** May cause ↑ AST and ALT levels.

Potential Nursing Diagnoses

Imbalanced nutrition: less than body requirements (Indications)

Implementation

- Correct hypokalemia and hypomagnesemia before administering.
- For chemotherapy or radiation, granisetron is administered only on the day(s) chemotherapy or radiation is given. Continued treatment when not on chemotherapy or radiation therapy has not been found to be useful.
- **PO:** Administer 1st dose up to 1 hr before chemotherapy or radiation therapy and 2nd dose 12 hr after the first.
- **Subcut:** Use kit and components provided by manufacturer. Injection should be administered by health care professional. Remove kit from refrigerator and allow to warm to room temperature for 60 min. Activate one syringe warming pouch, and wrap syringe in warming pouch for 5 to 6 minutes to warm to body temperature. Do not inject solutions that contain particulate matter. Inject in back of upper arm or in skin of abdomen at least 1 inch away from umbilicus. Avoid injecting in areas where skin is burned, hardened, inflamed, or swollen. Topical anesthesia may be used at injection site prior to injection. Solution is viscous and requires a slow, sustained injection over 20 to 30 seconds. Pressing the plunger harder will NOT expel medication faster.

IV Administration

- **IV Push:** **Diluent:** May be administered undiluted or diluted in 20–50 mL of 0.9% NaCl or D5W. Solution should be prepared at time of administration but is stable for 24 hr at room temperature. **Concentration:** Up to 1 mg/mL. **Rate:** Administer undiluted granisetron over 30 sec or as a diluted solution over 5 min.
- **Y-Site Compatibility:** acetaminophen, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium acetate, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisplatin, cisplatin, cladribine, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, doxetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, eptifibatid, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, flouxuridine, flucanazole, fludara-bine, fluorouracil, fosaprepitant, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, methotrexate, methyldopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxaliplatin, oxytocin, paclitaxel, pamidronate, pancuronium, pantoprazole, pemetrexed, pentamidine, pentazocine, pentobarbital, phenobarbital, phenolamine, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propofol, propranolol, quinupristin/dalfopristin, ranitidine, remifentanyl, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** amphotericin B colloidal, dantrolene, diazepam, phenytoin.
- **Additive Incompatibility:** Granisetron should not be admixed with other medications.
- **Transdermal:** Apply system to clear, dry, intact healthy skin on upper outer arm 24–48 hr before chemotherapy. Do not use creams, lotions, or oils that may keep patch from sticking. Do not apply to skin that is red, irritated, or damaged. Apply immediately after removing from package. Do not cut patch into pieces. Remove liner from adhesive layer and press firmly in place with palm of hand for 30 sec, especially around the edges, to make sure con-

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

tact is complete. Patch should be worn throughout chemotherapy. If patch does not stick, bandages or medical adhesive tape may be applied on edges of patch; do not cover patch with tape or bandages or wrap completely around arm. Patient may shower and wash normally while wearing patch; avoid swimming, strenuous exercise, sauna, or whirlpool during patch use. Remove patch gently at least 24 hr after completion of chemotherapy; may be worn for up to 7 days. Fold so that adhesive edges are together. Throw away in garbage out of reach of children and pets. Do not reuse patch. Use soap and water to remove remaining adhesive; do not use alcohol or acetone.

Patient/Family Teaching

- Instruct patient to take granisetron as directed.
- Advise patient to notify health care professional immediately if involuntary movement of eyes, face, or limbs occurs.
- May cause dizziness and drowsiness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional if symptoms of abnormal heart rate or rhythm (racing heartbeat, shortness of breath, dizziness, fainting) or serotonin syndrome occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- **Transdermal:** Instruct patient on correct application, removal, and disposal of patch. Advise patient to read *Patient Information* sheet prior to using and with each Rx refill in case of new information. Inform patient that additional granisetron should not be taken during patch application unless directed by health care professional.
- Advise patient referred for MRI test to discuss patch with referring health care professional and MRI facility to determine if removal of patch is necessary prior to test and for directions for replacing patch.
- Advise patient to avoid using a heating pad near or over patch and to cover patch application site with clothing to avoid exposure to sunlight, sunlamp, or tanning beds during and for 10 days following removal of patch.
- Instruct patient to notify health care professional if pain or swelling in the abdomen occurs or if redness at patch removal site remains for more than 3 days.

Evaluation/Desired Outcomes

- Prevention of nausea and vomiting associated with emetogenic cancer chemotherapy or radiation therapy.
- Prevention and treatment of postoperative nausea and vomiting.

guaifenesin (gwye-fen-e-sin)

Alfen Jr, Altarussin,

- ✦ Balminil Expectorant,
- ✦ Benlyn Chest Congestion Extra Strength, Breonesin,
- ✦ Bronchophan Expectorant,
- ✦ Chest Congestion,
- ✦ Cough Syrup Expectorant, Diabetic Tussin, ✦ Expectorant Syrup, Ganidin NR, Guiatuss, Hytuss, Hytuss-2X,
- ✦ Jack & Jill Expectorant, Mucinex, Naldecon Senior EX, Organidin NR, Robitussin, Scot-tussin Expectorant, Siltussin SA, Siltussin DAS,
- ✦ Vicks Chest Congestion Relief,
- ✦ Vicks Dayquil Mucus Control

Classification

Therapeutic: allergy, cold, and cough remedies, expectorant

Indications

Coughs associated with viral upper respiratory tract infections.

Action

Reduces viscosity of tenacious secretions by increasing respiratory tract fluid. **Therapeutic Effects:** Mobilization and subsequent expectoration of mucus.

Pharmacokinetics

Absorption: Well absorbed after oral administration.

Distribution: Unknown.

Metabolism and Excretion: Renally excreted as metabolites.

Half-life: Unknown.

TIME/ACTION PROFILE (expectorant action)

ROUTE	ONSET	PEAK	DURATION
PO	30 min	unknown	4–6 hr
PO-ER	unknown	unknown	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Some products contain alcohol; Avoid in patients with known intolerance; Some products contain aspartame and should be avoided in patients with phenylketonuria.

Use Cautiously in: Cough lasting >1 wk or accompanied by fever, rash, or headache; Patients receiving disulfiram (liquid products may contain alcohol); Diabetic patients (some products may contain sugar); **OB:** Although safety has not been established, guaifenesin has been used without adverse effects; **Pedi:** OTC cough and cold products containing this medication should be avoided in children <4 yr.

Adverse Reactions/Side Effects

CNS: dizziness, headache. **GI:** nausea, diarrhea, stomach pain, vomiting. **Derm:** rash, urticaria.

Interactions

Drug-Drug: None significant.

Route/Dosage

PO (Adults): 200–400 mg q 4 hr or 600–1200 mg q 12 hr as extended-release product (not to exceed 2400 mg/day).

PO (Children 6–12 yr): 100–200 mg q 4 hr or 600 mg q 12 hr as extended-release product (not to exceed 1200 mg/day).

PO (Children 4–6 yr): 50–100 mg q 4 hr (not to exceed 600 mg/day).

Availability (generic available)

Syrup: 100 mg/5 mL^{OTC}. **Oral solution:** 100 mg/5 mL^{Rx, OTC}, 200 mg/5 mL^{OTC}. **Capsules:** 200 mg^{OTC}. **Tablets:** 100 mg^{OTC}, 200 mg^{Rx, OTC}, 1200 mg. **Extended-release tablets (Mucinex):** 600 mg, 1200 mg. **In combination with:** hydrocodone (Flowtuss, Obredon); hydrocodone and pseudoephedrine (Deconfenix); analgesics/antipyretics, antihistamines, decongestants, and cough suppressants. See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess lung sounds, frequency and type of cough, and character of bronchial secretions periodically during therapy. Maintain fluid intake of 1500–2000 mL/day to decrease viscosity of secretions.

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)

Implementation

- **High Alert:** Do not confuse guaifenesin with guanfacine. Do not confuse Mucinex with Mucomyst. Do not confuse Mucinex with Mucinex Allergy.
- **PO:** Administer each dose of guaifenesin followed by a full glass of water to decrease viscosity of secretions.
- Extended-release tablets should be swallowed whole; do not open, break, crush, or chew.

Patient/Family Teaching

- Instruct patient to cough effectively. Patient should sit upright and take several deep breaths before attempting to cough.
- **Caution parents to avoid OTC cough and cold products while breast feeding or administering to children <4 yrs.**
- Inform patient that drug may occasionally cause dizziness. Avoid driving or other activities requiring alertness until response to drug is known.
- Advise patient to limit talking, stop smoking, maintain moisture in environmental air, and take some

sugarless gum or hard candy to help alleviate the discomfort caused by a chronic nonproductive cough.

- Instruct patient to contact health care professional if cough persists longer than 1 wk or is accompanied by fever, rash, or persistent headache or sore throat.

Evaluation/Desired Outcomes

- Easier mobilization and expectoration of mucus from cough associated with upper respiratory infection.

guanFACINE (gwahn-fa-seen)
Intuniv,  Intuniv XR, Tenex

Classification

Therapeutic: antihypertensives
Pharmacologic: centrally acting antiadrenergics

Indications

Hypertension (with thiazide-type diuretics) (immediate-release). Treatment of attention-deficit hyperactivity disorder (ADHD) as monotherapy or as adjunctive therapy to stimulants (extended-release).

Action

Stimulates CNS alpha₂-adrenergic receptors, producing a decrease in sympathetic outflow to heart, kidneys, and blood vessels. Result is decreased BP and peripheral resistance, a slight decrease in heart rate, and no change in cardiac output. Mechanism of action in ADHD is unknown. **Therapeutic Effects:** Lowering of BP in hypertension. Increased attention span in ADHD.

Pharmacokinetics

Absorption: Immediate-release is well absorbed (80%); extended-release has lower rate and extent of absorption (↑ absorption with high-fat meals).

Distribution: Appears to be widely distributed.

Metabolism and Excretion: 50% metabolized by the liver, 50% excreted unchanged by the kidneys.

Half-life: 17 hr.

TIME/ACTION PROFILE (antihypertensive effect)

ROUTE	ONSET	PEAK	DURATION
PO (single dose)	unknown	8–12 hr	24 hr
PO (multiple doses)	within 1 wk	1–3 mo	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Severe coronary artery disease or recent myocardial infarction; **Geri:** May have ↑ sensi-

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

tivity, especially those with hepatic, cardiac, or renal dysfunction; Cerebrovascular disease; Severe renal or liver disease; History of hypotension, heart block, bradycardia, or cardiovascular disease; **OB, Lactation, PEDI:** Pregnancy, lactation, or children <6 yr (safety not established).

Adverse Reactions/Side Effects

CNS: drowsiness, headache, weakness, depression, dizziness, fatigue, insomnia, irritability. **EENT:** tinnitus. **Resp:** dyspnea. **CV:** bradycardia, chest pain, hypotension, palpitations, rebound hypertension, syncope. **GI:** constipation, dry mouth, abdominal pain, nausea. **GU:** erectile dysfunction.

Interactions

Drug-Drug: ↑ hypotension with other anti-hypertensives, nitrates, and acute ingestion of alcohol. ↑ CNS depression may occur with other CNS depressants, including alcohol, antihistamines, opioid analgesics, tricyclic antidepressants, and sedative/hypnotics. NSAIDs may ↓ effectiveness. Adrenergics may ↓ effectiveness. ↑ risk of hypotension and bradycardia with strong and moderate CYP3A4 inhibitors, including ketoconazole and fluconazole (a ↓ in dose of guanfacine may be needed). Strong and moderate CYP3A4 inducers, including rifampin, efavirenz, and carbamazepine may ↓ effects (an ↑ in dose of guanfacine may be needed). May ↑ levels of valproic acid.

Route/Dosage

Immediate-release and extended-release tablets should not be interchanged.

Hypertension

PO (Adults): 1 mg daily given at bedtime, may be ↑ if necessary at 3–4 wk intervals up to 2 mg/day; may also be given in 2 divided doses.

ADHD

PO (Adults and Children ≥6 yr): 1 mg once daily in morning or evening; may be ↑ by 1 mg/day at weekly intervals to achieve dose of 1–4 mg/day (6–12 yr) or 1–7 mg/day (13–17 yr) when used as monotherapy or 1–4 mg/day when used as adjunctive therapy. *Concurrent strong or moderate CYP3A4 inhibitor*—↓ initial and maintenance dose by 50%; *Concurrent strong or moderate CYP3A4 inducer*—Consider ↑ initial and maintenance dose up to double the recommended level (maintenance dose can be ↑ over period of 1–2 wk).

Availability (generic available)

Immediate-release tablets (Tenex): 1 mg, 2 mg. **Cost:** Generic—1 mg \$10.34/100, 2 mg \$25.67/100. **Extended-release tablets (Intuniv):** 1 mg, 2 mg, 3 mg, 4 mg. **Cost:** All strengths \$884.11/100.

NURSING IMPLICATIONS

Assessment

- **Hypertension:** Monitor BP (lying and standing) and pulse frequently during initial dose adjustment and periodically during therapy. Report significant changes.
- Monitor frequency of prescription refills to determine adherence.
- **ADHD:** Assess attention span, impulse control, and interactions with others.
- Monitor BP and heart rate prior to starting therapy, following dose increases, and periodically during therapy. May cause hypotension, orthostatic hypotension, and bradycardia.
- **Lab Test Considerations:** May cause temporary, clinically insignificant ↑ in plasma growth hormone levels.
- May cause ↓ in urinary catecholamines and vanillyl-mandelic acid levels.

Potential Nursing Diagnoses

Risk for injury (Side Effects)

Noncompliance (Patient/Family Teaching)

Implementation

- **Do not confuse guanfacine with guaifenesin.**
- Do not substitute extended-release tablets for immediate-release tablets on a mg-mg basis. Doses are not the same.
- **PO:** For hypertension: Administer daily dose at bedtime to minimize daytime sedation.
- For ADHD: Administer once daily. Swallow extended-release tablets whole; do not crush, break, or chew. Do not administer with high fat meals, due to increased exposure.

Patient/Family Teaching

- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially cough, cold, or allergy remedies.
- Caution patient to avoid alcohol and other CNS depressants while taking guanfacine.
- Advise patient to notify health care professional if dry mouth or constipation persists. Frequent mouth rinses, good oral hygiene, and sugarless gum or candy may minimize dry mouth. Increase in fluid and fiber intake and exercise may decrease constipation.
- Instruct patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to notify health care professional if dizziness, prolonged drowsiness, fatigue, weakness, depression, headache, sexual dysfunction, mental depression, or sleep pattern disturbance occurs. Discontinuation may be required if drug-related mental depression occurs.

- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of follow-up exams to evaluate effectiveness of medication.
- **Hypertension:** Emphasize the importance of continuing to take medication as directed, even if feeling well. Medication controls but does not cure hypertension. Instruct patient to take medication at the same time each day. Take missed doses as soon as remembered; do not double doses. If 2 or more doses are missed, consult health care professional. Do not discontinue abruptly; may cause sympathetic overstimulation (nervousness, anxiety, rebound hypertension, chest pain, tachycardia, increased salivation, nausea, trembling, stomach cramps, sweating, difficulty sleeping). These effects may occur 2–7 days after discontinuation, although rebound hypertension is rare and more likely to occur with high doses.
- Advise patient to make sure enough medication is available for weekends, holidays, and vacations. A written prescription may be kept in wallet in case of emergency.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, and stress management).
- Instruct patient and family on proper technique for BP monitoring. Advise them to check BP at least weekly and to report significant changes.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- **ADHD:** Instruct patient to take medication as directed at the same time each day. Take missed doses as soon as possible, but should not take more than the total daily amount in any 24-hr period. Do not stop taking abruptly; discontinue gradually at no more than 1 mg/3–7 days. Advise patient and parents to read the *Medication Guide* prior to starting therapy and with each Rx refill.
- Inform patient that sharing this medication may be dangerous.
- **Pedi:** Advise parents to notify school nurse of medication regimen.

Evaluation/Desired Outcomes

- Decrease in BP without excessive side effects.
- Improved attention span and social interactions in ADHD. Re-evaluate use if used for >9 wk.

halcinonide, See CORTICOSTEROIDS (TOPICAL/LOCAL).

halobetasol, See CORTICOSTEROIDS (TOPICAL/LOCAL).

haloperidol (ha-loe-per-i-dole)
Haldol, Haldol Decanoate

Classification

Therapeutic: antipsychotics

Pharmacologic: butyrophenones

Indications

Acute and chronic psychotic disorders including: schizophrenia, manic states, drug-induced psychoses. Patients with schizophrenia who require long-term parenteral (IM) antipsychotic therapy. Also useful in managing aggressive or agitated patients. Tourette's syndrome. Severe behavioral problems in children which may be accompanied by: unprovoked, combative, explosive hyperexcitability, hyperactivity accompanied by conduct disorders (short-term use when other modalities have failed). Considered second-line treatment after failure with atypical antipsychotic. **Unlabeled Use:** Nausea and vomiting from surgery or chemotherapy.

Action

Alters the effects of dopamine in the CNS. Also has anticholinergic and alpha-adrenergic blocking activity.

Therapeutic Effects: Diminished signs and symptoms of psychoses. Improved behavior in children with Tourette's syndrome or other behavioral problems.

Pharmacokinetics

Absorption: Well absorbed following PO/IM administration. Decanoate salt is slowly absorbed and has a long duration of action.

Distribution: Concentrates in liver. Crosses placenta; enters breast milk.

Protein Binding: 92%.

Metabolism and Excretion: Mostly metabolized by the liver.

Half-life: 21–24 hr.

TIME/ACTION PROFILE (antipsychotic activity)

ROUTE	ONSET	PEAK	DURATION
PO	2 hr	2–6 hr	8–12 hr
IM	20–30 min	30–45 min	4–8 hr†
IM (decanoate)	3–9 days	unknown	1 mo

†Effect may persist for several days.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Angle-closure glaucoma; Bone marrow depression; CNS depression; Parkinsonism; Severe liver or cardiovascular disease (QT interval prolonging conditions); Some products contain tartrazine, sesame oil, or benzyl alcohol and should be avoided in patients with known intolerance or hypersensitivity.

Use Cautiously in: Debilitated patients (dose ↓ required); Cardiac disease (risk of QT prolongation with high doses); Diabetes; Respiratory insufficiency; Prostatic hyperplasia; CNS tumors; Intestinal obstruction; Seizures; Patients at risk for falls; **OB:** Neonates at ↑ risk for extrapyramidal symptoms and withdrawal after delivery when exposed during the 3rd trimester; use only if benefit outweighs risk to fetus; **Lactation:** Discontinue drug or bottle-feed; **Geriatrics:** Dose ↓ required due to ↑ sensitivity; ↑ risk of mortality in elderly patients treated for dementia-related psychosis.

Adverse Reactions/Side Effects

CNS: SEIZURES; extrapyramidal reactions, confusion, drowsiness, restlessness, tardive dyskinesia. **EENT:** blurred vision, dry eyes. **Resp:** respiratory depression. **CV:** hypotension, tachycardia, ECG changes (QT prolongation, torsade de pointes), ventricular arrhythmias. **GI:** constipation, dry mouth, anorexia, drug-induced hepatitis, ileus, weight gain. **GU:** impotence, urinary retention. **Derm:** diaphoresis, photosensitivity, rashes. **Endo:** amenorrhea, galactorrhea, gynecomastia. **Hemat:** AGRANULOCYTOSIS, anemia, leukopenia, neutropenia. **Metab:** hyperpyrexia. **Misc:** NEUROLEPTIC MALIGNANT SYNDROME, hypersensitivity reactions.

Interactions

Drug-Drug: May enhance the QTc-prolonging effect of QTc-prolonging agents. ↑ hypotension with antihypertensives, nitrates, or acute ingestion of alcohol. ↑ anticholinergic effects with drugs having anticholinergic properties, including antihistamines, antidepressants, atropine, phenothiazines, quinine, and disopyramide. ↑ CNS depression with other CNS depressants, including alcohol, antihistamines, opioid analgesics, and sedative/hypnotics. Concurrent use with epinephrine may result in severe hypotension and tachycardia. May ↓ therapeutic effects of levodopa. Acute encephalopathic syndrome may occur when used with lithium. Dementia may occur with methylidopa.

Drug-Natural Products: Kava-kava, valerian, or chamomile can ↑ CNS depression.

Route/Dosage

Haloperidol

PO (Adults): 0.5–5 mg 2–3 times daily. Patients with severe symptoms may require up to 100 mg/day.

* = Canadian drug name. † = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; _____ indicate most frequent.

PO (Geriatric Patients or Debilitated Patients): 0.5–2 mg twice daily initially; may be gradually ↑ as needed.

PO (Children 3–12 yr or 15–40 kg): 0.25–0.5 mg/day given in 2–3 divided doses; increase by 0.25–0.5 mg every 5–7 days; maximum dose: 0.15 mg/kg/day (up to 0.75 mg/kg/day for Tourette's syndrome or 0.15 mg/kg/day for psychoses).

IM (Adults): 2–5 mg q 1–8 hr (not to exceed 100 mg/day).

IM (Children 6–12 yr): 1–3 mg/dose every 4–8 hours to a maximum of 0.15 mg/kg/day.

IV (Adults): 0.5–5 mg, may be repeated q 30 min (unlabeled).

Haloperidol Decanoate

IM (Adults): 10–15 times the previous daily PO dose but not to exceed 100 mg initially, given monthly (not to exceed 300 mg/mo).

Availability (generic available)

Tablets: 0.5 mg, 1 mg, 2 mg, 5 mg, 10 mg, 20 mg.

Oral concentrate: 2 mg/mL. **Haloperidol lactate injection:** 5 mg/mL. **Haloperidol decanoate injection:** 50 mg/mL, 100 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess mental status (orientation, mood, behavior) prior to and periodically during therapy.
- Assess positive (hallucination, delusions) and negative (social isolation) symptoms of schizophrenia.
- Assess weight and BMI initially and throughout therapy. Refer as appropriate for nutritional/weight and medical management.
- Monitor BP (sitting, standing, lying) and pulse prior to and frequently during the period of dose adjustment. May cause QT interval changes on ECG.
- Observe patient carefully when administering medication, to ensure that medication is actually taken and not hoarded.
- Monitor intake and output ratios and daily weight. Assess patient for signs and symptoms of dehydration (decreased thirst, lethargy, hemoconcentration), especially in geriatric patients.
- Assess fluid intake and bowel function. Increased bulk and fluids in the diet help minimize constipating effects.
- Monitor patient for onset of akathisia (restlessness or desire to keep moving), which may appear within 6 hr of 1st dose and may be difficult to distinguish from psychotic agitation. Benzotropine may be used to differentiate agitation from akathisia. Observe closely for extrapyramidal side effects (*parkinsonian*—difficulty speaking or swallowing, loss of balance control, pill rolling of hands, mask-like face, shuffling gait, rigidity, tremors; and *dys-tonic*—muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs).

Trihexyphenidyl or benzotropine may be used to control these symptoms. Benzodiazepines may alleviate akathisia.

- Monitor for tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or worm-like movements of tongue, excessive eye blinking). Report immediately; may be irreversible.
- Monitor for symptoms related to hyperprolactinemia (menstrual abnormalities, galactorrhea, sexual dysfunction).
- **Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness, severe muscle stiffness, loss of bladder control). Report symptoms immediately. May also cause leukocytosis, elevated liver function tests, elevated CPK.**
- Assess for falls risk. Drowsiness, orthostatic hypotension, and motor and sensory instability increase risk. Institute prevention if indicated.
- **Lab Test Considerations: Monitor CBC with differential and liver function tests periodically during therapy.**
- Monitor serum prolactin prior to and periodically during therapy. May cause ↑ serum prolactin levels.

Potential Nursing Diagnoses

Disturbed thought process (Indications)

Disturbed sensory perception (specify: visual, auditory, kinesthetic, gustatory, tactile, olfactory) (Indications)

Implementation

- Avoid skin contact with oral solution; may cause contact dermatitis.
- **PO:** Administer with food or full glass of water or milk to minimize GI irritation.
- Use calibrated measuring device for accurate dosage. Do not dilute concentrate with coffee or tea; may cause precipitation. May be given undiluted or mixed with water or juice.
- **IM:** Inject slowly, using 2-in., 21-gauge needle into well-developed muscle via Z-track technique. Do not exceed 3 mL per injection site. Slight yellow color does not indicate altered potency. Keep patient recumbent for at least 30 min following injection to minimize hypotensive effects.

IV Administration

- **IV:** Haloperidol decanoate should not be administered IV.
- **IV Push:** **Diluent:** May be administered undiluted for rapid control of acute psychosis or delirium. **Concentration:** 5 mg/mL. **Rate:** Administer at a rate of 5 mg/min.
- **Intermittent Infusion:** **Diluent:** May be diluted in 30–50 mL of D5W. **Rate:** Infuse over 30 min.
- **Y-Site Compatibility:** alectuzimab, amifostine, aminocaproic acid, amphotericin B liposome, amsa-

crine, anidulafungin, argatroban, azithromycin, bleomycin, cangrelor, carboplatin, carmustine, caspofungin, cefaroline, cisatracurium, cisplatin, cladribine, clonidine, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin, dexmedetomidine, dexrazoxane, diltiazem, docetaxel, doxacurium, doxorubicin hydrochloride, doxorubicin liposome, epirubicin, eptifibatide, ertapenem, etoposide, etoposide phosphate, fenoldopam, filgrastim, fludarabine, gemcitabine, granisetron, hetastarch, hydromorphone, idarubicin, ifosfamide, irinotecan, ketamine, leucovorin calcium, levofloxacin, linezolid, lorazepam, mechlorethamine, melphalan, methadone, metronidazole, milrinone, mitoxantrone, morphine, moxifloxacin, mycophenolate, nesiritide, nicardipine, octreotide, oxaliplatin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, potassium acetate, propofol, quinupristin/dalfopristin, remifentanyl, rituximab, rocuronium, sodium acetate, tacrolimus, teniposide, thiopeta, tigecycline, tirofiban, trastuzumab, vecuronium, vinblastine, vincristine, vinorelbine, voriconazole, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, allopurinol, aminophylline, amphotericin B colloidal, amphotericin B lipid complex, ampicillin, ampicillin/sulbactam, azathioprine, bumetanide, calcium chloride, cefazolin, cefepime, cefonocid, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, clindamycin, dantrolene, dexamethasone, diazepam, diazoxide, epoetin alfa, fluoro-uracil, folic acid, foscarnet, fosphenytoin, furosemide, ganciclovir, heparin, hydralazine, hydrocortisone, imipenem/cilastatin, indomethacin, ketorolac, magnesium sulfate, methylprednisolone, nafcillin, oxacillin, pantoprazole, penicillin G, pentobarbital, phenobarbital, phenytoin, piperacillin/tazobactam, potassium chloride, sargramostim, sodium bicarbonate, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Advise patient to take medication as directed. Take missed doses as soon as remembered, with remaining doses evenly spaced throughout the day. May require several wk to obtain desired effects. Do not increase dose or discontinue medication without consulting health care professional. Abrupt withdrawal may cause dizziness; nausea; vomiting; GI upset; trembling; or uncontrolled movements of mouth, tongue, or jaw.
- Inform patient of possibility of extrapyramidal symptoms, tardive dyskinesia, and **neuroleptic malignant syndrome**. **Caution patient to report symptoms immediately.**
- Advise patient to change positions slowly to minimize orthostatic hypotension. Protect from falls.

- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Advise patient to use sunscreen and protective clothing when exposed to the sun to prevent photosensitivity reactions. Extremes of temperature should also be avoided; drug impairs body temperature regulation.
- Instruct patient to use frequent mouth rinses, good oral hygiene, and sugarless gum or candy to minimize dry mouth.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Instruct patient to notify health care professional promptly if weakness, tremors, visual disturbances, dark-colored urine or clay-colored stools, sore throat, fever, menstrual abnormalities, galactorrhea, or sexual dysfunction occur.
- Advise patient to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy.
- **Emphasize the importance of routine follow-up exams to monitor response to medication and detect side effects.**

Evaluation/Desired Outcomes

- Decrease in hallucinations, insomnia, agitation, hostility, and delusions.
- Decreased tics and vocalization in Tourette's syndrome.
- Improved behavior in children with severe behavioral problems. If no therapeutic effects are seen in 2–4 wk, dosage may be increased.

HIGH ALERT

heparin (hep-a-rin)

★ Hepalean, Hep-Lock, Hep-Lock U/P

Classification

Therapeutic: anticoagulants

Pharmacologic: antithrombotics

Indications

Prophylaxis and treatment of various thromboembolic disorders including: Venous thromboembolism, Pulmonary emboli, Atrial fibrillation with embolization, Acute and chronic consumptive coagulopathies, Peripheral arterial thromboembolism. Used in very low doses (10–100 units) to maintain patency of IV catheters (heparin flush).

Action

Potentiates the inhibitory effect of antithrombin on factor Xa and thrombin. In low doses, prevents the conver-

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

sion of prothrombin to thrombin by its effects on factor Xa. Higher doses neutralize thrombin, preventing the conversion of fibrinogen to fibrin. **Therapeutic Effects:** Prevention of thrombus formation. Prevention of extension of existing thrombi (full dose).

Pharmacokinetics

Absorption: Erratically absorbed following subcut or IM administration.

Distribution: Does not cross the placenta or enter breast milk.

Protein Binding: Very high (to low-density lipoproteins, globulins, and fibrinogen).

Metabolism and Excretion: Probably removed by the reticuloendothelial system (lymph nodes, spleen).

Half-life: 1–2 hr (↑ with increasing dose); affected by obesity, renal and hepatic function, malignancy, presence of pulmonary embolism, and infections.

TIME/ACTION PROFILE (anticoagulant effect)

ROUTE	ONSET	PEAK	DURATION
Heparin subcut	20–60 min	2 hr	8–12 hr
Heparin IV	immediate	5–10 min	2–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Uncontrolled bleeding; Severe thrombocytopenia; Open wounds (full dose); **Pedi:** Avoid use of products containing benzyl alcohol in premature infants.

Use Cautiously in: Severe liver or kidney disease; Retinopathy (hypertensive or diabetic); Untreated hypertension; Ulcer disease; Spinal cord or brain injury; History of congenital or acquired bleeding disorder; Malignancy; **OB:** Has been used safely during pregnancy; **Lactation:** Not likely to be excreted into breast milk; **Geri:** Women >60 yr have ↑ risk of bleeding.

Exercise Extreme Caution in: Severe uncontrolled hypertension; Bacterial endocarditis, bleeding disorders; GI bleeding/ulceration/pathology; Hemorrhagic stroke; Recent CNS or ophthalmologic surgery; Active GI bleeding/ulceration; History of thrombocytopenia related to heparin.

Adverse Reactions/Side Effects

GI: drug-induced hepatitis. **Derm:** alopecia (long-term use), rashes, urticaria. **Hemat:** BLEEDING, HEPARIN-INDUCED THROMBOCYTOPENIA (HIT) (WITH OR WITHOUT THROMBOSIS), anemia. **Local:** pain at injection site. **MS:** osteoporosis (long-term use). **Misc:** fever, hypersensitivity.

Interactions

Heparin is frequently used concurrently or sequentially with other agents affecting coagulation. The risk of potentially serious interactions is greatest with full anticoagulation.

Drug-Drug: Risk of bleeding may be ↑ by concurrent use of **drugs that affect platelet function**, in-

cluding **aspirin, NSAIDs, clopidogrel, dipyridamol, some penicillins, abciximab, eptifibatide, tirofiban, and dextran**. Risk of bleeding may be ↑ by concurrent use of **drugs that cause hypoprothrombinemia**, including **quinidine, cefotetan, and valproic acid**. Concurrent use of **thrombolytics** ↑ risk of bleeding. Heparins affect the prothrombin time used in assessing the response to **warfarin**. **Digoxin, tetracyclines, nicotine, and antihistamines** may ↓ anticoagulant effect of heparin. **Streptokinase** may be followed by relative resistance to heparin.

Drug-Natural Products: ↑ risk of bleeding with **arnica, anise, chamomile, clove, dong quai, fever few, garlic, ginger, and Panax ginseng**.

Route/Dosage

Therapeutic Anticoagulation

IV (Adults): Intermittent bolus—10,000 units, followed by 5000–10,000 units q 4–6 hr. **Continuous infusion**—5000 units (35–70 units/kg), followed by 20,000–40,000 units infused over 24 hr (approx. 1000 units/hr or 15–18 units/kg/hr).

IV (Children >1 yr): Intermittent bolus—50–100 units/kg, followed by 50–100 units/kg q 4 hr. **Continuous infusion**—Loading dose 75 units/kg, followed by 20 units/kg/hr, adjust to maintain aPTT of 60–85 sec.

IV (Neonates and Infants <1 yr): Continuous infusion—Loading dose 75 units/kg, followed by 28 units/kg/hr, adjust to maintain aPTT of 60–85 sec.

Subcut (Adults): 5000 units IV, followed by initial subcut dose of 10,000–20,000 units, then 8000–10,000 units q 8 hr or 15,000–20,000 units q 12 hr.

Prophylaxis of Thromboembolism

Subcut (Adults): 5000 units q 8–12 hr (may be started 2 hr prior to surgery).

Cardiovascular Surgery

IV (Adults): At least 150 units/kg (300 units/kg if procedure <60 min; 400 units/kg if >60 min).

Intra-arterial (Neonates, Infants, and Children): 100–150 units/kg via an artery prior to cardiac catheterization.

Line Flushing

IV (Adults and Children): 10–100 units/mL (10 units/mL for infants <10 kg, 100 units/mL for all others) solution to fill heparin lock set to needle hub; replace after each use.

Total Parenteral Nutrition

IV (Adults and Children): 0.5–1 units/mL (final solution concentration) to maintain line patency.

Arterial Line Patency

Intra-arterial (Neonates): 0.5–2 units/mL.

Availability (generic available)

Solution for injection: 10 units/mL, 100 units/mL, 1000 units/mL, 5000 units/mL, 7500 units/mL, 10,000

units/mL, 20,000 units/mL, 40,000 units/mL. **Pre-mixed solution:** 1000 units/500 mL, 2000 units/1000 mL, 12,500 units/250 mL, 25,000 units in 250 and 500 mL.

NURSING IMPLICATIONS

Assessment

- Assess for signs of bleeding and hemorrhage (bleeding gums; nosebleed; unusual bruising; black, tarry stools; hematuria; fall in hematocrit or BP; guaiac-positive stools). Notify health care professional if these occur.
- Assess patient for evidence of additional or increased thrombosis. Symptoms will depend on area of involvement.
- Monitor patient for hypersensitivity reactions (chills, fever, urticaria).
- **Subcut:** Observe injection sites for hematomas, ecchymosis, or inflammation.
- **Lab Test Considerations:** Monitor activated partial thromboplastin time (aPTT) and hematocrit prior to and periodically during therapy. When *intermittent IV* therapy is used, draw aPTT levels 30 min before each dose during initial therapy and then periodically. During *continuous* administration, monitor aPTT levels every 4 hr during early therapy. For *Subcut* therapy, draw blood 4–6 hr after injection.
- Monitor platelet count every 2–3 days throughout therapy. May cause mild thrombocytopenia, which appears on 4th day and resolves despite continued heparin therapy. Heparin-induced thrombocytopenia (HIT), a more severe form which necessitates discontinuing medication, may develop on 8th day of therapy; may reduce platelet count to as low as 5000/mm³ and lead to increased resistance to heparin therapy. HIT may progress to development of venous and arterial thrombosis (HITT) and may occur up to several wk after discontinuation. Patients who have received a previous course of heparin may be at higher risk for severe thrombocytopenia for several mo after the initial course.
- May cause hyperkalemia and ↑ AST and ALT levels.
- **Toxicity and Overdose:** Protamine sulfate is the antidote. Due to short half-life, overdose can often be treated by withdrawing the drug.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)

Risk for injury (Side Effects)

Implementation

- **High Alert:** Fatal hemorrhages have occurred in pediatric patients due to errors in which heparin sodium injection vials were confused with heparin flush vials. Carefully examine all heparin sodium injection vials to confirm the correct vial choice prior

to administration. Have second practitioner independently check original order, dose calculation, and infusion pump settings. Unintended concomitant use of two heparin products (unfractionated heparin and LMW heparins) has resulted in serious harm or death. Review patients' recent (emergency department, operating room) and current medication administration records before administering any heparin or LMW heparin product. Do not confuse heparin with Hespan (hetastarch in sodium chloride). Do not confuse vials of heparin with vials of insulin.

- Inform all personnel caring for patient of anticoagulant therapy. Venipunctures and injection sites require application of pressure to prevent bleeding or hematoma formation. Avoid IM injections of other medications; hematomas may develop.
- In patients requiring long-term anticoagulation, oral anticoagulant therapy should be instituted 4–5 days prior to discontinuing heparin therapy.
- Solution is colorless to slightly yellow.

IV Administration

- **Subcut:** Administer deep into subcut tissue. Alternate injection sites between arm and the left and right abdominal wall above the iliac crest. Inject entire length of needle at a 45°- or 90°-angle into a skin fold held between thumb and forefinger; hold skin fold throughout injection. Do not aspirate or massage. Rotate sites frequently. Do not administer IM because of danger of hematoma formation. Solution should be clear; do not inject solution containing particulate matter.
- **IV Push:** **Diluent:** Administer loading dose undiluted. **Concentration:** Varies depending upon vial used. **Rate:** Administer over at least 1 min. Loading dose given before continuous infusion.
- **Continuous Infusion:** **Diluent:** Dilute 25,000 units of heparin in 250–500 mL of 0.9% NaCl or D5W. Premixed infusions are already diluted and ready to use. Admixed solutions stable for 24 hr at room temperature or if refrigerated. Premixed infusion stable for 30 days once overwrap removed. **Concentration:** 50–100 units/mL. **Rate:** See Route/Dosage section. Adjust to maintain therapeutic aPTT. Use an infusion pump to ensure accuracy.
- **Flush:** To prevent clot formation in intermittent infusion (heparin lock) sets, inject dilute heparin solution of 10–100 units/0.5–1 mL after each medication injection or every 8–12 hr. To prevent incompatibility of heparin with medication, flush lock set with sterile water or 0.9% NaCl for injection before and after medication is administered.
- **Y-Site Compatibility:** acetaminophen, acetylcysteine, acyclovir, alemtuzumab, alentanil, allopurinol, amifostine, aminocaproic acid, aminophylline, am-

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

photericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, atropine, azathioprine, azithromycin, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, ceftazolin, cefotaxime, cefotetan, cefoxitin, cefuroxime, cefazidime, ceftriaxone, cefuroxime, chloramphenicol, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, digoxin, docetaxel, dopamine, doxacurium, doxapram, doxorubicin liposome, enalaprilat, ephedrine, epinephrine, epoetin alfa, eptifibatide, ertapenem, estrogens, conjugated, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, ganciclovir, gemcitabine, glycopyrrolate, granisetron, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, indomethacin, irinotecan, isoproterenol, ketorolac, leucovorin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, mepoepem, mesna, metaraminol, methotrexate, methoxamine, methylglucate, methylergonovine, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, mitomycin, morphine, moxifloxacin, multiple vitamins, nafcillin, nalbuphine, naloxone, neostigmine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, penmetrexed, penicillin G, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, promazine, propofol, propranolol, pyridostigmine, pyridoxime, ranitidine, remifentanyl, rituximab, rocuronium, sargramostim, scopolamine, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanyl, tacrolimus, theophylline, thiamine, thiotental, thiotepa, tigecycline, tirofiban, tolasoline, tranexamic acid, trastuzumab, trimetaphan, vasopressin, vecuronium, verapamil, vinblastine, vincristine, voriconazole, warfarin, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** alteplase, amiodarone, ampicillin, caspofungin, ciprofloxacin, dantrolene, daunorubicin hydrochloride, diazepam, diazoxide, doxycycline, epirubicin, filgrastim, haloperidol, hydroxyzine, idarubicin, ketamine, levofloxacin, mitoxantrone, mycophenolate, palifermin, papaverine, pentamidine, phenytoin, protamine, quinuapristin/dalfopristin, reteplase, tobramycin.
- **Additive Compatibility:** It is recommended that heparin not be mixed in solution with other medications when given for anticoagulation, even those that are compatible, because changes in rate of heparin

infusion may be required that would also affect admixtures.

Patient/Family Teaching

- Advise patient to report any symptoms of unusual bleeding or bruising to health care professional immediately.
- Instruct patient not to take medications containing aspirin or NSAIDs while on heparin therapy.
- Caution patient to avoid IM injections and activities leading to injury and to use a soft toothbrush and electric razor during heparin therapy.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Patients on anticoagulant therapy should carry an identification card with this information at all times.

Evaluation/Desired Outcomes

- Prolonged partial thromboplastin time (PTT) of 1.5–2.5 times the control, without signs of hemorrhage.
- Prevention of deep vein thrombosis and pulmonary emboli.
- Patency of IV catheters.

HIGH ALERT

HEPARINS (LOW MOLECULAR WEIGHT)

dalteparin (dal-te-pa-rin)

Fragmin

enoxaparin (e-nox-a-pa-rin)

Lovenox

Classification

Therapeutic: anticoagulants

Pharmacologic: antithrombotics

Indications

Enoxaparin and dalteparin: Prevention of venous thromboembolism (VTE) (deep vein thrombosis [DVT] and/or pulmonary embolism [PE]) in surgical or medical patients. **Dalteparin only:** Extended treatment of symptomatic DVT and/or PE in patients with cancer. **Enoxaparin only:** Treatment of DVT with or without PE (with warfarin). **Enoxaparin and dalteparin:** Prevention of ischemic complications (with aspirin) from unstable angina and non-ST-segment-elevation MI. **Enoxaparin only:** Treatment of acute ST-segment-elevation MI (with thrombolytics or percutaneous coronary intervention).

Action

Potentiate the inhibitory effect of antithrombin on factor Xa and thrombin. **Therapeutic Effects:** Prevention of thrombus formation.

Pharmacokinetics

Absorption: Well absorbed after subcut administration (87% for dalteparin, 92% for enoxaparin).

Distribution: Unknown.

Metabolism and Excretion: *Dalteparin*—unknown; *enoxaparin*—primarily eliminated renally.

Half-life: *Dalteparin*—2.1–2.3 hr; *enoxaparin*—3–6 hr (all are ↑ in renal insufficiency).

TIME/ACTION PROFILE (anticoagulant effect)

ROUTE	ONSET	PEAK	DURATION
Dalteparin subcut	rapid	4 hr	up to 24 hr
Enoxaparin subcut	unknown	3–5 hr	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to specific agents or pork products; cross-sensitivity may occur; Some products contain sulfites or benzyl alcohol and should be avoided in patients with known hypersensitivity or intolerance; Active major bleeding; History of heparin-induced thrombocytopenia; *Dalteparin*—regional anesthesia during treatment for unstable angina/non-Q-wave MI.

Use Cautiously in: Severe hepatic or renal disease (adjust dose of enoxaparin if CCr <30 mL/min); Women <45 kg or men <57 kg; Retinopathy (hypertensive or diabetic); Untreated hypertension; **Ger:** May have ↑ risk of bleeding due to age-related ↓ in renal function; *Dalteparin*—**Ger:** ↑ mortality in patients >70 yrs with renal insufficiency; Recent history of ulcer disease; History of congenital or acquired bleeding disorder; **OB, Lactation, Pedi:** Safety not established; should not be used in pregnant patients with prosthetic heart valves without careful monitoring.

Exercise Extreme Caution in: Spinal/epidural anesthesia (↑ risk of spinal/epidural hematomas, especially with concurrent NSAIDs, repeated or traumatic epidural puncture, or indwelling epidural catheter); Severe uncontrolled hypertension; Bacterial endocarditis; Bleeding disorders.

Adverse Reactions/Side Effects

CNS: dizziness, headache, insomnia. **CV:** edema. **GI:** constipation, ↑ liver enzymes, nausea, vomiting. **GU:** urinary retention. **Derm:** alopecia, ecchymoses, pruritus, rash, urticaria. **Hemat:** **BLEEDING**, anemia, eosinophilia, thrombocytopenia. **Local:** erythema at injection site, hematoma, irritation, pain. **MS:** osteoporosis.

Misc: fever.

Interactions

Drug-Drug: Risk of bleeding may be ↑ by concurrent use of **drugs that affect platelet function and coagulation**, including **warfarin, aspirin, NSAIDs, dipyridamole, clopidogrel, abxiximab, eptifibatide, tirofiban, and thrombolytics**.

Drug-Natural Products: ↑ bleeding risk with **arnica, chamomile, clove, feverfew, garlic, ginger, ginkgo, Panax ginseng**, and others.

Route/Dosage

Dalteparin

Subcut (Adults): *Prophylaxis of DVT following abdominal surgery*—2500 units 1–2 hr before surgery, then once daily for 5–10 days; *Prophylaxis of VTE in high-risk patients undergoing abdominal surgery*—5000 units evening before surgery, then once daily for 5–10 days or in patients with malignancy, 2500 units 1–2 hr before surgery, another 2500 units 12 hr later, then 5000 units once daily for 5–10 days; *Prophylaxis of VTE in patients undergoing hip replacement surgery*—2500 units within 2 hr before surgery, then 2500 units 4–8 hr after surgery, then 5000 units once daily (start at least 6 hr after postsurgical dose) for 5–10 days or 5000 units evening before surgery (10–14 hr before surgery), then 5000 units 4–8 hr after surgery, then 5000 units once daily for 5–10 days or 2500 units 4–8 hr after surgery, then 5000 units once daily (start at least 6 hr after postsurgical dose); *Prophylaxis of VTE in medical patients with severely restricted mobility during acute illness*: 5000 units once daily for 12 to 14 days. *Unstable angina/non-ST-segment-elevation MI*—120 units/kg (not to exceed 10,000 units) q 12 hr for 5–8 days with concurrent aspirin; *Extended treatment of symptomatic VTE in cancer patients*—200 units/kg (not to exceed 18,000 units) once daily for first 30 days, followed by 150 units/kg (not to exceed 18,000 units) once daily for mo 2–6.

Renal Impairment

Subcut (Adults): *Cancer patients receiving extended treatment of symptomatic VTE with CCr <30 mL/min*—Monitor anti-Xa levels (target 0.5–1.5 IU/mL).

Enoxaparin

Subcut (Adults): *VTE prophylaxis in patients undergoing knee replacement surgery*—30 mg q 12 hr starting 12–24 hr postop for 7–10 days; *VTE prophylaxis in patients undergoing hip replacement surgery*—30 mg q 12 hr starting 12–24 hr postop or 40 mg once daily starting 12 hr before surgery (either dose may be continued for 7–14 days; continued prophylaxis with 40 mg once daily may be continued for up to 3 wk); *VTE prophylaxis following abdominal surgery*—40 mg once daily starting 2 hr before surgery and then continued for 7–12 days or until ambulatory (up to 14 days); *VTE prophylaxis in medical patients with acute illness*—40 mg once daily for 6–14 days; *Treatment of DVT/PE (outpatient)*—1 mg/kg q 12 hr. Warfarin should be started within 72 hr; enoxaparin may be continued for a minimum of 5 days and until

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

therapeutic anticoagulation with warfarin is achieved (INR >2 for 2 consecutive days); *Treatment of DVT/PE (inpatient)*—1 mg/kg q 12 hr or 1.5 mg/kg once daily. Warfarin should be started within 72 hr; enoxaparin may be continued for a minimum of 5 days and until therapeutic anticoagulation with warfarin is achieved (INR >2 for two consecutive days); *Unstable angina/non-ST-segment-elevation MI*—1 mg/kg q 12 hr for 2–8 days (with aspirin).

IV, Subcut (Adults <75 yr): Acute ST-segment-elevation MI—Administer single IV bolus of 30 mg plus 1 mg/kg subcut dose (maximum of 100 mg for first 2 doses only), followed by 1 mg/kg subcut q 12 hr. The usual duration of treatment is 2–8 days. In patients undergoing percutaneous coronary intervention, if last subcut dose was <8 hr before balloon inflation, no additional dosing needed; if last subcut dose was ≥8 hr before balloon inflation, administer single IV bolus of 0.3 mg/kg.

Subcut (Adults ≥75 yr): Acute ST-segment-elevation MI—0.75 mg/kg every 12 hr (no IV bolus needed) (maximum of 75 mg for first 2 doses only; no initial bolus). The usual duration of treatment is 2–8 days.

Renal Impairment

Subcut (Adults CCr <30 mL/min): VTE prophylaxis for abdominal or knee/hip replacement surgery—30 mg once daily. *Treatment of DVT/PE*—1 mg/kg once daily. *Unstable angina/non-ST-segment-elevation MI*—1 mg/kg once daily. *Acute ST-segment-elevation MI (patients <75 yr)*—Single IV bolus of 30 mg plus 1 mg/kg subcut dose, followed by 1 mg/kg subcut once daily. *Acute ST-segment-elevation MI (patients ≥75 yr)*—1 mg/kg once daily (no initial bolus).

Availability

Dalteparin

Solution for injection (prefilled syringes): 2500 units/0.2 mL, 5000 units/0.2 mL, 7500 units/0.3 mL, 10,000 units/1 mL, 12,500 units/0.5 mL, 15,000 units/0.6 mL, 18,000 units/0.72 mL. **Solution for injection (multidose vials):** 25,000 IU/mL.

Enoxaparin (generic available)

Solution for injection (prefilled syringes): 30 mg/0.3 mL, 40 mg/0.4 mL, 60 mg/0.6 mL, 80 mg/0.8 mL, 100 mg/1 mL, 120 mg/0.8 mL, 150 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess for signs of bleeding and hemorrhage (bleeding gums; nosebleed; unusual bruising; black, tarry stools; hematuria; fall in hematocrit or BP; guaiac-positive stools); bleeding from surgical site. Notify health care professional if these occur.
- Assess patient for evidence of additional or increased thrombosis. Symptoms depend on area of involvement.

- Assess for evidence of additional or increased thrombosis. Symptoms depend on area of involvement. Monitor neurological status frequently for signs of neurological impairment. May require urgent treatment.
- Monitor for hypersensitivity reactions (chills, fever, urticaria). Report signs to health care professional.
- Monitor patients with epidural catheters frequently for signs and symptoms of neurologic impairment. Delay placement or removal of catheter for at least 12 hours after administration of lower doses (30 mg once or twice daily or 40 mg once daily) and at least 24 hours after administration of higher doses (0.75 mg/kg twice daily, 1 mg/kg twice daily, or 1.5 mg/kg once daily) of enoxaparin. Do not give 2nd enoxaparin dose in twice daily regimen to patients receiving 0.75 mg/kg twice daily dose or 1 mg/kg twice daily dose to allow a longer delay before catheter placement or removal, then delay next dose for at least 4 hrs. *For patients with creatinine clearance <30 mL/minute*, double timing of removal of catheter, at least 24 hrs for lower dose (30 mg once daily) and at least 48 hrs for higher dose (1 mg/kg/day). Monitor for signs and symptoms of neurological impairment (midline back pain, sensory and motor deficits [numbness or weakness in lower limbs], bowel and/or bladder dysfunction) frequently if epidural or spinal anesthesia or lumbar puncture is done during therapy.
- **Subcut:** Observe injection sites for hematomas, ecchymosis, or inflammation.
- **Lab Test Considerations:** Monitor CBC, platelet count, and stools for occult blood periodically during therapy. *If thrombocytopenia occurs (platelet count <100,000/mm³)*, discontinue therapy. *If hematocrit ↓ unexpectedly*, assess patient for potential bleeding sites. For *dalteparin* use for extended treatment of symptomatic VTE in cancer patients, if platelets ↓ to 50,000–100,000/mm³, reduce dose to 2500 units once daily until recovery to ≥100,000/mm³; if platelets <50,000/mm³, discontinue until count returns to ≥50,000/mm³.
- Special monitoring of aPTT is not necessary. Monitoring of anti-Xa levels may be considered in patients who are obese or have renal dysfunction (for *enoxaparin*, obtain 4 hr after injection).
- Monitoring of antifactor Xa levels may be necessary to titrate doses in pediatric patients (therapeutic range 0.5–1 unit/mL).
- May cause ↑ in AST and ALT levels.
- **Toxicity and Overdose:** For *enoxaparin* overdose, protamine sulfate 1 mg for each mg of *enoxaparin* should be administered by slow IV injection. For *dalteparin* overdose, protamine sulfate 1 mg for each 100 anti-factor Xa IU of *dalteparin* should be administered by slow IV injection. If the aPTT measured 2–4 hr after protamine administration remains prolonged, a 2nd infusion of protamine 0.5

mg/100 anti-factor Xa IU of *dalteparin* may be administered.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)

Risk for injury (Side Effects)

Implementation

- **High Alert:** Unintended concomitant use of two heparin products (unfractionated heparin and low molecular weight heparins) has resulted in serious harm and death. Review patients' recent and current medication administration records before administering any heparin or low-molecular-weight heparin product.
- Do not confuse Lovenox with Levemir.
- Cannot be used interchangeably (unit for unit) with unfractionated heparin or other low-molecular-weight heparins.
- **Subcut:** Administer deep into subcut tissue. Alternate injection sites daily between the left and right anterolateral and left and right posterolateral abdominal wall, the upper thigh, or buttocks. Inject entire length of needle at a 45° or 90° angle into a skin fold held between thumb and forefinger; hold skin fold throughout injection. Do not aspirate or massage. Rotate sites frequently. Do not administer IM because of danger of hematoma formation. Solution should be clear and colorless to slightly yellow; do not inject solution containing particulate matter.
- If excessive bruising occurs, ice cube massage of site before injection may lessen bruising.
- **Enoxaparin:** To avoid the loss of drug, do not expel the air bubble from the syringe before the injection.
- **Subcut:** Per manufacturer's recommendations, to enhance absorption, inject enoxaparin into left or right anterolateral or posterolateral abdominal wall only.
- To minimize risk of bleeding after vascular instrumentation for unstable angina, recommended intervals between doses should be followed closely. Leave vascular access sheath in place for 6–8 hr after enoxaparin dose. Give next enoxaparin dose ≥6–8 hr after sheath removal. Observe site for bleeding or hematoma formation.

IV Administration

- **IV Push:** (for treatment of STEMI only) Inject via IV line. Flush with 0.9% NaCl or D5W prior to and following administration to avoid mixture with other drugs and clear the port of the drug. May be administered with 0.9% NaCl or D5W. **Rate:** Inject as a bolus.
- **Y-Site Incompatibility:** Do not mix or co-administer with other medications.

Patient/Family Teaching

- Instruct patient in correct technique for self injection, care and disposal of equipment.
- Advise patient to report any symptoms of unusual bleeding or bruising, dizziness, itching, rash, fever, swelling, or difficulty breathing to health care professional immediately.
- Instruct patient not to take aspirin or NSAIDs without consulting health care professional while on therapy.

Evaluation/Desired Outcomes

- Prevention of DVT and pulmonary emboli (enoxaparin and dalteparin).
- Resolution of DVT and pulmonary embolism (enoxaparin only).
- Prevention of ischemic complications (with aspirin) in patients with unstable angina or non-ST-segment—elevation MI (enoxaparin and dalteparin).
- Treatment of acute ST-segment elevation myocardial infarction (enoxaparin only).

HISTAMINE H₂ ANTAGONISTS

cimetidine (sy-me-ti-deen)

Tagamet, Tagamet HB

famotidine (fa-moe-ti-deen)

★ Acid Control, Pepcid, Pepcid AC,

★ Peptic Guard, ★ Uclidine

nizatidine (ni-za-ti-deen)

Axid, Axid AR

ranitidine (ra-ni-ti-deen)

★ Acid Reducer, Zantac, Zantac EF-

FERdose, Zantac 75, Zantac 150

Classification

Therapeutic: antiulcer agents

Pharmacologic: histamine H₂ antagonists

Indications

Short-term treatment of active duodenal ulcers and benign gastric ulcers. Maintenance therapy for duodenal and gastric ulcers after healing of active ulcers. Management of GERD. Treatment of heartburn, acid indigestion, and sour stomach (OTC use). **Cimetidine**, **famotidine**, **ranitidine**: Management of gastric hypersecretory states (Zollinger-Ellison syndrome). **Famotidine**, **ranitidine IV**: Prevention and treatment of stress-induced upper GI bleeding in critically ill patients. **Ranitidine**: Treatment of and maintenance therapy for erosive esophagitis. **Unlabeled Use:** Management of GI symptoms associated with the use of NSAIDs. Prevention of acid inactivation of supplemental

★ = Canadian drug name. ⚡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

pancreatic enzymes in patients with pancreatic insufficiency. Management of urticaria.

Action

Inhibits the action of histamine at the H₂-receptor site located primarily in gastric parietal cells, resulting in inhibition of gastric acid secretion. **Therapeutic Effects:** Healing and prevention of ulcers. Decreased symptoms of gastroesophageal reflux. Decreased secretion of gastric acid.

Pharmacokinetics

Absorption: *Cimetidine*—well absorbed after oral administration. *Famotidine*—40–45% absorbed after oral administration. *Nizatidine*—70–95% absorbed after oral administration. *Ranitidine*—50% absorbed after PO and IM administration.

Distribution: All agents enter breast milk and cerebrospinal fluid.

Metabolism and Excretion: *Cimetidine*—30% metabolized by the liver; remainder is eliminated unchanged by the kidneys. *Famotidine*—up to 70% excreted unchanged by the kidneys, 30–35% metabolized by the liver. *Nizatidine*—60% excreted unchanged by the kidneys; some hepatic metabolism; at least 1 metabolite has histamine-blocking activity. *Ranitidine*—metabolized by the liver, mostly on first pass; 30% excreted unchanged by the kidneys after PO administration, 70% after parenteral administration.

Half-life: *Cimetidine*—2 hr; *famotidine*—2.5–3.5 hr; *nizatidine*—1.6 hr; *ranitidine*—2–2.5 hr (all are ↑ in renal impairment).

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
Cimetidine PO	30 min	45–90 min	4–5 hr
Famotidine PO	within 60 min	1–4 hr	6–12 hr
Famotidine IV	within 60 min	0.5–3 hr	8–15 hr
Nizatidine PO	unknown	unknown	8–12 hr
Ranitidine PO	unknown	1–3 hr	8–12 hr
Ranitidine IM	unknown	15 min	8–12 hr
Ranitidine IV	unknown	15 min	8–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Some products contain alcohol and should be avoided in patients with known intolerance; Some products contain aspartame and should be avoided in patients with phenylketonuria.

Use Cautiously in: Renal impairment (more susceptible to adverse CNS reactions; ↑ dose interval recommended for *cimetidine* and *nizatidine* if CCr ≤50 mL/min, and for *famotidine* and *ranitidine* if CCr <50 mL/min; Hepatic impairment (for *ranitidine*); Acute porphyria (for *ranitidine*); **Geri:** More susceptible to adverse CNS reactions; dose ↓ recommended; **OB, Lactation:** Pregnancy or lactation.

Adverse Reactions/Side Effects

CNS: confusion, dizziness, drowsiness, hallucinations, headache. **CV:** **ARRHYTHMIAS.** **GI:** constipation, diarrhea, drug-induced hepatitis (*nizatidine*, *cimetidine*), nausea. **GU:** ↓ sperm count, erectile dysfunction (*cimetidine*). **Endo:** gynecomastia. **Hemat:** **AGRANULOCYTOSIS, APLASTIC ANEMIA,** anemia, neutropenia, thrombocytopenia. **Local:** pain at IM site. **Misc:** hypersensitivity reactions, vasculitis.

Interactions

Drug-Drug: *Cimetidine* is a moderate inhibitor of the CYP1A2, CYP2C9, CYP2D6, and CYP3A4 isoenzymes in the liver; may lead to ↑ levels and toxicity with **benzodiazepines** (especially **chlordiazepoxide, diazepam, and midazolam**), some **beta blockers** (**labetalol, metoprolol, propranolol**), **caffeine, calcium channel blockers, carbamazepine, cyclosporine, dofetilide, lidocaine, metronidazole, mexiletine, nefazodone, pentoxifylline, phenytoin, procainamide, propafenone, quinidine, metformin, risperidone, ritonavir, ropinirole, selective serotonin reuptake inhibitors, sildenafil, sulfonyleureas, tacrolimus, theophylline, tricyclic antidepressants, venlafaxine, and warfarin.** *Famotidine, nizatidine, and ranitidine* have a much smaller and less significant effect on the metabolism of other drugs. *Cimetidine* may ↑ myelosuppressive effects of **carmustine** (avoid concurrent use). All may ↓ absorption of **ketoconazole, itraconazole, atazanavir, delavirdine, and gefitinib.** *Ranitidine* may ↑ absorption of **triazolam, midazolam, and glipizide.** *Ranitidine* may ↑ **procainamide** levels. *Ranitidine* may ↑ the effects of **warfarin.**

Route/Dosage

Cimetidine

PO (Adults): *Short-term treatment of active ulcers*—300 mg 4 times daily or 800 mg at bedtime or 400–600 mg twice daily (not to exceed 2.4 g/day) for up to 8 wk. *Duodenal ulcer prophylaxis*—300 mg twice daily or 400 mg at bedtime. *GERD*—400 mg q 6 hr or 800 mg twice daily for 12 wk. *Gastric hypersecretory conditions*—300–600 mg q 6 hr (up to 2400 mg/day). *OTC use*—up to 200 mg may be taken twice daily (for not more than 2 wk).

PO (Children): *Short-term treatment of active ulcers*—5–10 mg/kg every 6 hr.

Renal Impairment

PO (Adults): *CCr 10–50 mL/min*—Administer 50% of normal dose; *CCr <10 mL/min*—Administer 25% of normal dose.

Renal Impairment

PO (Children): 10–15 mg/kg/day.

Famotidine

PO (Adults): *Short-term treatment of active duodenal ulcers*—40 mg/day at bedtime or 20 mg twice

daily for up to 8 wk. *Treatment of benign gastric ulcers*—40 mg/day at bedtime. *Maintenance treatment of duodenal ulcers*—20 mg once daily at bedtime. *GERD*—20 mg twice daily for up to 6 wk; up to 40 mg twice daily for up to 12 wk for esophagitis with erosions, ulcerations, and continuing symptoms. *Gastric hypersecretory conditions*—20 mg every 6 hr initially, up to 160 mg every 6 hr. *OTC use*—10 mg for relief of symptoms; for prevention—10 mg 60 min before eating or take 10 mg as chewable tablet 15 minutes before heartburn-inducing foods or beverages (not to exceed 20 mg/24 hr for up to 2 wk).

PO, IV (Children 1–16 yr): *Peptic ulcer*—0.5 mg/kg/day as a single bedtime dose or in 2 divided doses (up to 40 mg daily); *GERD*—1 mg/kg/day in 2 divided doses (up to 80 mg twice daily).

PO (Infants >3 mo–1 yr): *GERD*—0.5 mg/kg/dose twice daily.

PO (Infants and neonates <3 mo): *GERD*—0.5 mg/kg/dose once daily.

IV (Adults): 20 mg every 12 hr.

Renal Impairment

PO (Adults): *CCr <50 mL/min*—administer normal dose every 36–48 hr or 50% of normal dose at normal dosing interval. *CCr <10 mL/min*—dosing interval may need to be ↑ to every 36–48 hr.

Nizatidine

PO (Adults): *Short-term treatment of active duodenal or benign gastric ulcers*—300 mg once daily at bedtime. *Maintenance treatment of duodenal ulcers*—150 mg once daily at bedtime. *GERD*—150 mg twice daily. *OTC use*—75 mg twice daily given 30–60 min before foods or beverages expected to cause symptoms.

Renal Impairment

PO (Adults): *Short-term treatment of active ulcers*—*CCr 20–50 mL/min*—150 mg once daily; *CCr <20 mL/min*—150 mg every other day. *Maintenance treatment of duodenal ulcers*—*CCr 20–50 mL/min*—150 mg every other day; *CCr <20 mL/min*—150 mg every 3 days.

Ranitidine

PO (Adults): *Short-term treatment of active duodenal or benign gastric ulcers*—150 mg twice daily or 300 mg once daily at bedtime. *Maintenance treatment of duodenal or gastric ulcers*—150 mg once daily at bedtime. *GERD*—150 mg twice daily. *Erosive esophagitis*—150 mg 4 times daily initially, then 150 mg twice daily as maintenance. *Gastric hypersecretory conditions*—150 mg twice daily initially; up to 6 g/day have been used. *OTC use*—75 mg 30–60 min before foods or beverages expected to cause symptoms (up to twice daily) (not to be used for more than 2 wk).

PO (Children 1 mo–16 yr): *Treatment of gastric/duodenal ulcers*—2–4 mg/kg/day in 2 divided doses (up to 300 mg/day); *Maintenance treatment of ulcers*—2–4 mg/kg once daily (up to 150 mg/day); *GERD/erosive esophagitis*—5–10 mg/kg/day in 2 divided doses (up to 300 mg/day for GERD or 600 mg/day for erosive esophagitis).

PO (Neonates): 2 mg/kg/day in 2 divided doses.

IV, IM (Adults): 50 mg every 6–8 hr. *Continuous IV infusion*—6.25 mg/hr. *Gastric hypersecretory conditions*—1 mg/kg/hr; may be ↑ by 0.5 mg/kg/hr (not to exceed 2.5 mg/kg/hr).

IV, IM (Children 1 mo–16 yr): *Treatment of gastric/duodenal ulcers*—2–4 mg/kg/day divided every 6–8 hr (up to 200 mg/day). *Continuous infusion*—1 mg/kg/dose followed by 0.08–0.17 mg/kg/hr.

IV (Neonates): 1.5 mg/kg/dose load, then in 12 hr start maintenance of 1.5–2 mg/kg/day divided every 12 hr. *Continuous IV infusion*—1.5 mg/kg/dose load followed by 0.04–0.08 mg/kg/hr infusion.

Renal Impairment

PO (Adults): *CCr <50 mL/min*—150 mg every 24 hr.

Renal Impairment

IV (Adults): *CCr <50 mL/min*—50 mg every 24 hr.

Availability

Cimetidine (generic available)

Tablets: 200 mg^{rx, otc}, 300 mg, 400 mg, 600 mg, 800 mg. **Cost:** *Generic*—200 mg \$82.15/100, 300 mg \$90.45/100, 400 mg \$146.85/100, 800 mg \$220.00/100. **Oral liquid (mint-peach flavor):** 200 mg/5 mL^{otc}, 300 mg/5 mL. **Cost:** *Generic*—300 mg/5 mL \$89.00/237 mL.

Famotidine (generic available)

Tablets: 10 mg^{otc}, 20 mg^{rx, otc}, 40 mg. **Cost:** *Generic*—20 mg \$173.50/100, 40 mg \$335.00/100. **Gelcaps:** 10 mg^{otc}. **Oral suspension (cherry-banana-mint flavor):** 40 mg/5 mL. **Cost:** *Generic*—\$176.95/50 mL. **Premixed infusion:** 20 mg/50 mL 0.9% NaCl. **Solution for injection:** 10 mg/mL. **In combination with:** ibuprofen (Duexis), calcium carbonate and magnesium hydroxide^{otc} (Pepcid Complete, see Appendix B).

Nizatidine (generic available)

Tablets: 75 mg^{otc}. **Capsules:** 150 mg, 300 mg. **Cost:** *Generic*—150 mg \$143.28/60, 300 mg \$142.98/30. **Oral solution (bubble gum flavor):** 15 mg/mL. **Cost:** *Generic*—\$347.65/473 mL.

Ranitidine (generic available)

Tablets: 75 mg^{otc}, 150 mg, 300 mg. **Cost:** *Generic*—150 mg \$156.20/100, 300 mg \$87.85/30. **Capsules:** 150 mg, 300 mg. **Cost:** *Generic*—150 mg \$91.27/60,

★ = Canadian drug name. ☒ = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

300 mg \$82.30/30. **Effervescent tablets (EFFER-dose):** 25 mg. **Syrup (peppermint flavor):** 15 mg/mL. **Cost:** *Generic*—\$350.49/473 mL. **Premixed infusion:** 50 mg/50 mL 0.45% NaCl. **Solution for injection:** 25 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess for epigastric or abdominal pain and frank or occult blood in the stool, emesis, or gastric aspirate.
- **Ger:** Assess geriatric and debilitated patients routinely for confusion. Report promptly.
- **Lab Test Considerations:** Monitor CBC with differential periodically during therapy.
- Antagonize effects of pentagastrin and histamine during gastric acid secretion testing. Avoid administration for 24 hr before the test.
- May cause false-negative results in skin tests using allergenic extracts. Histamine H₂ antagonists should be discontinued 24 hr before the test.
- May cause ↑ in serum transaminases and serum creatinine.
- Serum prolactin concentration may be ↑ after IV bolus of *cimetidine*. May also cause ↓ parathyroid concentrations.
- *Nizatidine* may cause ↑ alkaline phosphatase concentrations.
- *Ranitidine* and *famotidine* may cause false-positive results for urine protein; test with sulfosalicylic acid.

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- Do not confuse ranitidine with rimantidine. Do not confuse Zantac (ranitidine) with Xanax (alprazolam) or Zyrtec (cetirizine).
- **PO:** Administer with meals or immediately afterward and at bedtime to prolong effect.
- If antacids or sucralfate are used concurrently for relief of pain, avoid administration of antacids within 30 min–1 hr of the H₂ antagonist and take sucralfate 2 hr after H₂ antagonist; may ↓ absorption of H₂ antagonist.
- Doses administered once daily should be administered at bedtime to prolong effect.
- Shake oral suspension before administration. Discard unused suspension after 30 days.
- Remove foil from *ranitidine effervescent tablets* and dissolve in 6–8 oz water before drinking.

Famotidine

IV Administration

- **IV Push:** **Diluent:** 0.9% NaCl, D5W, D10W, or LR. **Concentration:** 4 mg/mL. **Rate:** Administer at a rate of 10 mg/min. Rapid administration may cause hypotension.
- **Intermittent Infusion:** **Diluent:** Dilute each 20 mg in 100 mL of 0.9% NaCl, D5W, D10W, or LR. Di-

luted solution is stable for 48 hr at room temperature. Do not use solution that is discolored or contains a precipitate. **Concentration:** 0.2 mg/mL.

Rate: Administer over 15–30 min.

- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, amsacrine, anakinra, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, aztreonam, benzotropine, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefotaxime, ceftaroline, ceftazidime, cefuroxime, chlorpromazine, cisatracurium, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxacurium, doxorubicin, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, epifibitide, ertapenem, erythromycin lactobionate, esmolol, etoposide, etoposide phosphate, fenoldopam, fentanyl, filgrastim, fluconazole, flunarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, mesna, metaraminol, methotrexate, methylodopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, pentazocine, pentobarbital, perphenazine, phenobarbital, phenolamine, phenylephrine, phytonadione, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxime, ranitidine, remifentanyl, rituximab, sargramostim, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, telavancin, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, tolazoline, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** amphotericin B colloidal, azathioprine, cefepime, chloramphenicol, dantro-

lene, diazepam, diazoxide, ganciclovir, indomethacin, mitomycin, pantoprazole, piperacillin/tazobactam, trimethoprim/sulfamethoxazole.

Ranitidine

IV Administration

- **IV Push:** **Diluent:** 0.9% NaCl or D5W for injection. **Concentration:** 2.5 mg/mL. **Rate:** Administer over at least 5 min not to exceed 10 mg/min. **Rapid administration may cause hypotension and arrhythmias.**
- **Intermittent Infusion:** **Diluent:** Dilute each 50 mg in 100 mL of 0.9% NaCl or D5W. Diluted solution is stable for 48 hr at room temperature. Do not use solution that is discolored or that contains precipitate. **Concentration:** 0.5 mg/mL. **Rate:** Administer over 15–30 min.
- **Continuous Infusion:** **Diluent:** D5W. **Concentration:** 150 mg/250 mL (no greater than 2.5 mg/mL for Zollinger-Ellison patients). **Rate:** Administer at a rate of 6.25 mg/hr. In patients with Zollinger-Ellison syndrome, start infusion at 1 mg/kg/hr. If gastric acid output is >10 mEq/hr or patient becomes symptomatic after 4 hr, adjust dose by 0.5 mg/kg/hr increments and remeasure gastric output.
- **Y-Site Compatibility:** acetaminophen, acyclovir, aldesleukin, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, amsacrine, anakinra, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, azithromycin, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxacurium, doxapram, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatid, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, indomethacin, irinotecan, isoproterenol, ketamine, ketorolac, labetalol, leucovorin calcium, levofloxa-

cin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, mesna, metamizolol, methotrexate, methyldopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, pentazocine, pentobarbital, phenobarbital, phenolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxime, remifentanyl, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, telavancin, teniposide, theophylline, thiamine, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, tolazoline, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, warfarin, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** amiodarone, caspofungin, dacarbazine, dantrolene, diazepam, diazoxide, pantoprazole, phenytoin, quinupristin/dalfopristin, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Instruct patient to take medication as directed for the full course of therapy, even if feeling better. Take missed doses as soon as remembered but not if almost time for next dose. Do not double doses.
- Advise patients taking OTC preparations not to take the maximum dose continuously for more than 2 wk without consulting health care professional. Notify health care professional if difficulty swallowing occurs or abdominal pain persists.
- Inform patient that smoking interferes with the action of histamine antagonists. Encourage patient to quit smoking or at least not to smoke after last dose of the day.
- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to the drug is known.
- Advise patient to avoid alcohol, products containing aspirin or NSAIDs, and foods that may cause an increase in GI irritation.
- Inform patient that increased fluid and fiber intake and exercise may minimize constipation.
- Advise patient to report onset of black, tarry stools; fever; sore throat; diarrhea; dizziness; rash; confusion; or hallucinations to health care professional promptly.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in abdominal pain.
- Treatment and prevention of gastric or duodenal irritation and bleeding. Healing of duodenal ulcers can be seen by x-rays or endoscopy. Therapy is continued for at least 6 wk in treatment of ulcers but not usually longer than 8 wk.
- Decreased symptoms of esophageal reflux.
- Treatment of heartburn, acid indigestion, and sour stomach (OTC use).

HMG-CoA REDUCTASE INHIBITORS (statins)

atorvastatin (a-tore-va-stat-in)

Lipitor

fluvastatin (floo-va-sta-tin)

Lescol, Lescol XL

lovastatin (loe-va-sta-tin)

pitavastatin (pi-tava-sta-tin)

Livalo

pravastatin (pra-va-sta-tin)

Pravachol

rosuvastatin (roe-soo-va-sta-tin)

Crestor

simvastatin (sim-va-sta-tin)

Zocor

Classification

Therapeutic: lipid-lowering agents

Pharmacologic: HMG-CoA reductase inhibitors

Indications

Adjunctive management of primary hypercholesterolemia and mixed dyslipidemias. **Atorvastatin:** Primary prevention of cardiovascular disease (\downarrow risk of MI or stroke) in patients with multiple risk factors for coronary heart disease CHD or type 2 diabetes mellitus (also \downarrow risk of angina or revascularization procedures in patients with multiple risk factors for CHD). **Atorvastatin and pravastatin:** Secondary prevention of cardiovascular disease (\downarrow risk of MI, stroke, revascularization procedures, angina, and hospitalizations for HF) in patients with clinically evident CHD. **Fluvastatin:** Secondary prevention of coronary revascularization procedures in patients with clinically evident CHD. **Fluvastatin and lovastatin:** Slow progression of coronary atherosclerosis in patients with CHD. **Lovastatin:** Primary prevention of CHD (\downarrow risk of MI, unstable

angina, and coronary revascularization) in patients without symptomatic cardiovascular disease with \uparrow total and low-density lipoprotein (LDL) cholesterol and \downarrow high-density lipoprotein (HDL) cholesterol. **Pravastatin:** Primary prevention of CHD (\downarrow risk of MI, coronary revascularization, and cardiovascular mortality) in patients without clinically evident CHD. **Simvastatin:** Secondary prevention of cardiovascular events (\downarrow risk of MI, coronary revascularization, stroke, and cardiovascular mortality) in patients with clinically evident CHD or those at high-risk for CHD (history of diabetes, peripheral arterial disease, or stroke). **Rosuvastatin:** Slow progression of coronary atherosclerosis. **Rosuvastatin:** Primary prevention of cardiovascular disease (reduces risk of stroke, myocardial infarction, and revascularization) in patients without clinically evident coronary heart disease but with an increased risk of cardiovascular disease because of age (≥ 50 yr for men; ≥ 60 yr for women), hsCRP ≥ 2 mg/L, and the presence of ≥ 1 risk factor for cardiovascular disease (hypertension, low HDL-C, smoking, or premature family history of coronary heart disease). **Rosuvastatin:** Adjunctive therapy to diet and exercise for the reduction of LDL cholesterol in children 8–17 yrs with heterozygous familial hypercholesterolemia if after diet therapy fails the following still exist: LDL cholesterol remains >190 mg/dL or remains >160 mg/dL [with family history of premature cardiovascular disease or ≥ 2 risk factors for cardiovascular disease]).

Action

Inhibit an enzyme, 3-hydroxy-3-methylglutaryl-coenzyme A (HMG-CoA) reductase, which is responsible for catalyzing an early step in the synthesis of cholesterol.

Therapeutic Effects: Lowers total and LDL cholesterol and triglycerides. Slightly increase HDL. Slows the progression of coronary atherosclerosis with resultant decrease in CHD-related events (all agents except rosuvastatin have indication for \downarrow events).

Pharmacokinetics

Absorption: *Atorvastatin*—rapidly absorbed but undergoes extensive GI and hepatic metabolism, resulting in 14% bioavailability; *fluvastatin*—98% absorbed after oral administration, but undergoes extensive first-pass metabolism resulting in 24% bioavailability; *lovastatin*, *pravastatin*—poorly and variably absorbed after oral administration; *pitavastatin*—well absorbed (51%) after oral administration; *rosuvastatin*—20% absorbed following oral administration; *simvastatin*—85% absorbed but rapidly metabolized.

Distribution: *Atorvastatin*—probably enters breast milk. *Fluvastatin*—enters breast milk. *Lovastatin*—crosses the blood-brain barrier and placenta. *Pravastatin*—small amounts enter breast milk. *Pitavastatin*, *rosuvastatin*, and *simvastatin*—unknown. **Protein Binding:** *Atorvastatin*, *fluvastatin*, *pitavastatin*, and *simvastatin*— $>98\%$.

Metabolism and Excretion: All agents are extensively metabolized by the liver; amount excreted un-

changed in urine: *atorvastatin*—<2%, *lovastatin*—10%, *fluvastatin*—5%, *pitavastatin*—15%, *pravastatin*—20%, and *simvastatin*—13%.

Half-life: *Atorvastatin*—14 hr; *fluvastatin*—1.2 hr; *lovastatin*—3 hr; *pitavastatin*—12 hr; *pravastatin*—1.3–2.7 hr; *rosuvastatin*—19 hr; *simvastatin*—unknown.

TIME/ACTION PROFILE (cholesterol-lowering effect)

ROUTE	ONSET	PEAK	DURATION*
Atorvastatin	unknown	unknown	20–30 hr
Fluvastatin	1–2 wk	4–6 wk	unknown
Lovastatin	2 wk	4–6 wk	6 wk
Pitavastatin	within 4 wk	4 wk	unknown
Pravastatin	several days	2–4 wk	unknown
Rosuvastatin	unknown	2–4 wk	unknown
Simvastatin	several days	2–4 wk	unknown

*After discontinuation.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Active liver disease or unexplained persistent ↑ in AST or ALT; *Simvastatin* and *lovastatin*—Concurrent use of strong CYP3A4 inhibitors (↑ risk of myopathy/rhabdomyolysis); *Pitavastatin*—Concurrent use of cyclosporine; *Pitavastatin*—severe renal impairment (Cr <30 mL/min); *Simvastatin*—Concurrent use of cyclosporine, gemfibrozil, or danazol (↑ risk of myopathy/rhabdomyolysis); **OB:** Avoid use during pregnancy (may cause fetal harm); **Lactation:** Avoid breast feeding if treatment is necessary.

Use Cautiously in: History of liver disease; Alcoholism; **⚠** *Rosuvastatin*—patients with Asian ancestry (may have ↑ blood levels and ↑ risk of rhabdomyolysis); *Atorvastatin*—Concurrent use of gemfibrozil, azole antifungals, erythromycin, clarithromycin, protease inhibitors, niacin, or cyclosporine (higher risk of myopathy/rhabdomyolysis); *Lovastatin*—Concurrent use of gemfibrozil, niacin, cyclosporine, amiodarone, danazol, diltiazem, verapamil, colchicine, or ranolazine (higher risk of myopathy/rhabdomyolysis); *Pitavastatin*—Hypothyroidism, concurrent use of fibrates or lipid-lowering doses of niacin (higher risk of myopathy/rhabdomyolysis); *Rosuvastatin*—Concurrent use of gemfibrozil, azole antifungals, protease inhibitors, niacin, cyclosporine, amiodarone, or verapamil (higher risk of myopathy/rhabdomyolysis); *Simvastatin*—Concurrent use of amiodarone, amlodipine, diltiazem, dronedarone, verapamil, lomitapide, or ranolazine (↑ risk of myopathy/rhabdomyolysis); **⚠** *Simvastatin*—Chinese patients receiving ≥1 g/day of niacin (↑ risk of myopathy; do not use simvastatin 80 mg/day in these patients); Renal impairment; **Geri:** *Pitavastatin*—↑ risk of myopathy (age >65 yr); **Rep:** Women of reproductive potential (use effective contra-

ception); **Pedi:** Children <8 yr (safety and effectiveness not established); some products approved for use in older children only.

Adverse Reactions/Side Effects

CNS: amnesia, confusion, dizziness, headache, insomnia, memory loss, weakness. **CV:** chest pain, peripheral edema. **EENT:** rhinitis; *lovastatin*, blurred vision. **Resp:** bronchitis. **GI:** abdominal cramps, constipation, diarrhea, flatus, heartburn, altered taste, drug-induced hepatitis, dyspepsia, elevated liver enzymes, nausea, pancreatitis. **GU:** erectile dysfunction. **Derm:** rashes, pruritus. **Endo:** hyperglycemia. **MS:** **RHABDOMYOLYSIS**, arthralgia, arthritis, immune-mediated necrotizing myopathy, myalgia, myopathy (↑ with simvastatin 80 mg/day dose). **Misc:** hypersensitivity reactions.

Interactions

Atorvastatin, lovastatin, simvastatin, and rosuvastatin are metabolized by the CYP3A4 metabolic pathway. Fluvastatin is metabolized by CYP 2C9. Pravastatin is not metabolized by the CYP P450 system.

Drug-Drug: Atorvastatin, lovastatin, and simvastatin may interact with **CYP3A4 inhibitors**. Risk of myopathy with lovastatin is ↑ by concurrent use of **strong CYP3A4 inhibitors**, including ketoconazole, itraconazole, posaconazole, voriconazole protease inhibitors, clarithromycin, erythromycin, nefazodone, and cobicistat-containing products; concurrent use contraindicated. Risk of myopathy with simvastatin is ↑ by concurrent use of cyclosporine, gemfibrozil, danazol, erythromycin, clarithromycin, protease inhibitors, nefazodone, ketoconazole, itraconazole, voriconazole, posaconazole, and cobicistat-containing products; concurrent use contraindicated. Risk of myopathy with pitavastatin is ↑ by concurrent use of cyclosporine; concurrent use contraindicated. Bioavailability and effectiveness may be ↓ by cholestyramine and colestipol. Risk of myopathy with atorvastatin is ↑ by concurrent use of cyclosporine, gemfibrozil, itraconazole, colchicine, erythromycin, clarithromycin, nelfinavir, ritonavir/saquinavir, lopinavir/ritonavir, tipranavir/ritonavir, saquinavir/ritonavir, darunavir/ritonavir, fosamprenavir, fosamprenavir/ritonavir, and large doses of niacin; concurrent use with gemfibrozil, cyclosporine, or tipranavir/ritonavir should be avoided; use lowest dose with lopinavir/ritonavir; use ↓ doses with nelfinavir, clarithromycin, itraconazole, saquinavir/ritonavir, darunavir/ritonavir, fosamprenavir, or fosamprenavir/ritonavir. Risk of myopathy with fluvastatin is ↑ by concurrent use of gemfibrozil, erythromycin, colchicine, cyclosporine, azole antifungal agents, or large doses of niacin may ↑ risk of myopathy; concurrent use with gemfibrozil should be avoided;

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

use ↓ doses with cyclosporine and fluconazole. Risk of myopathy with lovastatin is ↑ by concurrent use of **amiodarone cyclosporine, gemfibrozil, diltiazem, verapamil, danazol**, and large doses of **niacin**; concurrent use with gemfibrozil or cyclosporine should be avoided; use ↓ doses with danazol, amiodarone, diltiazem, or verapamil. Risk of myopathy with pitavastatin is ↑ by concurrent use of **erythromycin, rifampin, colchicine, fibrates**, or large doses of **niacin**; use ↓ doses with erythromycin, rifampin, and niacin; concurrent use with gemfibrozil should be avoided. Risk of myopathy with pravastatin is ↑ by concurrent use of **cyclosporine, fibrates, colchicine, erythromycin, clarithromycin, azithromycin**, or large doses of **niacin**; concurrent use with gemfibrozil should be avoided; consider lower dose with niacin. Risk of myopathy with rosuvastatin is ↑ by concurrent use of **cyclosporine, lopinavir/ritonavir, atazanavir/ritonavir, simeprevir, colchicine, fibrates**, or large doses of **niacin**; concurrent use of gemfibrozil should be avoided, if possible; use ↓ doses with cyclosporine, lopinavir/ritonavir, and atazanavir/ritonavir. Risk of myopathy with simvastatin is ↑ by concurrent use of **amiodarone, amlodipine, diltiazem, dronedarone, verapamil, lomitapide, ranolazine, or niacin**. Atorvastatin, fluvastatin, and simvastatin may slightly ↑ serum **digoxin** levels. Atorvastatin and rosuvastatin may ↑ levels of **hormonal contraceptives**. Atorvastatin, fluvastatin, lovastatin, rosuvastatin, and simvastatin may ↑ risk of bleeding with **warfarin. Alcohol, cimetidine, ranitidine, and omeprazole** may ↑ fluvastatin levels. **Rifampin** may ↓ fluvastatin levels. **Antacids** ↓ absorption of rosuvastatin (administer 2 hr after rosuvastatin). **Lopinavir/ritonavir** may ↑ rosuvastatin levels. Fluvastatin ↑ levels of **glyburide**. **Drug-Natural Products: St. John's wort** may ↓ levels and effectiveness (lovastatin and simvastatin). **Drug-Food: Large quantities of grapefruit juice** may ↑ blood levels and ↑ risk of rhabdomyolysis (atorvastatin, lovastatin, and simvastatin); concurrent use **contraindicated**. **Food** ↑ blood levels of lovastatin.

Route/Dosage

Atorvastatin

☞ **PO (Adults):** 10–20 mg once daily initially; (may start with 40 mg/day if LDL-C needs to be ↓ by >45%); may be ↑ every 2–4 wk up to 80 mg/day; *Concurrent nelfinavir therapy*—Dose should not exceed 40 mg/day; *Concurrent clarithromycin, itraconazole, saquinavir/ritonavir, darunavir/ritonavir, fosamprenavir, or fosamprenavir/ritonavir therapy*—Dose should not exceed 20 mg/day.

PO (Children 10–17 yr): 10 mg/day initially, may be ↑ every 4 wk up to 20 mg/day; *Concurrent nelfinavir therapy*—Dose should not exceed 40 mg/day; *Concurrent clarithromycin, itraconazole, saquinavir/ritonavir, darunavir/ritonavir, fosamprenavir, or fosamprenavir/ritonavir therapy*—Dose should not exceed 20 mg/day.

Fluvastatin

PO (Adults): 20–40 mg (immediate-release) once daily at bedtime. May be ↑ to 40 mg twice daily (immediate-release) or 80 mg once daily (extended-release); *Concurrent fluconazole or cyclosporine therapy*—Dose should not exceed 20 mg twice daily.

Lovastatin

PO (Adults): 20 mg once daily with evening meal. May be ↑ at 4-wk intervals to a maximum of 80 mg/day (immediate-release) or 60 mg/day (extended-release); *Concurrent danazol, verapamil, or diltiazem therapy*—Initiate at 10 mg/day; do not exceed 20 mg/day; *Concurrent amiodarone therapy*—Dose should not exceed 40 mg/day.

Renal Impairment

PO (Adults): *CCr* <30 mL/min—Dose should not exceed 20 mg/day unless carefully titrated.

PO (Children /Adolescents 10–17 yr): *Familial heterozygous hypercholesterolemia*—10–40 mg/day adjusted at 4-wk intervals.

Pitavastatin

PO (Adults): 2 mg once daily initially, may be ↑ up to 4 mg depending on response. *Concurrent erythromycin therapy*—Dose should not exceed 1 mg/day; *Concurrent rifampin therapy*—Dose should not exceed 2 mg/day.

Renal Impairment

PO (Adults): *CCr* 30–<60 mL/min—1 mg once daily initially, may be ↑ up to 2 mg daily.

Pravastatin

PO (Adults): 40 mg once daily at bedtime, may be ↑ after 4 wk, if needed to 80 mg once daily at bedtime); *Concurrent cyclosporine therapy*—Initiate therapy with 10 mg once daily at bedtime; may be ↑ after 4 wk, if needed, to 20 mg once daily at bedtime (max dose = 20 mg/day); *Concurrent clarithromycin therapy*—Dose should not exceed 40 mg/day.

PO (Children 14–18 yrs): 40 mg once daily (max dose = 40 mg/day).

PO (Children 8–13 yrs): 20 mg once daily (max dose = 20 mg/day).

Renal Impairment

PO (Adults): *CCr* <30 mL/min—Initiate therapy with 10 mg once daily at bedtime; may titrate at 4–wk intervals as needed (max dose = 80 mg/day).

Rosuvastatin

PO (Adults): 10 mg once daily initially (range 5–20 mg initially) (20 mg initial dose may be considered for patients with LDL-C >190 mg/dL or homozygous familial hypercholesterolemia); dose may be adjusted at 2–4 wk intervals, some patients may require up to 40 mg/day, however this dose is associated with ↑ risk of rhabdomyolysis; *Patients with Asian ancestry*—initial dose should be 5 mg; *Concurrent cyclosporine therapy*

apy—Dose should not exceed 5 mg/day; *Concurrent lopinavir/ritonavir, atazanavir/ritonavir, or simprevir therapy*—Dose should not exceed 10 mg/day; *Concurrent gemfibrozil therapy*—Dose should not exceed 10 mg/day (avoid if possible).

PO (Children 10–17 yr): 5–20 mg once daily.

PO (Children 8–<10 yr): 5–10 mg once daily.

Renal Impairment

PO (Adults): *CCr* <30 mL/min—5 mg once daily initially; dose may be ↑ but should not exceed 10 mg/day.

Simvastatin

The 80 mg dose should be restricted to patients who have been taking this dose for ≥12 mo without evidence of muscle toxicity.

PO (Adults): 5–40 mg once daily in the evening; if LDL goal cannot be achieved with 40 mg/day dose, add another lipid-lowering therapy (do not ↑ simvastatin dose to 80 mg/day). *Concurrent verapamil, diltiazem, or dronedarone therapy*—Dose should not exceed 10 mg/day. *Concurrent amiodarone, amlodipine, or ranolazine therapy*—Dose should not exceed 20 mg/day; *Concurrent lomitapide therapy*—↓ dose by 50% (dose should not exceed 20 mg/day or 40 mg/day for patients who previously received 80 mg/day chronically [for ≥12 mo] without evidence of myopathy).

PO (Children 10–17 yr): 10 mg once daily initially, may be ↑ at 4–wk intervals up to 40 mg/day. *Concurrent verapamil or diltiazem therapy*—Dose should not exceed 10 mg/day. *Concurrent amiodarone, amlodipine, or ranolazine therapy*—Dose should not exceed 20 mg/day.

Renal Impairment

PO (Adults): *CCr* <10 mL/min—5 mg/day initially, titrate carefully.

Availability

Atorvastatin (generic available)

Tablets: 10 mg, 20 mg, 40 mg, 80 mg. **Cost:** *Generic*—10 mg \$33.25/100, 20 mg \$48.75/100, 40 mg \$40.42/100, 80 mg \$49.20/100. **In combination with:** amlodipine (Caduet); see Appendix B.

Fluvastatin (generic available)

Capsules: 20 mg, 40 mg. **Cost:** *Generic*—All strengths \$113.40/30. **Extended-release tablets:** 80 mg. **Cost:** \$194.69/30.

Lovastatin (generic available)

Immediate-release tablets: 10 mg, 20 mg, 40 mg. **Cost:** *Generic*—10 mg \$10.83/100, 20 mg \$10.83/100, 40 mg \$16.50/100. **Extended-release tablets:** 20 mg, 40 mg, 60 mg. **Cost:** All strengths \$55.98/30.

Pitavastatin (generic available)

Tablets: 1 mg, 2 mg, 4 mg. **Cost:** All strengths \$492.48/90.

Pravastatin (generic available)

Tablets: 10 mg, 20 mg, 40 mg, 80 mg. **Cost:** *Generic*—20 mg \$10.83/100, 40 mg \$29.82/100, 80 mg \$142.06/100.

Rosuvastatin

Tablets: 5 mg, 10 mg, 20 mg, 40 mg. **Cost:** 5 mg \$609.27/100, 10 mg \$600.47/100, 20 mg \$609.27/100, 40 mg \$541.62/100.

Simvastatin (generic available)

Tablets: 5 mg, 10 mg, 20 mg, 40 mg, 80 mg. **Cost:** *Generic*—5 mg \$7.11/100, 10 mg \$10.83/100, 20 mg \$10.83/100, 40 mg \$10.83/100, 80 mg \$9.83/100. **In combination with:** ezetimibe (Vytorin). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Obtain a dietary history, especially with regard to fat consumption.
- **Lab Test Considerations:** Evaluate serum cholesterol and triglyceride levels before initiating, after 4–6 wk of therapy, and periodically thereafter.
- Monitor liver function tests, including AST and ALT, before initiating therapy and if signs of liver injury (fatigue, anorexia, right upper abdominal discomfort, dark urine, or jaundice) occur. May also cause ↑ alkaline phosphatase and bilirubin levels.
- If patient develops muscle tenderness during therapy, monitor CK levels. If CK levels are >10 times the upper limit of normal or myopathy occurs, therapy should be discontinued. Monitor for signs and symptoms of immune-mediated necrotizing myopathy (IMNM) (proximal muscle weakness and ↑ serum creatine kinase), persisting despite discontinuation of statin therapy. Perform muscle biopsy to diagnose; shows necrotizing myopathy without significant inflammation. Treat with immunosuppressive agents.

Potential Nursing Diagnoses

Noncompliance (Patient/Family Teaching)

Implementation

- Do not confuse Lipitor with Zyrtec. Do not confuse Mevacor with Benicar. Do not confuse atorvastatin with atomoxetine.
- **PO:** Administer *lovastatin* with food. Administration on an empty stomach decreases absorption by approximately 30%. Initial once-daily dose is administered with the evening meal.
- Administer extended-release tablets at bedtime. Extended-release tablets should be swallowed whole, do not break, crush, chew or open capsules.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Administer *fluvastatin*, *pravastatin*, and *simvastatin* once daily in the evening. Do not take two 40 mg fluvastatin tablets at one time. *Atorvastatin*, *pitavastatin*, and *rosuvastatin* can be taken any time of day. May be administered without regard to food.
- Avoid large amounts of grapefruit juice during therapy; may ↑ risk of toxicity.
- If *fluvastatin* or *pravastatin* is administered in conjunction with bile acid sequestrants (cholestyramine, colestipol), administer at least 4 hr after bile acid sequestrant.
- If *rosuvastatin* is administered in conjunction with magnesium or aluminum-containing antacids, administer antacid at least 2 hr after *rosuvastatin*.

Patient/Family Teaching

- Instruct patient to take medication as directed and not to skip doses or double up on missed doses. Advise patient to avoid drinking more than 200 mL/day of grapefruit juice during therapy. Medication helps control but does not cure elevated serum cholesterol levels.
- Advise patient that this medication should be used in conjunction with diet restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, and cessation of smoking.
- **Instruct patient to notify health care professional if signs of liver injury or if unexplained muscle pain, tenderness, or weakness occurs, especially if accompanied by fever or malaise.**
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's Wort.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- **Rep:** Instruct female patients to notify health care professional promptly if pregnancy is planned or suspected. Advise women with reproductive potential to use effective contraception during therapy and discuss plans to discontinue statins if trying to conceive. Advise patients to avoid breast feeding during therapy.
- Emphasize the importance of follow-up exams to determine effectiveness and to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in LDL and total cholesterol levels.
- Increase in HDL cholesterol levels.
- Decrease in triglyceride levels.
- Slowing of the progression of coronary artery disease.
- Prevention of cardiovascular disease.

HUMAN PAPILLOMAVIRUS VACCINE

(hyoo-man pa-pil-lo-ma)

human papillomavirus quadrivalent (types 6, 11, 16, and 18) vaccine, recombinant
Gardasil

human papillomavirus bivalent (types 16 and 18) vaccine, recombinant
Cervarix

human papillomavirus 9-valent (types 6, 11, 16, 18, 31, 33, 45, 52, and 58) vaccine, recombinant
Gardasil 9

Classification

Therapeutic: vaccines/immunizing agents

Indications

Gardasil and Gardasil 9: Prevention of cervical, vulvar, vaginal, and anal cancers and genital warts (in females) and anal cancer and genital warts (in males).

Cervarix: Prevention of cervical cancer.

Action

Vaccination results in antibodies to HPV viruses that are causative agents for cervical, vulvar, vaginal, and anal cancers and genital warts. **Therapeutic Effects:** Prevention of cervical, vulvar, vaginal, and anal cancers and genital warts.

Pharmacokinetics

Absorption: Well absorbed following IM administration.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: Unknown.

TIME/ACTION PROFILE (antibody response)

ROUTE	ONSET	PEAK	DURATION
IM	unknown	6 mo*	unknown

*After third vaccination.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Thrombocytopenia/bleeding disorder; **OB:** Limited data available; use only if potential benefit justifies potential risk to fetus.

Use Cautiously in: Current/recent febrile illness; Immunosuppression may ↓ antibody response; **Lactation:** Excretion into breast milk unknown; **Pedi:** Children <9 yr (safety not established).

Adverse Reactions/Side Effects

Neuro: fainting. **Local:** injection site reactions.

Misc: ANAPHYLAXIS (RARE).

Interactions

Drug-Drug: Immunosuppressants or antineoplastics may ↓ antibody response.

Route/Dosage

IM (Adults and Children—males and females 9–26 yr): *Gardasil and Gardasil 9*—Three 0.5 mL doses at 0, 2, and 6 mo.

IM (Adults and Children—females 9–25 yr): *Cervarix*—Three 0.5 mL doses at 0, 2, and 6 mo.

Availability

Sterile preparation for intramuscular administration (Gardasil): 20 mcg of HPV 6 L1 protein, 40 mcg of HPV 11 L1 protein, 40 mcg of HPV 16 L1 protein, and 20 mcg of HPV 18 L1 protein/0.5-mL dose.

Sterile preparation for intramuscular administration (Gardasil 9): 30 mcg of HPV 6 L1 protein, 40 mcg of HPV 11 L1 protein, 60 mcg of HPV 16 L1 protein, 40 mcg of HPV 18 L1 protein, 20 mcg of HPV 31 L1 protein, 20 mcg of HPV 33 L1 protein, 20 mcg of HPV 45 L1 protein, 20 mcg of HPV 52 L1 protein, and 20 mcg of HPV 58 L1 protein/0.5-mL dose.

Sterile preparation for intramuscular administration (Cervarix): 20 mcg of HPV type 16 L1 protein and 20 mcg of HPV type 18 L1 protein.

NURSING IMPLICATIONS

Assessment

- Assess vital signs prior to administration. Do not administer to patient with a current or recent febrile illness; low grade fever (<100°F) and mild upper respiratory infection are usually not contraindicated.
- Monitor patient for 15 min following injection for fainting. Patient should remain lying down or seated to prevent falls or injury.

Potential Nursing Diagnoses

Risk for infection (Indications)

Implementation

- Vaccine is not intended for treatment of active genital warts or cervical cancer and will not protect from diseases not caused by HPV.
- **IM:** *Gardasil and Gardasil 9:* Prefilled syringe is for single use; do not use for more than one person. Administer as supplied; do not dilute; administer full dose. Shake well prior to administration to maintain suspension of vaccine. Solution is cloudy and white; do not administer solution that is discolored or contains particulate matter. If using single-dose vial, withdraw 0.5 mL dose and administer entire contents of syringe. Administer intramuscularly in the deltoid or in the high anterolateral area of the thigh.

- **IM:** *Cervarix:* Prefilled syringe is for single use; do not use for more than one person. Administer as supplied; do not dilute; administer full dose. Shake vial or syringe well before use. Solution is a turbid, white suspension; do not administer if it is discolored or contains particulate matter. The tip cap and rubber plunger of needleless prefilled syringes contain dry natural latex rubber; may cause allergic reactions in latex sensitive individuals. Vial stopper does not contain latex.

Patient/Family Teaching

- Provide information about vaccine and the importance of completing immunization series, unless contraindicated, to patient and guardian.
- Inform patient that vaccine does not replace routine cervical cancer screening or prevent other sexually transmitted diseases; such screening should be continued as usual.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- **Rep:** Advise patient to notify health care professional if pregnancy is planned or suspected. Women exposed to *Gardasil or Gardasil 9* vaccine during pregnancy are encouraged to call manufacturer pregnancy registry at 800-986-8999. Women exposed to *Cervarix* vaccine during pregnancy are encouraged to call manufacturer pregnancy registry at 800-452-9622.
- Instruct patient to report any adverse reactions to health care professional.

Evaluation/Desired Outcomes

- Prevention of cervical cancer, genital warts, cervical adenocarcinoma in situ, cervical, vulvar, anal, and vaginal intraepithelial neoplasia caused by HPV.

hydrALAZINE

(hye-dral-a-zeen)

★ Apresoline

Classification

Therapeutic: antihypertensives

Pharmacologic: vasodilators

Indications

Moderate to severe hypertension (with a diuretic). **Unlabeled Use:** HF unresponsive to conventional therapy with digoxin and diuretics.

Action

Direct-acting peripheral arteriolar vasodilator. **Therapeutic Effects:** Lowering of BP in hypertensive patients and decreased afterload in patients with HF.

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Pharmacokinetics

Absorption: Rapidly absorbed following oral administration; well absorbed from IM sites.

Distribution: Widely distributed. Crosses the placenta; enters breast milk in minimal concentrations.

Metabolism and Excretion: Mostly metabolized by the GI mucosa and liver by N-acetyltransferase H (rate of acetylation is genetically determined [slow acetylators have \uparrow hydralazine levels and \uparrow risk of toxicity; fast acetylators have \downarrow hydralazine levels and \downarrow response]).

Half-life: 2–8 hr.

TIME/ACTION PROFILE (antihypertensive effect)

ROUTE	ONSET	PEAK	DURATION
PO	45 min	2 hr	2–4 hr
IM	10–30 min	1 hr	3–8 hr
IV	5–20 min	15–30 min	2–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Some products contain tartrazine and should be avoided in patients with known intolerance.

Use Cautiously in: Cardiovascular or cerebrovascular disease; Severe renal and hepatic impairment (dose modification may be necessary); **OB, Lactation:** Has been used safely during pregnancy.

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, headache. **CV:** tachycardia, angina, arrhythmias, edema, orthostatic hypotension. **GI:** diarrhea, nausea, vomiting. **Derm:** rash.

MS: arthralgias, arthritis. **Neuro:** peripheral neuropathy. **Misc:** drug-induced lupus syndrome.

Interactions

Drug-Drug: \uparrow hypotension with acute ingestion of alcohol, other antihypertensives, or nitrates. **MAO inhibitors** may exaggerate hypotension. May \downarrow pressor response to epinephrine. **NSAIDs** may \downarrow antihypertensive response. **Beta blockers** \downarrow tachycardia from hydralazine (therapy may be combined for this reason). **Metoprolol** and **propranolol** \uparrow levels. \uparrow levels of **metoprolol** and **propranolol**.

Route/Dosage

PO (Adults): Hypertension—10 mg 4 times daily initially. After 2–4 days may \uparrow to 25 mg 4 times daily for the rest of the 1st week; may then \uparrow to 50 mg 4 times daily (up to 300 mg/day). Once maintenance dose is established, twice-daily dosing may be used. **HF**—25–37.5 mg 4 times daily; may be \uparrow up to 300 mg/day in 3–4 divided doses.

PO (Children >1 mo): Initial—0.75–1 mg/kg/day in 2–4 divided doses, not to exceed 25 mg/dose; may \uparrow gradually to 5 mg/kg/day in infants and 7.5 mg/kg/day in children (not to exceed 200 mg/day) in 2–4 divided doses.

IM, IV (Adults): Hypertension—5–40 mg repeated as needed. **Eclampsia**—5 mg q 15–20 min; if no response after a total of 20 mg, consider an alternative agent.

IM, IV (Children >1 mo): Initial—0.1–0.2 mg/kg/dose (not to exceed 20 mg) every 4–6 hr as needed, up to 1.7–3.5 mg/kg/day in 4–6 divided doses.

Availability (generic available)

Tablets: 10 mg, 25 mg, 50 mg, 100 mg. **Injection:** 20 mg/mL. **In combination with:** isosorbide dinitrate (BiDil). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Monitor BP and pulse frequently during initial dose adjustment and periodically during therapy. H About 50–65% of Caucasians, Black, South Indians, and Mexicans are slow acetylators at risk for toxicity, while 80–90% of Eskimos, Japanese, and Chinese are rapid acetylators at risk for decreased levels and treatment failure.
- Monitor frequency of prescription refills to determine adherence.
- **Lab Test Considerations:** Monitor CBC, electrolytes, LE cell prep, and ANA titer prior to and periodically during prolonged therapy.
- May cause a positive direct Coombs' test result.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)
Noncompliance (Patient/Family Teaching)

Implementation

- **Do not confuse hydralazine with hydroxyzine or hydrochlorothiazide.**
- IM or IV route should be used only when drug cannot be given orally.
- May be administered concurrently with diuretics or beta blockers to permit lower doses and minimize side effects.
- **PO:** Administer with meals consistently to enhance absorption.
- Pharmacist may prepare oral solution from hydralazine injection for patients with difficulty swallowing.

IV Administration

- **IV Push:** **Diluent:** Administer undiluted. Use solution as quickly as possible after drawing through needle into syringe. **Concentration:** 20 mg/mL. **Rate:** Administer over at least 1 min. **Pedi:** Administer at a rate of 0.2 mg/kg/min in children. Monitor BP and pulse in all patients frequently after injection.
- **Y-Site Compatibility:** alemtuzumab, amiodarone, anidulafungin, argatroban, bivalirudin, bleomycin, carmustine, cyclophosphamide, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexrazoxane, diltiazem, docetaxel, etoposide, etoposide phosphate, fenoldopam, fludarabine, gemcitabine, granisetron, hetastarch, hydromorphone, ida-

rubicin, irinotecan, leucovorin, linezolid, mechlorethamine, mesna, metronidazole, milrinone, mitomycin, mitoxantrone, moxifloxacin, mycophenolate, octreotide, oxaliplatin, paclitaxel, palonosetron, pamidronate, pancuronium, prochlorperazine, tacrolimus, teniposide, thiotepa, tirofiban, topotecan, vecuronium, vinblastine, vincristine, vinorelbine, vitamin B complex with C, voriconazole, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, amphotericin B colloidal, amphotericin B lipid complex, ampicillin/sulbactam, ascorbic acid, azathioprine, ceftazidime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, dantrolene, diazepam, doxorubicin liposomal, ertapenem, folic acid, fosfarnet, fosphenytoin, ganciclovir, haloperidol, indomethacin, lorazepam, methylprednisolone, multivitamins, nafcillin, nitroprusside, oxacillin, pantoprazole, pemetrexed, pentobarbital, phenytoin, piperacillin/tazobactam, potassium acetate, sodium acetate, tigecycline, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Emphasize the importance of continuing to take this medication, even if feeling well. Instruct patient to take medication at the same time each day; last dose of the day should be taken at bedtime. Take missed doses as soon as remembered; do not double doses. If more than 2 doses in a row are missed, consult health care professional. Must be discontinued gradually to avoid sudden increase in BP. Hydralazine controls but does not cure hypertension.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol intake, regular exercise, and stress management). Instruct patient and family on proper technique for BP monitoring. Advise them to check BP at least weekly and report significant changes.
- Patients should weigh themselves twice weekly and assess feet and ankles for fluid retention.
- May occasionally cause drowsiness. Advise patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid sudden changes in position to minimize orthostatic hypotension.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially cough, cold, or allergy remedies.
- Instruct patient to notify health care professional of medication prior to treatment or surgery.
- Advise patient to notify health care professional immediately if general tiredness; fever; muscle or joint aching; chest pain; skin rash; sore throat; or numb-

ness, tingling, pain, or weakness of hands and feet occurs. Vitamin B₆ (pyridoxine) may be used to treat peripheral neuritis.

- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of follow-up exams to evaluate effectiveness of medication.

Evaluation/Desired Outcomes

- Decrease in BP without appearance of side effects.
- Decreased afterload in patients with HF.

hydralazine/isosorbide dinitrate

(hye-dral-a-zeen eye-so-sor-bide di-ni-trate)

BiDil

Classification

Therapeutic: vasodilators

Pharmacologic: vasodilators, nitrates

Indications

Management of heart failure in black patients.

Action

BiDil is a fixed-dose combination of **isosorbide dinitrate**, a vasodilator with effects on both arteries and veins, and **hydralazine**, a predominantly arterial vasodilator. **Therapeutic Effects:** Improved survival, increased time to hospitalization and decreased symptoms of heart failure in black patients.

Pharmacokinetics

See pharmacokinetic sections in hydralazine and isosorbide dinitrate monographs of Davis's Drug Guide for Nurses for more information.

Absorption: *Hydralazine*—10–26% absorbed in HF patients, absorption can be saturated leading to large ↑ in absorption with higher doses; *isosorbide dinitrate*—variable absorbed (10–90%) reflecting first-pass hepatic metabolism.

Distribution: *Hydralazine*—widely distributed, crosses the placenta, minimal amounts in breast milk; *isosorbide dinitrate*—accumulates in muscle and venous wall.

Metabolism and Excretion: *Hydralazine*—mostly metabolized by GI mucosa and liver; *isosorbide dinitrate*—undergoes extensive first-pass metabolism in the liver, mostly metabolized by the liver, some metabolites are vasodilators.

Half-life: *Hydralazine*—4 hr; *isosorbide dinitrate*—2 hr.

★ = Canadian drug name. ☒ = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; _____ indicates most frequent.

TIME/ACTION PROFILE (effect on BP)

ROUTE	ONSET	PEAK	DURATION
hydralazine	45 min	2 hr	2–4 hr
isosorbide	15–40 min	unknown	4 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to either component; Concurrent use of PDE-5 inhibitor (avanafil, sildenafil, tadalafil, vardenafil) or riociguat.

Use Cautiously in: Severe renal/hepatic disease (dose modification may be necessary); Head trauma or cerebral hemorrhage; **Geri:** Start with lower doses; **OB:** May compromise maternal/fetal circulation; **Lactation:** Safety not established; **Pedi:** Safety not established.

Adverse Reactions/Side Effects**Hydralazine**

CNS: dizziness, drowsiness, headache. **CV:** tachycardia, angina, arrhythmias, edema, orthostatic hypotension. **GI:** diarrhea, nausea, vomiting. **Derm:** rash. **F and E:** sodium retention. **MS:** arthralgias, arthritis. **Neuro:** peripheral neuritis. **Misc:** drug-induced lupus syndrome.

Isosorbide Dinitrate

CNS: dizziness, headache, apprehension, weakness. **CV:** hypotension, tachycardia, paradoxical bradycardia, syncope. **GI:** abdominal pain, nausea, vomiting. **Misc:** cross-tolerance, flushing, tolerance.

Interactions

Drug-Drug: Concurrent use of **avanafil, sildenafil, tadalafil, or vardenafil** may result in severe hypotension; concurrent use contraindicated. Concurrent use of **riociguat** may result in severe hypotension; concurrent use contraindicated. ↑ risk of hypotension with other **antihypertensives**, acute ingestion of **alcohol**, and **phenothiazines**. **MAO inhibitors** may exaggerate hypotension. May ↓ the pressor response to **epinephrine**. **Beta blockers** ↓ tachycardia from hydralazine (therapy may be combined for this reason).

Metoprolol and **propranolol** may ↑ hydralazine levels. Hydralazine ↑ levels of **metoprolol** and **propranolol**.

Route/Dosage

PO (Adults): 1 tablet 3 times daily, may be ↑ to 2 tablets 3 times daily.

Availability

Tablets: hydralazine 37.5 mg/isosorbide dinitrate 20 mg.

NURSING IMPLICATIONS**Assessment**

- Monitor BP and pulse routinely during period of dose adjustment. Symptomatic hypotension may occur even with small doses. Use caution with patients who are volume depleted or hypotensive.
- Assess for signs and symptoms of peripheral neuritis (paresthesia, numbness, tingling) periodically during

therapy. Adding pyridoxine may cause symptoms to decrease.

- **Lab Test Considerations:** If symptoms of systemic lupus erythematosus (SLE) occur obtain a CBC and ANA titer. If positive for SLE, carefully weigh risks/benefits of continued therapy.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)

Activity intolerance (Indications)

Implementation

- Dose may be titrated rapidly over 3–5 days, but may need to decrease if side effects occur. May decrease to one-half tablet 3 times daily if intolerable side effects occur. Titrate up as soon as side effects subside.

Patient/Family Teaching

- Instruct patient to take medication as directed on a regular schedule.
- Caution patient to make position changes slowly to minimize orthostatic hypotension.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid concurrent use of alcohol or medications for erectile dysfunction with this medication. Patient should also consult health care professional before taking Rx, OTC, or herbal products while taking this medication.
- Caution patient that inadequate fluid intake or excessive fluid loss from perspiration, diarrhea, or vomiting may lead to a fall in BP, dizziness, or syncope. If syncope occurs, discontinue medication and notify health care professional promptly.
- Inform patient that headache is a common side effect that should decrease with continuing therapy. Aspirin or acetaminophen may be ordered to treat headache. Notify health care professional if headache is persistent or severe. Do not alter dose to avoid headache.
- Advise patient to notify health care professional if symptoms of systemic lupus erythematosus occur (arthralgia, fever, chest pain, prolonged malaise, or other unexplained symptoms).
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Improved survival, increased time to hospitalization, and decreased symptoms of heart failure in black patients.

hydroCHLORothiazide, See DIURETICS (THIAZIDE).

REMS HIGH ALERT

HYDROcodone

(hye-droe-koe-done)

Hysingla ER, Zohydro ER

**HYDROcodone/
acetaminophen**

Anexsia, Norco

HYDROcodone/ibuprofen

Reprexain

Classification

Therapeutic: allergy, cold, and cough remedies (antitussive), opioid analgesics

Pharmacologic: opioid agonists/nonopioid analgesic combinations

Schedule II

For information on the acetaminophen and ibuprofen components of these formulations, see the acetaminophen and ibuprofen monographs

Indications

Extended-release product: Management of pain that is severe enough to warrant daily, around-the-clock, long-term opioid treatment where alternative treatment options are inadequate. **Combination products:** Management of moderate to severe pain. Antitussive (usually in combination products with decongestants).

Action

Bind to opiate receptors in the CNS. Alter the perception of and response to painful stimuli while producing generalized CNS depression. Suppress the cough reflex via a direct central action. **Therapeutic Effects:** Decrease in severity of moderate pain. Suppression of the cough reflex.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Unknown.

Metabolism and Excretion: Mostly metabolized by the liver; eliminated in the urine (50–60% as metabolites, 10% as unchanged drug).

Half-life: 2.2 hr; *Extended-release*—8 hr.

TIME/ACTION PROFILE (analgesic effect)

ROUTE	ONSET	PEAK	DURATION
PO	10–30 min	30–60 min	4–6 hr
PO-ER	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to hydrocodone (cross-sensitivity may exist to other opioids); Sig-

nificant respiratory depression; Paralytic ileus; Acute or severe bronchial asthma or hypercarbia; Congenital long QT syndrome (Hysingla only); Hypersensitivity to acetaminophen/ibuprofen (for combination products); Ibuprofen-containing products should be avoided in patients with bleeding disorders or thrombocytopenia; Acetaminophen-containing products should be avoided in patients with severe hepatic or renal disease; Ibuprofen-containing products should be avoided in patients undergoing coronary artery bypass graft surgery; **OB, Lactation:** Avoid chronic use; Products containing alcohol, aspartame, saccharin, sugar, or tartrazine (FDC yellow dye #5) should be avoided in patients who have hypersensitivity or intolerance to these compounds.

Use Cautiously in: Head trauma; ↑ intracranial pressure; Severe renal, hepatic, or pulmonary disease; Cardiovascular disease (ibuprofen-containing products only); History of peptic ulcer disease (ibuprofen-containing products only); Alcoholism; Difficulty swallowing; Patients with undiagnosed abdominal pain; Prostatic hyperplasia; **OB:** Labor and delivery; **OB, Lactation:** Avoid chronic use; prolonged use of opioids during pregnancy can result in neonatal opioid withdrawal syndrome; **Geri:** Geriatric or debilitated patients (initial dose ↓ required; more prone to CNS depression, constipation).

Adverse Reactions/Side Effects

Noted for hydrocodone only; see acetaminophen/ibuprofen monographs for specific information on individual components.

CNS: confusion, dizziness, sedation, euphoria, hallucinations, headache, unusual dreams. **EENT:** blurred vision, diplopia, miosis. **Resp:** respiratory depression.

CV: hypotension, bradycardia, QT interval prolongation (Hysingla only). **GI:** constipation, dyspepsia, nausea, choking, dysphagia, esophageal obstruction, vomiting. **GU:** urinary retention. **Endo:** adrenal insufficiency. **Derm:** sweating. **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Use with extreme caution in patients receiving **MAO inhibitors**; may produce severe, unpredictable reactions—do not use within 14 days of each other. Concurrent use of **CYP3A4 inhibitors** including ritonavir, ketoconazole, itraconazole, fluconazole, clarithromycin, erythromycin, nefazodone, diltiazem, verapamil, nelfinavir, and fosamprenavir ↑ levels and risk of opioid toxicity; careful monitoring during initiation, dose changes, or discontinuation of the inhibitor is recommended. Concurrent use with **CYP3A4 inducers** including barbiturates, carbamazepine, efavirenz, corticosteroids, modafinil, nevirapin, oxcarbazepine, phenobarbital, phenytoin, rifabutin, or rifampin may ↓ fentanyl levels and analgesia; if inducers are discontinued or dosage

* = Canadian drug name. † = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; _____ indicates most frequent.

↓, patients should be monitored for signs of opioid toxicity and necessary dose adjustments should be made. Use with **benzodiazepines** or other **CNS depressants** including **other opioids, non-benzodiazepine sedative/hypnotics, anxiolytics, general anesthetics, muscle relaxants, antipsychotics, and alcohol** may cause profound sedation, respiratory depression, coma, and death; reserve concurrent use for when alternative treatment options are inadequate. Administration of partial antagonist opioids (**buprenorphine, butorphanol, nalbuphine, or pentazocine**) may ↓ analgesia or precipitate opioid withdrawal in physically dependent patients. **Anticholinergic drugs** may ↑ risk of urinary retention and constipation. Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants, SSRIs, SNRIs, MAO inhibitors, TCAs, tramadol, trazodone, mirtazapine, 5-HT₂ receptor antagonists, linezolid, methylene blue, and triptans** ↑ risk of serotonin syndrome.

Drug-Natural Products: Concomitant use of **kava-kava, valerian, skullcap, chamomile, or hops** can ↑ CNS depression.

Route/Dosage

PO (Adults): *Analgesic*—2.5–10 mg q 3–6 hr as needed; if using combination products, acetaminophen dosage should not exceed 4 g/day and should not exceed 5 tablets/day of ibuprofen-containing products; *Antitussive*—5 mg q 4–6 hr as needed; *Extended-release (Zohydro ER)*—10 mg q 12 hr; may ↑ as needed in increments of 10 mg q 12 hr q 3–7 days; *Extended-release (Hysingla)*—20 mg once daily; may ↑ as needed in increments of 10–20 mg/day q 3–5 days.

PO (Children): *Analgesic (1–13 yr)*—0.1–0.2 mg/kg q 3–4 hr. *Antitussive*—0.6 mg/kg/day divided q 6–8 hr; (maximum doses <2 yr: 1.25 mg/dose; 2–12 yr: 5 mg/dose; >12 yr: 10 mg/dose).

Renal Impairment

PO (Adults): *CCr <45 mL/min*—Extended-release (*Hysingla*): ↓ initial dose by 50%.

Hepatic Impairment

PO (Adults): *Extended-release (Hysingla)*—↓ initial dose by 50%.

Availability

Hydrocodone (generic available)

Extended-release capsules (Zohydro ER) (abuse deterrent): 10 mg, 15 mg, 20 mg, 30 mg, 40 mg, 50 mg. **Extended-release tablets (Hysingla ER) (abuse deterrent):** 20 mg, 30 mg, 40 mg, 60 mg, 80 mg, 100 mg, 120 mg. **Syrup:** ★ 1 mg/mL. **In combination with:** chlorpheniramine (Tussicaps, Tussionex, Vituz); chlorpheniramine and pseudoephedrine (Zutriprio); guaifenesin (Flowtuss, Obredon); guaifenesin and pseudoephedrine (Hycofenix); pseudoephedrine (Rezira). See Appendix B.

Hydrocodone/Acetaminophen (generic available)

Tablets: 2.5 mg hydrocodone/325 mg acetaminophen, 5 mg hydrocodone/325 mg acetaminophen (Anexsia 5/325, Norco), 7.5 mg hydrocodone/325 mg acetaminophen (Anexsia 7.5/325, Norco), 10 mg hydrocodone/325 mg acetaminophen (Norco). **Cost:** *Generic*—5 mg/325 mg \$15.08/100, 7.5 mg/325 mg \$30.93/100, 10 mg/325 mg \$41.59/100. **Elixir/oral solution:** 7.5 mg hydrocodone plus 325 mg acetaminophen/15 mL, 10 mg hydrocodone plus 325 mg acetaminophen/15 mL. **Cost:** *Generic*—\$58.12/473 mL.

Hydrocodone/Ibuprofen (generic available)

Tablets: 2.5 mg hydrocodone/200 mg ibuprofen (Reprexain), 5 mg hydrocodone/200 mg ibuprofen, 7.5 mg hydrocodone/200 mg ibuprofen, 10 mg hydrocodone/200 mg ibuprofen (Reprexain). **Cost:** *Generic*—7.5 mg/200 mg \$48.40/100.

NURSING IMPLICATIONS

Assessment

- Assess BP, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Physical stimulation may be sufficient to prevent significant hypoventilation. Dose may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use.
- Assess bowel function routinely. Prevention of constipation should be instituted with increased intake of fluids and bulk, and laxatives to minimize constipating effects. Stimulant laxatives should be administered routinely if opioid use exceeds 2–3 days, unless contraindicated.
- **Pain:** Assess type, location, and intensity of pain prior to and 1 hr (peak) following administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal.
- Patients taking extended-release hydrocodone may require additional short-acting or rapid-onset opioid doses for breakthrough pain. Doses of short-acting opioids should be equivalent to 10–20% of 24 hr total and given every 2 hr as needed.
- An equianalgesic chart (see Appendix J) should be used when changing routes or when changing from one opioid to another.
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive opioids for pain do not develop psychological dependence. If progressively higher

doses are required, consider conversion to a stronger opioid.

- **Assess risk for opioid addiction, abuse, or misuse prior to administration.** Abuse or misuse of extended-release preparations by crushing, chewing, snorting, or injecting dissolved product will result in uncontrolled delivery of hydrocodone and can result in overdose and death. Hysingla ER and Zohydro ER are abuse deterrent formulations that are difficult to crush and, if crushed, result in a gel.
- **Cough:** Assess cough and lung sounds during anti-tussive use.
- **Lab Test Considerations:** May cause ↑ plasma amylase and lipase concentrations.
- **Toxicity and Overdose:** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

Potential Nursing Diagnoses

Acute pain (Indications)

Chronic pain (Indications)

Risk for injury (Side Effects)

Implementation

- **High Alert:** Do not confuse hydrocodone with oxycodone. Do not confuse Repraxin with Zyprexa.
- Explain therapeutic value of medication prior to administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Combination with nonopioid analgesics may have additive analgesic effects and permit lower doses. Maximum doses of nonopioid agents limit the titration of hydrocodone doses.
- Medication should be discontinued gradually after long-term use to prevent withdrawal symptoms.
- **PO:** May be administered with food or milk to minimize GI irritation.
- Swallow extended-release capsules whole; do not open, crush, dissolve, or chew.

Patient/Family Teaching

- Advise patient to take medication as directed and not to take more than the recommended amount. Severe and permanent liver damage may result from prolonged use or high doses of acetaminophen. Renal damage may occur with prolonged use of acetaminophen or ibuprofen. Doses of nonopioid agents should not exceed the maximum recommended

daily dose. Do not stop taking without discussing with health care professional; may cause withdrawal symptoms if discontinued abruptly after prolonged use.

- Instruct patient on how and when to ask for and take pain medication.
- Advise patient that hydrocodone is a drug with known abuse potential. Protect it from theft, and never give to anyone other than the individual for whom it was prescribed.
- May cause drowsiness or dizziness. Advise patient to call for assistance when ambulating or smoking. Caution patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Advise patient to notify health care professional if pain control is not adequate or if severe or persistent side effects occur.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Emphasize the importance of aggressive prevention of constipation with the use of hydrocodone.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.
- Advise patient that good oral hygiene, frequent mouth rinses, and sugarless gum or candy may decrease dry mouth.
- Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.
- Suppression of nonproductive cough.

hydrocortisone, See CORTICOSTEROIDS (SYSTEMIC).

hydrocortisone, See CORTICOSTEROIDS (TOPICAL/LOCAL).

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

REMS HIGH ALERT

HYDROMORPHONE

(hye-droe-mor-fone)

Dilaudid, Dilaudid-HP, Exalgo,

* Hydromorphone Contin, * Jurnista

Classification

Therapeutic: allergy, cold, and cough remedies (antitussives), opioid analgesics
 Pharmacologic: opioid agonists

Schedule II**Indications**

Moderate to severe pain (alone and in combination with nonopioid analgesics). Moderate to severe chronic pain in opioid-tolerant patients requiring use of daily, around-the-clock long-term opioid treatment and for which alternative treatment options are inadequate (extended-release). Antitussive (lower doses).

Action

Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli while producing generalized CNS depression. Suppresses the cough reflex via a direct central action. **Therapeutic Effects:** Decrease in moderate to severe pain. Suppression of cough.

Pharmacokinetics

Absorption: Well absorbed following oral, rectal, subcut, and IM administration. Extended-release product results in an initial release of drug, followed by a second sustained phase of absorption.

Distribution: Widely distributed. Crosses the placenta; enters breast milk.

Metabolism and Excretion: Mostly metabolized by the liver.

Half-life: Oral (immediate-release), or injection—2–4 hr; Oral (extended-release)—8–15 hr.

TIME/ACTION PROFILE (analgesic effect)

ROUTE	ONSET	PEAK	DURATION
PO-IR	30 min	30–90 min	4–5 hr
PO-ER	unknown	unknown	unknown
Subcut	15 min	30–90 min	4–5 hr
IM	15 min	30–60 min	4–5 hr
IV	10–15 min	15–30 min	2–3 hr
Rect	15–30 min	30–90 min	4–5 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Some products contain bisulfites and should be avoided in patients with known hypersensitivity; Severe respiratory depression (in absence of resuscitative equipment) (extended-release only); Acute or severe bronchial asthma (extended-release only); Paralytic ileus (extended-release only); Acute, mild, intermittent, or postoperative pain (extended-release only); Prior GI surgery or nar-

rowing of GI tract (extended-release only); Opioid non-tolerant patients (extended-release only); Severe hepatic impairment (extended-release only).

Use Cautiously in: Head trauma; ↑ intracranial pressure; Severe pulmonary disease; Moderate or severe renal disease (extended-release only) (dose ↓ recommended); Moderate hepatic impairment (extended-release only) (dose ↓ recommended); Hypothyroidism; Seizure disorder; Adrenal insufficiency; Alcoholism; Undiagnosed abdominal pain; Prostatic hypertrophy; Biliary tract disease (including pancreatitis); **OB:** Labor and delivery; **OB, Lactation:** Avoid chronic use; prolonged use of opioids during pregnancy can result in neonatal opioid withdrawal syndrome; **Ger:** Geriatric or debilitated patients (↑ risk of respiratory depression; dose ↓ suggested).

Adverse Reactions/Side Effects

CNS: confusion, sedation, dizziness, dysphoria, euphoria, floating feeling, hallucinations, headache, unusual dreams. **EENT:** blurred vision, diplopia, miosis.

Resp: RESPIRATORY DEPRESSION. **CV:** hypotension, bradycardia. **Endo:** adrenal insufficiency. **GI:** constipation, dry mouth, nausea, vomiting. **GU:** urinary retention. **Derm:** flushing, sweating. **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Exercise extreme caution with MAO inhibitors (may produce severe, unpredictable reactions—reduce initial dose of hydromorphone to 25% of usual dose, discontinue MAO inhibitors 2 wk prior to hydromorphone). Use with benzodiazepines or other CNS depressants including other opioids, non-benzodiazepine sedative/hypnotics, anxiolytics, general anesthetics, muscle relaxants, anti-psychotics, and alcohol may cause profound sedation, respiratory depression, coma, and death; reserve concurrent use for when alternative treatment options are inadequate. Administration of partial antagonists (buprenorphine, butorphanol, nalbuphine, or pentazocine) may precipitate opioid withdrawal in physically dependent patients. Nalbuphine or pentazocine may ↓ analgesia. Drugs that affect serotonergic neurotransmitter systems, including tricyclic antidepressants, SSRIs, SNRIs, MAO inhibitors, TCAs, tramadol, trazodone, mirtazapine, 5-HT₃ receptor antagonists, linezolid, methylene blue, and triptans ↑ risk of serotonin syndrome.

Drug-Natural Products: Concomitant use of kava-kava, valerian, chamomile, or hops can ↑ CNS depression.

Route/Dosage

Doses depend on level of pain and tolerance. Larger doses may be required during chronic therapy.

Analgesic

PO (Adults ≥50 kg): Immediate-release—4–8 mg every 3–4 hr initially (some patients may respond to

doses as small as 2 mg initially); or once 24-hr opioid requirement is determined, convert to *extended-release* by administering total daily oral dose once daily.

PO (Adults and Children <50 kg): 0.06 mg/kg every 3–4 hr initially, younger children may require smaller initial doses of 0.03 mg/kg. Maximum dose 5 mg.

IV, IM, Subcut (Adults ≥50 kg): 1.5 mg every 3–4 hr as needed initially; may be ↑.

IV, IM, Subcut (Adults and Children <50 kg): 0.015 mg/kg mg every 3–4 hr as needed initially; may be ↑.

IV (Adults): *Continuous infusion (unlabeled)* — 0.2–3 mg/hr depending on previous opioid use. An initial bolus of twice the hourly rate in mg may be given with subsequent breakthrough boluses of 50–100% of the hourly rate in mg.

Rect (Adults): 3 mg every 6–8 hr initially as needed.

Hepatic Impairment

PO (Adults): *Moderate hepatic impairment (extended-release)* — ↓ initial dose by 75%.

Renal Impairment

PO (Adults): *Moderate renal impairment (extended-release)* — ↓ initial dose by 50%; *Severe renal impairment (extended-release)* — ↓ initial dose by 75%.

Antitussive

PO (Adults and Children >12 yr): 1 mg every 3–4 hr.

PO (Children 6–12 yr): 0.5 mg every 3–4 hr.

Availability (generic available)

Immediate-release tablets: 2 mg, 4 mg, 8 mg. **Extended-release tablets (abuse-deterrent):** ✱ 4 mg, 8 mg, 12 mg, 16 mg, 32 mg. **Controlled-release capsules:** ✱ 3 mg, ✱ 4.5 mg, ✱ 6 mg, ✱ 9 mg, ✱ 12 mg, ✱ 18 mg, ✱ 24 mg, ✱ 30 mg. **Oral solution:** 1 mg/mL. **Injection:** 1 mg/mL, 2 mg/mL, 4 mg/mL, 10 mg/mL. **Suppositories:** 3 mg.

NURSING IMPLICATIONS

Assessment

- Assess BP, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Dose may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use. **Ger, Pedi:** Assess geriatric and pediatric patients frequently; more sensitive to the effects of opioid analgesics and may experience side effects and respiratory complications more frequently.
- Assess bowel function routinely. Institute prevention of constipation with increased intake of fluids and bulk, and laxatives to minimize constipating effects.

Administer stimulant laxatives routinely if opioid use exceeds 2–3 days, unless contraindicated.

- **Pain:** Assess type, location, and intensity of pain prior to and 1 hr following IM or PO and 5 min (peak) following IV administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief. When titrating doses of short-acting hydromorphone, a repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal.
- Patients on a continuous infusion should have additional bolus doses provided every 15–30 min, as needed, for breakthrough pain. The bolus dose is usually set to the amount of drug infused each hour by continuous infusion.
- Patients taking extended-release hydromorphone may require additional short-acting or rapid-onset opioid doses for breakthrough pain. Doses of short-acting opioids should be equivalent to 10–20% of 24 hr total and given every 2 hr as needed.
- An equianalgesic chart (see Appendix J) should be used when changing routes or when changing from one opioid to another.
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive hydromorphone for pain do not develop psychological dependence. Progressively higher doses may be required to relieve pain with long-term therapy.
- **Assess risk for opioid addiction, abuse, or misuse prior to administration.** Abuse or misuse of extended-release preparations by crushing, chewing, snorting, or injecting dissolved product will result in uncontrolled delivery of hydromorphone and can result in overdose and death. Exalgo is an abuse-deterrent formulation that is difficult to crush and, if crushed, results in a gel.
- **Cough:** Assess cough and lung sounds during antitussive use.
- **Lab Test Considerations:** May ↑ plasma amylase and lipase concentrations.
- **Toxicity and Overdose:** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

✱ = Canadian drug name. ⚡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Potential Nursing Diagnoses

Acute pain (Indications)

Chronic pain (Indications)

Risk for injury (Side Effects)

Implementation

- **High Alert:** Accidental overdose of opioid analgesics has resulted in fatalities. Before administering, check infusion pump settings. **Pedi:** Medication errors with opioid analgesics are common in pediatric patients; calculate doses carefully. Use appropriate measuring devices.
- **High Alert:** Do not confuse with morphine or oxymorphone; fatalities have occurred. Do not confuse high-potency (HP) dose forms with regular dose forms.
- Explain therapeutic value of medication prior to administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive analgesic effects and permit lower opioid doses.
- Medication should be discontinued gradually after long-term use to prevent withdrawal symptoms.
- When converting from immediate-release to extended-release hydromorphone administer total daily oral hydromorphone dose once daily; dose of extended-release product can be titrated every 3–4 days. To convert from another opioid to extended-release hydromorphone, convert to total daily dose of hydromorphone and then administer 50% of this dose as extended-release hydromorphone once daily; can then titrate dose every 3–4 days. When converting from transdermal fentanyl, initiate extended-release hydromorphone 18 hr after removing transdermal fentanyl patch; for each 25 mcg/hr fentanyl transdermal dose, the equianalgesic dose of extended-release hydromorphone is 12 mg once daily (should initiate at 50% of this calculated total daily dose given once daily).
- **PO:** May be administered with food or milk to minimize GI irritation.
- Swallow extended-release tablets whole; do not break, crush, dissolve, or chew.

IV Administration

- **IV Push:** **Diluent:** Dilute with at least 5 mL of sterile water or 0.9% NaCl for injection. Inspect solution for particulate matter. Slight yellow color does not alter potency. Store at room temperature. **Rate:** Administer slowly, at a rate not to exceed 2 mg over 3–5 min. **High Alert:** Rapid administration may lead to increased respiratory depression, hypotension, and circulatory collapse.
- **Y-Site Compatibility:** acetaminophen, acyclovir, alemtuzumab, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amidarone,

amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, ampicillin/sulbactam, anidulafungin, argatroban, atracurium, atropine, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, busulfan, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, cefepime, cefotaxime, cefoxitin, ceftaroline, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, cladribine, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, epifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meropenem, mesna, methotrexate, methylprednisolone, metoprolol, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, mitoxantrone, mitomycin, morphine, mycophenolate, nafcillin, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, penicillin G potassium, pentamidine, pentobarbital, phenylephrine, piperacillin/tazobactam, posaconazole, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propofol, propranolol, quinupristin/dalfopristin, ranitidine, remifentanyl, rituximab, rocuronium, scopolamine, sodium acetate, sodium phosphates, streptozocin, succinylcholine, tacrolimus, teniposide, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** dantrolene, dimenhydrinate, minocycline, phenytoin, sargramostim, thiopental.

Patient/Family Teaching

- Instruct patient on how and when to ask for pain medication. Do not stop taking without discussing with health care professional; may cause withdrawal symptoms if discontinued abruptly after prolonged use.

- Advise patient that hydromorphone is a drug with known abuse potential. Protect it from theft, and never give to anyone other than the individual for whom it was prescribed.
- May cause drowsiness or dizziness. Advise patient to call for assistance when ambulating or smoking. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional if pain control is not adequate or if side effects occur.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Instruct patient to avoid concurrent use of alcohol or other CNS depressants.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.
- Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- **Home Care Issues:** Explain to patient and family how and when to administer hydromorphone, discuss safe storage of medication, and how to care for infusion equipment properly. **Pedi:** Teach parents or caregivers how to accurately measure liquid medication and to use only measuring device dispensed with medication.
- Emphasize the importance of aggressive prevention of constipation with the use of hydromorphone.

Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.
- Suppression of cough.

hydroxocobalamin, See VITAMIN B₁₂ PREPARATIONS.

hydroxychloroquine (hye-drox-ee-klor-oh-kwin) Plaquenil

Classification

Therapeutic: antimalarials, antirheumatics (DMARDs)

Indications

Treatment of uncomplicated malaria in geographic areas where chloroquine-resistance is not reported. Pro-

phylaxis of malaria in geographic areas where chloroquine-resistance is not reported. Treatment of acute and chronic rheumatoid arthritis. Treatment of chronic discoid lupus erythematosus and systemic lupus erythematosus.

Action

Inhibits protein synthesis in susceptible organisms by inhibiting DNA and RNA polymerase. **Therapeutic**

Effects: Death of plasmodia responsible for causing malaria. Also has anti-inflammatory properties. **Spectrum:** Active against chloroquine-sensitive strains of: *Plasmodium falciparum*, *Plasmodium malariae*, *Plasmodium ovale*, and *Plasmodium vivax*.

Pharmacokinetics

Absorption: Highly variable (31–100%) following oral administration.

Distribution: Widely distributed; high concentrations in RBCs; crosses the placenta; excreted into breast milk.

Metabolism and Excretion: Partially metabolized by the liver to active metabolites; partially excreted unchanged by the kidneys.

Half-life: 40 days.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid†	1–2 hr	days–weeks

†Onset of antirheumatic action may take 6 wk.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to hydroxychloroquine or chloroquine; Previous visual damage from hydroxychloroquine or chloroquine.

Use Cautiously in: Concurrent use of hepatotoxic drugs; Hepatic impairment or alcoholism; Use of high doses (>5 mg/kg base), duration of use >5 yr, renal impairment, concurrent use of tamoxifen or macular disease (↑ risk of retinopathy); G6PD deficiency; Psoriasis; Porphyria; Bone marrow depression; Obesity (determine dose by ideal body weight); **OB, Lactation:** Avoid use unless treating/preventing malaria or treating amebic abscess; **Geri:** ↓ renal function may ↑ risk of adverse reactions; **Pedi:** Safety and effectiveness for chronic use not established.

Adverse Reactions/Side Effects

CNS: SEIZURES, SUICIDAL THOUGHTS/BEHAVIORS, aggressiveness, anxiety, dizziness, fatigue, headache, irritability, nightmares, personality changes, psychoses.

EENT: corneal deposits, nystagmus, retinopathy, tinnitus, vertigo, visual disturbances. **CV:** HF, **TORSADE DE POINTES**, heart block, QT interval prolongation. **Endo:** hypoglycemia. **GI:** HEPATOTOXICITY, abdominal pain, anorexia, diarrhea, ↑ liver enzymes, nausea, vomiting.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Derm: DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), ERYTHEMA MULTIFORME, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, acute generalized exanthematous pustulosis, alopecia, hair color changes, hyperpigmentation, photosensitivity, pruritus, rash, urticaria. **Hemat:** AGRANULOCYTOSIS, APLASTIC ANEMIA, leukopenia, thrombocytopenia. **Me-tab:** ↓ weight. **Neuro:** ataxia, dyskinesia, dystonia, neuromyopathy, peripheral neuritis, tremor. **Resp:** PULMONARY HYPERTENSION, bronchospasm. **Misc:** ANGIOEDEMA.

Interactions

Drug-Drug: Concurrent use of other **QT interval-prolonging drugs** may ↑ risk of torsade de pointes. May ↑ the risk of hepatotoxicity when administered with **hepatotoxic drugs**. May ↑ risk of hypoglycemia when used with **antidiabetic agents**. Use with **mefloquine** may ↑ risk of seizures. **Antacids** may bind to and ↓ the absorption of hydroxychloroquine; separate administration by ≥4 hr. **Cimetidine** may ↑ levels; avoid concurrent use. **Urinary acidifiers** may ↑ renal excretion. May ↑ levels of **digoxin** or **cyclosporine**.

Route/Dosage

200 mg hydroxychloroquine sulfate = 155 mg of hydroxychloroquine base.

Malaria

PO (Adults): *Prophylaxis*—400 mg sulfate (310 mg base) once weekly; start 2 wk prior to entering malarious area; continue for 4 wk after leaving area. *Treatment*—800 mg sulfate (620 mg base), then 400 mg sulfate (310 mg base) at 6 hr, 24 hr, and 48 hr after initial dose.

PO (Children ≥31 kg): *Prophylaxis*—6.5 mg/kg sulfate (5 mg/kg base) (not to exceed 400 mg sulfate [310 mg base]) once weekly; start 2 wk prior to entering malarious area; continue for 4 wk after leaving area. *Treatment*—13 mg/kg sulfate (10 mg/kg base) (not to exceed 800 mg sulfate [620 mg base]) initially, then 6.5 mg/kg sulfate (5 mg/kg base) (not to exceed 400 mg sulfate [310 mg base]) at 6 hr, 24 hr, and 48 hr after initial dose.

Rheumatoid Arthritis

PO (Adults): 400–600 mg sulfate (310–465 mg base) per day in 1–2 divided doses; once adequate response obtained, may ↓ dose to maintenance dose of 200–400 mg sulfate (155–310 mg base) per day in 1–2 divided doses.

Lupus Erythematosus

PO (Adults): 200–400 mg sulfate (155–310 mg base) per day in 1–2 divided doses.

Availability (generic available)

Tablets: 200 mg sulfate (155 mg base). **Cost:** *Generic*—\$14.88/100.

NURSING IMPLICATIONS

Assessment

- Assess deep tendon reflexes periodically to determine muscle weakness. Therapy may be discontinued should this occur.
- Obtain baseline ocular exam within first year of therapy. Patients on prolonged high-dose therapy should have eye exams prior to and every 3–6 mo during therapy to detect retinal damage. Monitor patients without risk factors every 5 yrs. Retinal changes may progress even after therapy is completed.
- Monitor ECG for cardiomyopathy and QT prolongation periodically during therapy.
- **Monitor for signs and symptoms of DRESS** (fever, rash, lymphadenopathy, and/or facial swelling, associated with involvement of other organ systems (hepatitis, nephritis, hematologic abnormalities, myocarditis, myositis) during therapy. May resemble an acute viral infection. Eosinophilia is often present. Discontinue therapy if signs occur.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.
- Assess for suicidal tendencies, depression, or changes in behavior periodically during therapy.
- **Malaria or Lupus Erythematosus:** Assess patient for improvement in signs and symptoms of condition daily throughout course of therapy.
- **Rheumatoid Arthritis:** Assess patient monthly for pain, swelling, and range of motion.
- **Lab Test Considerations:** Monitor CBC and platelet count periodically throughout therapy. May cause decreased RBC, WBC, and platelet counts. If severe decreases occur that are not related to the disease process, hydroxychloroquine should be discontinued.
- Monitor liver function tests periodically during therapy.
- May cause hypoglycemia.

Potential Nursing Diagnoses

Risk for infection (Indications)

Chronic pain (Indications)

Implementation

- **PO:** Administer with milk or meals to minimize GI distress.
- Tablets may be crushed and placed inside empty capsules for patients with difficulty swallowing. Contents of capsules may also be mixed with a teaspoonful of jam, jelly, or Jell-O prior to administration.
- **Malaria Prophylaxis:** Hydroxychloroquine therapy should be started 2 wk prior to potential exposure and continued for 4–6 wk after leaving the malarious area.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed and continue full course of therapy even if feeling better. Missed doses should be taken as soon as remembered unless it is almost time for next dose. Do not double doses.
- Advise patients to avoid use of alcohol while taking hydroxychloroquine.
- **Caution patient to keep hydroxychloroquine out of reach of children; fatalities have occurred with ingestion of 3 or 4 tablets.**
- Explain need for periodic ophthalmic exams for patients on prolonged high-dose therapy. Advise patient that the risk of ocular damage may be decreased by the use of dark glasses in bright light. Protective clothing and sunscreen should also be used to reduce risk of dermatoses.
- Advise patient to notify health care professional promptly if sore throat, fever, unusual bleeding or bruising, blurred vision, visual changes, ringing in the ears, difficulty hearing, or muscle weakness occurs.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- **Malaria Prophylaxis:** Review methods of minimizing exposure to mosquitoes with patients receiving hydroxychloroquine prophylactically (use repellent, wear long-sleeved shirt and long trousers, use screen or netting).
- Advise patient to notify health care professional if fever develops while traveling or within 2 mo of leaving an endemic area.
- **Rheumatoid Arthritis:** Instruct patient to contact health care professional if no improvement is noticed within a few days. Treatment for rheumatoid arthritis may require up to 6 mo for full benefit.

Evaluation/Desired Outcomes

- Prevention or resolution of malaria.
- Improvement in signs and symptoms of rheumatoid arthritis.
- Improvement in symptoms of lupus erythematosus.

hydroxyprogesterone caproate

(hye-drox-ee-pro-jess-te-rone kap-roe-ate)
Makena

Classification

Therapeutic: hormones
Pharmacologic: progestins

Indications

To ↓ the risk of preterm birth in women with a singleton pregnancy who have a history of previous singleton preterm birth.

Action

A synthetic analog of progesterone. Produces secretory changes in the endometrium. ↑s basal temperature. Produces changes in the vaginal epithelium. Relaxes uterine smooth muscle. Stimulates mammary alveolar growth. Inhibits pituitary function. Action in reducing risk of recurrent preterm birth is unknown. **Therapeutic Effects:** ↓ risk of preterm birth in women at risk.

Pharmacokinetics

Absorption: Slowly absorbed following IM administration.

Distribution: Unknown.

Protein Binding: Extensively bound to plasma proteins.

Metabolism and Excretion: Extensively metabolized by the liver.

Half-life: 7.8 days.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IM	unknown	4.6 days	7 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity to hydroxyprogesterone or castor oil; History of or known thrombosis/thromboembolic disorder; History of or known/suspected breast cancer or other hormone-sensitive cancer; Unexplained abnormal vaginal bleeding unrelated to pregnancy; Cholestatic jaundice of pregnancy; Benign/malignant liver tumors or active liver disease; Uncontrolled hypertension.

Use Cautiously in: Risk factors for thromboembolic disorders (may ↑ risk); Diabetes mellitus or risk factors for diabetes mellitus (may impair glucose tolerance); History of preeclampsia, epilepsy, cardiac or renal impairment (may be adversely affected by fluid retention); History of depression (may worsen); Safe and effective use in children <16 yr has not been established.

Adverse Reactions/Side Effects

CNS: depression. **CV:** hypertension. **GI:** diarrhea, jaundice, nausea. **Derm:** urticaria, pruritus. **F and E:** fluid retention. **Hemat:** ~~THROMBOEMBOLISM~~. **Local:** injections site reactions. **Misc:** allergic reactions including ANGIOEDEMA.

Interactions

Drug-Drug: May ↑ metabolism and ↓ blood levels and effectiveness of **drugs metabolized by the CYP1A2, CYP2A6, and CYP2B6 enzyme systems.**

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Route/Dosage

IM (Adults): 250 mg once weekly starting between 16 wks, 0 days and 20 wks, 6 days continuing until wk 37 of gestation or delivery, whichever occurs first.

Availability

Solution for IM injection (contains castor oil):

1250 mg/5 mL vial (250 mg/mL).

NURSING IMPLICATIONS

Assessment

- **Monitor for signs and symptoms of thromboembolic disorders throughout therapy.**
- Monitor vital signs during therapy. If hypertension occurs, consider discontinuation of therapy.
- Assess for signs and symptoms of allergic reactions (urticaria, pruritus, angioedema) during therapy. Consider discontinuation if allergic reactions occur.
- Monitor for fluid retention during therapy, especially in patients at ↑ risk for complications (preeclampsia, epilepsy, migraine, asthma, cardiac or renal dysfunction).
- Assess mental status and mood changes, especially in women with a history of depression. Discontinue hydroxyprogesterone if depression recurs or worsens.
- **Lab Test Considerations:** May ↓ glucose tolerance. Monitor serum glucose in prediabetic and diabetic women during therapy.

Potential Nursing Diagnoses

Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching)

Implementation

- **IM:** Draw up 1 mL of solution into a 3 mL syringe with an 18 gauge needle. Solution is clear, yellow, viscous and oily. Do not administer solutions that are cloudy or contain particles. Change needle to 21 gauge 1 1/2 inch needle. Inject into upper outer quadrant of gluteus maximus slowly, over 1 min or longer. Apply pressure to injection site to minimize bruising and swelling. Store hydroxyprogesterone in original box, at room temperature, protected from light. Discard unused product after 5 wks from first use.

Patient/Family Teaching

- Instruct patient to continue to receive injection weekly from health care professional. If a dose is missed, consult health care professional for instructions regarding returning to schedule.
- Advise patient to notify health care professional if signs and symptoms of blood clots (leg swelling, redness in your leg, a spot on your leg that is warm to touch, leg pain that worsens when you bend your foot), allergic reactions (hives, itching, swelling of the face), depression, or yellowing of skin and whites of the eyes occur.
- Inform patient that injection site reactions (pain, swelling, itching, bruising, nodule formation) may occur. If ↑ pain over time, oozing of blood or fluid, or swelling occur, notify health care professional.

Evaluation/Desired Outcomes

- ↓ risk of preterm birth in women at risk.

ibandronate (i-ban-dro-nate)

Boniva

Classification

Therapeutic: bone resorption inhibitors

Pharmacologic: bisphosphonates

Indications

Treatment/prevention of postmenopausal osteoporosis.

Action

Inhibits resorption of bone by inhibiting osteoclast activity. **Therapeutic Effects:** Reversal/prevention of progression of osteoporosis with decreased fractures.

Pharmacokinetics

Absorption: 0.6% absorbed following oral administration (significantly ↓ by food).

Distribution: Rapidly binds to bone.

Protein Binding: 90.9–99.5%.

Metabolism and Excretion: 50–60% excreted in urine; unabsorbed drug is eliminated in feces.

Half-life: PO—10–60 hr; IV—4.6–25.5 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	0.5–2 hr	up to 1 mo
IV	unknown	3 hr	up to 3 mo

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Abnormalities of the esophagus which delay esophageal emptying (i.e. strictures, achalasia); Uncorrected hypocalcemia; Inability to stand/sit upright for at least 60 min; CCR <30 mL/min.

Use Cautiously in: History of upper GI disorders; Concurrent use of NSAIDs or aspirin; Invasive dental procedures, cancer, receiving chemotherapy, corticosteroids, or angiogenesis inhibitors, poor oral hygiene, periodontal disease, dental disease, anemia, coagulopathy, infection, or poorly-fitting dentures (may ↑ risk of jaw osteonecrosis); **OB:** Use only if potential benefit outweighs risks to mother and fetus; **Lactation:** Lactation; **Pedi:** Children <18 yr (safety not established); **Ger:** Consider age related ↓ in body mass, renal and hepatic function, concurrent disease states and drug therapy.

Adverse Reactions/Side Effects

GI: diarrhea, dyspepsia, dysphagia, esophageal cancer, esophagitis, esophageal/gastric ulcer. **MS:** musculoskeletal pain, pain in arms/legs, femur fractures, osteonecrosis (primarily of jaw). **Derm:** ERYTHEMA MULTIFORME, STEVENS-JOHNSON SYNDROME. **Resp:** asthma exacerbation. **Misc:** ANAPHYLAXIS, injection site reactions.

Interactions

Drug-Drug: Calcium-, aluminum-, magnesium-, and iron- containing products, including antacids ↓ absorption (ibandronate should be taken 60 min before). Concurrent use of NSAIDs including aspirin, may ↑ risk of gastric irritation.

Drug-Food: Milk and other foods ↓ absorption.

Route/Dosage

PO (Adults): 150 mg once monthly.

IV (Adults): 3 mg every 3 mo.

Availability (generic available)

Tablets: 150 mg. **Injection:** 3 mg/3 mL in prefilled single-use syringe.

NURSING IMPLICATIONS**Assessment**

- **Osteoporosis:** Assess patients for low bone mass before and periodically during therapy.
- **IV:** Monitor for signs and symptoms of anaphylactic reactions (swelling of face, lips, mouth or tongue; trouble breathing; wheezing; severe itching; skin rash, redness or swelling; dizziness or fainting; fast heartbeat or pounding in chest; sweating) during therapy. Discontinue injection immediately and begin supportive treatment if symptoms occur.
- Perform a routine oral exam prior to initiation of therapy. Dental exam with appropriate preventative dentistry should be considered prior to therapy. Patients with history of tooth extraction, poor oral hygiene, gingival infections, diabetes, or use of a dental appliance or those taking immunosuppressive therapy, angiogenesis inhibitors, or systemic corticosteroids are at greater risk for osteonecrosis of the jaw.
- **Lab Test Considerations:** Assess serum calcium before and periodically during therapy. Hypocalcemia and vitamin D deficiency should be treated before initiating ibandronate therapy.
- May cause ↓ total alkaline phosphatase levels.
- May cause hypercholesterolemia.

Potential Nursing Diagnoses

Risk for injury (Indications)

Implementation

- **PO:** Administer first thing in the morning with 6–8 oz plain water 30 min before other medications, beverages, or food. Tablet should be swallowed whole; do not break, crush, or chew.
- **Once-monthly tablet** should be administered on the same date each mo.

IV Administration

- **IV:** Administer using prefilled syringe. Do not administer solution that is discolored or contains particulate matter. Administer IV only; other routes may cause tissue damage.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- **Rate:** Administer as a 15–30 second bolus.
- **Y-Site Incompatibility:** Do not administer with calcium-containing solutions or other IV drugs.

Patient/Family Teaching

- Advise patient to eat a balanced diet and consult health care professional about the need for supplemental calcium and vitamin D. Wait at least 60 min after administration before taking supplemental calcium and vitamin D.
- Encourage patient to participate in regular exercise and to modify behaviors that increase the risk of osteoporosis (stop smoking, reduce alcohol consumption).
- Inform patient that severe musculoskeletal pain may occur within days, months, or yr after starting ibandronate. Symptoms may resolve completely after discontinuation or slow or incomplete resolution may occur. Notify health care professional if severe pain occurs.
- Advise patient to notify health care professional if rash or signs and symptoms of osteonecrosis of the jaw (pain, numbness, swelling of or drainage from the jaw, mouth, or teeth) occur.
- Instruct patient to notify health care professional if swallowing difficulties, chest pain, new or worsening heartburn, or trouble or pain when swallowing occurs; may be signs of problems of the esophagus.
- Advise patient to inform health care professional of ibandronate therapy prior to dental surgery.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- **PO:** Instruct patient on the importance of taking as directed, first thing in the morning, 60 min before other medications, beverages, or food. Ibandronate should be taken with 6–8 oz plain water (mineral water, orange juice, coffee, and other beverages decrease absorption). Do not chew or suck on tablet. If a dose is missed, skip dose and resume the next morning; do not double doses or take later in the day. If a once-monthly dose is missed and the next scheduled dose is >7 days away, take in the morning following the date it is remembered. Resume original schedule the following mo. If the next dose is <7 days away, omit dose and take next scheduled dose. Do not discontinue without consulting health care professional.
- Caution patient to remain upright for 60 min following dose to facilitate passage to stomach and minimize risk of esophageal irritation. Advise patient to stop taking ibandronate and contact health care professional if symptoms of esophageal irritation (new or worsening dysphagia, pain on swallowing, retrosternal pain, or heartburn) occur.
- **IV:** Advise patient that IV doses should not be administered sooner than every 3 mo. If a dose is missed, have health care professional administer as soon as possible; next injection should be scheduled 3 mo from last injection.

Evaluation/Desired Outcomes

- Prevention of or decrease in the progression of osteoporosis in postmenopausal women. Discontinuation after 3–5 years should be considered for women with low risk for fractures.

ibuprofen (eye-byoo-proe-fen)

Advil, Advil Infants, Advil Junior Strength, Advil Migraine, Children's Advil, *Children's Europrofen, Children's Motrin, *Motrin, Motrin IB, Motrin Infants Drops, Motrin Junior Strength, PediaCare IB Ibuprofen

ibuprofen (injection)

Caldolor, NeoProfen (ibuprofen lysine)

Classification

Therapeutic: antipyretics, antirheumatics, nonopioid analgesics, nonsteroidal anti-inflammatory agents

Pharmacologic: nonopioid analgesics

Indications

PO, IV: Treatment of: Mild to moderate pain, Fever.

PO: Treatment of: Inflammatory disorders including rheumatoid arthritis (including juvenile) and osteoarthritis, Dysmenorrhea. **IV:** Moderate to severe pain with opioid analgesics. Closure of a clinically significant PDA in neonates weighing 500–1500 g and ≤32 wk gestational age (ibuprofen lysine only)

Action

Inhibits prostaglandin synthesis. **Therapeutic Effects:** Decreased pain and inflammation. Reduction of fever.

Pharmacokinetics

Absorption: Oral formulation is well absorbed (80%) from the GI tract; IV administration results in complete bioavailability.

Distribution: Does not enter breast milk in significant amounts.

Protein Binding: 99%.

Metabolism and Excretion: Mostly metabolized by the liver; small amounts (1%) excreted unchanged by the kidneys.

Half-life: Neonates: 26–43 hr; Children: 1–2 hr; Adults: 2–4 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO (antipyretic)	0.5–2.5 hr	2–4 hr	6–8 hr
PO (analgesic)	30 min	1–2 hr	4–6 hr
PO (anti-inflammatory)	≤7 days	1–2 wk	unknown
IV (analgesic)	unknown	unknown	6 hr
IV (antipyretic)	within 2 hr	10–12 hr†	4–6 hr

† With repeated dosing.

Contraindications/Precautions

Contraindicated in: Hypersensitivity (cross-sensitivity may exist with other NSAIDs, including aspirin); Active GI bleeding or ulcer disease; Chewable tablets contain aspartame and should not be used in patients with phenylketonuria; Coronary artery bypass graft (CABG) surgery; History of recent MI; Severe HF; **OB:** Avoid after 30 wk gestation (may cause premature closure of fetal ductus arteriosus); **Pedi:** Ibuprofen lysine: Preterm neonates with untreated infection, congenital heart disease where patency of PDA is necessary for pulmonary or systemic blood flow, bleeding, thrombocytopenia, coagulation defects, necrotizing enterocolitis, significant renal dysfunction.

Use Cautiously in: Cardiovascular disease or risk factors for cardiovascular disease (may ↑ risk of serious cardiovascular thrombotic events, MI, and stroke, especially with prolonged use or use of higher doses); avoid use in patients with recent MI or HF; Renal or hepatic disease, dehydration, or patients on nephrotoxic drugs (may ↑ risk of renal toxicity); Aspirin triad patients (asthma, nasal polyps, and aspirin intolerance); can cause fatal anaphylactoid reactions; Chronic alcohol use/abuse; **Ger:** ↑ risk of adverse reactions secondary to age-related ↓ in renal and hepatic function, concurrent illnesses, and medications; Coagulation disorders; **OB:** Use cautiously up to 30 wk gestation; avoid after that; **Lactation:** Use cautiously; **Pedi:** Safety not established for infants <6 mo (oral and IV Caldolor); Hyperbilirubinemia in neonates (may displace bilirubin from albumin-binding sites).

Exercise Extreme Caution in: History of GI bleeding or GI ulcer disease.

Adverse Reactions/Side Effects

CNS: headache, dizziness, drowsiness, intraventricular hemorrhage (ibuprofen lysine), psychic disturbances.

EENT: amblyopia, blurred vision, tinnitus. **CV:** HF, MYOCARDIAL INFARCTION, STROKE, arrhythmias, edema, hypertension. **F and E:** hyperkalemia. **GI:** GI BLEEDING, HEPATITIS, constipation, dyspepsia, nausea, necrotizing enterocolitis (ibuprofen lysine), vomiting, abdominal discomfort. **GU:** cystitis, hematuria, renal failure. **Derm:** EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, rash, injection site reaction. **Hemat:** anemia, blood dyscrasias, prolonged bleeding time. **Misc:** allergic reactions including ANAPHYLAXIS.

Interactions

Drug-Drug: May limit the cardioprotective effects of low-dose aspirin. Concurrent use with aspirin may ↓ effectiveness of ibuprofen. Additive adverse GI side effects with aspirin, oral potassium, other NSAIDs, corticosteroids, or alcohol. Chronic use with acetaminophen may ↑ risk of adverse renal reactions. May

↓ effectiveness of diuretics, ACE inhibitors, or other antihypertensives. May ↑ hypoglycemic effects of insulin or oral hypoglycemic agents. May ↑ serum lithium levels and risk of toxicity. ↑ risk of toxicity from methotrexate. Probenecid ↑ risk of toxicity from ibuprofen. ↑ risk of bleeding with cefotetan, corticosteroids, valproic acid, thrombolytics, warfarin, and drugs affecting platelet function including clopidogrel, abciximab, eptifibatid, or tirofiban. ↑ risk of adverse hematologic reactions with antineoplastics or radiation therapy. ↑ risk of nephrotoxicity with cyclosporine.

Drug-Natural Products: ↑ bleeding risk with, arnica, chamomile, feverfew, garlic, ginger, ginkgo, Panax ginseng, and others.

Route/Dosage

Analgesia

PO (Adults): *Anti-inflammatory*—400–800 mg 3–4 times daily (not to exceed 3200 mg/day). *Analgesic/antidysmenorrheal/antipyretic*—200–400 mg every 4–6 hr (not to exceed 1200 mg/day).

PO (Children 6 mo–12 yr): *Anti-inflammatory*—30–50 mg/kg/day in 3–4 divided doses (maximum dose: 2.4 g/day). *Antipyretic*—5 mg/kg for temperature <102.5°F (39.17°C) or 10 mg/kg for higher temperatures (not to exceed 40 mg/kg/day); may be repeated every 4–6 hr. *Cystic fibrosis (unlabeled)*—20–30 mg/kg/day divided twice daily.

PO (Infants and Children): *Analgesic*—4–10 mg/kg/dose every 6–8 hr.

IV (Adults): *Analgesic*—400–800 mg every 6 hr as needed (not to exceed 3200 mg/day); *Antipyretic*—400 mg initially, then 400 mg every 4–6 hr or 100–200 mg every 4 hr as needed (not to exceed 3200 mg/day).

IV (Children 12–17 yr): *Analgesic and antipyretic*—400 mg every 4–6 hr as needed (not to exceed 2400 mg/day).

IV (Children 6 mo–12 yr): *Analgesic and antipyretic*—10 mg/kg (not to exceed 400 mg) every 4–6 hr as needed (not to exceed 40 mg/kg/day or 2400 mg/day whichever is less).

Pediatric OTC Dosing

PO (Children 11 yr/72–95 lb): 300 mg every 6–8 hr.

PO (Children 9–10 yr/60–71 lb): 250 mg every 6–8 hr.

PO (Children 6–8 yr/48–59 lb): 200 mg every 6–8 hr.

PO (Children 4–5 yr/36–47 lb): 150 mg every 6–8 hr.

PO (Children 2–3 yr/24–35 lb): 100 mg every 6–8 hr.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

PO (Children 12–23 mo/18–23 lb): 75 mg every 6–8 hr.

PO (Infants 6–11 mo/12–17 lb): 50 mg every 6–8 hr.

PDA Closure

IV (Neonates Gestational age \leq 32 weeks, 500–1500 g): 10 mg/kg followed by two doses of 5 mg/kg at 24 and 48 hr after initial dose.

Availability (generic available)

Tablets: 100 mg^{OTC}, 200 mg^{OTC}, 300 mg, 400 mg, 600 mg, 800 mg. **Capsules (liquisgels):** 200 mg^{OTC}. **Chewable tablets (fruit, grape, orange, and citrus flavor):** 50 mg^{OTC}, 100 mg^{OTC}. **Oral suspension (fruit, berry, grape flavor):** 100 mg/5 mL^{OTC}. **Pediatric drops (berry flavor):** 50 mg/1.25 mL^{OTC}. **Solution for injection:** 100 mg/mL (Caldolor), 17.1 mg/mL as lysine, 10 mg/mL as ibuprofen base (Neoprofen). **In combination with:** decongestants^{OTC}, hydrocodone (Reprexain), famotidine (Duexis). See Appendix B.

NURSING IMPLICATIONS

Assessment

- **Patients who have asthma, aspirin-induced allergy, and nasal polyps are at increased risk for developing hypersensitivity reactions. Assess for rhinitis, asthma, and urticaria.**
- Assess for signs and symptoms of GI bleeding (tarry stools, light-headedness, hypotension), renal dysfunction (elevated BUN and serum creatinine levels, decreased urine output), and hepatic impairment (elevated liver enzymes, jaundice). **Geri:** Higher risk for poor outcomes or death from GI bleeding. Age-related renal impairment increases risk of hepatic and renal toxicity.
- **Assess patient for skin rash frequently during therapy. Discontinue ibuprofen at first sign of rash; may be life-threatening. Stevens-Johnson syndrome or toxic epidermal necrolysis may develop. Treat symptomatically; may recur once treatment is stopped.**
- **Pain:** Assess pain (note type, location, and intensity) prior to and 1–2 hr following administration.
- **Arthritis:** Assess pain and range of motion prior to and 1–2 hr following administration.
- **Fever:** Monitor temperature; note signs associated with fever (diaphoresis, tachycardia, malaise).
- **PDA Closure:** Monitor preterm neonates for signs of bleeding, infection and decreased urine output. Monitor IV site for signs of extravasation. If ductus arteriosus closes or size significantly decreases, 2nd and 3rd doses are unnecessary.
- **Lab Test Considerations:** BUN, serum creatinine, CBC, and liver function tests should be evaluated periodically in patients receiving prolonged therapy.
- Serum potassium, BUN, serum creatinine, alkaline phosphatase, LDH, AST, and ALT may show \uparrow levels. Blood glucose, hemoglobin, and hematocrit concen-

trations, leukocyte and platelet counts, and CCr may be \downarrow .

- May cause prolonged bleeding time; may persist for $<$ 1 day following discontinuation.
- **PDA Closure:** If urinary output $<$ 0.6 mL/kg/hr at time of 2nd or 3rd dose, hold dose until renal function has returned to normal.

Potential Nursing Diagnoses

Acute pain (Indications)

Impaired physical mobility (Indications)

Ineffective thermoregulation (Indications)

Implementation

- Do not confuse Motrin (ibuprofen) with Neurontin (gabapentin).
- Administration of higher than recommended doses does not provide increased pain relief but may increase incidence of side effects.
- Patient should be well hydrated before administration to prevent renal adverse reactions. Do not give to neonates with urine output $<$ 0.6 mL/kg/hour.
- Use lowest effective dose for shortest period of time, especially in the elderly, to minimize risk of cardiovascular thrombotic events.
- Coadministration with opioid analgesics may have additive analgesic effects and may permit lower opioid doses.
- **PO:** For rapid initial effect, administer 30 min before or 2 hr after meals. May be administered with food, milk, or antacids to decrease GI irritation. Tablets may be crushed and mixed with fluids or food; 800-mg tablet can be dissolved in water.
- **Dysmenorrhea:** Administer as soon as possible after the onset of menses. Prophylactic treatment has not been shown to be effective.

IV Administration

- **Intermittent Infusion:** **Diluent:** 0.9% NaCl, D5W, or LR. **Concentration:** *Ibuprofen injection:* Dilute the 800 mg dose in at least 200 mL and the 100 mg, 200 mg, and 400 mg doses in at least 100 mL for a concentration of 4 mg/mL or less. *Ibuprofen lysine:* Dilute in appropriate volume of D5W or 0.9% NaCl and infuse over 15 minutes. Do not administer solutions that are discolored or contain particulate matter. Stable for up to 24 hr at room temperature. Discard remaining solution; does not contain preservatives. **Rate:** Infuse over at least 30 min for adults and at least 10 min for children for *Caldolor* or over 15 min for *NeoProfen*.

Patient/Family Teaching

- Advise patients to take ibuprofen with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Instruct patient to take medication as directed. Take missed doses as soon as remembered but not if almost time for next dose. Do not double doses. **Pedi:** Teach parents and caregivers to calculate and mea-

sure doses accurately and to use measuring device supplied with product.

- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid the concurrent use of alcohol, aspirin, acetaminophen, and other OTC or herbal products without consulting health care professional.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Instruct patients not to take OTC ibuprofen preparations for more than 10 days for pain or more than 3 days for fever, and to consult health care professional if symptoms persist or worsen. Many OTC products contain ibuprofen; avoid duplication.
- **Caution patient that use of ibuprofen with 3 or more glasses of alcohol per day may increase the risk of GI bleeding.**
- Advise patient to consult health care professional if rash, itching, visual disturbances, tinnitus, weight gain, edema, epigastric pain, dyspepsia, black stools, hematemesis, persistent headache, or influenza-like syndrome (chills, fever, muscle aches, pain) occurs.
- **Pedi:** Advise parents or caregivers not to administer ibuprofen to children who may be dehydrated (can occur with vomiting, diarrhea, or poor fluid intake); dehydration increases risk of renal dysfunction.
- Advise female patients to notify health care professional if pregnancy is planned or suspected.

Evaluation/Desired Outcomes

- Decrease in severity of pain.
- Improved joint mobility. Partial arthritic relief is usually seen within 7 days, but maximum effectiveness may require 1–2 wk of continuous therapy. Patients who do not respond to one NSAID may respond to another.
- Reduction in fever.
- Closure of PDA.

idarucizumab

(eye-da-roo-siz-ue-mab)
Praxbind

Classification

Therapeutic: antidotes

Pharmacologic: monoclonal antibodies

Indications

To counteract the anticoagulant effect of dabigatran for emergency surgery/urgent procedures or life-threatening uncontrolled bleeding.

Action

Human monoclonal antibody fragment (Fab) that selectively binds to dabigatran and its metabolites, preventing its binding to thrombin and negating its anticoagulant effects. Does not reverse any other anticoagulants. **Therapeutic Effects:** Reversal of the anticoagulant effect of dabigatran.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Biodegraded to smaller molecules. 60% excreted in urine, remainder via protein catabolism primarily in the kidneys.

Half-life: 10.3 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	immediate	unknown	24 hr

Contraindications/Precautions

Contraindicated in: None noted.

Use Cautiously in: **Ger:** Elderly patients may be more sensitive to drug effects; **OB:** Safety not established. Consider maternal benefits and fetal risks; **Lactation:** Safety not established, consider beneficial effects of breast feeding and possible adverse effects in infant; **Pedi:** Safety and effectiveness not established.

Exercise Extreme Caution in: Hereditary fructose intolerance (risk of serious adverse reactions due to sorbitol excipient); History of serious hypersensitivity (including anaphylactoid reactions) to idarucizumab.

Adverse Reactions/Side Effects

CNS: delirium. **CV:** THROMBOEMBOLISM. **GI:** constipation. **F and E:** hypokalemia. **Misc:** hypersensitivity reactions, fever.

Interactions

Drug-Drug: None noted.

Route/Dosage

IV (Adults): 5 g as single dose.

Availability

Solution for injection (contains sorbitol): 2.5 g/50 mL single-use vial.

NURSING IMPLICATIONS

Assessment

- Reversal of dabigatran exposes patient to thrombotic risk of their underlying disease; may cause thromboembolism. Resume anticoagulant therapy as soon as medically appropriate. Dabigatran therapy can be reinstituted 24 hr after idarucizumab infusion.
- Monitor for signs and symptoms of hypersensitivity reactions (rash, urticaria, fever, pruritus, dyspnea,

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

orofacial swelling). Contains sorbitol; reactions in patients with hereditary fructose intolerance have included hypoglycemia, hypophosphatemia, metabolic acidosis, increase in uric acid, acute liver failure. If symptoms occur discontinue therapy and treat symptomatically.

- **Lab Test Considerations:** Monitor coagulation parameters (activated partial thromboplastin time [aPTT], ecarin clotting time [ECT]) 12–24 hrs after infusion.
- May cause hypokalemia.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Adverse Reactions)

Implementation

- **Do not confuse idarucizumab with idarubicin.**
- **Intermittent Infusion:** Flush IV line with 0.9% NaCl prior to and following infusion. Solution is clear to opalescent, colorless to slightly yellow; do not administer solutions that are discolored or contain precipitates. Administer as 2 consecutive infusion or inject both vials consecutively via syringe. Must be administered within 1 hr when removed from vial. Store in refrigerator; stable for 48 hrs at room temperature and 6 hrs if exposed to light.

Patient/Family Teaching

- Explain purpose of idarucizumab to patient.
- Instruct patient to notify health care professional immediately if bleeding occurs.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Reversal of the anticoagulant effect of dabigatran.

ifosfamide (eye-foss-fam-ide)

lfex

Classification

Therapeutic: antineoplastics

Pharmacologic: alkylating agents

Indications

Germ cell testicular carcinoma (with other agents). Used with mesna, which prevents ifosfamide-induced hemorrhagic cystitis.

Action

Following conversion to active compounds, interferes with DNA replication and RNA transcription, ultimately disrupting protein synthesis (cell-cycle phase–nonspecific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: Administered IV only; inactive prior to conversion to metabolites.

Distribution: Excreted in breast milk.

Metabolism and Excretion: Metabolized by the liver to active antineoplastic compounds.

Half-life: 15 hr.

TIME/ACTION PROFILE (effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	7–14 days	21 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **OB, Lactation:** Pregnancy or lactation.

Use Cautiously in: Patients with childbearing potential; Active infections; ↓ bone marrow reserve; **Geri:** Geriatric patients; Other chronic debilitating illness; Renal impairment; **Pedi:** Children.

Adverse Reactions/Side Effects

CNS: CNS toxicity (somnia, confusion, hallucinations, coma), cranial nerve dysfunction, disorientation, dizziness. **CV:** cardiotoxicity. **GI:** nausea, vomiting, anorexia, constipation, diarrhea, hepatotoxicity. **GU:** hemorrhagic cystitis, dysuria, sterility, renal toxicity.

Derm: alopecia. **Hemat:** ANEMIA, LEUKOPENIA, THROMBOCYTOPENIA. **Local:** phlebitis. **Misc:** allergic reactions.

Interactions

Drug-Drug: CYP3A4 inhibitors, including ketoconazole, fluconazole, itraconazole, sorafenib, and aprepitant may ↓ its effectiveness. CYP3A4 inducers, including carbamazepine, phenytoin, phenytoin, phenobarbital, and rifampin may ↑ the formation of a toxic metabolite and may ↑ risk of toxicity. ↑ myelosuppression with other antineoplastics or radiation therapy. Toxicity may be ↑ by allopurinol or phenobarbital. May ↓ antibody response to and ↑ risk of adverse reactions from live-virus vaccines.

Drug-Food: Grapefruit juice may ↑ levels; avoid concurrent use.

Route/Dosage

Other Regimens are Used

IV (Adults): 1.2 g/m²/day for 5 days; coadminister with mesna. May repeat cycle q 3 wk.

Availability (generic available)

Powder for injection (requires reconstitution): 1 g/vial, 3 g/vial. **Solution for injection:** 50 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor BP, pulse, respiratory rate, and temperature frequently during administration. Report significant changes.
- Monitor urinary output frequently during therapy. Notify health care professional if hematuria occurs. To reduce the risk of hemorrhagic cystitis, fluid intake should be at least 3000 mL/day for adults and

1000–2000 mL/day for children. Mesna is given concurrently to prevent hemorrhagic cystitis.

- Monitor neurologic status. Ifosfamide should be discontinued if severe CNS symptoms (agitation, confusion, hallucinations, unusual tiredness) occur. Symptoms usually abate within 3 days of discontinuation of ifosfamide but may persist for longer; fatalities have been reported.
- Assess nausea, vomiting, and appetite. Weigh weekly. Premedication with an antiemetic may be used to minimize GI effects. Adjust diet as tolerated.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- **Lab Test Considerations:** Monitor CBC, differential, and platelet count prior to and periodically during therapy. Withhold dose if WBC <2000/mm³ or platelet count is <50,000/mm³. Nadir of leukopenia and thrombocytopenia occurs within 7–14 days and usually recovers within 21 days of therapy.
- Urinalysis should be evaluated before each dose. Withhold dose until recovery if urinalysis shows >10 RBCs per high-power field.
- May cause ↑ in liver enzymes and serum bilirubin.
- Monitor AST, ALT, serum alkaline phosphatase, bilirubin, and LDH prior to and periodically during therapy. May cause ↑ in liver enzymes and serum bilirubin.
- Monitor BUN, serum creatinine, phosphate, and potassium periodically during therapy. May cause hypokalemia.

Potential Nursing Diagnoses

Risk for infection (Side Effects)

Disturbed body image (Side Effects)

Implementation

- Prepare solution in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers.

IV Administration

- **IV:** Prepare solution by diluting each 1-g vial with 20 mL of sterile water or bacteriostatic water for injection containing parabens. Use solution prepared without bacteriostatic water within 6 hr. Solution prepared with bacteriostatic water is stable for 1 wk at 30°C or 6 wk at 5°C.
- **Intermittent Infusion:** **Diluent:** May be further diluted in D5W, 0.9% NaCl, LR, or sterile water for injection. **Concentration:** 0.6 to 20 mg/mL (maxi-

mum 40 mg/mL). Dilute solution is stable for 7 days at room temperature or 6 wk if refrigerated. **Rate:** Administer over at least 30 min.

- **Continuous Infusion:** Has also been administered as a continuous infusion over 72 hr.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B cholesteryl, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, eripenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, imipenem/cilastatin, insulin, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, levorphanol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, minocycline, mitomycin, mitoxantrone, morphine, moxifloxacin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, pentamidine, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, quinupristin/dalfopristin, ranitidine, remifentanyl, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, sodium phosphates, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiopeptal, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- **Y-Site Incompatibility:** cefepime, diazepam, methotrexate, pantoprazole, phenytoin, potassium phosphates.

Patient/Family Teaching

- Emphasize need for adequate fluid intake throughout therapy. Patient should void frequently to decrease bladder irritation from metabolites excreted by the kidneys. Notify health care professional immediately if hematuria is noted.
- Instruct patient to drink at least 8 glasses of water/day during and for 3 days after completion of therapy.
- Advise patient to avoid grapefruit and grapefruit juice during therapy.
- **Instruct patient to notify health care professional promptly if fever; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; painful or difficult urination; bleeding gums; bruising; petechiae; blood in urine, stool, or emesis; or confusion occurs.**
- Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Patients should also be cautioned not to drink alcoholic beverages or to take products containing aspirin or NSAIDs, as these may precipitate GI hemorrhage.
- Discuss with patient the possibility of hair loss. Explore methods of coping.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Instruct patient not to receive any vaccinations without advice of health care professional; ifosfamide may decrease antibody response to and increase risk of adverse reactions from live-virus vaccines.
- Review with patient the need for contraception during therapy and for at least 6 mo after therapy. Women should avoid pregnancy and breast feeding and men should avoid fathering a child during and for at least 6 mo after end of therapy.
- **Rep:** Caution patient about the potential for amenorrhea, premature menopause, and sterility from this medication.

Evaluation/Desired Outcomes

- Decrease in size or spread of malignant germ cell testicular carcinoma.

iloperidone
(eye-loe-per-i-done)
Fanapt

Classification

Therapeutic: antipsychotics
Pharmacologic: benzisoxazoles

Indications

Schizophrenia.

Action

May act by antagonizing dopamine and serotonin in the CNS. **Therapeutic Effects:** Decreased symptoms of schizophrenia.

Pharmacokinetics

Absorption: Well absorbed (96%) following oral administration.

Distribution: Unknown.

Metabolism and Excretion: Extensively metabolized by the liver. **M:** Metabolism is genetically determined; primarily by CYP3A4 and CYP2D6 enzyme systems, with individual variability in metabolism via CYP2D6 (extensive metabolizers [EM] and poor metabolizers [PM] and some in-between; 7–10% of Caucasians and 3–8% of Black/African Americans are considered PM). Two major metabolites (P88 and P95) may be partially responsible for pharmacologic activity. 58% excreted in urine as metabolites in EM and 45% in PM; 20% eliminated in feces in EM and 22.1% in PM.

Half-life: *EMs*—iloperidone—18 hr, P88—26 hr, P95—23 hr; *PMs*—iloperidone—33 hr, P88—37 hr, P95—31 hr.

TIME/ACTION PROFILE (antipsychotic effect)

ROUTE	ONSET	PEAK	DURATION
PO	2–4 wk	2–4 hr†	unknown

† Blood level.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of drugs known to prolong QTc interval; Bradycardia, recent MI or uncompensated heart failure (↑ risk of serious arrhythmias); Congenital long QT syndrome, QTc interval >500 msec or history of cardiac arrhythmias; Electrolyte abnormalities, especially hypomagnesemia or hypokalemia (correct prior to therapy); Severe hepatic impairment; **Lactation:** Breast feeding should be avoided.

Use Cautiously in: Known cardiovascular disease including heart failure, history of MI/ischemia, conduction abnormalities, cerebrovascular disease, or other conditions known to predispose to hypotension including dehydration, hypovolemia, concurrent anti-hypertensive therapy (↑ risk of orthostatic hypotension); Concurrent use of CYP3A4 or CYP2D6 inhibitors; Known ↓ WBC or history of drug-induced leukopenia/neutropenia; Circumstances that may result in ↑ body temperature, including strenuous exercise, exposure to extreme heat, concurrent anticholinergic activity, or dehydration (may impair thermoregulation); Patients at risk for aspiration or falls; Moderate hepatic impairment; **OB:** Neonates at ↑ risk for extrapyramidal symptoms and withdrawal after delivery when exposed during the 3rd trimester; use only if potential maternal benefit justifies potential fetal risk; **Pedi:** Safety and effectiveness not established; **Ger:** Elderly patients with dementia-related psychoses (↑ risk of death, CVA or TIA).

Adverse Reactions/Side Effects

CNS: **NEUROLEPTIC MALIGNANT SYNDROME**, **SUICIDAL THOUGHTS**, dizziness, drowsiness, fatigue, agitation, delusion, restlessness, extrapyramidal disorders. **EENT:** nasal congestion. **CV:** orthostatic hypotension, tachycardia, palpitations, QTc interval prolongation. **GI:** dry mouth, nausea, abdominal discomfort, diarrhea. **GU:** priapism, urinary incontinence. **Endo:** dyslipidemia, hyperglycemia, hyperprolactinemia. **Neuro:** tardive dyskinesia. **Metab:** weight gain, weight loss. **MS:** ↓ bone density, musculoskeletal stiffness. **Misc:** **ANAPHYLAXIS**, **ANGIOEDEMA**.

Interactions

Drug-Drug: Avoid use of drugs known to the prolonged QTc interval including the **quinidine**, **procaïnamide**, **amiodarone**, **sotalol**, **chlorpromazine**, **thioridazine**, **moxifloxacin**, **pentamidine**, and **methadone**. Concurrent use of strong **CYP2D6 inhibitors** including **fluoxetine** and **paroxetine** ↑ levels and the risk of toxicity; dose ↓ is required. Concurrent use of strong **CYP3A4 inhibitors** including **ketoconazole** and **clarithromycin** ↑ levels and the risk of toxicity; dosage ↓ is required. Concurrent use of **antihypertensives** including **diuretics** may ↑ risk of orthostatic hypotension. Concurrent **anticholinergics** may ↑ risk of impaired thermoregulation.

Route/Dosage

PO (Adults): Initiate treatment with 1 mg twice daily on the first day, then 2 mg twice daily the second day, then ↑ by 2 mg/day every day until a target dose of 12–24 mg/day given in two divided doses is reached; *Concurrent strong CYP2D6 or CYP3A4 inhibitors*—↓ dose by 50%, if inhibitor is withdrawn ↑ dose to previous amount. Re-titration is required if iloperidone is discontinued >300 days; *Poor metabolizers of CYP2D6*—↓ dose by 50%.

Availability

Tablets: 1 mg, 2 mg, 4 mg, 6 mg, 8 mg, 10 mg, 12 mg.

NURSING IMPLICATIONS

Assessment

- Monitor patient's mental status (delusions, hallucinations, and behavior) before and periodically during therapy.
- **Monitor mood changes. Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.**
- Monitor BP (sitting, standing, lying down) and pulse before and periodically during therapy. May cause prolonged QT interval, tachycardia, and orthostatic hypotension. Protect patient from falls.
- Assess weight and BMI initially and throughout therapy.

- Observe patient when administering medication to ensure that medication is actually swallowed and not hoarded.
- Monitor patient for onset of extrapyramidal side effects (*akathisia*—restlessness; *dystonia*—muscle spasms and twisting motions; or *pseudoparkinsonism*—mask-like face, rigidity, tremors, drooling, shuffling gait, dysphagia). Report these symptoms; reduction of dose or discontinuation of medication may be necessary.
- Monitor for tardive dyskinesia (involuntary rhythmic movement of mouth, face, and extremities). Report immediately and discontinue therapy; may be irreversible.
- **Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness). Discontinue iloperidone and notify health care professional immediately if these symptoms occur.**
- Monitor for symptoms related to hyperprolactinemia (menstrual abnormalities, galactorrhea, sexual dysfunction).
- Assess weight and BMI initially and throughout therapy. Refer as appropriate for nutritional/weight and medical management.
- Assess for falls risk. Drowsiness, orthostatic hypotension, and motor and sensory instability increase risk. Institute prevention if indicated.
- **Lab Test Considerations:** Monitor fasting blood glucose before and periodically during therapy in diabetic patients.
- Monitor CBC frequently during initial mo of therapy in patients with pre-existing or history of low WBC. May cause leukopenia, neutropenia, or agranulocytosis. Discontinue therapy if this occurs.
- Monitor serum potassium and magnesium levels in patients at risk for electrolyte disturbances.
- Monitor serum prolactin prior to and periodically during therapy. May cause ↑ serum prolactin levels.

Potential Nursing Diagnoses

Risk for self-directed violence (Indications)

Disturbed thought process (Indications)

Risk for injury (Side Effects)

Implementation

- **Do not confuse Fanapt (iloperidone) with Xanax (alprazolam).**
- **PO:** Administer twice daily without regard to food.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed. If doses are missed for >3 days, restart at initiation dose. Advise patient that appearance of tablets in stool is normal and not of concern.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Inform patient of the possibility of extrapyramidal symptoms. Instruct patient to report these symptoms immediately to health care professional.
- Advise patient to change positions slowly to minimize orthostatic hypotension. Protect from falls.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Extremes in temperature should also be avoided; this drug impairs body temperature regulation.
- Instruct patient to notify health care professional promptly if sore throat, fever, unusual bleeding or bruising, rash, tremors, palpitations, fainting, menstrual abnormalities, galactorrhea or sexual dysfunction occur.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; other unusual changes in behavior or mood occur.
- Caution patient to avoid concurrent use of alcohol and other CNS depressants.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding. Encourage women who become pregnant while taking iloperidone to enroll in the National Pregnancy Registry for Atypical Antipsychotics at 1-866-961-2388 or visit <http://womensmental-health.org/clinical-and-research-programs/pregnancyregistry/>.
- Emphasize the need for continued follow-up for psychotherapy and monitoring for side effects.

Evaluation/Desired Outcomes

- Decrease in excited, paranoid, or withdrawn behavior.

HIGH ALERT

imatinib (i-mat-i-nib)

Gleevec

Classification

Therapeutic: antineoplastics

Pharmacologic: enzyme inhibitors

Indications

 Newly diagnosed Philadelphia positive (Ph+) chronic myeloid leukemia (CML). CML in blast crisis, accelerated phase, or in chronic phase after failure of

interferon-alpha treatment.  Kit (CD117) positive metastatic/unresectable malignant gastrointestinal stromal tumors (GIST). Adjuvant treatment following resection of Kit (CD117) positive GIST.  Pediatric patients with Ph+ CML after failure of bone marrow transplant or resistance to interferon-alpha.  Adult patients with relapsed or refractory Ph+ acute lymphoblastic leukemia (ALL).  Newly diagnosed Ph+ ALL (in combination with chemotherapy).  Myelodysplastic/myeloproliferative disease (MDS/MPD) associated with platelet-derived growth factor receptor (PDGFR) gene re-arrangements.  Aggressive systemic mastocytosis (ASM) without the D816V c-Kit mutation or with c-Kit mutational status unknown. Hypereosinophilic syndrome and/or chronic eosinophilic leukemia (HES/CEL). Unresectable, recurrent, or metastatic dermatofibrosarcoma protuberans (DFSP).

Action

Inhibits kinases which may be produced by malignant cell lines. **Therapeutic Effects:** Inhibits production of malignant cell lines with decreased proliferation of leukemic cells in CML, HES/CEL, and ALL and malignant cells in GIST, MDS/MPD, ASM, and DFSP.

Pharmacokinetics

Absorption: Well absorbed (98%) following oral administration.

Distribution: Unknown.

Protein Binding: 95%.

Metabolism and Excretion: Mostly metabolized by the CYP3A4 enzyme system to N-demethyl imatinib, which is as active as imatinib. Excreted mostly in feces as metabolites. 5% excreted unchanged in urine.

Half-life: *Imatinib*—18 hr; *N-desmethyl imatinib*—40 hr.

TIME/ACTION PROFILE (blood levels of imatinib)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–4 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **OB:** Potential for fetal harm; **Lactation:** Potential for serious adverse reactions in nursing infants; breast feeding should be avoided.

Use Cautiously in: Hepatic impairment (dose ↓ recommended if bilirubin >3 times normal or liver transaminases >5 times normal); Cardiac disease (severe HF and left ventricular dysfunction may occur); **Rep:** Women of reproductive potential; **Pedi:** Children <1 yr (safety not established); **Ger:** ↑ risk of edema.

Adverse Reactions/Side Effects

CNS: fatigue, headache, weakness, dizziness, somnolence. **CV:** **HF:** **Resp:** epistaxis, nasopharyngitis, blurred vision. **ENT:** cough, dyspnea, pneumonia.

GI: **HEPATOTOXICITY,** abdominal pain, anorexia, consti-

pation, diarrhea, dyspepsia, nausea, vomiting. **Derm:** DRUG RASH WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), petechiae, pruritus, skin rash. **F and E:** edema (including pleural effusion, pericardial effusion, pulmonary edema, and superficial edema), hypokalemia. **Endo:** ↓ growth (in children), hypothyroidism. **Hemat:** BLEEDING, NEUTROPENIA, THROMBOCYTOPENIA. **Metab:** weight gain. **MS:** arthralgia, muscle cramps, musculoskeletal pain, myalgia. **Misc:** TUMOR LYSIS SYNDROME, fever, night sweats.

Interactions

Drug-Drug: Blood levels and effects are ↑ by concurrent use of potent CYP3A4 inhibitors (e.g. ketoconazole, itraconazole, clarithromycin, atazanavir, indinavir, nefazodone, nelfinavir, ritonavir, saquinavir, or voriconazole). Blood levels and effects may be ↓ by potent CYP3A4 inducers (e.g., dexamethasone, phenytoin, carbamazepine, rifampin, rifabutin, and phenobarbital; if used concurrently, ↑ dose of imatinib by 50%. ↑ blood levels of simvastatin. Imatinib inhibits the following enzyme systems: CYP2C9, CYP2D6, CYP3A4/5 and may be expected to alter the effects of other drugs metabolized by these systems.

Drug-Food: Blood levels and effects are ↑ by grapefruit juice; concurrent use should be avoided.

Route/Dosage

Chronic Myeloid Leukemia

PO (Adults): *Chronic phase*—400 mg once daily, may be ↑ to 600 mg once daily; *accelerated phase or blast crisis*—600 mg once daily; may be ↑ to 800 mg/day given as 400 mg twice daily based on response and circumstances.

PO (Children): *Newly diagnosed Ph + CML*—340 mg/m² once daily (not to exceed 600 mg); *CML recurrent after failure of bone marrow transplant or resistance to interferon- α* —260 mg/m² once daily.

Gastrointestinal Stromal Tumors

PO (Adults): *Metastatic or unresectable*—400 mg once daily; may be ↑ to 400 mg twice daily if well tolerated and response insufficient; *Adjuvant treatment after resection*—400 mg once daily.

Ph+ Acute Lymphoblastic Leukemia

PO (Adults): 600 mg once daily.

PO (Children): 340 mg/m² once daily (not to exceed 600 mg).

Myelodysplastic/Myeloproliferative Diseases

PO (Adults): 400 mg once daily.

Aggressive Systemic Mastocytosis

PO (Adults): 400 mg once daily. *For patients with eosinophilia*—100 mg once daily; ↑ to 400 mg once daily if well tolerated and response insufficient.

Hypereosinophilic Syndrome and/or Chronic Eosinophilic Leukemia

PO (Adults): 400 mg once daily. *For patients with FIP1L1–PDGFRA fusion kinase* 100 mg once daily; ↑ to 400 mg once daily if well tolerated and response insufficient.

Dermatofibrosarcoma Protuberans

PO (Adults): 400 mg twice daily.

Hepatic Impairment

PO (Adults): ↓ dose by 25% in severe hepatic impairment.

Renal Impairment

PO (Adults): *CCr 40–59 mL/min*—Do not exceed dose of 600 mg/day; *CCr 20–39 mL/min*—↓ initial dose by 50%; ↑ as tolerated.

Availability (generic available)

Tablets: 100 mg, 400 mg.

NURSING IMPLICATIONS

Assessment

- Monitor for fluid retention. Weigh regularly, and assess for signs of pleural effusion, pericardial effusion, pulmonary edema, ascites (dyspnea, periorbital edema, swelling in feet and ankles, weight gain). Evaluate unexpected weight gain. Edema is usually managed with diuretics. **General fluid retention is usually dose related, more common in accelerated phase or blast crisis, and is more common in the elderly. Treatment usually involves diuretics, supportive therapy, and interruption of imatinib.**
- Monitor growth rate in children and adolescents; may cause decrease in growth.
- Monitor vital signs; may cause fever.
- Monitor for tumor lysis syndrome (malignant disease progression, high WBC counts, hyperuricemia, hyperkalemia, hyperphosphatemia, hypocalcemia, and/or dehydration). Prevent by maintain adequate hydration and correcting uric acid levels prior to starting imatinib.
- Monitor for signs and symptoms of DRESS (fever, rash, lymphadenopathy, and/or facial swelling, associated with involvement of other organ systems (hepatitis, nephritis, hematologic abnormalities, myocarditis, myositis) during therapy. May resemble an acute viral infection. Eosinophilia is often present. Discontinue therapy if signs occur.
- **Lab Test Considerations:** Monitor liver function before and monthly during treatment or when clinically indicated.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

cally indicated. May cause ↑ transaminases and bilirubin which usually lasts 1 wk and may require dose reduction or interruption. If bilirubin is >3 times the upper limit of normal or transaminases are >5 times the upper limit of normal withhold dose until bilirubin levels return to <1.5 times the upper limit of normal and transaminase levels to <2.5 times the upper limit of normal. Treatment may then be continued at reduced levels (patients on 400 mg/day should receive 300 mg/day and patients receiving 600 mg/day should receive 400 mg/day).

- Monitor CBC weekly for the first month, biweekly for the second month, and periodically during therapy. May cause neutropenia and thrombocytopenia, usually lasting 2–3 wk or 3–4 wk, respectively, and anemia. Usually requires dose reduction, but may require discontinuation (see Implementation).
- Patients receiving *chronic phase, myelodysplastic/myeloproliferative disease, aggressive systemic mastocytosis, and hypereosinophilic syndrome and/or chronic eosinophilic leukemia* treatment who develop an ANC <1.0 × 10⁹/L and/or platelets <50 × 10⁹/L should stop imatinib until ANC ≥1.5 × 10⁹/L and platelets are ≥75 × 10⁹/L. Then resume imatinib treatment at 400 mg or 600 mg/day.
- *Patients receiving accelerated phase and blast crisis treatment or Pb+ acute lymphoblastic leukemia* who develop an ANC <0.5 × 10⁹/L and/or platelets <10 × 10⁹/L should determine if cytopenia is related to leukemia via marrow aspirate or biopsy. If cytopenia is unrelated to leukemia, reduce dose to 400 mg/day. If cytopenia persists for 2 wk, reduce dose to 300 mg/day. If cytopenia persists for 4 wk and is still unrelated to leukemia, stop imatinib until ANC ≥1 × 10⁹/L and platelets are ≥20 × 10⁹/L. Then resume imatinib treatment at 300 mg/day.
- *Patients receiving aggressive systemic mastocytosis with eosinophilia or hypereosinophilic syndrome and/or chronic eosinophilic leukemia with FIP1L1–PDGFRa fusion kinase*—who develop ANC <1.0 × 10⁹/L and platelets <50 × 10⁹/L should stop imatinib until ANC ≥1.5 × 10⁹/L and platelets ≥75 × 10⁹/L. Resume treatment at previous dose.
- May cause hypokalemia.
- Verify pregnancy status in females with reproductive potential before starting therapy.

Potential Nursing Diagnoses

Risk for injury (Adverse Reactions)

Implementation

- **High Alert:** Fatalities have occurred with incorrect administration of chemotherapeutic agents. Before administering, clarify all ambiguous orders; double check single, daily, and course-of-therapy dose limits; have second practitioner independently double check original order and dose calculations. Therapy should be initiated by physician experienced in the treatment of patients with chronic myeloid leukemia.

- Patients requiring anticoagulation should receive low-molecular-weight or standard heparin, not warfarin.
- Treatment should be continued as long as patient continues to benefit.
- **PO:** Administer with food and a full glass of water to minimize GI irritation.
- Tablets may be dispersed in water or apple juice (50 mL for the 100 mg and 100 mL for the 400 mg tablet) and stirred with a spoon for patients unable to swallow pills. Administer immediately after suspension.
- Doses for children may be given once daily or divided into two doses, one in morning and one in evening.
- Administer doses >800 mg/day as 400 mg twice daily to decrease exposure to iron.

Patient/Family Teaching

- Explain purpose of imatinib to patient. Instruct patient to take imatinib as directed. If a dose is missed, take next dose at regular scheduled time. Do not double doses.
- Advise patient to avoid grapefruit and grapefruit juice during therapy.
- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- **Inform patient of possibility of edema and fluid retention.** Advise patient to notify health care professional if unexpected rapid weight gain occurs.
- **Advise patient to notify health care professional if signs and symptoms of liver failure (jaundice, anorexia, bleeding or bruising) or DRESS occur.**
- **Rep:** Advise female patient with reproductive potential to use effective contraception during and for at least 14 days after last dose of imatinib. Advise patient to notify health care professional if pregnancy is planned or suspected; avoid breast feeding for at least 1 mo after last dose of imatinib.

Evaluation/Desired Outcomes

- Decrease in production of leukemic cells in patients with CML, HES/CEL, and ALL and malignant cells in GIST, MDS/MPD, ASM, and DFSP.

imipenem/cilastatin
(i-me-pen-em/sye-la-stat-in)
Primaxin

Classification

Therapeutic: anti-infectives
Pharmacologic: carbapenems

Indications

Treatment of: Lower respiratory tract infections, Urinary tract infections, Abdominal infections, Gynecologic infections, Skin and skin structure infections, Bone and joint infections, Bacteremia, Endocarditis, Polymicrobial infections.

Action

Imipenem binds to the bacterial cell wall, resulting in cell death. Combination with cilastatin prevents renal inactivation of imipenem, resulting in high urinary concentrations. Imipenem resists the actions of many enzymes that degrade most other penicillins and penicillin-like anti-infectives. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Spectrum is broad. Active against most gram-positive aerobic cocci: *Streptococcus pneumoniae*, Group A beta-hemolytic streptococci, *Enterococcus*, *Staphylococcus aureus*. Active against many gram-negative bacillary organisms: *Escherichia coli*, *Klebsiella*, *Acinetobacter*, *Proteus*, *Serratia*, *Pseudomonas aeruginosa*. Also displays activity against: *Salmonella*, *Shigella*, *Neisseria gonorrhoeae*, Numerous anaerobes.

Pharmacokinetics

Absorption: Well absorbed after IM administration (imipenem 95%, cilastatin 75%). IV administration results in complete bioavailability.

Distribution: Widely distributed. Crosses the placenta; enters breast milk.

Metabolism and Excretion: *Imipenem and cilastatin* — 70% excreted unchanged by the kidneys.

Half-life: *Imipenem and cilastatin* — 1 hr (↑ in renal impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IM	rapid	1–2 hr	12 hr
IV	rapid	end of infusion	6–8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity may occur with penicillins and cephalosporins.

Use Cautiously in: Previous history of multiple hypersensitivity reactions; Seizure disorders; Renal impairment (dose ↓ required if $CCr \leq 70$ mL/min/1.73 m²); **OB, Lactation, Pedi:** Safety not established; **Geri:** May be at ↑ risk for toxic reactions due to age-related ↑ in renal function.

Adverse Reactions/Side Effects

CNS: SEIZURES, dizziness, somnolence. **CV:** hypotension. **GI:** CLOSTRIDIUM DIFFICILE-ASSOCIATED DIARRHEA (CDAD), diarrhea, nausea, vomiting. **Derm:** rash, pruritus, sweating, urticaria. **Hemat:** eosinophilia.

Local: phlebitis at IV site. **Misc:** allergic reaction including ANAPHYLAXIS, fever, superinfection.

Interactions

Drug-Drug: Do not admix with aminoglycosides (inactivation may occur). **Probenecid** ↓ renal excretion and ↑ blood levels. ↑ risk of seizures with **ganciclovir** or **cyclosporine** (avoid concurrent use of ganciclovir). May ↓ serum **valproate** levels (↑ risk of seizures).

Route/Dosage

Route/Dosage

IV (Adults): *Mild infections* — 250–500 mg q 6 hr. *Moderate infections* — 500 mg q 6–8 hr or 1 g q 8 hr. *Serious infections* — 500 mg q 6 hr to 1 g q 6–8 hr.

IV (Children ≥3 mo [non-CNS infections]): 15–25 mg/kg q 6 hr; higher doses have been used in older children with cystic fibrosis.

IV (Children 4 wk–3 mo): 25 mg/kg q 6 hr.

IV (Children 1–4 wk): 25 mg/kg q 8 hr.

IV (Children <1 wk): 25 mg/kg q 12 hr.

IM (Adults): 500–750 mg q 12 hr.

IM (Children): 10–15 mg/kg q 6 hr.

Renal Impairment

IV (Adults): If dose for normal renal function is 1 g/day *CCr 41–70 mL/min* — 125–250 mg q 6–8 hr, *CCr 21–40 mL/min* — 125–250 mg q 8–12 hr, *CCr 6–20 mL/min* — 125–250 mg q 12 hr; **if dose for normal renal function is 1.5 g/day** *CCr 41–70 mL/min* — 125–250 mg q 6–8 hr, *CCr 21–40 mL/min* — 125–250 mg q 8–12 hr, *CCr 6–20 mL/min* — 125–250 mg q 12 hr; **if dose for normal renal function is 2 g/day** *CCr 41–70 mL/min* — 125–500 mg q 6–8 hr, *CCr 21–40 mL/min* — 125–250 mg q 8–12 hr, *CCr 6–20 mL/min* — 125–250 mg q 12 hr; **if dose for normal renal function is 3 g/day** *CCr 41–70 mL/min* — 250–500 mg q 6–8 hr, *CCr 21–40 mL/min* — 250–500 mg q 6–8 hr, *CCr 6–20 mL/min* — 250–500 mg q 12 hr; **if dose for normal renal function is 4 g/day** *CCr 41–70 mL/min* — 250–750 mg q 6–8 hr, *CCr 21–40 mL/min* — 250–500 mg q 6–8 hr, *CCr 6–20 mL/min* — 250–250 mg q 12 hr.

Availability (generic available)

Powder for IV injection: 250 mg imipenem/250 mg cilastatin, 500 mg imipenem/500 mg cilastatin. **Powder for IM injection:** 500 mg imipenem/500 mg cilastatin, 750 mg imipenem/750 mg cilastatin.

NURSING IMPLICATIONS

Assessment

- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain a history before initiating therapy to determine previous use of and reactions to penicillins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify the physician immediately if these occur. Have epinephrine, an antihistamine, and resuscitative equipment close by in the event of an anaphylactic reaction.
- **Lab Test Considerations:** BUN, AST, ALT, LDH, serum alkaline phosphatase, bilirubin, and creatinine may be transiently ↑.
- Hemoglobin and hematocrit concentrations may be ↓.
- May cause positive direct Coombs' test.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)

Implementation

- **IM: Only the IM formulation can be used for IM administration.** Reconstitute 500-mg vial with 2 mL and 750-mg vial with 3 mL of lidocaine without epinephrine. Shake well to form a suspension. Withdraw and inject entire contents of vial IM.

IV Administration

- **Intermittent Infusion: Only the IV formulation can be used for IV administration. Diluent:** Reconstitute each 250- or 500-mg vial with 10 mL of D5W or 0.9% NaCl and shake well. Further dilute in 100 mL of D5W or 0.9% NaCl. Solution may range from clear to yellow in color. Infusion is stable for 4 hr at room temperature and 24 hr if refrigerated. **Concentration:** 2.5 mg/mL (with 250-mg vial); 5 mg/mL (with 500-mg vial). **Rate:** Infuse doses \leq 500 mg over 20–30 min. Infuse doses \geq 750 mg over 40–60 min. **Pedi:** Infuse doses \leq 500 mg over 15–30 min. Infuse doses $>$ 500 mg over 40–60 min.
- Rapid infusion may cause nausea and vomiting. If these symptoms develop, slow infusion.
- **Y-Site Compatibility:** acyclovir, alfentanil, amifostine, amikacin, aminocaproic acid, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, carboplatin, carmustine, caspofungin, ceftazolin, cefepime, cefotaxime, cefoxitin, ceftazidime, cefuroxime, chloramphenicol, cisatracurium, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, dexamethasone sodium phosphate, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, docetaxel, dolasetron, dopamine, doxacurium, doxorubicin, doxorubicin liposomal, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin, eptifibatid, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentanyl, fludarabine, fluorouracil, folic acid, foscarnet, furosemide, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone sodium succinate, hydro-

morphone, idarubicin, ifosfamide, indomethacin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, magnesium sulfate, melphalan, methotrexate, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, mitoxantrone, morphine, multivitamins, nafcillin, naloxone, nesiritide, nitroglycerin, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, pamidronate, pancuronium, pantoprazole, pemetrexed, penicillin G, pentobarbital, phenolamine, phenylephrine, phytonadione, potassium acetate, potassium chloride, propranolol, propofol, propranolol, protamine, ranitidine, remifentanyl, rituximab, rocuronium, sodium acetate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, tolazoline, trastuzumab, vasopressin, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine.

- **Y-Site Incompatibility:** alemtuzumab, aloprurinol, amiodarone, amphotericin B cholesteryl sulfate, amphotericin B lipid complex, amphotericin B liposome, azathioprine, ceftriaxone, chlorpromazine, dantrolene, daptomycin, diazepam, diazoxide, etoposide phosphate, gallium nitrate, ganciclovir, gemcitabine, haloperidol, lorazepam, mannitol, mechlorethamine, metaraminol, methyldopate, milrinone, mycophenolate, nalbuphine, nicardipine, palonosetron, phenytoin, prochlorperazine, pyridoxime, quinupristin/dalfopristin, sargramostim, sodium bicarbonate, thiamine, trimethoprim/sulfamethoxazole, vecuronium.
- **Additive Incompatibility:** May be inactivated if administered concurrently with aminoglycosides. If administered concurrently, administer in separate sites, if possible, at least 1 hr apart. If second site is unavailable, flush lines between medications.

Patient/Family Teaching

- Advise patient to report the signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools) and allergy. Consult health care professional before treating with anti-diarrheals.
- **Caution patient to notify health care professional if fever and diarrhea occur, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional. May occur up to several wk after discontinuation of medication.**

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

imipramine (im-ip-ra-meen)

★ Impril, Tofranil, Tofranil PM

Classification

Therapeutic: antidepressants

Pharmacologic: tricyclic antidepressants

Indications

Various forms of depression. Enuresis in children. **Unlabeled Use:** Adjunct in the management of chronic pain, incontinence (in adults), vascular headache prophylaxis, cluster headache, insomnia.

Action

Potentiates the effect of serotonin and norepinephrine. Has significant anticholinergic properties. **Therapeutic Effects:** Antidepressant action that develops slowly over several weeks.

Pharmacokinetics

Absorption: Well absorbed from the GI tract.

Distribution: Widely distributed. Probably crosses the placenta and enters breast milk.

Protein Binding: 89–95%.

Metabolism and Excretion: Mostly metabolized by the liver (CYP2D6 isoenzyme) to desipramine; ~~the~~ the CYP2D6 enzyme system exhibits genetic polymorphism; ~7% of population may be poor metabolizers (PMs) and may have significantly ↑ imipramine concentrations and an ↑ risk of adverse effects.

Half-life: 8–16 hr.

TIME/ACTION PROFILE (antidepressant effect)

ROUTE	ONSET	PEAK	DURATION
PO	hours	2–6 wk	weeks

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with other antidepressants may occur; Angle-closure glaucoma; Hypersensitivity to tartrazine or sulfites (in some preparations); Recent MI, known history of QTC interval prolongation, heart failure; Concurrent use of MAO inhibitors or MAO-like drugs (linezolid or methylene blue).

Use Cautiously in: Pre-existing cardiovascular disease; Seizures or history of seizure disorder; May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; **Lactation:** Drug is present in breast milk; discontinue imipramine or bottle feed;

Pedi: Suicide risk may be greater in children or adolescents. Safety not established in children <6 yr; **Geri:** More susceptible to adverse reactions. Geriatric males with prostatic hyperplasia are more susceptible to urinary retention.

Adverse Reactions/Side Effects

CNS: **SUICIDAL THOUGHTS**, drowsiness, fatigue, agitation, confusion, hallucinations, insomnia. **EENT:** blurred vision, dry eyes. **CV:** **ARRHYTHMIAS**, hypotension, ECG changes. **GI:** constipation, dry mouth, nausea, paralytic ileus, weight gain. **GU:** urinary retention, ↓ libido. **Derm:** photosensitivity. **Endo:** gynecomastia. **Hemat:** blood dyscrasias.

Interactions

Drug-Drug: Concurrent use with **MAO inhibitors** may result in serious potentially fatal reactions (MAO inhibitors should be stopped at least 14 days before imipramine therapy. Imipramine should be stopped at least 14 days before MAO inhibitor therapy). Concurrent use with **MAO-inhibitor like drugs**, such as **linezolid** or **methylene blue** may ↑ risk of serotonin syndrome; concurrent use contraindicated; do not start therapy in patients receiving **linezolid** or **methylene blue**; if **linezolid** or **methylene blue** need to be started in a patient receiving imipramine, immediately discontinue imipramine and monitor for signs/symptoms of serotonin syndrome for 2 wk or until 24 hr after last dose of linezolid or methylene blue, whichever comes first (may resume imipramine therapy 24 hr after last dose of linezolid or methylene blue). Concurrent use with **SSRI antidepressants** may result in ↑ toxicity and should be avoided (**fluoxetine** should be stopped 5 wk before). Hypertensive crisis may occur with **clonidine**. Imipramine is metabolized in the liver by the **cytochrome P450 2D6 enzyme** and its action may be affected by drugs that compete for metabolism by this enzyme including **other antidepressants**, **phenothiazines**, **carbamazepine**, **class 1C antiarrhythmics (propafenone, flecainide)**; when used concurrently, dose reduction of one or the other or both may be necessary. Concurrent use of other drugs that inhibit the activity of the enzyme, including **cimetidine**, **quinidine**, **amiodarone**, and **ritonavir**, may result in ↑ effects of imipramine. Concurrent use with **levodopa** may result in delayed/↓ absorption of levodopa or hypertension. Blood levels and effects may be ↓ by **rifamycins**. ↑ CNS depression with other CNS **depressants** including **alcohol**, **antihistamines**, **clonidine**, **opioids**, and **sedative/hypnotics**. **Barbiturates** may alter blood levels and effects. **Adrenergic** and **anticholinergic** side effects may be ↑ with other **agents having these properties**. **Phenothiazines** or **hormonal contraceptives** ↑ levels and may cause toxicity. **Cigarette smoking (nicotine)** may ↑ metabolism and alter effects. Drugs that affect serotonergic neurotransmitter systems, including **SSRIs**, **SNRIs**, **fentanyl**, **bupirone**, **tramadol** and **triptans** ↑ risk of serotonin syndrome.

Drug-Natural Products: Use with **St. John's wort** ↑ of serotonin syndrome. Concomitant use of

★ = Canadian drug name. ~~the~~ = Genetic implication. ~~through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

kava-kava, valerian, or chamomile can ↑ CNS depression. ↑ anticholinergic effects with jimson weed and scopolia.

Route/Dosage

PO (Adults): 25–50 mg 3–4 times daily (not to exceed 300 mg/day); total daily dose may be given at bedtime.

PO (Geriatric Patients): 25 mg at bedtime initially, up to 100 mg/day in divided doses.

PO (Children >12 yr): *Antidepressant*—25–50 mg/day in divided doses (not to exceed 100 mg/day).

PO (Children 6–12 yr): *Antidepressant*—10–30 mg/day in 2 divided doses.

PO (Children ≥6 yr): *Emuresis*—25 mg once daily 1 hr before bedtime; ↑ if necessary by 25 mg at weekly intervals to 50 mg in children <12 yr, up to 75 mg in children >12 yr.

Availability (generic available)

Tablets: 10 mg, 25 mg, 50 mg, 75 mg. **Capsules:** 75 mg, 100 mg, 125 mg, 150 mg.

NURSING IMPLICATIONS

Assessment

- Monitor BP and pulse rate prior to and during initial therapy.
- Monitor plasma levels in treatment-resistant patients.
- Monitor weight and BMI initially and periodically throughout therapy.
- For overweight/obese individuals, obtain FBS and cholesterol levels. Refer as appropriate for nutrition/weight management and medical management.
- Obtain weight and BMI initially and regularly throughout therapy.
- Assess for sexual dysfunction (decreased libido; erectile dysfunction).
- **Assess for suicidal tendencies, especially during early therapy.** Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yrs. After starting therapy, children, adolescents, and young adults should be seen by health care professional at least weekly for 4 wk, every 3 wk for next 4 wk, and on advice of health care professional thereafter.
- **Pedi, Geri:** Monitor baseline and periodic ECGs in elderly patients or patients with heart disease and before increasing dose with children treated for enuresis. May cause prolonged PR and QT intervals and may flatten T waves.
- **Depression:** Assess mental status (orientation, mood, behavior) frequently. Confusion, agitation, and hallucinations may occur during initiation of therapy and may require dosage reduction. **Assess for suicidal tendencies, especially during early therapy.** Restrict amount of drug available to patient.
- **Enuresis:** Assess frequency of bedwetting during therapy. Ask patient or caretaker to maintain diary.

- **Pain:** Assess location, duration, and severity of pain periodically during therapy. Use pain scale to monitor effectiveness of therapy.
- **Lab Test Considerations:** Assess leukocyte and differential blood counts and renal and hepatic functions prior to and periodically during prolonged or high-dose therapy.
- Serum levels may be monitored in patients who fail to respond to usual therapeutic dose. Therapeutic plasma concentration range for depression is 150–300 ng/mL.
- May cause alterations in blood glucose levels.
- **Toxicity and Overdose:** Symptoms of acute overdose include disturbed concentration, confusion, restlessness, agitation, seizures, drowsiness, mydriasis, arrhythmias, fever, hallucinations, vomiting, and dyspnea.
- Treatment of overdose includes gastric lavage, activated charcoal, and a stimulant cathartic. Maintain respiratory and cardiac function (monitor ECG for at least 5 days) and temperature. Medications may include digoxin for HF, antiarrhythmics, and anticonvulsants.

Potential Nursing Diagnoses

Ineffective coping (Indications)

Impaired urinary elimination (Indications, Side Effects)

Sexual dysfunction (Side Effects)

Implementation

- Dose increases should be made at bedtime because of sedation. Dose titration is a slow process; may take wk to mo. May be given as a single dose at bedtime to minimize sedation during the day.
- Taper to avoid withdrawal effects. Reduce by 50% for 3 days, then reduce by 50% for 3 days, then discontinue.
- **PO:** Administer medication with or immediately following a meal to minimize gastric irritation.
- **IM:** May be slightly yellow or red in color. Crystals may develop if solution is cool; place ampule under warm running water for 1 min to dissolve.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as possible unless almost time for next dose; if regimen is a single dose at bedtime, do not take in the morning because of side effects. Advise patient that drug effects may not be noticed for at least 2 wk. Abrupt discontinuation may cause nausea, vomiting, diarrhea, headache, trouble sleeping with vivid dreams, and irritability.
- May cause drowsiness and blurred vision. Caution patient to avoid driving and other activities requiring alertness until response to drug is known.
- Instruct patient to notify health care professional if visual changes occur. Inform patient that periodic glaucoma testing may be needed during long-term therapy.
- Caution patient to change positions slowly to minimize orthostatic hypotension. **Advise patient, family,**

and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide, new or worse depression or anxiety, agitation or restlessness, panic attacks, insomnia, new or worse irritability, aggressiveness, acting on dangerous impulses, mania, or other changes in mood or behavior or if symptoms of serotonin syndrome occur.

- Advise patient to avoid alcohol or other CNS depressant drugs during therapy and for at least 3–7 days after therapy has been discontinued.
- Instruct patient to notify health care professional if urinary retention, dry mouth, or constipation persists. Sugarless candy or gum may diminish dry mouth and an increase in fluid intake or bulk may prevent constipation. If symptoms persist, dose reduction or discontinuation may be necessary. Consult health care professional if dry mouth persists for more than 2 wk.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Alert patient that urine may turn blue-green in color.
- Inform patient of need to monitor dietary intake, as possible increase in appetite may lead to undesired weight gain. Inform patient that increased amounts of riboflavin in the diet may be required; consult health care professional.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Therapy for depression is usually prolonged. Emphasize the importance of follow-up exams to evaluate progress and improve coping skills.
- Instruct female patients to notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- **Pedi:** Inform parents that the side effects most likely to occur include nervousness, insomnia, unusual tiredness, and mild nausea and vomiting. Notify health care professional if these symptoms become pronounced.
- Advise parents to keep medication out of reach of children to prevent inadvertent overdose.

Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings.
- Increased appetite.
- Improved energy level.
- Pain relief.
- Diminished incidence of enuresis.
- Improved sleep in patients treated for depression. Patient may require 2–6 wk of therapy before full therapeutic effects of medication are noticeable.
- Control of bedwetting in children >6 yr.
- Decrease in chronic neurogenic pain.

indacaterol (in-da-kat-e-role)

Arcapta Neohaler,  Onbrez Breezhaler

Classification

Therapeutic: bronchodilators, COPD agents
Pharmacologic: adrenergics

Indications

Long-term maintenance treatment of airflow obstruction associated with chronic obstructive pulmonary disease (COPD).

Action

Produces accumulation of cyclic adenosine monophosphate (cAMP) at beta₂-adrenergic receptors. Relatively specific for pulmonary receptors. Acts as a long-acting beta-agonist (LABA). **Therapeutic Effects:** Bronchodilation, with improvement in symptoms of COPD.

Pharmacokinetics

Absorption: Some systemic absorption from lungs and GI tract (43–45%).

Distribution: Extensively distributed.

Metabolism and Excretion: 54% excreted unchanged in feces; absorbed drug is mostly metabolized; 23% excreted in feces as metabolites.

Half-life: 45.5–126 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Inhaln	unknown	15 min	24 hr [†]

[†] Bronchodilation.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Acutely deteriorating COPD or acute respiratory symptoms; Asthma.

Use Cautiously in: **OB:** Use during pregnancy only if potential benefit justifies potential fetal risks; may interfere with uterine contractility during labor; **Pedi:** Safety and effectiveness not established.

Exercise Extreme Caution in: Concurrent use of MAO inhibitors, tricyclic antidepressants or drugs that prolong the QTc interval (↑ risk of adverse cardiovascular reactions).

Adverse Reactions/Side Effects

CNS: headache. **EENT:** nasopharyngitis, oropharyngeal pain. **Resp:** PARADOXICAL BRONCHOSPASM, cough. **GI:** nausea. **Misc:** ALLERGIC REACTIONS.

Interactions

Drug-Drug: ↑ risk of serious adverse cardiovascular effects with MAO inhibitors, tricyclic antidepressants, drugs that prolong the QTc interval; use with extreme caution. Effectiveness may be ↓ by beta-blockers; use cautiously and only when necessary. Con-

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

current use with other **adrenergics** may ↑ adrenergic adverse reactions (↑ heart rate, BP, jitteriness). ↑ risk of hypokalemia or ECG changes with **xanthine derivatives**, **corticosteroids**, **diuretics**, or **non-potassium sparing diuretics**.

Drug-Natural Products: Use with **caffeine-containing herbs** (cola nut, guarana, mate, tea, coffee) ↑ stimulant effect.

Route/Dosage

Inhaln (Adults): 75 mcg once daily.

Availability

Capsules for inhalation: 75 mcg.

NURSING IMPLICATIONS

Assessment

- **Assess respiratory status** (rate, breath sounds, degree of dyspnea, pulse) before administration and at peak of medication. Consult health care professional about alternative medication if severe bronchospasm is present; onset of action is too slow for patients in acute distress. If paradoxical bronchospasm (wheezing) occurs, withhold medication and notify health care professional immediately.
- **Monitor for signs and symptoms of allergic reactions** (difficulties in breathing or swallowing, swelling of tongue, lips and face, urticaria, skin rash). Discontinue therapy if symptoms occur.
- **Lab Test Considerations:** May cause transient hypokalemia and hyperglycemia.

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)

Risk for activity intolerance (Indications)

Implementation

- **Inhaln:** Pull cap off *Neobaler*. Open inhaler by holding the base and tilting the mouthpiece. Tear perforation to separate one blister from blister card; peel away protective back to expose foil. With dry hands, push capsule through foil to remove. Insert capsule into capsule chamber; do not swallow capsule or place directly into mouthpiece. Close inhaler until it clicks. Press both buttons fully 1 time; click is heard as capsule is pierced; do not press piercing buttons more than 1 time. Release buttons fully. Breathe out; do not blow into mouthpiece. Close lips around mouthpiece; hold inhaler with buttons left and right (not up and down). Breathe in rapidly and steadily, as deep as possible, a whirring noise is heard. Continue to hold breath as long as possible while removing inhaler from mouth. Open inhaler, if powder remains in capsule, close inhaler and inhale again. Usually requires 1–2 breaths. Remove capsule.

Patient/Family Teaching

- Instruct patient in the correct use of capsules and *Neobaler*. Advise patient not to discontinue without consulting health care professional; symptoms may recur.

- Inform patient that indacaterol is not a bronchodilator and should not be used for treating sudden breathing problems.
- Advise patient to notify health care professional if signs and symptoms of allergic reaction, worsening symptoms; decreasing effectiveness of inhaled, short-acting beta₂-agonists; need for more inhalations than usual of inhaled, short-acting beta₂-agonists; or significant decrease in lung function occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to avoid concurrent use of Rx, OTC, and herbal products without consulting health care professional.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in the number of flare-ups or the worsening of COPD symptoms (exacerbations).

indomethacin

(in-doe-meth-a-sin)

Indocin, Tivorbex

Classification

Therapeutic: antirheumatics, ductus arteriosus patency adjuncts (IV only), nonsteroidal anti-inflammatory agents

Indications

PO: Inflammatory disorders including: Rheumatoid arthritis, Gouty arthritis, Osteoarthritis, Ankylosing spondylitis. Mild-to-moderate acute pain. **IV:** Alternative to surgery in the management of patent ductus arteriosus (PDA) in premature neonates.

Action

Inhibits prostaglandin synthesis. In the treatment of PDA, decreased prostaglandin production allows the ductus to close. **Therapeutic Effects:** **PO:** Suppression of pain and inflammation. **IV:** Closure of PDA.

Pharmacokinetics

Absorption: Well absorbed after oral administration in adults, incomplete oral absorption in neonates.

Distribution: Crosses the blood-brain barrier and the placenta. Enters breast milk.

Protein Binding: 99%.

Metabolism and Excretion: Mostly metabolized by the liver.

Half-life: Neonates <2 weeks: 20 hr; >2 weeks: 11 hr; Adults: 2.6–11 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO (analgesic)	30 min	0.5–2 hr	4–6 hr
PO-ER (analgesic)	30 min	unknown	4–6 hr
PO (anti-inflammatory)	up to 7 days	1–2 wk	4–6 hr
PO-ER (anti-inflammatory)	up to 7 days	1–2 wk	4–6 hr
IV (closure of PDA)	up to 48 hr	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Known alcohol intolerance (suspension); Cross-sensitivity may exist with other NSAIDs, including aspirin; Active GI bleeding; Ulcer disease; Proctitis or recent history of rectal bleeding; Intraventricular hemorrhage; Thrombocytopenia; Coronary artery bypass graft (CABG) surgery; **Pedi:** ↑ risk of necrotizing enterocolitis and bowel perforation in premature infants with PDA.

Use Cautiously in: Severe renal or hepatic disease; Cardiovascular disease or risk factors for cardiovascular disease (may ↑ risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke, especially with prolonged use or use of higher doses); avoid use in patients with recent MI or HF; History of ulcer disease; Seizure disorders; Hypertension; **OB:** Not recommended starting at 30 wk gestation (potential for causing premature closure of ductus arteriosus); **Lactation:** Usually compatible with breast feeding (AAP); **Ger:** ↑ risk of adverse reactions.

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, headache, psychic disturbances. **EENT:** blurred vision, tinnitus. **CV:** HF, MYOCARDIAL INFARCTION, STROKE, edema, hypertension. **GI:** PO—DRUG-INDUCED HEPATITIS, GI BLEEDING, constipation, dyspepsia, nausea, vomiting, discomfort, necrotizing enterocolitis. **GU:** cystitis, hematuria, renal failure. **Derm:** rash. **F and E:** hyperkalemia; IV, dilutional hyponatremia; IV, hypoglycemia. **Hemat:** thrombocytopenia, blood dyscrasias, prolonged bleeding time. **Local:** phlebitis at IV site. **Misc:** allergic reactions including ANAPHYLAXIS.

Interactions

Drug-Drug: Concurrent use with aspirin may ↓ effectiveness. Additive adverse GI effects with aspirin, other NSAIDs, corticosteroids, or alcohol. Chronic use of acetaminophen ↑ risk of adverse renal reactions. May ↓ effectiveness of diuretics or anti-hypertensives. May ↑ hypoglycemia from insulins or oral hypoglycemic agents. May ↑ risk of toxicity

from lithium or zidovudine (avoid concurrent use with zidovudine). ↑ risk of toxicity from methotrexate. Probenecid ↑ risk of toxicity from indomethacin. ↑ risk of bleeding with anticoagulants, aspirin, clopidogrel, ticagrelor, prasugrel, corticosteroids, fibrinolytics, SNRIs, or SSRIs. ↑ risk of adverse hematologic reactions with antineoplastics or radiation therapy. ↑ risk of nephrotoxicity with cyclosporine. Concurrent use with potassium-sparing diuretics may result in hyperkalemia. May ↑ levels of digitalis glycosides, methotrexate, lithium, and aminoglycosides when used IV in neonates.

Drug-Natural Products: ↑ bleeding risk with anise, arnica, chamomile, clove, dong quai, feverfew, garlic, ginger, ginkgo, Panax ginseng.

Route/Dosage

Anti-inflammatory

PO (Adults): *Antiarthritic*—25–50 mg 2–4 times daily or 75-mg extended-release capsule once or twice daily (not to exceed 200 mg or 150 mg of SR/day). A single bedtime dose of 100 mg may be used. *Antigout*—100 mg initially, followed by 50 mg 3 times daily for relief of pain, then ↓ further. *Mild-to-moderate acute pain (Tivorbex)*—20 mg 3 times daily or 40 mg 2–3 times daily.

PO (Children >2 yr): 1–2 mg/kg/day in 2–4 divided doses (not to exceed 4 mg/kg/day or 150–200 mg/day).

PDA Closure

IV (Neonates): *Treatment*—0.2 mg/kg initially, then 2 subsequent doses at 12–24 hr intervals of 0.1 mg/kg if age <48 hr at time of initial dose; 0.2 mg/kg if 2–7 days at initial dose; 0.25 mg/kg if age >7 days at initial dose. *Prophylaxis*—0.1–0.2 mg/kg initially, then 0.1 mg/kg q 12–24 hr for 2 doses.

Availability (generic available)

Capsules: 25 mg, 50 mg. **Capsules (Tivorbex):** 20 mg, 40 mg. **Sustained-release capsules:** 75 mg.

Oral suspension (fruit mint, pineapple coconut mint flavors): 5 mg/mL. **Rectal suppository:** 50 mg. **Powder for injection:** 1 mg/vial.

NURSING IMPLICATIONS

Assessment

- Patients who have asthma, aspirin-induced allergy, and nasal polyps are at increased risk for developing hypersensitivity reactions. Monitor for rhinitis, asthma, and urticaria.
- Assess patient for skin rash frequently during therapy. Discontinue ibuprofen at first sign of rash; may be life-threatening. Stevens-Johnson syndrome or toxic epidermal necrolysis may develop. Treat symptomatically; may recur once treatment is stopped.

* = Canadian drug name. † = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; underline indicate most frequent.

- Monitor BP during initiation periodically during therapy. May cause fluid retention and edema leading to new onset or worsening hypertension.
- **Arthritis:** Assess limitation of movement and pain—note type, location, and intensity before and 1–2 hr after administration.
- **PDA:** Monitor respiratory status, heart rate, BP, echocardiogram, and heart sounds routinely throughout therapy.
- Monitor intake and output. Fluid restriction is usually instituted throughout therapy.
- **Acute pain:** Assess type, location, and intensity of pain prior to and 2 hrs (peak) following administration.
- **Lab Test Considerations:** Evaluate BUN, serum creatinine, CBC, serum potassium levels, and liver function tests periodically in patients receiving prolonged therapy.
- Serum potassium, BUN, serum creatinine, AST, and ALT tests may show ↑ levels. Blood glucose concentrations may be altered. Hemoglobin and hematocrit concentrations, leukocyte and platelet counts, and CCr may be ↓.
- Urine glucose and urine protein concentrations may be ↑.
- Leukocyte and platelet count may be ↓. Bleeding time may be prolonged for several days after discontinuation.

Potential Nursing Diagnoses

Acute pain (Indications)

Impaired physical mobility (Indications)

Implementation

- If prolonged therapy is used, dose should be reduced to the lowest level that controls symptoms to minimize risk of cardiovascular thrombotic events.
- **PO:** Administer after meals, with food, or with antacids to decrease GI irritation. Do not break, crush, or chew sustained-release capsules.
- Shake suspension before administration. Do not mix with antacid or any other liquid.

IV Administration

- **IV Push:** **Diluent:** Preservative-free 0.9% NaCl or preservative-free sterile water. Reconstitute with 1 or 2 mL of diluent. **Concentration:** 0.5–1 mg/mL. Reconstitute immediately before use and discard any unused solution. Do not dilute further or admix. Do not administer via umbilical catheter into vessels near the superior mesenteric artery, as these can cause vasoconstriction and compromise blood flow to the intestines. Do not administer intra-arterially. **Rate:** Administer over 20–30 min. Avoid extravasation, as solution is irritating to tissues.
- **Y-Site Compatibility:** aminophylline, ascorbic acid, atropine, bumetanide, cefazolin, cefotaxime, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, cisplatin, clindamycin, cyanocobalamin, cyclosporine, dexamethasone, digoxin, enalaprilat,

ephedrine, epoetin alfa, fentanyl, fluconazole, folic acid, furosemide, ganciclovir, heparin, hydrocortisone, imipenem/cilastatin, insulin, ketorolac, lidocaine, mannitol, metoclopramide, metoprolol, multivitamins, nafcillin, nitroglycerin, nitroprusside, penicillin G, pentobarbital, phenobarbital, phytonadione, potassium chloride, procainamide, ranitidine, sodium bicarbonate, streptokinase, theophylline.

- **Y-Site Incompatibility:** amikacin, amino acid injection, aztreonam, benzotropine, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cefotetan, chlorpromazine, dactinomycin, dantrolene, daunorubicin hydrochloride, diazepam, diphenhydramine, dobutamine, dopamine, doxycycline, epinephrine, erythromycin, esmolol, etoposide, famotidine, gentamicin, glycopyrrolate, haloperidol, isoproterenol, labetalol, levofloxacin, magnesium sulfate, meperidine, methyldopate, midazolam, morphine, nalbuphine, norepinephrine, ondansetron, oxytocin, paclitaxel, pantoprazole, piperazine, pentamidine, pentazocine, phenylephrine, phenytoin, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, succinylcholine, sufentanil, thiamine, tobramycin, tolazoline, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, verapamil.

Patient/Family Teaching

- Advise patient to take this medication with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Instruct patient to take medication as directed. Take missed doses as soon as remembered if not almost time for next dose. Do not double doses.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid the concurrent use of alcohol, aspirin, other NSAIDs, acetaminophen, or other OTC medications without consulting health care professional.
- Caution patient to wear sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- **Instruct patient to notify health care professional if signs and symptoms of hepatotoxicity (nausea, fatigue, lethargy, diarrhea, pruritus, jaundice, right upper quadrant tenderness, “flu-like” symptoms) occur or if rash, itching, chills, fever, muscle aches, visual disturbances, weight gain, edema, abdominal pain, black stools, or persistent headache occurs.**
- **PDA:** Explain to parents the purpose of medication and the need for frequent monitoring.

Evaluation/Desired Outcomes

- Decrease in severity of mild to moderate pain.
- Improved joint mobility. Partial arthritic relief is usually seen within 2 wk, but maximum effectiveness

may require up to 1 mo of continuous therapy. Patients who do not respond to one NSAID may respond to another.

- Successful PDA closure.

inFLIXimab (in-flix-i-mab)

Inflextra, Remicade, Renflexis,
 * Remsima

Classification

Therapeutic: antirheumatics (DMARDs), gastrointestinal anti-inflammatories
 Pharmacologic: monoclonal antibodies

Indications

Moderately to severe active rheumatoid arthritis (in combination with methotrexate). Moderately to severely active Crohn's disease in patients with an inadequate response to conventional therapy. Active psoriatic arthritis. Active ankylosing spondylitis. Moderately to severely active ulcerative colitis in patients with an inadequate response to conventional therapy. Chronic severe plaque psoriasis in patients who are candidates for systemic therapy and when other systemic therapies are less appropriate.

Action

Neutralizes and prevents the activity of tumor necrosis factor-alpha (TNF-alpha), resulting in anti-inflammatory and antiproliferative activity. **Therapeutic Effects:** Decreased signs and symptoms, decreased rate of joint destruction and improved physical function in rheumatoid arthritis and psoriatic arthritis. Decreased signs and symptoms and induction and maintenance of clinical remission in Crohn's disease. Reduction in number of fistulas and maintenance of closure of fistulae in Crohn's disease. Decreased signs and symptoms in ankylosing spondylitis. Decreased signs and symptoms, maintenance of clinical remission and mucosal healing, and eliminating corticosteroid use in ulcerative colitis. Decreased induration, scaling and erythema of psoriatic lesions.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Predominantly distributed within the vascular compartment.

Metabolism and Excretion: Unknown.

Half-life: 9.5 days.

TIME/ACTION PROFILE (symptoms of Crohn's disease)

ROUTE	ONSET	PEAK	DURATION
IV	1–2 wk	unknown	12–48 wk†

†After infusion.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to infliximab, murine (mouse) proteins, or other components in the formulation; Moderate to severe HF (doses >5 mg/kg); Concurrent anakinra or abatacept; **Lactation:** Lactation.

Use Cautiously in: History of chronic or recurrent infection or underlying illness/treatment predisposing to infection; Patients being retreated after 2 yr without treatment (↑ risk of adverse reactions); History of tuberculosis or exposure (latent tuberculosis should be treated prior to infliximab therapy); History of opportunistic infection; Patients residing, or who have resided, where tuberculosis, histoplasmosis, coccidioidomycoses, or blastomycosis is endemic; Chronic obstructive pulmonary disease (↑ risk of malignancy); **Geri:** Geriatric patients; **OB:** Use only if clearly needed; **Pedi:** Children <6 yr (safety not established); ↑ risk of lymphoma (including hepatosplenic T-cell lymphoma [HSTCL] in patients with Crohn's disease or ulcerative colitis), leukemia, and other malignancies.

Adverse Reactions/Side Effects

CNS: fatigue, headache, anxiety, depression, dizziness, insomnia. **EENT:** conjunctivitis. **Resp:** upper respiratory tract infection, bronchitis, cough, dyspnea, laryngitis, pharyngitis, respiratory tract allergic reaction, rhinitis, sinusitis. **CV:** chest pain, hypertension, hypotension, pericardial effusion, tachycardia, HF. **GI:** abdominal pain, nausea, vomiting, constipation, diarrhea, dyspepsia, flatulence, hepatotoxicity, intestinal obstruction, oral pain, tooth pain, ulcerative stomatitis.

GU: dysuria, urinary frequency, urinary tract infection. **Derm:** acne, alopecia, dry skin, ecchymosis, eczema, erythema, flushing, hematoma, hot flashes, pruritus, psoriasis, rash, sweating, urticaria. **Hemat:** neutropenia. **MS:** arthralgia, arthritis, back pain, involuntary muscle contractions, myalgia. **Neuro:** paresthesia.

Misc: **INFECTIONS** (including reactivation tuberculosis and other opportunistic infections due to bacterial, invasive fungal, viral, mycobacterial, and parasitic pathogens), **MALIGNANCY** (including lymphoma, HSTCL, leukemia, and skin cancer), fever, **SARCOIDOSIS**, **infusion reactions**, chills, flu-like syndrome, herpes simplex, herpes zoster, hypersensitivity reactions, lupus-like syndrome, moniliasis, pain, peripheral edema, vasculitis.

Interactions

Drug-Drug: Concurrent use with **anakinra** or **abatacept** ↑ risk of serious infections (not recommended). Concurrent use with **azathioprine** and/or **methotrexate** may ↑ risk of HSTCL. Use of **live virus vaccines** or therapeutic infectious agents may ↑ risk of infection; avoid concurrent use.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Route/Dosage

Rheumatoid Arthritis

IV (Adults): 3 mg/kg initially, then repeat at 2 and 6 wk after initial infusion, then repeat every 8 wk; dose may be adjusted in partial responders up to 10 mg/kg or treatment as often as every 4 wk (to be used with methotrexate).

Crohn's Disease

IV (Adults): 5 mg/kg initially, then repeat at 2 and 6 wk after initial infusion, then maintenance dose of 5 mg/kg every 8 wk; dose may be adjusted up to 10 mg/kg in patients who initially respond and then lose their response.

IV (Children): 5 mg/kg initially, then repeat at 2 and 6 wk after initial infusion, then maintenance dose of 5 mg/kg every 8 wk.

Ankylosing Spondylitis

IV (Adults): 5 mg/kg initially, then repeat at 2 and 6 wk after initial infusion, then maintenance dose of 5 mg/kg every 6 wk.

Psoriatic Arthritis

IV (Adults): 5 mg/kg initially, then repeat at 2 and 6 wk after initial infusion, then maintenance dose of 5 mg/kg every 8 wk (to be used with or without methotrexate).

Ulcerative Colitis

IV (Adults and Children ≥ 6 yr): 5 mg/kg initially, then repeat at 2 and 6 wk after initial infusion, then maintenance dose of 5 mg/kg every 8 wk.

Plaque Psoriasis

IV (Adults): 5 mg/kg initially, then repeat at 2 and 6 wk after initial infusion, then maintenance dose of 5 mg/kg every 8 wk.

Availability

Powder for injection: 100 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess for infusion-related reactions (fever, chills, urticaria, pruritus) during and for 2 hr after infusion. Symptoms usually resolve when infusion is discontinued. Reactions are more common after 1st or 2nd infusion. Frequency of reactions may be reduced with immunosuppressant agents.
- Monitor patients who develop a new infection while taking infliximab closely. Discontinue therapy in patients who develop a serious infection or sepsis. Do not initiate therapy in patients with active infections.
- Assess for signs and symptoms of systemic infections (fever, malaise, weight loss, sweats, cough, dyspnea, pulmonary infiltrates, serious systemic illness with or without concomitant shock). Ascertain if patient lives in or has traveled to areas of endemic mycoses.

Consider empiric antifungal treatment for patients at risk of histoplasmosis and other invasive fungal infections until the pathogens are identified. Consult with an infectious diseases specialist. Consider stopping infliximab until the infection has been diagnosed and adequately treated.

- Assess for latent tuberculosis with a tuberculin skin test prior to initiation of and during therapy. Treatment of latent tuberculosis should be initiated prior to therapy with infliximab.
- Observe patient for hypersensitivity reactions (urticaria, dyspnea, hypotension) during infusion. Discontinue infliximab if severe reaction occurs. Have medications (antihistamines, acetaminophen, corticosteroids, epinephrine) and equipment readily available in the event of a severe reaction.
- **Rheumatoid Arthritis:** Assess pain and range of motion prior to and periodically during therapy.
- **Crohn's Disease and Ulcerative Colitis:** Assess for signs and symptoms before, during, and after therapy.
- **Psoriasis:** Assess lesions periodically during therapy.
- **Lab Test Considerations:** May cause \uparrow in positive ANA. Frequency may be decreased with baseline immunosuppressant therapy.
- Monitor liver function tests periodically during therapy. May cause mild to moderate AST and ALT \uparrow without progressing to liver dysfunction. If patient develops jaundice or liver enzyme elevations ≥ 5 times the upper limits of normal, discontinue infliximab.
- Monitor CBC with differential periodically during therapy. May cause leukopenia, neutropenia, thrombocytopenia, and pancytopenia. Discontinue infliximab if symptoms of blood dyscrasias (persistent fever) occur.

Potential Nursing Diagnoses

Chronic pain (Indications)

Diarrhea (Indications)

Implementation

- Do not confuse infliximab with rituximab.

IV Administration

- **Intermittent Infusion:** Calculate the total number of vials needed. Reconstitute each vial with 10 mL of sterile water for injection using a syringe with a 21-gauge needle or smaller. Direct stream to sides of vial. Do not use if vacuum is not present in vial. Gently swirl solution by rotating vial to dilute; do not shake. May foam on reconstitution; allow to stand for 5 min. Solution is colorless to light yellow and opalescent; a few translucent particles may develop because infliximab is a protein. Do not use if opaque particles, discoloration, or other particles occur.
Diluent: Withdraw volume of total infliximab dose from infusion container containing 250 mL with 0.9% NaCl. Slowly add total dose of infliximab. Do

not dilute with other solutions. **Concentration:** 0.4 to 4 mg/mL. Mix gently. Infusion should begin within 3 hr of preparation. Solution is incompatible with polyvinyl chloride equipment. Prepare in glass infusion bottle or polypropylene or polyolefin bags. Do not reuse or store any portion of infusion solution. **Rate:** Administer over at least 2 hr through polyethylene-lined administration set with an in-line, sterile, nonpyrogenic, low protein-building filter with ≤ 1.2 -micron pore size.

- **Y-Site Incompatibility:** Do not administer concurrently in the same line with any other agents.

Patient/Family Teaching

- Advise patient that adverse reactions (myalgia, rash, fever, polyarthralgia, pruritus) may occur 3–12 days after delayed (>2 yr) retreatment with infliximab. Symptoms usually decrease or resolve within 1–3 days. Instruct patient to notify health care professional if symptoms occur.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional promptly if symptoms of fungal infection occur.
- Advise patient of risk of malignancies such as hepatosplenic T-cell lymphoma. Instruct patient to report signs and symptoms (splenomegaly, hepatomegaly, abdominal pain, persistent fever, night sweats, weight loss) to health care professional promptly.
- Advise patient to examine skin periodically during therapy and notify health care professional of any changes in appearance of skin or growths on skin.
- Instruct patient not to receive live vaccines during therapy.
- **Rep:** Advise female patient to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding. Infants exposed to infliximab in utero should wait at least 6 mo before receiving any live vaccine; may be at increased risk of infection.

Evaluation/Desired Outcomes

- Decreased pain and swelling with decreased rate of joint destruction and improved physical function in patients with ankylosing spondylitis, psoriatic, or rheumatoid arthritis.
- Decrease in the signs and symptoms of Crohn's disease and a decrease in the number of draining enterocutaneous fistulas. Decreased symptoms, maintaining remission and mucosal healing with decreased corticosteroid use in ulcerative colitis.
- Decrease in induration, scaling and erythema of psoriatic lesions.

insulin degludec (in-soo-lin deg-lu-dek)

Tresiba

Classification

Therapeutic: antidiabetics, hormones

Pharmacologic: pancreatics

See Appendix L for more information concerning insulins

Indications

Improvement of glycemic control in adults with diabetes mellitus.

Action

Lowers blood glucose by: stimulating glucose uptake in skeletal muscle and fat, inhibiting hepatic glucose production. Other actions: inhibition of lipolysis and proteolysis, enhanced protein synthesis. **Therapeutic Effects:** Control of hyperglycemia in diabetic patients.

Pharmacokinetics

Absorption: Absorption is slow and delayed.

Distribution: Widely distributed.

Protein Binding: $>99\%$.

Metabolism and Excretion: Metabolized by liver, spleen, kidney, and muscle.

Half-life: 25 hr (as a result of rate of absorption).

TIME/ACTION PROFILE (effect on blood sugar)

ROUTE	ONSET	PEAK	DURATION
subcut	within 2 hr	12 hr	up to 42 hr†

†Following discontinuation after chronic use.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to insulin degludec; Hypoglycemia.

Use Cautiously in: Stress and infection (may temporarily \uparrow insulin requirements); Renal/hepatic impairment (may \downarrow insulin requirements); Concomitant use with pioglitazone or rosiglitazone (\uparrow risk of fluid retention and worsening HF); Effects may be \downarrow in obese patients; **Ger:** Elderly may be \uparrow sensitive to drug effects; **OB:** Pregnancy may temporarily \uparrow insulin requirements; **Lactation:** Consider possible effects on infant (lactating females may require adjustments in insulin dose and/or meal plan); **Pedi:** Children <1 yr (safety and effectiveness not established).

Adverse Reactions/Side Effects

Endo: **HYPOLYCEMIA.** **Local:** lipodystrophy, pruritus, erythema, swelling. **F and E:** hypokalemia. **Misc:** allergic reactions including **ANAPHYLAXIS.**

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Interactions

Drug-Drug: Beta blockers, clonidine, and reserpine may mask some of the signs and symptoms of hypoglycemia. Corticosteroids, thyroid supplements, estrogens, isoniazid, niacin, phenothiazines, and rifampin may ↑ insulin requirements. Alcohol, ACE inhibitors, MAO inhibitors, octreotide, oral hypoglycemic agents, and salicylates, may ↓ insulin requirements. Concurrent use with pioglitazone or rosiglitazone may ↑ risk of fluid retention and worsening HF.

Drug-Natural Products: Glucosamine may worsen blood glucose control. Fenugreek, chromium, and coenzyme Q-10 may produce additive hypoglycemic effects.

Route/Dosage

Subcut (Adults): *Type 1 diabetes (insulin naïve)* — 1/3–1/2 of the total daily insulin dose given once daily, then adjust on the basis of patient's needs (remainder of insulin dose should be given as a short-acting insulin and divided between each daily meal) (usual starting total daily insulin dose = 0.2–0.4 units/kg); *Type 2 diabetes (insulin naïve)* — 10 units once daily, then adjust on the basis of patient's needs; *Type 1 or 2 diabetes (and already on insulin)* — Give the same dose as the total daily dose of the long-acting or intermediate-acting insulin once daily, then adjust on the basis of patient's needs.

Subcut (Children ≥1 yr): *Type 1 or 2 diabetes (and already on insulin)* — Give 80% of the total daily dose of the long-acting or intermediate-acting insulin once daily, then adjust on the basis of patient's needs.

Availability

Solution for subcutaneous injection: 100 units/mL (U-100) in 3-mL FlexTouch system, 200 units/mL (U-200) in 3-mL FlexTouch system. **In combination with:** insulin aspart (Rysodeg 70/30); liraglutide (Xulpho). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess patient for signs and symptoms of hypoglycemia (anxiety; restlessness; tingling in hands, feet, lips, or tongue; chills; cold sweats; confusion; cool, pale skin; difficulty in concentration; drowsiness; nightmares or trouble sleeping; excessive hunger; headache; irritability; nausea; nervousness; tachycardia; tremor; weakness; unsteady gait) and hyperglycemia (confusion, drowsiness; flushed, dry skin; fruit-like breath odor; rapid, deep breathing, polyuria; loss of appetite; nausea; vomiting; unusual thirst) periodically during therapy.
- Monitor body weight periodically. Changes in weight may necessitate changes in insulin dose.
- Monitor for signs and symptoms of hypersensitivity reactions (swelling of tongue and lips, diarrhea, nausea, tiredness, itching, urticaria). Discontinue insulin degludec and treat symptomatically.

- **Lab Test Considerations:** Monitor blood glucose during therapy, more frequently in ketoacidosis and times of stress. Hemoglobin A_{1c} may be monitored every 3–6 mo to determine effectiveness.
- Monitor serum potassium periodically during therapy, especially in patients at risk (patients using potassium-lowering medications, patients taking medications sensitive to serum potassium concentrations). May cause hypokalemia.
- **Toxicity and Overdose:** Overdose is manifested by symptoms of hypoglycemia. Mild hypoglycemia may be treated by ingestion of oral glucose. Severe hypoglycemia is a life-threatening emergency; treatment consists of IV glucose, glucagon, or epinephrine.

Potential Nursing Diagnoses

Deficient knowledge, related to diet and medication regimen (Patient/Family Teaching)

Implementation

- **High Alert:** Insulin-related medication errors have resulted in patient harm and death. Clarify ambiguous orders; do not accept orders using the abbreviation “u” for units, (can be misread as a zero or the numeral 4; has resulted in tenfold overdoses). Insulins are available in different types, strengths. Check type, dose, and expiration date. Do not interchange insulins without consulting health care professional.
- **Subcut:** Inject once daily at the time of each day. Administer into thigh, upper arm, or abdomen. Press and hold down the dose button until dose counter shows 0 and then keep needle in the skin and count slowly to 6. When dose counter returns to 0, prescribed dose is not completely delivered until 6 seconds later. If the needle is removed earlier, a stream of insulin may be seen coming from the needle tip. If so, full dose will not be delivered; frequently check blood glucose levels, may need additional insulin. Use a new needle for each dose; do not reuse needles. Rotate injection sites to reduce risk of lipodystrophy. Do not administer IV, IM, or in an insulin infusion pump. Store unopened prefilled pens in refrigerator; do not freeze. Do not store opened (in-use) prefilled pens in refrigerator, stable at controlled room temperature, protected from light for 56 days (8 wks).
- Do not mix with other insulins or solutions.
- Do not transfer from pen into a syringe for administration.
- Dose increases should be made every 3–4 days as needed.
- Do not perform dose conversion when using the *Tresiba* U-100 or U-200 *FlexTouch* pens. Dose window for both the *Tresiba* U-100 and U-200 *FlexTouch* pens shows number of insulin units to be delivered and no conversion is needed.
- **Starting Dose in Insulin Naïve Patients:** *Type 1 Diabetes Mellitus:* Starting dose is one-third to one-half total daily insulin dose. Administer remainder of

total daily insulin dose as short-acting insulin divided between daily meals. Generally, 0.2 to 0.4 units of insulin/kg can be used to calculate initial total daily insulin dose in insulin naïve patients with type 1 diabetes. *Type 2 Diabetes Mellitus*: 10 units once daily.

- **Starting Dose in Patients Already on Insulin Therapy**: *Type 1 and Type 2 Diabetes Mellitus*: Start insulin degludec at same unit dose as total daily long or intermediate-acting insulin unit dose.

Patient/Family Teaching

- Instruct patient on proper technique for administration. Include type of insulin, equipment (syringe, cartridge pens, alcohol swabs), storage, and place to discard syringes. If a dose is missed, inject daily dose during waking hrs upon discovering missed dose. Ensure that at least 8 hours have elapsed between consecutive injections. Discuss importance of not changing brands of insulin or syringes, selection and rotation of injection sites, and compliance with therapeutic regimen. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Caution patient not to share pen device with another person, even if needle is changed; may risk transmission of blood-borne pathogens.
- Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long term.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness and health care professional notified of significant changes.
- Emphasize the importance of compliance with nutritional guidelines and regular exercise as directed by health care professional.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, herbal products, or alcohol.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to notify health care professional if nausea, vomiting, or fever develops, if unable to eat regular diet, or if blood glucose levels are not controlled.
- **Instruct patient and caregiver on signs and symptoms of hypoglycemia and hyperglycemia and what to do if they occur.**
- Patients with diabetes mellitus should carry a source of sugar (candy, glucose gel) and identification describing their disease and treatment regimen at all times.

- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of regular follow-up, especially during first few wk of therapy.

Evaluation/Desired Outcomes

- Control of blood glucose levels in diabetic patients without the appearance of hypoglycemic or hyperglycemic episodes.

HIGH ALERT

INSULIN (mixtures) (in-su-lin)

insulin lispro protamine suspension/insulin lispro injection mixtures, rDNA origin
HumaLOG Mix 75/25, HumaLOG Mix 50/50

insulin aspart protamine suspension/insulin aspart injection mixtures, rDNA origin
NovoLOG Mix 70/30

NPH/regular insulin mixtures
HumuLIN 70/30, NovoLIN 70/30

Classification

Therapeutic: antidiabetics, hormones
Pharmacologic: pancreatics

See Appendix L for more information concerning insulins

Indications

Control of hyperglycemia in patients with type 1 or type 2 diabetes mellitus.

Action

Lower blood glucose by: stimulating glucose uptake in skeletal muscle and fat, inhibiting hepatic glucose production. Other actions: inhibition of lipolysis and proteolysis, enhanced protein synthesis. **Therapeutic Effects**: Control of hyperglycemia in diabetic patients.

Pharmacokinetics

Absorption: Well absorbed from subcutaneous administration sites. Absorption rate is determined by type of insulin, injection site, volume of injectate, and other factors.

Distribution: Widely distributed.

Metabolism and Excretion: Metabolized by liver, spleen, kidney, and muscle.

Half-life: 5–6 min (prolonged in patients with diabetes; biologic half-life is 1–1.5 hr).

★ = Canadian drug name. ☒ = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; _____ indicate most frequent.

TIME/ACTION PROFILE (hypoglycemic effect)

ROUTE	ONSET	PEAK	DURATION
insulin lispro protamine suspension/insulin lispro injection mixture subcut	15–30 min	2.8 hr	24 hr
insulin aspart protamine suspension/insulin aspart injection mixture subcut	15 min	1–4 hr	18–24 hr
NPH/Regular Insulin mixture subcutaneous	30 min	2–12 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypoglycemia; Allergy or hypersensitivity to a particular type of insulin, preservatives, or other additives.

Use Cautiously in: Stress and infection (may temporarily ↑ insulin requirements); Renal/hepatic impairment (may ↓ insulin requirements); Concomitant use with pioglitazone or rosiglitazone (↑ risk of fluid retention and worsening HF); **OB:** Pregnancy may temporarily ↑ insulin requirements; **Pedi:** Safety of Humalog not established.

Adverse Reactions/Side Effects

Endo: **HYPOGLYCEMIA**. **F and E:** hypokalemia. **Local:** erythema, lipodystrophy, pruritis, swelling. **Misc:** allergic reactions including **ANAPHYLAXIS**.

Interactions

Drug-Drug: Beta blockers, clonidine, and reserpine may mask some of the signs and symptoms of hypoglycemia. **Corticosteroids, thyroid supplements, estrogens, isoniazid, niacin, phenothiazines, and rifampin** may ↑ insulin requirements. **Alcohol, ACE inhibitors, MAO inhibitors, octreotide, oral hypoglycemic agents, and salicylates,** may ↓ insulin requirements. Concurrent use with **pioglitazone** or **rosiglitazone** may ↑ risk of fluid retention and worsening HF.

Drug-Natural Products: **Glucosamine** may worsen blood glucose control. **Fenugreek, chromium, and coenzyme Q-10** may produce additive hypoglycemic effects.

Route/Dosage

Dose depends on blood glucose, response, and many other factors.

Subcut (Adults and Children): 0.5–1 unit/kg/day. **Adolescents during rapid growth**—0.8–1.2 units/kg/day.

Availability

NPH insulin/regular insulin suspension mixture: 70 units NPH/30 units regular insulin/mL—Novolin 70/30, Humulin 70/30 (100 units/mL total) in 10-mL vials and 3-mL prefilled pens^{OTC}. **Insulin lispro protamine suspension/insulin lispro injection mixture:** 75% insulin lispro protamine suspension and 25% insulin lispro injection—Humalog Mix 75/25 100 units/mL in 10-mL vials and 3-mL prefilled pens, 50% insulin lispro protamine suspension and 50% insulin lispro injection—Humalog Mix 50/50 100 units/mL in 10-mL vials and 3-mL prefilled pens. **Insulin aspart protamine suspension/insulin aspart injection mixture:** 70% insulin aspart protamine suspension and 30% insulin aspart injection—NovoLog Mix 70/30 100 units/mL in 10-mL vials and 3-mL prefilled pens.

NURSING IMPLICATIONS

Assessment

- Assess for symptoms of hypoglycemia (anxiety; restlessness; tingling in hands, feet, lips, or tongue; chills; cold sweats; confusion; cool, pale skin; difficulty in concentration; drowsiness; excessive hunger; headache; irritability; nightmares or trouble sleeping; nausea; nervousness; tachycardia; tremor; weakness; unsteady gait) and hyperglycemia (confusion, drowsiness; flushed, dry skin; fruit-like breath odor; rapid, deep breathing, polyuria; loss of appetite; nausea; vomiting; unusual thirst) periodically during therapy.
- Monitor body weight periodically. Changes in weight may necessitate changes in insulin dose.
- **Lab Test Considerations:** Monitor blood glucose every 6 hr during therapy, more frequently in ketoacidosis and times of stress. Hemoglobin A_{1c} may also be monitored every 3–6 mo to determine effectiveness.
- Monitor serum potassium in patients at risk for hypokalemia (those using potassium-lowering agents, those receiving IV insulin) periodically during therapy.
- **Toxicity and Overdose:** Overdose is manifested by symptoms of hypoglycemia. Mild hypoglycemia may be treated by ingestion of oral glucose. Severe hypoglycemia is a life-threatening emergency; treatment consists of IV glucose, glucagon, or epinephrine.

Potential Nursing Diagnoses

Noncompliance (Patient/Family Teaching)

Implementation

- **High Alert:** Insulin-related medication errors have resulted in patient harm and death. Clarify ambiguous orders; do not accept orders using the abbreviation “u” for units, (can be misread as a zero or the numeral 4; has resulted in tenfold overdoses).

- Insulins are available in different types and strengths. Check type, dose, and expiration date with another licensed nurse. Do not interchange insulins without consulting health care professional.
- Do not confuse Humalog with Humulin. Do not confuse Novolin with Novolog.
- Use *only* insulin syringes to draw up dose. The unit markings on the insulin syringe must match the insulin's units/mL.
- Insulin should be stored in a cool place but does not need to be refrigerated. Follow manufacturer's instructions regarding storage of insulin and insulin pens before and after use. Do not use if cloudy, discolored, or unusually viscous.
- NPH insulins should not be used in the management of ketoacidosis.
- **Subcut:** Rotate injection sites.
- Administer into abdominal wall, thigh, or upper arm subcutaneously.

Patient/Family Teaching

- Instruct patient on proper technique for administration. Include type of insulin, equipment (syringe, cartridge pens, alcohol swabs), storage, and place to discard syringes. Discuss the importance of not changing brands of insulin or syringes, selection and rotation of injection sites, and compliance with therapeutic regimen. Caution patient that insulin pens should not be shared with others, even if clean needles are used.
- Caution patient not to share pen device with another person, even if needle is changed; may risk transmission of blood-borne pathogens.
- Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long term.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness and health care professional notified of significant changes.
- Emphasize the importance of compliance with nutritional guidelines and regular exercise as directed by health care professional.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, herbal products, or alcohol.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to notify health care professional if nausea, vomiting, or fever develops, if unable to eat regular diet, or if blood glucose levels are not controlled.
- **Instruct patient on signs and symptoms of hypoglycemia and hyperglycemia and what to do if they occur.**

- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding or planning to breast feed.
- Patients with diabetes mellitus should carry a source of sugar (candy, glucose gel) and identification describing their disease and treatment regimen at all times.
- Emphasize the importance of regular follow-up, especially during first few wk of therapy.

Evaluation/Desired Outcomes

- Control of blood glucose levels in diabetic patients without the appearance of hypoglycemic or hyperglycemic episodes.

HIGH ALERT

NPH insulin (isophane insulin suspension)

HumuLIN N, NovoLIN N

Classification

Therapeutic: antidiabetics, hormones
Pharmacologic: pancreatics

See Appendix L for more information concerning insulins

Indications

Control of hyperglycemia in patients with diabetes mellitus.

Action

Lowers blood glucose by: stimulating glucose uptake in skeletal muscle and fat, inhibiting hepatic glucose production. Other actions of insulin: inhibition of lipolysis and proteolysis, enhanced protein synthesis. **Therapeutic Effects:** Control of hyperglycemia in diabetic patients.

Pharmacokinetics

Absorption: Rapidly absorbed from subcutaneous administration sites. Presence of protamine delays peak effect and prolongs action.

Distribution: Identical to endogenous insulin.

Metabolism and Excretion: Metabolized by liver, spleen, kidney, and muscle.

Half-life: Unknown.

TIME/ACTION PROFILE (hypoglycemic effect)

ROUTE	ONSET	PEAK	DURATION
NPH subcutaneous	2–4 hr	4–10 hr	10–16 hr
70% NPH/ 30% Regular Insulin mixture	30 min	2–12 hr	24 hr

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Contraindications/Precautions

Contraindicated in: Hypoglycemia; Allergy or hypersensitivity to a particular type of insulin, preservatives, or other additives.

Use Cautiously in: Stress or infection (may temporarily ↑ insulin requirements); Renal/hepatic impairment (may ↓ insulin requirements); Concomitant use with pioglitazone or rosiglitazone (↑ risk of fluid retention and worsening HF); **OB:** Pregnancy may temporarily ↑ insulin requirements.

Adverse Reactions/Side Effects

Endo: **HYPOGLYCEMIA.** **F and E:** hypokalemia. **Local:** lipodystrophy, pruritus, erythema, swelling. **Misc:** allergic reactions including **ANAPHYLAXIS.**

Interactions

Drug-Drug: Beta blockers, clonidine, and reserpine may mask some of the signs and symptoms of hypoglycemia. **Corticosteroids, thyroid supplements, estrogens, isoniazid, niacin, phenothiazines, and rifampin** may ↑ insulin requirements. **Alcohol, ACE inhibitors, MAO inhibitors, octreotide, oral hypoglycemic agents, and salicylates,** may ↓ insulin requirements. Concurrent use with **pioglitazone or rosiglitazone** may ↑ risk of fluid retention and worsening HF.

Drug-Natural Products: **Glucosamine** may worsen blood glucose control. **Fenugreek, chromium, and coenzyme Q-10** may produce additive hypoglycemic effects.

Route/Dosage

Dose depends on blood glucose, response, and many other factors.

Subcut (Adults and Children): 0.5–1 unit total insulin/kg/day. *Adolescents during rapid growth*—0.8–1.2 units total insulin/kg/day.

Availability

Isophane insulin suspension (NPH insulin): 100 units/mL in 10–mL vials and 3–mL prefilled pens.

NURSING IMPLICATIONS

Assessment

- **Assess patient periodically for symptoms of hypoglycemia** (anxiety; restlessness; tingling in hands, feet, lips, or tongue; chills; cold sweats; confusion; cool, pale skin; difficulty in concentration; drowsiness; nightmares or trouble sleeping; excessive hunger; headache; irritability; nausea; nervousness; tachycardia; tremor; weakness; unsteady gait) and hyperglycemia (confusion, drowsiness; flushed, dry skin; fruit-like breath odor; rapid, deep breathing, polyuria; loss of appetite; unusual thirst) during therapy.
- Monitor body weight periodically. Changes in weight may necessitate changes in insulin dose.
- **Lab Test Considerations:** Monitor blood glucose every 6 hr during therapy, more frequently in ketoacidosis and times of stress. A1C may be monitored every 3–6 mo to determine effectiveness.

- Monitor serum potassium in patients at risk for hypokalemia (those using potassium-lowering agents, those receiving IV insulin) periodically during therapy.
- **Toxicity and Overdose:** Overdose is manifested by symptoms of hypoglycemia. Mild hypoglycemia may be treated by ingestion of oral glucose. Severe hypoglycemia is a life-threatening emergency; treatment consists of IV glucose, glucagon, or epinephrine.

Potential Nursing Diagnoses

Noncompliance (Patient/Family Teaching)

Implementation

- **High Alert:** Medication errors involving insulins have resulted in serious patient harm and death. Clarify all ambiguous orders and do not accept orders using the abbreviation “u” for units, which can be misread as a zero or the numeral 4 and has resulted in tenfold overdoses. Insulins are available in different types and strengths. Check type, dose, and expiration date with another licensed nurse. Do not interchange insulins without consulting physician or other health care professional.
 - Do not confuse Humulin with Humalog. Do not confuse Novolin with Novolog.
 - Use *only* insulin syringes to draw up dose. The unit markings on the insulin syringe must match the insulin’s units/mL. Special syringes for doses <50 units are available. Prior to withdrawing dose, rotate vial between palms to ensure uniform solution; do not shake.
 - When mixing insulins, draw regular insulin or insulin lispro into syringe first to avoid contamination of regular insulin vial.
 - Insulin should be stored in a cool place but does not need to be refrigerated. Once opened, store at room temperature. Follow manufacturer’s instructions regarding storage of insulin and insulin pens before and after use.
 - When transferring from once-daily NPH human insulin to *insulin glargine*, the dose usually remains unchanged. When transferring from twice-daily NPH human insulin to insulin glargine, the initial dose of insulin glargine is usually reduced by 20%.
 - NPH insulin should not be used in the management of ketoacidosis.
 - **Subcut:** Administer NPH insulin within 30–60 min before a meal.
- ## Patient/Family Teaching
- Instruct patient on proper technique for administration. Include type of insulin, equipment (syringe, cartridge pens, alcohol swabs), storage, and place to discard syringes. Discuss the importance of not changing brands of insulin or syringes, selection and rotation of injection sites, and compliance with therapeutic regimen. Caution patient that insulin pens should not be shared with others, even if clean needles are used.

- Demonstrate technique for mixing insulins by drawing up regular insulin or insulin lispro first and rolling intermediate-acting insulin vial between palms to mix, rather than shaking (may cause inaccurate dose).
- Caution patient not to share pen device with another person, even if needle is changed; may risk transmission of blood-borne pathogens.
- Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long term.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness and health care professional notified of significant changes.
- Emphasize the importance of compliance with nutritional guidelines and regular exercise as directed by health care professional.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, herbal products, or alcohol.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to notify health care professional if nausea, vomiting, or fever develops, if unable to eat regular diet, or if blood glucose levels are not controlled.
- **Instruct patient on signs and symptoms of hypoglycemia and hyperglycemia and what to do if they occur.**
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding or planning to breast feed.
- Patients with diabetes mellitus should carry a source of sugar (candy, glucose gel) and identification describing their disease and treatment regimen at all times.
- Emphasize the importance of regular follow-up, especially during first few wk of therapy.

Evaluation/Desired Outcomes

- Control of blood glucose levels in diabetic patients without the appearance of hypoglycemic or hyperglycemic episodes.

HIGH ALERT

insulin, regular (injection, concentrated) (in-su-lin)

HumuLIN R,  Novolin geToronto, NovoLIN R, HumuLIN R U-500 (Concentrated)

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Classification

Therapeutic: antidiabetics, hormones

Pharmacologic: pancreatics

See Appendix L for more information concerning insulins

Indications

Control of hyperglycemia in patients with diabetes mellitus. **Concentrated regular insulin U-500:** Only for use in patients with insulin requirements >200 units/day. **Unlabeled Use:** Treatment of hyperkalemia.

Action

Lowers blood glucose by: stimulating glucose uptake in skeletal muscle and fat, inhibiting hepatic glucose production. Other actions of insulin: inhibition of lipolysis and proteolysis, enhanced protein synthesis. **Therapeutic Effects:** Control of hyperglycemia in diabetic patients.

Pharmacokinetics

Absorption: Rapidly absorbed from subcutaneous administration sites. U-100 regular insulin is absorbed slightly more quickly than U-500.

Distribution: Identical to endogenous insulin.

Metabolism and Excretion: Metabolized by liver, spleen, kidney, and muscle.

Half-life: 30–60 min.

TIME/ACTION PROFILE (hyperglycemic effect)

ROUTE	ONSET	PEAK	DURATION
Regular insulin IV	10–30 min	15–30 min	30–60 min
Regular insulin subcutaneous	30–60 min	2–4 hr	5–7 hr

Contraindications/Precautions

Contraindicated in: Hypoglycemia; Allergy or hypersensitivity to a particular type of insulin, preservatives, or other additives.

Use Cautiously in: Stress or infection—may temporarily ↑ insulin requirements; Renal/hepatic impairment—may ↓ insulin requirements; Concomitant use with pioglitazone or rosiglitazone (↑ risk of fluid retention and worsening HF); **OB:** Pregnancy may temporarily ↑ insulin requirements.

Adverse Reactions/Side Effects

Endo: **HYPOGLYCEMIA.** **F and E:** hypokalemia. **Local:** lipodystrophy, pruritus, erythema, swelling. **Misc:** allergic reactions including **ANAPHYLAXIS.**

Interactions

Drug-Drug: **Beta blockers, clonidine, and reserpine** may mask some of the signs and symptoms of hypoglycemia. **Corticosteroids, thyroid supplements,**

estrogens, isoniazid, niacin, phenothiazines, and rifampin may ↑ insulin requirements. Alcohol, ACE inhibitors, MAO inhibitors, octreotide, oral hypoglycemic agents, and salicylates, may ↓ insulin requirements. Concurrent use with pioglitazone or rosiglitazone may ↑ risk of fluid retention and worsening HF.

Drug-Natural Products: Glucosamine may worsen blood glucose control. Fenugreek, chromium, and coenzyme Q-10 may produce additive hypoglycemic effects.

Route/Dosage

Dose depends on blood glucose, response, and many other factors.

Ketoacidosis—Regular (100 units/mL) Insulin Only

IV (Adults): 0.1 unit/kg/hr as a continuous infusion.

IV (Children): Loading dose—0.1 unit/kg, then maintenance continuous infusion 0.05–0.2 unit/kg/hr, titrate to optimal rate of ↓ of serum glucose of 80–100 mg/dL/hr.

Maintenance Therapy

Subcut (Adults and Children): 0.5–1 unit/kg/day in divided doses. *Adolescents during rapid growth*—0.8–1.2 unit/kg/day in divided doses.

Treatment of Hyperkalemia

Subcut, IV (Adults and Children): dextrose 0.5–1 g/kg combined with insulin 1 unit for every 4–5 g dextrose given.

Availability

Insulin injection (regular insulin): 100 units/mL in 10-mL vials and 3-mL prefilled pens^{OTC}. **Regular (concentrated) insulin injection:** 500 units/mL in 20-mL vials and 3-mL prefilled pens. **In combination with:** NPH insulins (Humulin 70/30, Novolin 70/30).

NURSING IMPLICATIONS

Assessment

- Assess patient periodically for symptoms of hypoglycemia (anxiety; restlessness; tingling in hands, feet, lips, or tongue; chills; cold sweats; confusion; cool, pale skin; difficulty in concentration; drowsiness; nightmares or trouble sleeping; excessive hunger; headache; irritability; nausea; nervousness; tachycardia; tremor; weakness; unsteady gait) and hyperglycemia (confusion, drowsiness; flushed, dry skin; fruit-like breath odor; rapid, deep breathing, polyuria; loss of appetite; unusual thirst) during therapy.
- Monitor body weight periodically. Changes in weight may necessitate changes in insulin dose.
- **Lab Test Considerations:** Monitor blood glucose every 6 hr during therapy, more frequently in ketoacidosis and times of stress. A1C may be monitored every 3–6 mo to determine effectiveness.

- Monitor serum potassium in patients at risk for hypokalemia (those using potassium-lowering agents, those receiving IV insulin) periodically during therapy.
- **Toxicity and Overdose:** Overdose is manifested by symptoms of hypoglycemia. Mild hypoglycemia may be treated by ingestion of oral glucose. Severe hypoglycemia is a life-threatening emergency; treatment consists of IV glucose, glucagon, or epinephrine.

Potential Nursing Diagnoses

Noncompliance (Patient/Family Teaching)

Implementation

- **High Alert:** Medication errors involving insulins have resulted in serious patient harm and death. Clarify all ambiguous orders and do not accept orders using the abbreviation “u” for units, which can be misread as a zero or the numeral 4 and has resulted in tenfold overdoses. Insulins are available in different types and strengths. Check type, dose, and expiration date with another licensed nurse. Do not interchange insulins without consulting health care professional. Do not confuse regular concentrated (U-500) insulin with regular insulin. To prevent errors between regular U-100 insulin and concentrated U-500 insulin, concentrated U-500 insulin is marked with a band of diagonal brown strips and “U-500” is highlighted in red on the label and a conversion chart should always be available.
- Do not confuse Humulin with Humalog. Do not confuse Novolin with Novolog.
- Use **only** insulin syringes to draw up dose. The unit markings on the insulin syringe must match the insulin’s units/mL. Special syringes for doses <50 units and U–500 insulin are available. Prior to withdrawing dose, rotate vial between palms to ensure uniform solution; do not shake.
- When mixing insulins, draw regular insulin into syringe first to avoid contamination of regular insulin vial.
- Insulin should be stored in a cool place but does not need to be refrigerated. Once opened, store at room temperature. Follow manufacturer’s instructions regarding storage of insulin and insulin pens before and after use.
- **Subcut:** Administer regular insulin within 15–30 min before a meal.

IV Administration

- **IV:** Do not use if cloudy, discolored, or unusually viscous. **High Alert:** Do not administer regular (concentrated) insulin U-500 IV.
- **IV Push: Diluent:** May be administered IV undiluted directly into vein or through Y-site. **Rate:** Administer up to 50 units over 1 min.
- **Continuous Infusion: Diluent:** May be diluted in 0.9% NaCl using polyvinyl chloride infusion bags. **Concentration:** 0.1 unit/mL to 1 unit/mL in infu-

sion systems with the infusion fluids. **Rate:** Rate should be ordered by health care professional, and infusion placed on an IV pump for accurate administration.

- Rate of administration should be decreased when serum glucose level reaches 250 mg/dL.
- **Y-Site Compatibility:** acyclovir, alfentanil, aminophylline, amphotericin B lipid complex, anidulafungin, argatroban, ascorbic acid, atropine, azathioprine, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, ceftazidime, cefepime, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, clindamycin, cyanocobalamin, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, docetaxel, doxorubicin liposomal, doxycycline, enalapril, ephedrine, epirubicin, epoetin alfa, ertapenem, erythromycin, esmolol, esomeprazole, etoposide, etoposide phosphate, fenoldopam, fentanyl, flucanazole, fludarabine, folic acid, foscarnet, fosphenytoin, ganciclovir, gemcitabine, granisetron, hetastarch, hydrocortisone, hydromorphone, ibuprofen lysine, idarubicin, ifosfamide, imipenem/cilastatin, indomethacin, irinotecan, ketorolac, leucovorin calcium, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, meropenem, mesna, methotrexate, methylodopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, milrinone, mitoxantrone, moxifloxacin, mycophenolate, nalbuphine, naloxone, nitroglycerin, nitroprusside, octreotide, oxacillin, oxaliplatin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, pentazocine, pentobarbital, phenobarbital, phytonadione, potassium acetate, potassium chloride, procainamide, promethazine, propofol, pyridoxine, remifentanyl, sodium bicarbonate, streptokinase, sufentanil, tacrolimus, teniposide, terbutaline, theophylline, thiamine, thiotepa, tigecycline, tirofiban, topotecan, vancomycin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, vitamin B complex with C, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** alemtuzumab, butorphanol, cefoxitin, chlorpromazine, cisplatin, dantrolene, diazepam, diphenhydramine, glycopyrrolate, hydroxyzine, isoproterenol, ketamine, labetalol, micafungin, mitomycin, nesiritide, pentamidine, phenolamine, phenylephrine, phenytoin, piperacillin/tazobactam, prochlorperazine, propranolol, protamine, quinupristin/dalfopristin, rocuronium, trimethoprim/sulfamethoxazole.

- **Additive Compatibility:** May be added to total parenteral nutrition (TPN) solutions.

Patient/Family Teaching

- Instruct patient on proper technique for administration. Include type of insulin, equipment (syringe, cartridge pens, alcohol swabs), storage, and place to discard syringes. Discuss the importance of not changing brands of insulin or syringes, selection and rotation of injection sites, and compliance with therapeutic regimen. Opened, unused insulin vials should be discarded 1 mo after opening.
- Demonstrate technique for mixing insulins by drawing up regular insulin first and rolling intermediate-acting insulin vial between palms to mix, rather than shaking (may cause inaccurate dose).
- Caution patient not to share pen device with another person, even if needle is changed; may risk transmission of blood-borne pathogens.
- Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long term.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness and health care professional notified of significant changes.
- Emphasize the importance of compliance with nutritional guidelines and regular exercise as directed by health care professional.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, herbal products, or alcohol.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to notify health care professional if nausea, vomiting, or fever develops, if unable to eat regular diet, or if blood glucose levels are not controlled.
- **Instruct patient on signs and symptoms of hypoglycemia and hyperglycemia and what to do if they occur.**
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding or planning to breast feed.
- Patients with diabetes mellitus should carry a source of sugar (candy, glucose gel) and identification describing their disease and treatment regimen at all times.
- Emphasize the importance of regular follow-up, especially during first few wk of therapy.

Evaluation/Desired Outcomes

- Control of blood glucose levels in diabetic patients without the appearance of hypoglycemic or hyperglycemic episodes.

★ = Canadian drug name. † = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; _____ indicate most frequent.

HIGH ALERT

INSULINS (long-acting)
(in-su-lin)**insulin degludec**
Tresiba**insulin detemir**
Levemir**insulin glargine**
Basaglar, Lantus, Toujeo**Classification**Therapeutic: antidiabetics, hormones
Pharmacologic: pancreatic

See Appendix L for more information concerning insulins

Indications

Control of hyperglycemia in patients with type 1 or type 2 diabetes mellitus.

ActionLower blood glucose by: stimulating glucose uptake in skeletal muscle and fat, inhibiting hepatic glucose production. Other actions: inhibition of lipolysis and proteolysis, enhanced protein synthesis. **Therapeutic Effects:** Control of hyperglycemia in diabetic patients.**Pharmacokinetics****Absorption:** Physicochemical characteristics of long-acting insulins result in delayed and prolonged absorption.**Distribution:** Widely distributed.**Metabolism and Excretion:** Metabolized by liver, spleen, kidney, and muscle.**Half-life:** 5–6 min (prolonged in patients with diabetes); biologic half-life is 1–1.5 hr; *insulin degludec* 25 hr; *insulin detemir* 5–7 hr (dose-dependent).**TIME/ACTION PROFILE (hypoglycemic effect)**

ROUTE	ONSET	PEAK	DURATION
Insulin degludec	within 2 hr	12 hr	up to 42 hr*
Insulin detemir	3–4 hr	3–14 hr†	6–24 hr‡
Insulin glargine	3–4 hr	none†	24 hr

*Following discontinuation after chronic use.

†Small amounts of insulin glargine and insulin detemir are slowly released resulting in a relatively constant effect over time.

‡Duration is dose dependent; duration ↑ as dose ↑.

Contraindications/Precautions**Contraindicated in:** Hypoglycemia; Allergy or hypersensitivity to a particular type of insulin, preservatives, or other additives.**Use Cautiously in:** Stress and infection (may temporarily ↑ insulin requirements); Renal/hepatic impairment (may ↓ insulin requirements); Concomitant use with pioglitazone or rosiglitazone (↑ risk of fluid retention and worsening HF); **OB:** Pregnancy may temporarily ↑ insulin requirements; **Pedi:** Children <18 yr (Toujeo), <6 yr (Basaglar or Lantus), <2 yr (detemir), or <1 yr (degludec) (safety not established).**Adverse Reactions/Side Effects****Endo:** **HYPOGLYCEMIA.** **F and E:** hypokalemia. **Local:** lipodystrophy, pruritis, erythema, swelling. **Misc:** allergic reactions including **ANAPHYLAXIS.****Interactions****Drug-Drug:** Beta blockers, clonidine, and reserpine may mask some of the signs and symptoms of hypoglycemia. **Corticosteroids, thyroid supplements, estrogens, isoniazid, niacin, phenothiazines, and rifampin** may ↑ insulin requirements. **Alcohol, ACE inhibitors, MAO inhibitors, octreotide, oral hypoglycemic agents, and salicylates,** may ↓ insulin requirements. Concurrent use with **pioglitazone** or **rosiglitazone** may ↑ risk of fluid retention and worsening HF.**Drug-Natural Products:** **Glucosamine** may worsen blood glucose control. **Fenugreek, chromium, and coenzyme Q-10** may produce additive hypoglycemic effects.**Route/Dosage****Toujeo has a lower glucose lowering effect than Basaglar or Lantus on a unit-to-unit basis****Insulin Degludec****Subcut (Adults):** *Type 1 diabetes (insulin naïve)*— $\frac{1}{3}$ – $\frac{1}{2}$ of the total daily insulin dose given once daily, then adjust on the basis of patient's needs (remainder of insulin dose should be given as a short-acting insulin and divided between each daily meal) (usual starting total daily insulin dose = 0.2–0.4 units/kg); *Type 2 diabetes (insulin naïve)*—10 units once daily, then adjust on the basis of patient's needs; *Type 1 or 2 diabetes (and already on insulin)*—Give the same dose as the total daily dose of the long-acting or intermediate-acting insulin once daily, then adjust on the basis of patient's needs.**Subcut (Children ≥1 yr):** *Type 1 or 2 diabetes (and already on insulin)*—Give 80% of the total daily dose of the long-acting or intermediate-acting insulin once daily, then adjust on the basis of patient's needs.**Insulin Detemir****Subcut (Adults and Children ≥6 yr):** *Type 2 diabetes patients who are insulin-naïve*—0.1–0.2 units/kg once daily in the evening (or divided into a twice daily regimen) or 10 units once daily in the evening (or

divided into a twice daily regimen). *Patients with type 1 or 2 diabetes receiving basal insulin or basal bolus therapy*—May substitute on an equivalent unit-per-unit basis.

Insulin Glargine (Basaglar or Lantus)

Subcut (Adults and Children ≥ 6 yr): *Type 1 diabetes (insulin naïve)*— $\frac{1}{3}$ of the total daily insulin dose given once daily, then adjust on the basis of patient's needs (remainder of insulin dose should be given as a short-acting insulin) (usual starting total daily insulin dose = 0.2–0.4 units/kg); *Type 2 diabetes (insulin naïve)*—0.2 units/kg or up to 10 units once daily; then adjust on the basis of patient's needs; *Type 1 or 2 diabetes (and converting from Toujeo)*—Give 80% of Toujeo dose as Basaglar or Lantus once daily, then adjust on the basis of patient's needs; *Type 1 or 2 diabetes (and converting from once daily NPH)*—Give the same dose once daily, then adjust on the basis of patient's needs; *Type 1 or 2 diabetes (and converting from twice daily NPH)*—Give 80% of the total daily NPH dose once daily, then adjust on the basis of patient's needs.

Insulin Glargine (Toujeo)

Subcut (Adults): *Type 1 diabetes (insulin naïve)*— $\frac{1}{3}$ to $\frac{1}{2}$ of the total daily insulin dose given once daily, then adjust on the basis of patient's needs (range = 1–80 units/day), (remainder of insulin dose should be given as a short-acting insulin) (usual starting total daily insulin dose = 0.2–0.4 units/kg); *Type 2 diabetes (insulin naïve)*—0.2 units/kg once daily, then adjust on the basis of patient's needs; *Type 1 or 2 diabetes (and converting from intermediate or long-acting insulin)*—Use same total daily dose and give once daily, then adjust on the basis of patient's needs; *Type 1 or 2 diabetes (and converting from NPH insulin)*—Use 80% of the total daily NPH and give once daily, then adjust on the basis of patient's needs.

Availability

Insulin Degludec

Solution for subcutaneous injection: 100 units/mL in 3–mL FlexTouch system, 200 units/mL in 3–mL FlexTouch system. **In combination with:** insulin aspart (Rysodeg 70/30); liraglutide (Xultophy). See Appendix B.

Insulin Detemir

Solution for subcutaneous injection: 100 units/mL in 10-mL vials and 3-mL prefilled pens. **Cost:** \$177.61/10-mL vial *Levemir Flexpen (3 mL)*—\$290.07/5 pens.

Insulin Glargine

Solution for subcutaneous injection (Basaglar): 100 units/mL in 3–mL prefilled pens. **Solution for**

subcutaneous injection (Lantus): 100 units/mL in 10-mL vials and 3-mL prefilled pens. **Cost:** \$180.34/10-mL vial *Lantus Solostar (3 mL)*—\$306.22/5 pens. **Solution for subcutaneous injection (Toujeo):** 300 units/mL in 1.5-mL prefilled pens. **In combination with:** lixisenatide (Soliqua). See Appendix B.

NURSING IMPLICATIONS

Assessment

- **Assess patient for signs and symptoms of hypoglycemia** (anxiety; restlessness; mood changes; tingling in hands, feet, lips, or tongue; chills; cold sweats; confusion; cool, pale skin; difficulty in concentration; drowsiness; nightmares or trouble sleeping; excessive hunger; headache; irritability; nausea; nervousness; tachycardia; tremor; weakness; unsteady gait) and hyperglycemia (confusion, drowsiness; flushed, dry skin; fruit-like breath odor; rapid, deep breathing, polyuria; loss of appetite; nausea; vomiting; tiredness; unusual thirst) periodically during therapy.
- Monitor body weight periodically. Changes in weight may necessitate changes in insulin dose.
- **Lab Test Considerations:** Monitor blood glucose every 6 hr during therapy, more frequently in ketoacidosis and times of stress. Hemoglobin A_{1c} may also be monitored every 3–6 mo to determine effectiveness.
- Monitor serum potassium in patients at risk for hypokalemia (those using potassium-lowering agents, those receiving IV insulin) periodically during therapy.
- **Toxicity and Overdose:** Overdose is manifested by symptoms of hypoglycemia. Mild hypoglycemia may be treated by ingestion of oral glucose. Severe hypoglycemia is a life-threatening emergency; treatment consists of IV glucose, glucagon, or epinephrine. Recovery from hypoglycemia may be delayed due to the prolonged effect of long-acting insulins.

Potential Nursing Diagnoses

Noncompliance (Patient/Family Teaching)

Implementation

- **High Alert:** Insulin-related medication errors have resulted in patient harm and death. Clarify ambiguous orders; do not accept orders using the abbreviation “u” for units, (can be misread as a zero or the numeral 4; has resulted in tenfold overdoses).
- Insulins are available in different types and strengths. Check type, dose, and expiration date with another licensed nurse. Do not interchange insulins without consulting health care professional.
- Do not confuse Levemir (insulin detemir) with Lovenox (enoxaparin).
- Use *only* insulin syringes to draw up dose. The unit markings on the insulin syringe must match the in-

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

sulin's units/mL. Special syringes for doses <50 units are available. Prior to withdrawing dose, rotate vial between palms to ensure uniform solution; do not shake.

- **High Alert:** Do not mix *insulin glargine* or *insulin detemir* with any other insulin or solution, or use syringes containing any other medicinal product or residue. If giving with a short-acting insulin, use separate syringes and different injection sites. Solution should be clear and colorless with no particulate matter.
- Do not use if cloudy, discolored, or unusually viscous. Store unopened vials and cartridges of *insulin glargine* and *insulin detemir* in the refrigerator; do not freeze. If unable to refrigerate, the 10-mL vial of *insulin glargine* can be kept in a cool place unrefrigerated for up to 28 days. Once the cartridge is placed in a pen, do not refrigerate. After initial use, *insulin detemir* vials, cartridges, or a prefilled syringe may be stored in a cool place for 42 days. *Insulin degludec* pens may be stored in the refrigerator or kept at room temperature for up to 56 days. Do not store in-use cartridges and pre-filled syringes in refrigerator or with needle in place. Keep away from direct heat and sunlight.
- When transferring from once-daily NPH human insulin to *insulin glargine*, the dose usually remains unchanged. When transferring from twice-daily NPH human insulin to insulin glargine, the initial dose of insulin glargine is usually reduced by 20%.
- **Subcut:** Rotate injection sites.
- Administer *insulin glargine* and *insulin degludec* once daily at the same time each day.
- Administer *daily insulin detemir* with evening meal or at bedtime. With *twice daily insulin detemir*, administer evening dose with evening meal, at bedtime, or 12 hr after morning dose.
- Do not administer *insulin detemir*, *insulin degludec*, or *insulin glargine* IV or in insulin pumps.

Patient/Family Teaching

- Instruct patient on proper technique for administration. Include type of insulin, equipment (syringe, cartridge pens, alcohol swabs), storage, and place to discard syringes. Discuss the importance of not changing brands of insulin or syringes, selection and rotation of injection sites, and compliance with therapeutic regimen. Patients taking insulin detemir and *insulin degludec* should be given the *Patient Information* circular for this product.
- Caution patient not to share pen device with another person, even if needle is changed; may risk transmission of blood-borne pathogens.
- Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long term.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness and health care professional notified of significant changes.

- Emphasize the importance of compliance with nutritional guidelines and regular exercise as directed by health care professional.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, herbal products, or alcohol.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to notify health care professional if nausea, vomiting, or fever develops, if unable to eat regular diet, or if blood glucose levels are not controlled.
- **Instruct patient on signs and symptoms of hypoglycemia and hyperglycemia and what to do if they occur.**
- Patients with diabetes mellitus should carry a source of sugar (candy, glucose gel) and identification describing their disease and treatment regimen at all times.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding or planning to breast feed.
- Emphasize the importance of regular follow-up, especially during first few wk of therapy.

Evaluation/Desired Outcomes

- Control of blood glucose levels in diabetic patients without the appearance of hypoglycemic or hyperglycemic episodes.

HIGH ALERT

INSULINS (rapid acting) (in-su-lin)

insulin aspart, rDNA origin
Fiasp, NovoLOG, ✳ NovoRapid

insulin glulisine
Apidra, Apidra Solostar

insulin lispro, rDNA origin
HumaLOG

Classification

Therapeutic: antidiabetics, hormones
Pharmacologic: pancreatics

See Appendix L for more information concerning insulins

Indications

Control of hyperglycemia in patients with type 1 or type 2 diabetes mellitus.

Action

Lower blood glucose by: stimulating glucose uptake in skeletal muscle and fat, inhibiting hepatic glucose production. Other actions: inhibition of lipolysis and proteolysis, enhanced protein synthesis. These are rapid-

acting insulins with a more rapid onset and shorter duration than regular insulin; should be used with an intermediate- or long-acting insulin. **Therapeutic Effects:** Control of hyperglycemia in diabetic patients.

Pharmacokinetics

Absorption: Very rapidly absorbed from subcut administration sites.

Distribution: Widely distributed.

Metabolism and Excretion: Metabolized by liver, spleen, kidney, and muscle.

Half-life: *Insulin aspart*—1–1.5 hr; *Insulin lispro*—1 hr; *insulin glulisine*—42 min.

TIME/ACTION PROFILE (hypoglycemic effect)

ROUTE	ONSET	PEAK	DURATION
Insulin aspart	within 15 min	1–2 hr	3–4 hr
Insulin glulisine	within 15 min	1–2 hr	3–4 hr
Insulin lispro	within 15 min	1–2 hr	3–4 hr

Contraindications/Precautions

Contraindicated in: Hypoglycemia; Allergy or hypersensitivity to a particular type of insulin, preservatives, or other additives.

Use Cautiously in: Stress and infection (may temporarily ↑ insulin requirements); Renal/hepatic dysfunction (may ↓ insulin requirements); Concomitant use with pioglitazone or rosiglitazone (↑ risk of fluid retention and worsening HF); **OB:** Pregnancy may temporarily ↑ insulin requirements; **Pedi:** Safety not established in children <3 yr (for insulin lispro), <4 yr (insulin glulisine), <6 yr (for insulin aspart).

Adverse Reactions/Side Effects

Endo: **HYPOGLYCEMIA.** **F and E:** hypokalemia. **Local:** erythema, lipodystrophy, pruritus, swelling. **Misc:** allergic reactions including **ANAPHYLAXIS.**

Interactions

Drug-Drug: Beta blockers, clonidine, and reserpine may mask some of the signs and symptoms of hypoglycemia. **Corticosteroids, thyroid supplements, estrogens, isoniazid, niacin, phenothiazines, and rifampin** may ↑ insulin requirements. **Alcohol, ACE inhibitors, MAO inhibitors, octreotide, oral hypoglycemic agents, and salicylates,** may ↓ insulin requirements. Concomitant use with **pioglitazone** or **rosiglitazone** may ↑ risk of fluid retention and worsening HF.

Drug-Natural Products: **Glucosamine** may worsen blood glucose control. **Fenugreek, chromium, and coenzyme Q-10** may produce additive hypoglycemic effects.

Route/Dosage

Dose depends on blood glucose, response, and many other factors. Only insulin aspart and insulin glulisine can be administered IV.

Subcut (Adults and Children): Total insulin dose determined by needs of patient; generally 0.5–1 unit/kg/day; 50–70% of this dose may be given as meal-related boluses of rapid-acting insulin, and the remainder as an intermediate or long-acting insulin. *Subcutaneous infusion pump*—~50% of total dose can be given as meal-related boluses and ~50% of total dose can be given as basal infusion.

Availability

Insulin aspart: 100 units/mL in 10-mL vials and 3-mL prefilled cartridges or pens. **Cost:** \$163.68/10-mL vial *NovoLog Flexpen (3 mL)*—\$310.56/5 pens; *NovoLog Pen Fill (3 mL)*—\$298.95/5 cartridges. **Insulin aspart 70/30 mix (Novolog Mix 70/30):** 70% insulin aspart protamine suspension and 30% insulin aspart solution mix 100 units/mL in 10-mL vials and 3-mL prefilled pens. **Cost:** \$169.64/10-mL vial *NovoLog Mox 70/30 Flexpen (3 mL)*—\$310.56/5 pens. **Insulin glulisine:** 100 units/mL in 10-mL vials and 3-mL prefilled pens. **Cost:** \$158.53/10-mL vial *Apidra Solostar (3 mL)*—, \$294.61/5 pens. **Insulin lispro:** 100 units/mL in 10-mL vials and 3-mL prefilled cartridges and pens, 200 units/mL in 3-mL prefilled cartridges and pens. **Cost:** \$163.56/10-mL vial *Humalog Kwipen (3 mL)*—\$309.53/5 pens. **Insulin lispro 75/25 mix (Humalog Mix 75/25):** 75% lispro insulin protamine suspension and 25% insulin lispro mix 100 units/mL in 10-mL vials and 3-mL prefilled pens. **Cost:** \$165.07/10-mL vial. **Insulin lispro 50/50 mix (Humalog Mix 50/50):** 50% lispro insulin protamine suspension and 50% insulin lispro mix 100 units/mL in 10-mL vials and 3-mL prefilled pens. **Cost:** *Humalog Mix 50/50 Kwipen (3 mL)*—\$303.58/5 pens.

NURSING IMPLICATIONS

Assessment

- Assess for symptoms of hypoglycemia (anxiety; restlessness; tingling in hands, feet, lips, or tongue; chills; cold sweats; confusion; cool, pale skin; difficulty in concentration; drowsiness; nightmares or trouble sleeping; excessive hunger; headache; irritability; nausea; nervousness; tachycardia; tremor; weakness; unsteady gait) and hyperglycemia (confusion, drowsiness; flushed, dry skin; fruit-like breath odor; rapid, deep breathing, polyuria; loss of appetite; nausea; vomiting; unusual thirst) periodically during therapy.
- Monitor body weight periodically. Changes in weight may necessitate changes in insulin dose.
- Assess patient for signs of allergic reactions (rash, shortness of breath, wheezing, rapid pulse, sweating, low BP) during therapy.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- **Lab Test Considerations:** Monitor blood glucose every 6 hr during therapy, more frequently in ketoacidosis and times of stress. HbA_{1c} may also be monitored every 3–6 mo to determine effectiveness.
- Monitor serum potassium in patients at risk for hypokalemia (those using potassium-lowering agents, those receiving IV insulin) periodically during therapy.
- **Toxicity and Overdose:** Overdose is manifested by symptoms of hypoglycemia. Mild hypoglycemia may be treated by ingestion of oral glucose. Severe hypoglycemia is a life-threatening emergency; treatment consists of IV glucose, glucagon, or epinephrine. Early signs of hypoglycemia may be less pronounced by long duration of diabetes, diabetic nerve disease, and use of beta blockers; may result in loss of consciousness prior to patient's awareness of hypoglycemia.

Potential Nursing Diagnoses

Noncompliance (Patient/Family Teaching)

Implementation

- **High Alert:** Insulin-related medication errors have resulted in patient harm and death. Clarify ambiguous orders; do not accept orders using the abbreviation "u" for units, (can be misread as a zero or the numeral 4; has resulted in tenfold overdoses).
- Insulins are available in different types and strengths. Check type, dose, and expiration date with another licensed nurse. Do not interchange insulins without consulting health care professional.
- Do not confuse Humalog with Humulin. Do not confuse Novolog with Novolin. Do not confuse Apidra with Spiriva (tiotropium).
- Use *only* insulin syringes to draw up dose. The unit markings on the insulin syringe must match the insulin's units/mL. Special syringes for doses <50 units are available. Do not draw up dose into a syringe from the Kwik Pens; syringe markings do not match-up and could lead to a medication error. Use *only* U-100 insulin syringes to draw up *insulin lispro* dose. Prior to withdrawing dose, rotate vial between palms to ensure uniform solution; do not shake.
- *Insulin aspart*, *insulin glulisine*, and *insulin lispro* may be mixed with NPH insulin. When mixing insulins, draw insulin aspart, insulin glulisine, or insulin lispro into syringe first to avoid contamination of rapid-acting insulin vial. Mixed insulins should never be used in a pump or for IV infusion.
- Store vials in refrigerator. Vials may also be kept at room temperature for up to 28 days. Do not use if cloudy, discolored, or unusually viscous. Store cartridges and pens at room temperature and use within 28 days. Never use the *PenFill* cartridge after the expiration date on the *PenFill* cartridge or on the box.
- Because of their short duration, *insulin lispro*, *insulin glulisine*, and *insulin aspart*, must be used

with a longer-acting insulin or insulin infusion pump. In patients with type 2 diabetes, *insulin lispro* may be used without a longer-acting insulin when used in combination with an oral sulfonylurea agent.

- Humalog U-200 should not be mixed with other insulins, administered IV, or used in insulin pumps.
- **Subcut:** Administer into abdominal wall, thigh, or upper arm subcut. Rotate injection sites.
- Administer *insulin aspart* within 5–10 min before a meal.
- When used as meal time insulin, administer *insulin glulisine* 15 min before or within 20 min after starting a meal.
- Administer *insulin lispro* within 15 min before or immediately after a meal.
- May also be administered subcut via external insulin pump. Do not mix with other insulins or solution when used with a pump. Change the solution in the reservoir at least every 6 days, change the infusion set, and the infusion set insertion site at least every 3 days. Do not mix with other insulins or with a diluent when used in the pump.
- **IV:** *Insulin aspart* and *insulin glulisine* may be administered IV in selected situations under appropriate medical supervision. **Diluent:** Dilute *insulin aspart* with 0.9% NaCl or D5W in infusion systems using polypropylene infusion bags. Dilute *insulin glulisine* with 0.9% NaCl, using polyvinyl chloride (PVC) Vialflex infusion bags and Polyvinyl chloride (PVC) tubing (Clearlink System Continu-Flo solution set) with a dedicated infusion line. **Concentration:** 0.05–1 unit/mL. *Insulin lispro Humalog U-100* can be administered IV under medical supervision **ONLY** with close monitoring of blood glucose and potassium levels to avoid hypoglycemia and hypokalemia. **Concentration:** 0.1 unit/mL to 1 unit/mL. **Diluent:** 0.9% NaCl. Solutions of insulin lispro and 0.9% NaCl can be stored for 48 hrs in refrigerator, then used at room temperature for another 48 hr.

Patient/Family Teaching

- Instruct patient on proper technique for administration. Include type of insulin, equipment (syringe, cartridge pens, external pump, alcohol swabs), storage, and place to discard syringes. Discuss the importance of not changing brands of insulin or syringes, selection and rotation of injection sites, and compliance with therapeutic regimen. Caution patient that insulin pens should not be shared with others, even if clean needles are used.
- Demonstrate technique for mixing insulins by drawing up insulin aspart, insulin glulisine, or insulin lispro first. Roll intermediate-acting insulin vial between palms to mix, rather than shaking (may cause inaccurate dose).
- Caution patient not to share pen device with another person, even if needle is changed; may risk transmission of blood-borne pathogens.

- Explain to patient that this medication controls hypoglycemia but does not cure diabetes. Therapy is long term.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness and health care professional notified of significant changes.
- Emphasize the importance of compliance with nutritional guidelines and regular exercise as directed by health care professional.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications or alcohol.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to notify health care professional if nausea, vomiting, or fever develops, if unable to eat regular diet, or if blood glucose levels are not controlled.
- **Instruct patient on signs and symptoms of hypoglycemia and hyperglycemia and what to do if they occur.**
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding or planning to breast feed.
- Patients with diabetes mellitus should carry a source of sugar (candy, glucose gel) and identification describing their disease and treatment regimen at all times.
- Emphasize the importance of regular follow-up, especially during first few wk of therapy.

Evaluation/Desired Outcomes

- Control of blood glucose levels without the appearance of hypoglycemic or hyperglycemic episodes.

INTERFERONS, BETA (in-ter-feer-on)

interferon beta-1a

Avonex, Rebif

interferon beta-1b

Betaseron, Extavia

Classification

Therapeutic: anti-multiple sclerosis agents, immune modifiers

Pharmacologic: interferons

Indications

Relapsing forms of multiple sclerosis.

Action

Antiviral and immunoregulatory properties produced by interacting with specific receptor sites on cell sur-

faces may explain beneficial effects. Produced by recombinant DNA technology. **Therapeutic Effects:** Reduce incidence of relapse (neurologic dysfunction) and slow physical disability.

Pharmacokinetics

Absorption: *Interferon beta-1b*—50% absorbed following subcut administration.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: *Interferon beta-1a*—69 hr (subcut), 10 hr (IM); *interferon beta-1b*—8 min—4.3 hr.

TIME/ACTION PROFILE (serum concentrations)

ROUTE	ONSET	PEAK	DURATION
Interferon beta-1a IM, subcut	unknown	3–15 h	unknown
Interferon beta-1b subcut	rapid	16 h	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to natural or recombinant interferon beta or human albumin.

Use Cautiously in: History of suicide attempt or depression; History of seizures (*interferon beta-1a*); Cardiovascular disease; Congestive HF (may worsen HF); Liver disease (*interferon beta-1a*); History of alcohol abuse (*interferon beta-1a*); Latex sensitivity (Extavia only); **OB:** May ↑ risk of spontaneous abortion; use only if potential maternal benefit outweighs potential fetal risk; **Lactation:** Safety not established; **Pedi:** Safety and effectiveness not established; **Rep:** Women of reproductive potential.

Adverse Reactions/Side Effects

CNS: SEIZURES (↑ WITH INTERFERON BETA-1A), depression, dizziness, fatigue, headache, insomnia, drowsiness, incoordination, rigors, suicidal ideation. **EENT:** sinusitis, vision abnormalities. **Resp:** dyspnea, upper respiratory tract infection. **CV:** chest pain, edema, hypertension. **GI:** constipation, nausea, vomiting, abdominal pain, autoimmune hepatitis, dry mouth, ↑ liver enzymes. **GU:** cystitis, erectile dysfunction, polyuria, urinary incontinence. **Derm:** ERYTHEMA MULTIFORME, STEVENS-JOHNSON SYNDROME, rash, alopecia, ↑ sweating. **Endo:** menstrual disorders, hyperthyroidism, hypothyroidism, menorrhagia, spontaneous abortion. **Hemat:** THROMBOTIC THROMBOCYTOPENIC PURPURA, HEMOLYTIC UREMIC SYNDROME, neutropenia, anemia, eosinophilia, thrombocytopenia. **Local:** injection-site reactions, injection site necrosis. **MS:** myalgia, arthralgia, drug-induced lupus erythematosus, muscle spasm. **Misc:** ALLERGIC REACTIONS (including anaphylaxis, dyspnea,

* = Canadian drug name. † = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; _____ indicate most frequent.

bronchospasm, tongue edema, rash, and urticaria), chills, fever, flu-like symptoms, pain.

Interactions

(All interactions below are for Interferon beta-1b).

Drug-Drug: ↑ myelosuppression may occur with other myelosuppressives including **antineoplastics**. Concurrent use of **hepatotoxic agents** may ↑ the risk of hepatotoxicity (↑ liver enzymes).

Drug-Natural Products: Avoid concomitant use with immunomodulating natural products such as **astragalus**, **echinacea**, and **melatonin**.

Route/Dosage

Interferon Beta-1a

IM (Adults): *Avonex*—30 mcg once weekly.

Subcut (Adults): *Rebif* (target dose of 22 mcg 3 times/wk)—Start with 4.4 mcg 3 times/wk for 2 wk, then ↑ to 11 mcg 3 times/wk for 2 wk, then ↑ to maintenance dose of 22 mcg 3 times/wk. *Rebif* (target dose of 44 mcg 3 times/wk)—Start with 8.8 mcg 3 times/wk for 2 wk, then ↑ to 22 mcg 3 times/wk for 2 wk, then ↑ to maintenance dose of 44 mcg 3 times/wk.

Interferon Beta-1b

Subcut (Adults): Initiate with 0.0625 mg (2 million units) every other day and then ↑ dose by 0.0625 mg every 2 wk over a 6-wk period up to target dose of 0.25 mg (8 million units) every other day.

Availability

Interferon Beta-1a

Powder for injection (Avonex): 30 mcg/vial. **Prefilled syringes (Avonex):** 30 mcg/0.5 mL. **Prefilled pens (Avonex):** 30 mcg/0.5 mL. **Prefilled syringes (Rebif):** 22 mcg/0.5 mL, 44 mcg/0.5 mL, titration pack of 6 syringes prefilled with 8.8 mcg/0.2 mL and 6 syringes prefilled with 22 mcg/0.5 mL.

Interferon Beta-1b

Powder for injection: 0.3 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess frequency of exacerbations of symptoms of multiple sclerosis periodically during therapy.
- **Monitor patient for signs of depression during therapy.** If depression occurs, notify health care professional immediately; discontinuation of therapy should be considered.
- **Lab Test Considerations:** Monitor hemoglobin, WBC, platelets, and blood chemistries including liver function tests prior to and 1, 3, and 6 mo after initiation of therapy and periodically thereafter. Therapy may be temporarily discontinued if the absolute neutrophil count is $<750/\text{mm}^3$, if AST or ALT exceeds 10 times the upper limit of normal, or if serum bilirubin exceeds 5 times the upper limit of normal. Once the absolute neutrophil count is $>750/\text{mm}^3$ or

the hepatic enzymes have returned to normal, therapy can be restarted at 50% of the original dose.

- Thyroid function tests should be monitored every 6 mo, especially in patients with a history of thyroid abnormalities.

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- **Do not confuse products.** Interferon beta-1a and interferon beta-1b are not interchangeable.
- **Interferon Beta-1a:** *Avonex:* Reconstitute with 1.1 mL of diluent and swirl gently to dissolve. Do not shake the vial. Inject into the thigh or upper arm. Keep reconstituted solution in refrigerator; inject within 6 hr of reconstitution.
- *Rebif:* Administer subcut via prefilled, single-use syringe at the same time (afternoon or evening) on the same days (Monday, Wednesday, Friday) at least 48 hr apart each wk. Rotate sites with each injection to minimize risk of injection site reactions (pain, erythema, edema, cellulitis, abscess, necrosis). Avoid areas that are inflamed, edematous, erythematous, ecchymotic, or has signs of infection. Discard unused portions. Store in refrigerator.
- **Interferon Beta-1b:** To reconstitute, inject 1.2 mL of diluent supplied into interferon beta-1b vial for a concentration of 0.25 mg/mL. Swirl gently to dissolve completely; do not shake. Do not use solutions that are discolored or contain particulate matter. Keep reconstituted solution refrigerated; inject within 3 hr of reconstitution. **Rubber cap of diluent prefilled syringe of Extavia contains latex and should not be handled by individuals allergic to latex.**
- Following reconstitution, withdraw 1 mL into a syringe with a 27-gauge needle and inject subcut into arm, abdomen, hip, or thigh. Pinch skin during injection and inject at a 90° angle. Gently massage injection site. Rotate sites with each injection to minimize risk of injection site reactions. Discard unused portion; vials are for single dose only.

Patient/Family Teaching

- **Home Care Issues:** Instruct patient in correct technique for injection and care and disposal of equipment. Caution patient not to reuse needles or syringes and provide patient with a puncture-resistant container for disposal.
- Instruct patient to take medication as directed; do not change dose or schedule without consulting health care professional. Patients should receive a medication guide with each product.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on

dangerous impulses; an extreme increase in activity and talking, other unusual changes in behavior or mood occur.

- Inform patient that flu-like symptoms (fever, chills, myalgia, sweating, malaise) may occur during therapy. Acetaminophen may be used for relief of fever and myalgias.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding. May cause spontaneous abortion.

Evaluation/Desired Outcomes

- Decrease in the frequency of relapse (neurologic dysfunction) in patients with relapsing-remitting multiple sclerosis.

ipilimumab (i-pil-li-moo-mab)
Yervoy

Classification

Therapeutic: antineoplastics
Pharmacologic: monoclonal antibodies

Indications

Treatment of unresectable/metastatic melanoma. Adjuvant treatment of cutaneous melanoma with pathologic involvement of regional lymph nodes > 1 mm in patients who have undergone complete resection, including total lymphadenectomy.

Action

Binds to cytotoxic T-lymphocyte-associated antigen 4 (CTLA-4) and prevents it from binding to CD80/CD86 ligands. CTLA-4 is a negative regulator of T-cell activation; binding results in augmented T-cell activation and proliferation as well as enhanced T-cell responsiveness.

Therapeutic Effects: ↓ spread or recurrence of melanoma.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Crosses the placenta.

Metabolism and Excretion: Unknown.

Half-life: 14.7 days.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: **Lactation:** Avoid breast feeding.

Use Cautiously in: **OB:** Use only if potential maternal benefit justifies potential risk to the fetus; may cause fetal harm; **Rep:** Women of reproductive potential; **Pedi:**

Children <12 yr (safety and effectiveness not established).

Adverse Reactions/Side Effects

CNS: ENCEPHALITIS, fatigue. **EENT:** hearing loss, immune-mediated ocular disease. **GI:** IMMUNE-MEDIATED COLITIS, IMMUNE-MEDIATED HEPATITIS, colitis, diarrhea.

Derm: immune-mediated dermatitis including TOXIC EPIDERMAL NECROLYSIS, pruritus, rash. **Endo:** IMMUNE-MEDIATED ENDOCRINOPATHIES including HYPOPITUITARISM, HYPOTHYROIDISM, HYPERTHYROIDISM, ADRENAL INSUFFICIENCY, CUSHING'S SYNDROME, AND HYPOGONADISM.

MS: myositis. **Neuro:** IMMUNE-MEDIATED NEUROPATHY.

Misc: SARCOIDOSIS.

Interactions

Drug-Drug: Concurrent use with vemurafenib may ↑ risk of hepatic dysfunction.

Route/Dosage

Unresectable/Metastatic Melanoma

IV (Adults and Children ≥12 yr): 3 mg/kg every 3 wk for a total of 4 doses.

Adjuvant Treatment of Melanoma

IV (Adults and Children ≥12 yr): 10 mg/kg every 3 wk for 4 doses, then 10 mg/kg every 12 wk for up to 3 yr.

Availability

Solution for IV infusion (requires further dilution): 5 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor for signs and symptoms of enterocolitis (diarrhea, abdominal pain, mucus or blood in stool, with or without fever) and bowel perforation (peritoneal signs, ileus). Rule out infection and consider endoscopic evaluation. If severe enterocolitis occurs, discontinue ipilimumab and start systemic corticosteroids at doses of 1–2 mg/kg/day of prednisone or equivalents. At improvement to Grade 1 or less, taper corticosteroid over at least 1 mo. Consider adding anti-TNF therapy or other immunosuppressive therapy if signs and symptoms of enterocolitis persist despite systemic corticosteroid therapy within 3–5 days or if they recur after symptomatic improvement. Withhold dose for moderate enterocolitis; administer anti-diarrheal treatment and if persists for > 1 wk, start corticosteroids at a dose of 0.5 mg/kg/day of prednisone or equivalent.
- Assess for signs and symptoms of hepatotoxicity (yellowing of skin or whites of eyes, unusual darkening of urine, unusual tiredness, pain in right upper stomach) before each dose. If hepatotoxicity occurs, rule out infectious or malignant causes. Permanently

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

discontinue ipilimumab if Grade 3–5 hepatotoxicity occurs and start systemic corticosteroids at a dose of 1–2 mg/kg/day of prednisone or equivalent. When liver function tests show sustained improvement or return to baseline, start corticosteroid taper over 1 mo. May administer mycophenolate in patients with persistent severe hepatitis despite high-dose corticosteroids. Withhold ipilimumab in patients with Grade 2 hepatotoxicity.

- Monitor for signs and symptoms of dermatitis (rash, pruritus). Unless other causes are identified, assume immune-mediated dermatitis. Permanently discontinue ipilimumab in patients with Stevens-Johnson syndrome, toxic epidermal necrolysis, or rash complicated by full thickness dermal ulceration, or necrotic, bullous, or hemorrhagic manifestations. Administer corticosteroids at a dose of 1–2 mg/kg/day of prednisone or equivalent. When dermatitis is controlled, taper corticosteroids over at least 1 mo. Withhold ipilimumab in patients with moderate to severe signs and symptoms. Treat mild to moderate dermatitis symptomatically. Administer topical or systemic corticosteroids if there is no improvement of symptoms within 1 wk.
- Monitor for symptoms of motor or sensory neuropathy (unilateral or bilateral weakness, sensory alterations, paresthesia). Permanently discontinue ipilimumab in patients with severe neuropathy (interfering with daily activities). Institute treatment as needed. Consider systemic corticosteroids of 1–2 mg/kg/day of prednisone or equivalent for severe neuropathy. Withhold dose of ipilimumab in patients with moderate neuropathy (not interfering with daily activities).
- Monitor for clinical signs and symptoms of hypophysitis, adrenal insufficiency (including adrenal crisis), and hyper or hypothyroidism (fatigue, headache, mental status changes, abdominal pain, unusual bowel habits, hypotension). Unless other causes are determined, consider signs and symptoms as immune-mediated endocrinopathies. Withhold ipilimumab in symptomatic patients and initiate corticosteroids at 1–2 mg/kg/day of prednisone or equivalents. Initiate hormone replacement therapy as needed.
- Assess eyes for signs and symptoms of uveitis, iritis, or episcleritis. Administer corticosteroid eye drops if these occur. Permanently discontinue ipilimumab for immune-mediated ocular disease unresponsive to local immunosuppressive therapy.
- **Lab Test Considerations:** Monitor liver function tests (AST, ALT, bilirubin) prior to each dose of ipilimumab; ↑ frequency of monitoring if levels ↑. Withhold ipilimumab in patients with Grade 2 hepatotoxicity. With complete or partial resolution (Grade 0–1), and patient receiving <7.5 mg prednisone, resume at a dose of 3 mg/kg every 3 wk until administration of all 4 planned doses or 16 wk from first dose, whichever occurs earlier. Discontinue ipilimumab

permanently with Grade 3–5 hepatotoxicity and administer systemic corticosteroids at a dose of 1 to 2 mg/kg/day of prednisone or equivalent. Initiate corticosteroid taper when liver function tests show sustained improvement or return to baseline; continue to taper over 1 mo.

- Monitor thyroid function tests and serum chemistries at start of therapy, before each dose, and as clinically indicated.

Potential Nursing Diagnoses

Impaired skin integrity (Indications)

Implementation

- For unresectable/metastatic melanoma, doses may be delayed in the event of toxicity, but must be administered with 16 wks from 1st dose. For adjuvant treatment of melanoma, doses can be omitted, but not delayed in the event of toxicity.
- Withhold dose for any moderate immune-mediated adverse reactions or for symptomatic endocrinopathy. For patients with complete or partial resolution of adverse reactions (Grade 0–1), who are receiving equivalents of <7.5 mg prednisone/day, resume ipilimumab therapy.
- Permanently discontinue if persistent moderate adverse reactions or inability to reduce corticosteroid dose to equivalent of prednisone 7.5 mg/day, failure to complete full treatment course within 16 wks from infusion of 1st dose, or severe or life threatening adverse reactions occur including: Colitis with abdominal pain, fever, or peritoneal signs; ↑ in stool frequency of 7 or more over baseline, stool incontinence. Need for IV hydration for >24 hrs, GI hemorrhage and GI perforation; AST or ALT >5 times the upper limits of normal or total bilirubin >3 times the upper limit of normal; Stevens-Johnson syndrome, toxic epidermal necrolysis, or rash complicated by full-thickness dermal ulceration, or necrotic, bullous, or hemorrhagic manifestations; Severe motor or sensory neuropathy, Guillian-Barre syndrome, or myasthenia gravis; Severe immune-mediated reactions involving any organ system (nephritis, pneumonitis, pancreatitis, non-infectious myocarditis); and Immune-mediated ocular disease that is unresponsive to topical immunosuppressive therapy.
- Allow vial to stand at room temperature for 5 min prior to preparation of infusion. Withdraw amount of ipilimumab required and transfer to IV bag. **Diluent:** Dilute with 0.9% NaCl or D5W. **Concentration:** 1 mg/mL to 2 mg/mL. Mix slowly by gentle inversion; do not shake. Solution is clear, pale yellow, and may contain translucent-to-white amorphous particles; do not administer if cloudy, discolored, or contains particulate matter. Store for up to 24 hr at room temperature or refrigerated; do not freeze, protect from light. Discard partially used vials. **Rate:** Infuse over 90 min through a sterile, non-py-

rogenic, low-protein-binding in-line filter. Flush the IV line with 0.9% NaCl or D5W after each dose.

- **Y-Site Incompatibility:** Do not mix with or infuse with other solutions or products.

Patient/Family Teaching

- Inform patient of the risk of immune-mediated reactions due to T-cell activation and proliferation. Advise patients these may be severe and fatal. Instruct patient to notify health care professional immediately if signs and symptoms occur.
- Instruct patient to read the *Medication Guide* before starting therapy and before each dose of ipilimumab.
- Inform female patient to use effective contraception and avoid breast feeding during and for at least 3 mo following therapy. Women must choose to discontinue breast feeding or ipilimumab. Advise female patients to notify health care professional if pregnancy is planned or suspected. Encourage women who become pregnant during therapy to enroll in a Pregnancy Safety Surveillance Study by calling 1-844-593-7869.

Evaluation/Desired Outcomes

- ↓ spread or recurrence of melanoma.

ipratropium (i-pra-troe-pee-um)

Atrovent, Atrovent HFA

Classification

Therapeutic: allergy, cold, and cough remedies, bronchodilators

Pharmacologic: anticholinergics

Indications

Inhaln: Maintenance therapy of reversible airway obstruction due to COPD, including chronic bronchitis and emphysema. **Intranasal:** Rhinorrhea associated with allergic and nonallergic perennial rhinitis (0.03% solution) or the common cold (0.06% solution). **Unlabeled Use:** **Inhaln:** Adjunctive management of bronchospasm caused by asthma.

Action

Inhaln: Inhibits cholinergic receptors in bronchial smooth muscle, resulting in decreased concentrations of cyclic guanosine monophosphate (cGMP). Decreased levels of cGMP produce local bronchodilation. **Intranasal:** Local application inhibits secretions from glands lining the nasal mucosa. **Therapeutic Effects:** **Inhaln:** Bronchodilation without systemic anticholinergic effects. **Intranasal:** Decreased rhinorrhea.

Pharmacokinetics

Absorption: Minimal systemic absorption (2% for inhalation solution; 20% for inhalation aerosol; <20% following nasal use).

Distribution: 15% of dose reaches lower airways after inhalation.

Metabolism and Excretion: Small amounts absorbed are metabolized by the liver.

Half-life: 2 hr.

TIME/ACTION PROFILE (bronchodilation)

ROUTE	ONSET	PEAK	DURATION
Inhalation	1–3 min	1–2 hr	4–6 hr
Intranasal	15 min	unknown	6–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to ipratropium, atropine, belladonna alkaloids, or bromide; Avoid use during acute bronchospasm; **Note:** **Atrovent HFA has replaced the discontinued Atrovent CFC (chlorofluorocarbon). Soy and CFC-allergic patients can now safely use the Atrovent HFA formulation. However, Combivent (ipratropium/albuterol combination) MDI does contain soy lecithin and is contraindicated in patients with a history of hypersensitivity to soy and peanuts.**

Use Cautiously in: Patients with bladder neck obstruction, prostatic hyperplasia, glaucoma, or urinary retention; **Ger:** May be more sensitive to effects.

Adverse Reactions/Side Effects

CNS: dizziness, headache, nervousness. **EENT:** blurred vision, sore throat; *nasal only*, epistaxis, nasal dryness/irritation. **Resp:** bronchospasm, cough. **CV:** hypotension, palpitations. **GI:** GI irritation, nausea.

Derm: rash. **Misc:** allergic reactions.

Interactions

Drug-Drug: ↑ anticholinergic effects with other drugs having anticholinergic properties (antihistamines, phenothiazines, disopyramide).

Route/Dosage

Inhaln (Adults and Children >12 yr): Metered-dose inhaler (nonacute)—2 inhalations 4 times daily (not to exceed 12 inhalations/24 hr or more frequently than q 4 hr). **Acute exacerbations**—4–8 puffs using a spacer device as needed. **Via nebulization (nonacute)**—500 mcg 3–4 times daily. **Via nebulization (acute exacerbations)**—500 mcg q 30 min for 3 doses then q 2–4 hr as needed.

Inhaln (Children 5–12 yr): Metered-dose inhaler (nonacute)—1–2 inhalations/q 6 hr as needed (not to exceed 12 inhalations/24 hr). **Acute exacerbations**—4–8 puffs as needed **Via nebulization (nonacute)**—250–500 mcg 4 times daily given q 6 hr. **Acute exacerbations**—250 mcg q 20 min for 3 doses then q 2–4 hr as needed.

Inhaln (Infants): Nebulization—125–250 mcg 3 times a day.

* = Canadian drug name. † = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; underline indicate most frequent.

Inhaln (Neonates): *Nebulization*—25 mcg/kg/dose 3 times a day.

Intranasal (Adults and Children >6 yr): 0.03% *solution*—2 sprays in each nostril 2–3 times daily (21 mcg/spray).

Inhaln (Adults and Children >5 yr): 0.06% *solution*—2 sprays in each nostril 3–4 times daily (42 mcg/spray).

Availability (generic available)

Aerosol inhaler (HFA) (chlorofluorocarbon-free): 17 mcg/spray in 12.9-g canister (200 inhalations). **Inhalation solution:** ★ 0.0125%, 0.02% in single-dose vials containing 500 mcg, ★ 0.025%. **Nasal spray:** 0.03% solution—21 mcg/spray in 30-mL bottle (345 sprays/bottle), 0.06% solution—42 mcg/spray in 15-mL bottle (165 sprays). **In combination with:** albuterol (Combivent). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess for allergy to atropine and belladonna alkaloids; patients with these allergies may also be sensitive to ipratropium. Atrovent HFA MDI does not contain CFC or soy and may be used safely in soy or CFC-allergic patients. However, Combivent MDI should be avoided in soy or peanut-allergic patients.
- **Inhaln:** Assess respiratory status (rate, breath sounds, degree of dyspnea, pulse) before administration and at peak of medication. Consult health care professional about alternative medication if severe bronchospasm is present; onset of action is too slow for patients in acute distress. If paradoxical bronchospasm (wheezing) occurs, withhold medication and notify health care professional immediately.
- **Nasal Spray:** Assess patient for rhinorrhea.

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)

Activity intolerance (Indications)

Implementation

- **Inhaln:** See Appendix D for administration of inhalation medications.
- When ipratropium is administered concurrently with other inhalation medications, administer adrenergic bronchodilators first, followed by ipratropium, then corticosteroids. Wait 5 min between medications.
- Solution for *nebulization* can be diluted with preservative-free 0.9% NaCl. Diluted solution should be used within 24 hr at room temperature or 48 hr if refrigerated. Solution can be mixed with preservative-free albuterol, cromolyn, or metaproterenol if used within 1 hr of mixing.

Patient/Family Teaching

- Instruct patient in proper use of inhaler, nebulizer, or nasal spray and to take medication as directed. Take missed doses as soon as remembered unless

almost time for the next dose; space remaining doses evenly during day. Do not double doses.

- Advise patient that rinsing mouth after using inhaler, good oral hygiene, and sugarless gum or candy may minimize dry mouth. Health care professional should be notified if stomatitis occurs or if dry mouth persists for more than 2 wk.
- **Inhalation:** Caution patient not to exceed 12 doses within 24 hr. Patient should notify health care professional if symptoms do not improve within 30 min after administration of medication or if condition worsens.
- Explain need for pulmonary function tests prior to and periodically during therapy to determine effectiveness of medication.
- Caution patient to avoid spraying medication in eyes; may cause blurring of vision or irritation.
- Advise patient to inform health care professional if cough, nervousness, headache, dizziness, nausea, or GI distress occurs.
- **Nasal Spray:** Instruct patient in proper use of nasal spray. Clear nasal passages gently before administration. Do not inhale during administration, so medication remains in nasal passages. Prime pump initially with 7 actuations. If used regularly, no further priming is needed. If not used in 24 hr, prime with 2 actuations. If not used for >7 days, prime with 7 actuations.
- Advise patient to contact health care professional if symptoms do not improve within 1–2 wk or if condition worsens.

Evaluation/Desired Outcomes

- Decreased dyspnea.
- Improved breath sounds.
- Decrease in rhinorrhea from perennial rhinitis or the common cold.

irbesartan, See ANGIOTENSIN II RECEPTOR ANTAGONISTS.

irinotecan
(eye-ri-noe-tee-kan)
Camptosar

Classification

Therapeutic: antineoplastics
Pharmacologic: enzyme inhibitors

Indications

Metastatic colorectal cancer (with 5-fluorouracil and leucovorin).

Action

Interferes with DNA synthesis by inhibiting the enzyme topoisomerase. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Protein Binding: *Irinotecan*—30–68%; *SN-38 (active metabolite)*—95%.

Metabolism and Excretion: Converted by the liver to *SN-38*, its active metabolite, which is metabolized by the liver by UDP-glucuronosyl 111 transferase 1A1 (UGT1A1) and CYP3A4. Small amounts excreted by kidneys.

Half-life: 6 hr.

TIME/ACTION PROFILE (hematologic effects)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	21–29 days	27–34 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hereditary fructose intolerance (contains sorbitol); Concurrent use of ketoconazole and St. John's wort; **OB, Lactation:** Pregnancy or lactation.

Use Cautiously in: Previous pelvic or abdominal irradiation or age ≥ 65 yr (\uparrow risk of myelosuppression); Presence of infection, underlying bone marrow depression, or concurrent chronic illness; History of prior pelvic/abdominal irradiation and serum bilirubin $> 1-2$ mg/dL (initial dose reduction recommended); **Geri:** \uparrow sensitivity to adverse effects (myelosuppression); initiate at lower dose; Hepatic impairment; Previous severe myelosuppression or diarrhea (restitute at lower dose following resolution); **⚠** Patients with genetically reduced UGT1A1 activity (\uparrow risk of neutropenia); **Rep:** Patients with childbearing potential; **Pedi:** Safety not established.

Adverse Reactions/Side Effects

CNS: dizziness, headache, insomnia, weakness.

EENT: rhinitis. **Resp:** **INTERSTITIAL LUNG DISEASE**, coughing, dyspnea. **CV:** edema, vasodilation. **GI:** **DIARRHEA**, \uparrow **LIVER ENZYMES**, abdominal pain/cramping, anorexia, constipation, dyspepsia, flatulence, nausea, stomatitis, vomiting, abdominal enlargement, colonic ulceration. **Derm:** alopecia, rash, sweating. **F and E:** dehydration. **Hemat:** anemia, leukopenia, neutropenia, thrombocytopenia. **Local:** injection site reactions. **Metab:** weight loss. **MS:** back pain. **Misc:** chills, fever.

Interactions

Drug-Drug: Combination with **fluorouracil** may result in serious toxicity (dehydration, neutropenia, sepsis). \uparrow bone marrow depression may occur with other **antineoplastics** or radiation therapy. Strong **CYP3A4 inhibitors** (ketoconazole, clarithromycin, indinavir, itraconazole, lopinavir, nefazo-

done, nelfinavir, ritonavir, saquinavir, and voriconazole) and strong **UGT1A1 inhibitors** (atazanavir, gemfibrozil, and indinavir) may \uparrow levels of irinotecan and its active metabolite; should be discontinued ≥ 1 wk before initiating irinotecan. **Phenobarbital, phenytoin, carbamazepine, rifampin, or rifabutin** may \downarrow levels of irinotecan and its active metabolite; consider using an alternative anticonvulsant at least 2 wk before initiating irinotecan. **Laxatives** should be avoided (diarrhea may be \uparrow). **Diuretics** \uparrow risk of dehydration (may discontinue during therapy). **Dexamethasone** may \uparrow risk of hyperglycemia and lymphocytopenia. **Prochlorperazine** given on the same day as irinotecan \uparrow risk of akathisia. May \downarrow antibody response to and \uparrow risk of adverse reactions from **live virus vaccines**.

Drug-Natural Products: **St. John's wort** \downarrow levels of the active metabolite; concurrent use is contraindicated; should be discontinued at least 2 wk before initiating irinotecan.

Route/Dosage

Other regimens are used; careful modification required for all levels of toxicity/tolerance.

Single Agent

⚠ IV (Adults): *Weekly dosage schedule*—125 mg/m² once weekly for 4 wk, followed by a 2-wk rest period. Cycle may be repeated using doses which depend on patient tolerance and degree of toxicity encountered. *Once-every-3-wk schedule*—350 mg/m² once every 3 wk. Cycle may be repeated using doses which depend on patient tolerance and degree of toxicity encountered.

IV (Geriatric Patients > 70 yr): *Weekly dosage schedule*—125 mg/m² once weekly for 4 wk, followed by a 2-wk rest period. Cycle may be repeated using doses which depend on patient tolerance and degree of toxicity encountered. *Once-every-3-wk schedule*—300 mg/m² once every 3 wk. Cycle may be repeated using doses which depend on patient tolerance and degree of toxicity encountered.

⚠ IV (Adults Patients with Reduced UGT1A1 Activity): *Weekly dosage schedule*—100 mg/m² once weekly for 4 wk, followed by a 2-wk rest period. Cycle may be repeated using doses which depend on patient tolerance and degree of toxicity encountered. *Once-every-3-wk schedule*—300 mg/m² once every 3 wk. Cycle may be repeated using doses which depend on patient tolerance and degree of toxicity encountered.

Hepatic Impairment

IV (Adults): *Bilirubin 1–2 mg/dL and history of prior pelvic/abdominal irradiation*—*Weekly dosage schedule*—Initiate therapy at lower dose (100 mg/m²); once weekly for 4 wk, followed by a 2-wk rest period. Cycle may be repeated with dose adjusted as

* = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

tolerated. **Once-every-3-wk schedule**—300 mg/m² once every 3 wk. Cycle may be repeated with dose adjusted as tolerated.

As Part of Combination Therapy with Leucovorin and 5-Fluorouracil

IV (Adults): Regimen 1 (Bolus regimen)—125 mg/m² once weekly for 4 wk, followed by a 2-wk rest period. Cycle may be repeated using doses that depend on patient tolerance and degree of toxicity encountered; **Regimen 2 (Infusional regimen)**—180 mg/m² every 2 wk for 3 doses, followed by a 3-wk rest period. Cycle may be repeated using doses that depend on patient tolerance and degree of toxicity encountered.

PO IV (Adults Patients with Reduced UGT1A1 Activity): Regimen 1 (Bolus regimen)—100 mg/m² once weekly for 4 wk, followed by a 2-wk rest period. Cycle may be repeated using doses that depend on patient tolerance and degree of toxicity encountered; **Regimen 2 (Infusional regimen)**—150 mg/m² every 2 wk for 3 doses, followed by a 3-wk rest period. Cycle may be repeated using doses that depend on patient tolerance and degree of toxicity encountered.

Availability (generic available)

Solution for injection: 20 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs frequently during administration.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor closely for the development of diarrhea. Two types may occur. The early type occurs within 24 hr of administration and may be preceded by cramps and sweating. Atropine 0.25–1 mg IV may be given to decrease symptoms. **Potentially life-threatening diarrhea may occur more than 24 hr after a dose and may be accompanied by severe dehydration and electrolyte imbalance. Loperamide 4 mg initially, followed by 2 mg every 2 hr until diarrhea ceases for at least 12 hr (or 4 mg every 4 hr if given during sleeping hours) should be administered promptly to treat late-occurring diarrhea. Do not administer loperamide at these doses for >48 hr. Careful fluid and electrolyte replacement should be instituted to prevent complications. Subsequent doses should be delayed in patients with active diarrhea until diarrhea is resolved for 24 hr. If diarrhea is grade 2, 3, or 4, decrease subsequent doses of irinotecan.**
- Nausea and vomiting are common. Pretreatment with dexamethasone 10 mg along with agents such

as ondansetron or granisetron should be started on the same day as irinotecan at least 30 min before administration. Prochlorperazine may be used on subsequent days but may increase risk of akathisia if given on the same day as irinotecan.

- Assess IV site frequently for inflammation. Avoid extravasation. If extravasation occurs, infusion must be stopped and restarted in another vein to avoid damage to subcut tissue. Flushing site with sterile water and application of ice over the extravasated site are recommended.
- **If signs of pulmonary toxicity (dyspnea, cough, fever) occur, interrupt therapy. If interstitial pulmonary disease is determined, discontinue irinotecan.**
- Assess for cholinergic symptoms (rhinitis, increased salivation, miosis, lacrimation, diaphoresis, flushing, abdominal cramping, diarrhea) during therapy. Atropine 0.25–1 mg subcut or IV may be used to prevent or treat symptoms.
- **Lab Test Considerations:** Monitor CBC with differential and platelet count prior to each dose. Temporarily discontinue irinotecan if absolute neutrophil count is <500 cells/mm³ or if neutropenic fever occurs. Administration of a colony-stimulating factor may be considered if clinically significant decreases in WBC (<2000/mm³), neutrophil count (<1000/mm³), hemoglobin (<9 g/dL), or platelet count (<100,000 cells/mm³) occur.
- **May cause ↑ serum alkaline phosphatase and AST concentrations.**

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)

Implementation

- Prepare solution in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers.

IV Administration

- **Intermittent Infusion:** **Diluent:** Dilute before infusion with D5W or 0.9% NaCl. Usual diluent is 500 mL of D5W. **Concentration:** 0.12–2.8 mg/mL. Solution is pale yellow. Do not administer solutions that are cloudy or contain particulate matter. Solution is stable for 24 hr at room temperature or 48 hr if refrigerated. To prevent microbial contamination, solutions should be used within 24 hr of dilution if refrigerated or 6 hr at room temperature. Do not refrigerate solutions diluted with 0.9% NaCl. **Rate:** Administer dose over 90 min.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, amifostine, amikacin, aminophylline, amiodarone, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, caspofungin, ceftazolin, cefotetan, cefoxitin, ceftazidime, cefuroxime, ciprofloxacin, cisatracu-

rium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, daptomycin, daunorubicin, dexamethasone, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxacurium, doxorubicin, doxycycline, enalaprilat, ephedrine, epinephrine, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, foscarnet, gentamicin, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydromorphone, idarubicin, imipenem/cilastatin, insulin, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, levoleucovorin, levorphanol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem, mesna, metaraminol, methylodopate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, pancuronium, pantoprazole, pentamidine, pentazocine, pentobarbital, phenobarbital, phenylephrine, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, ranitidine, remifentanyl, rituximab, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, tolazoline, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, allopurinol, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, cefepime, cefotaxime, ceftriaxone, chloramphenicol, chlorpromazine, dantrolene, dexmedetomidine, diazepam, droperidol, fluorouracil, fosphenytoin, furosemide, ganciclovir, gemcitabine, glycopyrrolate, methohexital, methylprednisolone, mitomycin, nafcillin, nitroprusside, pemetrexed, phenytoin, piperacillin/tazobactam, thiopental, trastuzumab.
- **Additive Incompatibility:** Information unavailable. Do not admix with other solutions or medications.

Patient/Family Teaching

- Instruct patient to report occurrence of diarrhea to health care professional immediately, especially if it occurs more than 24 hr after dose. Diarrhea may be accompanied by severe dehydration and electrolyte imbalance. It may be life-threatening and should be treated promptly. Patient should have loperamide for treatment.

- Instruct patient to notify health care professional promptly if fever; chills; sore throat; signs of infection; bleeding gums; bruising; petechiae; blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Caution patient not to drink alcoholic beverages or take products containing aspirin or other NSAIDs.
- Instruct patient to notify nurse of pain at injection site immediately.
- Instruct patient to notify health care professional if vomiting, fainting, or dizziness occurs.
- Discuss with patient possibility of hair loss. Explore methods of coping.
- Instruct patient not to receive any vaccinations without consulting health care professional.
- **Rep:** Advise patient that this medication may have teratogenic effects. Contraception should be used during therapy.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in size and spread of malignancy.

IRON SUPPLEMENTS

carbonyl iron (100%) (kar-bo-nil eye-ern)

Feosol, Icar

ferrous fumarate (33% elemental iron) (fer-us fyoo-ma-rate)

Femiron, Feostat, Fumasorb, Fumerin, Hemocyte, Neo-Fer, Span-FF

ferrous gluconate (12% elemental iron) (fer-us gloo-koe-nate)

Fergon, Ferralet, Simron

ferrous sulfate (30% elemental iron) (fer-us sul-fate)

ED-IN-SOL, Fe50, Feosol, Feratab, Fer-gen-sol, Fer-In-Sol, Fer-Iron, Slow FE

iron dextran (eye-ern dex-tran)

DexFerrum, *****Dexiron, InFeD, *****Infufer

iron polysaccharide (eye-ern poll-ee-sak-a-ride)

Hytinic, Niferex, Nu-Iron

iron sucrose (eye-ern su-krose)

***CAPITALS** indicates life-threatening; underlines indicate most frequent.

**sodium ferric gluconate complex
(so-dee-yum ferr-ic gloo-ko-nate)**

Ferlecit

Classification

Therapeutic: antianemics

Pharmacologic: iron supplements

Indications**PO:** Prevention/treatment of iron-deficiency anemia.**IM, IV:** *Iron dextran*—Treatment of iron-deficiency anemia in patients who cannot tolerate or receive oral iron. *Sodium ferric gluconate complex*—Treatment of iron deficiency in patients undergoing chronic hemodialysis or peritoneal dialysis who are concurrently receiving erythropoietin. Treatment of iron-deficiency anemia in patients with chronic kidney disease including patients who are not on dialysis (with or without erythropoietin) and patients dependent on dialysis (with erythropoietin).**Action**An essential mineral found in hemoglobin, myoglobin, and many enzymes. Enters the bloodstream and is transported to the organs of the reticuloendothelial system (liver, spleen, bone marrow), where it is separated out and becomes part of iron stores. **Therapeutic Effects:** Prevention/treatment of iron deficiency.**Pharmacokinetics****Absorption:** 5–10% of dietary iron is absorbed (up to 30% in deficiency states). Therapeutically administered PO iron may be 60% absorbed via an active and passive transport process. Well absorbed following IM administration.**Distribution:** Remains in the body for many mo. Crosses the placenta; enters breast milk.**Protein Binding:** ≥90%.**Metabolism and Excretion:** Mostly recycled; small daily losses occurring via desquamation, sweat, urine, and bile.**Half-life:** *Iron dextran, iron sucrose*—6 hr.

TIME/ACTION PROFILE (effects on erythropoiesis)

ROUTE	ONSET	PEAK	DURATION
PO	4 days	7–10 days	2–4 mo
IM, IV	4 days	1–2 wk	wk–mos

Contraindications/Precautions**Contraindicated in:** Hemochromatosis, hemosiderosis, or other evidence of iron overload; Anemias not due to iron deficiency; Some products contain alcohol, tartrazine, or sulfites and should be avoided in patients with known intolerance or hypersensitivity.**Use Cautiously in:** Peptic ulcer; Ulcerative colitis or regional enteritis (condition may be aggravated); Alcoholism; Severe hepatic impairment; Severe renal impairment (oral products); Pre-existing cardiovasculardisease (iron dextran) (may be exacerbated by adverse reactions to this drug); Significant allergies or asthma (iron dextran); History of drug allergy or multiple drug allergies (iron dextran) (may be at ↑ risk for anaphylactic reaction); Rheumatoid arthritis (iron dextran) (may have exacerbation of joint swelling); **OB, Lactation:** Pregnancy or lactation (safety of some parenteral products not established); **Pedi:** Safety not established for infants <4 mo (iron dextran) or children <6 yr (sodium ferric gluconate complex); safety may not be established for other products in the pediatric population.**Adverse Reactions/Side Effects****CNS:** *IM, IV*—**SEIZURES**, dizziness, headache, syncope.**CV:** *IM, IV*—**hypotension**, hypertension, tachycardia.**GI:** nausea; *PO*, constipation, dark stools, diarrhea, epigastric pain, GI bleeding; *IM, IV*, taste disorder, vomiting. **Derm:** *IM, IV*—flushing, urticaria. **Resp:** *IV*—cough, dyspnea. **Local:** pain at IM site (iron dextran), phlebitis at IV site, skin staining at IM site (iron dextran). **MS:** *IM, IV*—arthralgia, myalgia. **Misc:** *PO*—staining of teeth (liquid preparations); *IM, IV*, allergic reactions including **ANAPHYLAXIS**, fever, lymphadenopathy, sweating.**Interactions****Drug-Drug:** Oral iron supplements ↓ absorption of tetracyclines, bisphosphonates, fluoroquinolones, levothyroxine, mycophenolate mofetil, and penicillamine (simultaneous administration should be avoided). ↓ absorption of and may ↓ effects of **levodopa** and **methyl dopa**. Concurrent administration of **H₂ antagonists**, **proton pump inhibitors**, and **cholestyramine** may ↓ absorption of iron. Doses of **ascorbic acid** ≥200 mg may ↑ absorption of iron up to ≥30%. **Chloramphenicol** and **vitamin E** may ↓ hematologic response to iron therapy. **ACE inhibitors** may ↑ risk of anaphylactic reaction with iron dextran.**Drug-Food:** Iron absorption is ↓ 33–50% by concurrent administration of food.**Route/Dosage**

Oral Iron Dosage for Iron Deficiency (expressed as mg elemental iron, note individual salt forms, multiple ones exist—see approximate equivalent doses below for dose conversions).

Approximate Equivalent Doses (mg of iron salt): *Ferrous fumarate*—197; *Ferrous gluconate*—560; *Ferrous sulfate*—324; *Ferrous sulfate, exsiccated*—217.**PO (Adults):** *Deficiency*—120–240 mg/day (2–3 mg/kg/day) in 2–4 divided doses. *Prophylaxis*—60–100 mg/day.**PO (Infants and Children):** *Severe deficiency*—4–6 mg/kg/day in 3 divided doses. *Mild to moderate deficiency*—3 mg/kg/day in 1–2 divided doses. *Prophylaxis*—1–2 mg/kg/day in 1–2 divided dose (maximum: 15 mg/day).

PO (Neonates, premature): 2–4 mg/kg/day in 1–2 divided doses, maximum: 15 mg/day.

Iron Dextran

IM, IV (Adults and Children): Test dose of 0.5 mL (25 mg) is given 1 hr prior to therapy.

IM, IV (Infants): Test dose of 0.25 mL (12.5 mg) is given 1 hr prior to therapy.

IM, IV (Adults and Children >15 kg): Iron deficiency—Total dose (mL) = $0.0442 \times (\text{desired Hgb} - \text{actual Hgb}) \times \text{lean body weight (kg)} + [0.26 \times \text{lean body weight (kg)}]$. Divided up and given in small daily doses until total is reached; not to exceed 100 mg/day. **Total dose IV infusion—**Total dose may be diluted and infused over 4–5 hr following a test dose of 10 drops (unlabeled).

IM, IV (Adults): Blood loss—Dose (mL) = $(\text{Blood loss [mL]} \times \text{hematocrit}) \times 0.02$.

IM, IV (Children 5–15 kg): Iron deficiency—Total dose (mL) = $0.042 (\text{desired Hgb} - \text{actual Hgb}) \times \text{weight (kg)} + [0.26 \times \text{weight (kg)}]$. Divided up and given in small daily doses until total is reached; not to exceed 25 mg/day in children <5 kg; 50 mg/day in children 5–10 kg; or 100 mg/day in children >10 kg.

Iron Polysaccharide Complex

PO (Adults): 50–100 mg twice daily of tablets/elixir or 150–300 mg/day of the capsules.

PO (Children >6yr): 50–100 mg/day (may be given in divided doses).

PO (Infants): 1–2 mg/kg/day.

PO (Adults — Pregnant Women): 30–60 mg/day.

Iron Sucrose

IV (Adults): Hemodialysis dependent patients—100 mg (5 mL) during each dialysis session for 10 doses (total of 1000 mg) additional smaller doses may be necessary; **Peritoneal dialysis dependent patients—**300 mg (15 mL) infusion, followed by another 300 mg (15 mL) infusion 14 days later, followed by 400 mg (20 mL) infusion 14 days later; **Non-dialysis dependent patients—**200 mg (10 mL) on 5 different days within a 14 day period to a total of 1000 mg, may also be given as infusion of 500 mg on day 1 and day 14.

Sodium Ferric Gluconate Complex

IV (Adults): 10 mL (125 mg elemental iron) repeated during 8 sequential dialysis treatments to a total cumulative dose of 1 g.

IV (Children >6 yr): 0.12 mL/kg (not to exceed 125 mg/dose) repeated during 8 sequential dialysis treatments.

Availability

Carbonyl Iron (100% Iron)

Tablets: 50 mg^{OTC}. **Oral suspension:** 15 mg/1.25 mL^{OTC}.

Ferrous Fumarate (33% Elemental Iron) (generic available)

Tablets: 63 mg^{OTC}, 195 mg^{OTC}, 200 mg^{OTC}, 324 mg^{OTC}, 325 mg^{OTC}. **Chewable tablets:** 100 mg^{OTC}. **Controlled-release capsules:** 325 mg^{OTC}. **Suspension (butterscotch flavor):** 100 mg/5 mL^{OTC}, 300 mg/5 mL^{OTC}. **Drops:** 45 mg/0.6 mL^{OTC}, 60 mg/1 mL^{OTC}.

Ferrous Gluconate (11.6% Elemental Iron) (generic available)

Tablets: 300 mg^{OTC}, 320 mg^{OTC}, 325 mg^{OTC}. **Sustained-release tablets:** 320 mg^{OTC}. **Soft gelatin capsules:** 86 mg^{OTC}. **Elixir:** 300 mg/5 mL^{OTC}. **Syrup:** 300 mg/5 mL^{OTC}.

Ferrous Sulfate (20–30% Elemental Iron)

Tablets: 195 mg^{OTC}, 300 mg^{OTC}, 325 mg^{OTC}. **Capsules:** 150 mg^{OTC}, 250 mg^{OTC}. **Timed-release tablets:** 525 mg^{OTC}. **Syrup:** 90 mg/5 mL^{OTC}. **Elixir:** 220 mg/5 mL^{OTC}. **Drops:** 75 mg/0.6 mL^{OTC}, 125 mg/1 mL^{OTC}.

Iron Dextran

Injection: 50 mg/mL, 100 mg/mL.

Iron Polysaccharide (mg Iron)

Capsules: 150 mg^{OTC}. **Tablets:** 50 mg^{OTC}.

Iron Sucrose

Aqueous complex for injection: 20 mg/mL.

Sodium Ferric Gluconate Complex (generic available)

Injection: 62.5 mg/5 mL.

NURSING IMPLICATIONS

Assessment

- Assess nutritional status and dietary history to determine possible cause of anemia and need for patient teaching.
- Assess bowel function for constipation or diarrhea. Notify health care professional and use appropriate nursing measures should these occur.
- **Iron Dextran, Iron Sucrose, and Sodium Ferric Gluconate Complex:** Monitor BP and heart rate frequently following IV administration until stable. Rapid infusion rate may cause hypotension and flushing.
- **Assess patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing) for at least 30 min following injection. Notify health care professional immediately if these occur. Keep epinephrine and resuscitation equipment close by in the event of an anaphylactic reaction.**

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- **Lab Test Considerations:** Monitor hemoglobin, hematocrit, and reticulocyte values prior to and every 3 wk during the first 2 mo of therapy and periodically thereafter. Serum ferritin and iron levels may also be monitored to assess effectiveness of therapy.
- Occult blood in stools may be obscured by black coloration of iron in stool. Guaiac test results may occasionally be false-positive.
- **Iron Dextran:** Monitor hemoglobin, hematocrit, reticulocyte values, transferrin, ferritin, total iron-binding capacity, and plasma iron concentrations periodically during therapy. Serum ferritin levels peak in 7–9 days and return to normal in 3 wk. Serum iron determinations may be inaccurate for 1–2 wk after therapy with large doses; therefore, hemoglobin and hematocrit are used to gauge initial response.
- May impart a brownish hue to blood drawn within 4 hr of administration. May cause false ↑ in serum bilirubin and false decrease in serum calcium values.
- Prolonged PTT may be calculated when blood sample is anticoagulated with citrate dextrose solution; use sodium citrate instead.
- **Iron Sucrose:** Monitor hemoglobin, hematocrit, serum ferritin, and transferrin saturation prior to and periodically during therapy. Transferrin saturation values increase rapidly after IV administration; therefore, serum iron values may be reliably obtained 48 hr after IV administration. Withhold iron therapy if evidence of iron overload occurs.
- May cause ↑ liver enzymes.
- **Toxicity and Overdose:** Early symptoms of overdose include stomach pain, fever, nausea, vomiting (may contain blood), and diarrhea. Late symptoms include bluish lips, fingernails, and palms; drowsiness; weakness; tachycardia; seizures; metabolic acidosis; hepatic injury; and cardiovascular collapse. Patient may appear to recover prior to the onset of late symptoms. Hospitalization continues for 24 hr after patient becomes asymptomatic to monitor for delayed onset of shock or GI bleeding. Late complications of overdose include intestinal obstruction, pyloric stenosis, and gastric scarring.
- If patient is comatose or seizing, gastric lavage with sodium bicarbonate is performed. Deferoxamine is the antidote. Additional supportive treatments to maintain fluid and electrolyte balance and correction of metabolic acidosis are also indicated.
- If signs of overdose occur during IV administration of iron sucrose, treatment includes IV fluids, corticosteroids, and/or antihistamines. Administering at a slower rate usually relieves symptoms.
- Sodium ferric gluconate and iron sucrose are for IV use only.
- **PO:** Oral preparations are most effectively absorbed if administered 1 hr before or 2 hr after meals. If gastric irritation occurs, administer with meals. Take tablets and capsules with a full glass of water or juice. **Do not crush or chew enteric-coated tablets and do not open capsules.**
- Liquid preparations may stain teeth. Dilute in water or fruit juice, full glass (240 mL) for adults and ½ glass (120 mL) for children, and administer with a straw or place drops at back of throat.
- Avoid using antacids, coffee, tea, dairy products, eggs, or whole-grain breads with or within 1 hr after administration of ferrous salts. Iron absorption is decreased by 33% if iron and calcium are given with meals. If calcium supplementation is needed, calcium carbonate does not decrease absorption of iron salts if supplements are administered between meals.
- **Iron Dextran:** The 2-mL ampule may be used for IM or IV administration.
- Prior to initial IM or IV dose, a test dose of 25 mg should be given by the same route as the dose will be given, to determine reaction. The IV test dose should be administered over 5 min. The IM dose should be administered in the same injection site and by same technique as the therapeutic dose. The remaining portion may be administered after 1 hr, if no adverse symptoms have occurred.
- **IM:** Inject deeply via Z-track technique into upper outer quadrant of buttock, never into arm or other exposed areas. Use a 2–3 in., 19- or 20-gauge needle. Change needles between withdrawal from container and injection to minimize staining of subcut tissues. Stains are usually permanent.

IV Administration

- **IV: Iron Dextran:** Following IV administration, patient should remain recumbent for at least 30 min to prevent orthostatic hypotension.
- **IV Push: Diluent:** May administer undiluted or dilute in 0.9% NaCl or D5W. **Concentration:** 50 mg/mL. **Rate:** Administer slowly at a rate of 50 mg (1 mL) over at least 1 min.
- **Intermittent Infusion:** May be diluted in 200–1000 mL of 0.9% NaCl or D5W; 0.9% NaCl is the preferred diluent; dilution in D5W increases incidence of pain and phlebitis. **Rate:** Administer over 1–6 hr following a test dose of 10 drops/min for 10 min. Flush line with 10 mL of 0.9% NaCl at completion of infusion.
- **Y-Site Incompatibility:** Discontinue other IV solutions during infusion.
- **Additive Incompatibility:** Manufacturers recommend that iron dextran not be mixed with other solutions; however, iron dextran has been added to total parenteral nutrition solutions.

Potential Nursing Diagnoses

Activity intolerance (Indications)

Implementation

- Discontinue oral iron preparations prior to parenteral administration.

- **Sodium Ferric Gluconate Complex Diluent:** Dilute test dose in 50 mL of 0.9% NaCl and administer IV over 60 min. **Concentration:** 12.5 mg/mL.
- To administer therapeutic dose of 10 mL (125 mg of elemental iron) dilute in 100 mL of 0.9% NaCl. Dialysis patients frequently require a cumulative dose of 1 g of elemental iron, administered over 8 sessions of sequential dialysis. **Rate:** Administer at a maximum rate of 12.5 mg/min.
- **Iron Sucrose:** Each 5-mL vial contains 100 mg of elemental iron.
- **Hemodialysis**—Most patients require a minimum cumulative dose of 1000 mg of elemental iron, administered over 10 sequential dialysis sessions, to achieve a favorable hemoglobin or hematocrit response.
- Solution is brown. Inspect for particulate matter or discoloration. Do not administer solutions that contain particulate matter or are discolored.
- **IV Push:** May be administered undiluted by slow injection into dialysis line. **Rate:** Administer at a rate of 1 mL undiluted solution per minute, not to exceed one vial per injection. Discard any unused portion.
- **Intermittent Infusion:** May also be administered via infusion, into dialysis line for hemodialysis patients. May reduce risk of hypotensive episodes. **Diluent:** Each vial must be diluted in a maximum of 100 mL of 0.9% NaCl immediately prior to infusion. Unused diluted solution should be discarded. **Concentration:** 1–2 mg/mL. **Rate:** Infuse at a rate of 100 mg of iron over at least 15 min, large doses (500 mg) should be given over 3.5–4 hr.
- **Intermittent Infusion: For Peritoneal Dialysis Patients**—**Diluent:** Dilute each dose in a maximum of 250 mL of 0.9% NaCl. **Rate:** Administer doses of 300 mg over 1.5 hr and doses of 400 mg over 2.5 hr.
- **IV Push: For Non-dialysis dependent patients**—May be administered as a slow injection of 200 mg undiluted. **Rate:** Administer over 2–5 min.
- **Intermittent Infusion:** Dilute 500 mg in 250 mL 0.9% NaCl. **Rate:** Infuse over 3.5–4 hr on days 1 and 14. May cause hypotension; monitor closely.
- **Additive Incompatibility:** Do not mix iron sucrose with other medications or add to parenteral nutrition solutions for IV infusion.

Patient/Family Teaching

- Explain purpose of iron therapy to patient.
- Encourage patient to comply with medication regimen. Take missed doses as soon as remembered within 12 hr; otherwise, return to regular dosing schedule. Do not double doses.
- Advise patient that stools may become dark green or black and that this change is harmless.
- Instruct patient to follow a diet high in iron (see Appendix K).

- Discuss with parents the risk of children's overdosing on iron. Medication should be stored in the original childproof container and kept out of reach of children. Do not refer to vitamins as candy. In the event of a suspected overdose, parents or guardians should contact the poison control center (1-800-222-1222) or emergency medical services (911) immediately.
- **Iron Dextran:** Delayed reaction may occur 1–2 days after administration and last 3–4 days if IV route used, 3–7 days with IM route. Instruct patient to contact physician if fever, chills, malaise, muscle and joint aches, nausea, vomiting, dizziness, and backache occur.
- **Iron sucrose and sodium ferric gluconate complex:** Instruct patient to immediately report symptoms of hypersensitivity reaction to health care professional.

Evaluation/Desired Outcomes

- Increase in hemoglobin, which may reach normal parameters after 1–2 mo of therapy. May require 3–6 mo for normalization of body iron stores.
- Improvement in iron deficiency anemia or anemia of chronic renal failure.

isavuconazonium

(eye-sa-vue-kon-a-zoe-nee-um)
Cresemba

Classification

Therapeutic: antifungals
Pharmacologic: azoles

Indications

Treatment of invasive aspergillosis and mucormycosis.

Action

A prodrug that is converted (rapidly hydrolyzed) to isavuconazole, the active component. Inhibits the synthesis of ergosterol, a key component of fungal cell walls. **Therapeutic Effects:** Resolution of invasive fungal infections. **Spectrum:** Active against *Aspergillus flavus*, *Aspergillus fumigatus*, *Aspergillus niger* and Mucormycetes species including *Rhizopus oryzae*.

Pharmacokinetics

Absorption: Prodrug is rapidly converted to isavuconazole, the active component. 98% absorbed following oral administration. Similar conversion follows intravenous administration, resulting in complete bioavailability.

Distribution: Extensively distributed.

Protein Binding: >99%.

Metabolism and Excretion: Extensively metabolized (mostly by CYP3A4 and CYP5); inactive metabo-

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

lites are mostly renally eliminated, <1% excreted unchanged in urine.

Half-life: 130 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unk	2 hr	unk
IV	unk	end of infusion	unk

Contraindications/Precautions

Contraindicated in: Known hypersensitivity; Strong CYP3A4 inhibitors; Familial short QT syndrome; Strong CYP3A4 inducers; **Lactation:** Discontinue breast feeding.

Use Cautiously in: Severe hepatic impairment (use only if benefits outweigh risks, monitor carefully for adverse reactions); **OB:** Use during pregnancy only if maternal benefits outweigh risks to the fetus; **Pedi:** Safe and effective use in children <18 yr has not been established.

Adverse Reactions/Side Effects

CNS: fatigue, insomnia, headache, anxiety, delirium.

Resp: cough, dyspnea, respiratory failure. **CV:** peripheral edema, chest pain, hypotension. **GI:** constipation, diarrhea, ↑ liver enzymes, nausea, vomiting, ↓ appetite, dyspepsia. **GU:** renal failure. **Derm:** pruritus, rash. **F and E:** hypokalemia, hypomagnesemia. **Local:** injection site reactions. **MS:** back pain. **Misc:** infusion-related reactions.

Interactions

Drug-Drug: ↑ levels and risk of toxicity with strong inhibitors of CYP3A4, including ketoconazole or high-dose ritonavir; concurrent use is contraindicated. Lopinavir/ritonavir significantly ↑ levels and risk of toxicity; concurrent use should be undertaken with caution. Isavuconazonium ↓ levels and effectiveness of lopinavir/ritonavir. Isavuconazonium ↑ levels and risk of toxicity with atorvastatin, cyclosporine, digoxin, midazolam, mycophenolate, sirolimus, tacrolimus; undertake concurrent use with caution, monitoring drug effects and making adjustments if necessary. Strong inducers of CYP3A4 including long-acting barbiturates, carbamazepine or rifampin ↓ levels and effectiveness; concurrent use is contraindicated. ↓ levels and effectiveness of bupropion; bupropion dose may need to be ↑ but should not exceed maximum recommended dose.

Drug-Natural Products: St. John's wort ↓ blood levels and effectiveness; concurrent use in contraindicated.

Route/Dosage

186 mg isavuconazonium = 100 mg isavuconazole; doses expressed as isavuconazole.

PO, IV (Adults ≥18 yr): Loading dose—200 mg every 8 hr for six doses; maintenance dose—200 mg once daily starting 12–24 hr after last loading dose.

Availability

186 mg isavuconazonium = 100 mg isavuconazole; strength expressed as isavuconazole

Capsules: 100 mg. **Lyophilized powder for intravenous injection (requires reconstitution):** 200 mg.

NURSING IMPLICATIONS

Assessment

- Obtain specimens for culture and sensitivity prior to therapy. First dose may be given before receiving results.
- Monitor for signs and symptoms of infusion-related reactions (hypotension, dyspnea, chills, dizziness, paresthesia, hypoesthesia) periodically during therapy. Discontinue infusion if symptoms occur.
- Monitor skin for hypersensitivity reactions during therapy.
- **Lab Test Considerations:** Monitor liver function tests prior to and periodically during therapy. Discontinue therapy if clinical signs of liver disease occur.
- May cause hypokalemia and hypomagnesemia.

Potential Nursing Diagnoses

Risk for infection (Indications)

Implementation

- Oral and IV formulations are bioequivalent; may be used interchangeably. Loading dose is not needed when switching.
- **PO:** Administer without regard to food. Swallow capsule whole; do not open, dissolve, crush or chew.

IV Administration

- Reconstitute by adding 5 mL sterile water to vial. Shake gently to dissolve powder completely. Solution should be clear and colorless; do not administer solutions that are discolored or contain particulate matter. Solution is stable for 1 hr at room temperature.
- **Intermittent Infusion:** **Diluent:** Remove 5 mL of reconstituted solution from vial and add to 250 mL 0.9% NaCl or D5W. **Concentration:** 1.5 mg isavuconazonium/mL. Diluted solution may show visible translucent to white particulates; removed with in-line filter. Roll bag to mix gently; avoid shaking. Solution is stable if infused at room temperature within 6 hrs; may refrigerate for up to 24 hrs; do not freeze. Flush line with 0.9% NaCl or D5W prior to and following infusion. **Rate:** Infuse over at least 1 hr to minimize infusion-related reactions. Infuse through a 0.2–1.2 micron in-line filter. Do not administer as a bolus injection.

- **Y-Site Incompatibility:** Do not infuse with other medication.

Patient/Family Teaching

- Instruct patient to take isavuconazonium as directed. Do not stop taking isavuconazonium without consulting health care professional. Advise patient to read *Patient Information* before starting and with each Rx refill in case of changes.
- Advise patient to notify health care professional promptly of signs and symptoms of liver disease (itchy skin, nausea, vomiting, yellowing of eyes, feeling very tired, flu-like symptoms), infusion-related reactions, or rash occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of lab tests to monitor for side effects during therapy.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of invasive fungal infection.

isoniazid (eye-soe-nye-a-zid) INH, Isotamine

Classification

Therapeutic: antituberculars

Indications

First-line therapy of active tuberculosis, in combination with other agents. Prevention of tuberculosis in patients exposed to active disease (alone).

Action

Inhibits mycobacterial cell wall synthesis and interferes with metabolism. **Therapeutic Effects:** Bacteriostatic or bactericidal action against susceptible mycobacteria.

Pharmacokinetics

Absorption: Well absorbed following PO/IM administration.

Distribution: Widely distributed; readily crosses the blood-brain barrier. Crosses the placenta; enters breast milk in concentrations equal to plasma.

Protein Binding: 10–15%.

Metabolism and Excretion: 50% metabolized by the liver by N-acetyltransferase  (rate of acetylation is genetically determined [slow acetylators have ↑ isoniazid levels and ↑ risk of toxicity; fast acetylators have ↓ isoniazid levels and ↓ risk for treatment failure]); 50% excreted unchanged by the kidneys.

Half-life: 1–4 hr in patients with normal renal and hepatic function;  0.5–1.6 hr in fast acetylators; 2–5 hr in slow acetylators.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1–2 hr	up to 24 hr
IM	rapid	1–2 hr	up to 24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Acute liver disease; History of hepatitis from previous use.

Use Cautiously in: History of liver damage or chronic alcohol ingestion; Black and Hispanic women, women in the postpartum period, or patients >50 yr (↑ risk of drug-induced hepatitis); Severe renal impairment (dose ↓ may be necessary); Malnourished patients, patients with diabetes, or chronic alcoholics (↑ risk of neuropathy); **OB, Lactation:** Although safety is not established, isoniazid has been used with ethambutol to treat tuberculosis in pregnant women without harm to the fetus.

Adverse Reactions/Side Effects

CNS: psychosis, seizures. **EENT:** visual disturbances.

GI: **DRUG-INDUCED HEPATITIS**, nausea, vomiting.

Derm: **DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS)**, **TOXIC EPIDERMAL NECROLYSIS**, rash. **Endo:** gynecomastia. **GI:** **PANCREATITIS**. **Hemat:** blood dyscrasias. **Neuro:** peripheral neuropathy. **Misc:** fever.

Interactions

Drug-Drug: Additive CNS toxicity with other antituberculars. **BCG vaccine** may not be effective during isoniazid therapy. Isoniazid ↓ metabolism of and may ↑ levels of **phenytoin**. **Aluminum-containing antacids** may ↓ absorption. Psychotic reactions and coordination difficulties may result with **disulfiram**. Concurrent administration of **pyridoxine** may prevent neuropathy. ↑ risk of hepatotoxicity with other **hepatotoxic agents** including **alcohol**, **acetaminophen** and **rifampin**. Isoniazid may ↓ blood levels and effectiveness of **ketoconazole**. May ↑ **carbamazepine** levels and risk of hepatotoxicity. May ↓ effectiveness of **clopidogrel** (avoid concurrent use).

Drug-Food: Severe reactions may occur with ingestion of foods containing high concentrations of **tyramine** (see Appendix K).

Route/Dosage

PO, IM (Adults): 300 mg/day (5 mg/kg) or 15 mg/kg (up to 900 mg) 2–3 times weekly.

PO, IM (Children <40 kg): *Latent TB infection*—10–20 mg/kg/day (up to 300 mg/day) or 20–40 mg/kg (up to 900 mg) 2 times weekly; *Active TB infec-*

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

tion—10–15 mg/kg/day (up to 300 mg/day) or 20–40 mg/kg (up to 900 mg) 2 times weekly.

Availability (generic available)

Tablets: 100 mg, 300 mg. **Oral solution (orange, raspberry flavor):** 50 mg/5 mL. **Solution for injection:** 100 mg/mL. **In combination with:** rifampin (Rifamate); rifampin and pyrazinamide (Rifater). See Appendix B.

NURSING IMPLICATIONS

Assessment

- **⚠** Mycobacterial studies and susceptibility tests should be performed prior to and periodically throughout therapy to detect possible resistance. About 50% to 65% of Caucasians, Black, South Indians and Mexicans are slow acetylators at risk for toxicity, while 80 to 90% of Eskimos, Japanese, and Chinese are rapid acetylators at risk for decreased levels and treatment failure.
- **Monitor for signs and symptoms of DRESS (fever, rash, lymphadenopathy, and/or facial swelling, associated with involvement of other organ systems (hepatitis, nephritis, hematologic abnormalities, myocarditis, myositis) during therapy. May resemble an acute viral infection. Eosinophilia is often present. Discontinue therapy if signs occur.**
- **Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.**
- **Lab Test Considerations:** **⚠** Hepatic function should be evaluated prior to and monthly throughout therapy. Increased AST, ALT, and serum bilirubin may indicate drug-induced hepatitis. Black and Hispanic women, postpartal women, and patients >50 yr are at highest risk. Risk is lower in children; therefore, liver function tests are usually ordered less frequently for children.
- **Toxicity and Overdose:** If isoniazid overdosage occurs, treatment with pyridoxine (vitamin B) is instituted.

Potential Nursing Diagnoses

Risk for infection (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** May be administered with food or antacids if GI irritation occurs, although antacids containing aluminum should not be taken within 1 hr of administration.
- **IM:** Medication may cause discomfort at injection site. Massage site after administration and rotate injection sites.
- Solution may form crystals at low temperatures; crystals will redissolve upon warming to room temperature.

Patient/Family Teaching

- Advise patient to take medication as directed. Take missed doses as soon as possible unless almost time for next dose; do not double up on missed doses. Emphasize the importance of continuing therapy even after symptoms have subsided. Therapy may be continued for 6 mo–2 yr.
- **Advise patient to notify health care professional promptly if signs and symptoms of hepatitis (yellow eyes and skin, nausea, vomiting, anorexia, dark urine, unusual tiredness, or weakness) or peripheral neuritis (numbness, tingling, paresthesia) occur.** Pyridoxine may be used concurrently to prevent neuropathy. Any changes in visual acuity, eye pain, or blurred vision should also be reported immediately.
- **Caution patient to avoid the use of alcohol during this therapy, as this may increase the risk of hepatotoxicity.** Ingestion of Swiss or Cheshire cheeses, fish (tuna, skipjack, and sardinella), and possibly tyramine-containing foods (see Appendix K) should also be avoided, as they may result in redness or itching of the skin; hot feeling; rapid or pounding heartbeat; sweating; chills; cold, clammy feeling; headache; or light-headedness.
- Emphasize the importance of regular follow-up physical and ophthalmologic exams to monitor progress and to check for side effects.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of tuberculosis.
- Negative sputum cultures.
- Prevention of activation of tuberculosis in persons known to have been exposed.

ISOSORBIDE

isosorbide dinitrate
(eye-soe-sor-bide dye-nye-trate)
Dilatrate-SR, Isordil

isosorbide mononitrate
(eye-soe-sor-bide mo-noe-nye-trate)
Imdur,  Imdur,  Monoket

Classification

Therapeutic: antianginals

Pharmacologic: nitrates

Indications

Prophylactic management of angina pectoris. **Unlabeled Use:** Treatment of chronic heart failure (unlabeled).

Action

Produce vasodilation (venous greater than arterial). Decrease left ventricular end-diastolic pressure and left ventricular end-diastolic volume (preload). Net effect is

reduced myocardial oxygen consumption. Increase coronary blood flow by dilating coronary arteries and improving collateral flow to ischemic regions. **Therapeutic Effects:** Prevention of anginal attacks.

Pharmacokinetics

Absorption: Isosorbide dinitrate undergoes extensive first-pass metabolism by the liver, resulting in 25% bioavailability; isosorbide mononitrate has 100% bioavailability (does not undergo first-pass metabolism).

Distribution: Unknown.

Metabolism and Excretion: Isosorbide dinitrate is metabolized by the liver to 2 active metabolites (5-mononitrate and 2-mononitrate). Isosorbide mononitrate is primarily metabolized by the liver to inactive metabolites; primarily excreted in urine as metabolites.

Half-life: *Isosorbide dinitrate*—1 hr; *isosorbide mononitrate*—5 hr.

TIME/ACTION PROFILE (cardiovascular effects)

ROUTE	ONSET	PEAK	DURATION
ISDN-PO	45–60 min	unknown	4 hr
ISDN-PO-ER	30 min	unknown	up to 12 hr
ISMN-PO	30–60 min	unknown	7 hr
ISMN-ER	unknown	unknown	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of PDE-5 inhibitor (sildenafil, tadalafil, vardenafil) or riociguat.

Use Cautiously in: Volume depleted patients; Right ventricular infarction; Hypertrophic cardiomyopathy; **OB:** May compromise maternal/fetal circulation; **Lactation:** No data available; **Pedi:** Safety not established; **Geri:** Initial dose ↓ required due to ↑ potential for hypotension.

Adverse Reactions/Side Effects

CNS: dizziness, headache. **CV:** hypotension, tachycardia, paradoxical bradycardia, syncope. **GI:** nausea, vomiting. **Misc:** flushing, tolerance.

Interactions

Drug-Drug: Concurrent use of **sildenafil**, **tadalafil**, or **vardenafil** may result in severe hypotension (do not use within 24 hr of isosorbide dinitrate or mononitrate); concurrent use contraindicated. Concurrent use of **riociguat** may result in severe hypotension; concurrent use contraindicated. Additive hypotension with **antihypertensives**, acute ingestion of **alcohol**, **beta blockers**, **calcium channel blockers**, and **phenothiazines**.

Route/Dosage

Isosorbide Dinitrate

PO (Adults): *Prophylaxis of angina pectoris*—5–20 mg 2–3 times daily; usual maintenance dose is 10–40 mg q 6 hr (immediate-release) or 40–80 mg q 8–12 hr (sustained-release).

Isosorbide Mononitrate

PO (Adults): *ISMO, Monoket*—5–20 mg twice daily with the 2 doses given 7 hr apart. *Imdur*—30–60 mg once daily; may ↑ to 120 mg once daily (maximum dose = 240 mg/day).

Availability

Isosorbide Dinitrate (generic available)

Tablets: 5 mg, 10 mg, 20 mg, 30 mg, 40 mg. **Cost:** *Isordil*—40 mg \$191.65/100; *Generic*—5 mg \$15.54/100, 10 mg \$32.96/100, 20 mg \$18.85/100, 30 mg \$23.32/100. **Extended-release tablets:** 40 mg. **Sustained-release capsules:** 40 mg. **In combination with:** hydralazine (BiDil). See Appendix B.

Isosorbide Mononitrate (generic available)

Tablets (Monoket): 10 mg, 20 mg. **Cost:** *Generic*—10 mg \$55.97/180, 20 mg \$48.99/180. **Extended-release tablets:** 30 mg, 60 mg, 120 mg. **Cost:** *Generic*—30 mg \$10.00/90, 60 mg \$10.00/90, 120 mg \$61.18/90.

NURSING IMPLICATIONS

Assessment

- Assess location, duration, intensity, and precipitating factors of anginal pain.
- Monitor BP and pulse routinely during period of dose adjustment.
- **Lab Test Considerations:** Excessive doses may ↑ methemoglobin concentrations.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)
Activity intolerance (Indications)

Implementation

Isosorbide Dinitrate

- Do not confuse Isordil (isosorbide dinitrate) with Plendil (felodipine).
- **PO:** Swallow extended-release capsules whole; do not break, crush, or chew.

Isosorbide Mononitrate

- **PO:** Extended-release tablets should be swallowed whole. Do not break, crush, or chew.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Patient/Family Teaching

- Instruct patient to take medication as directed, even if feeling better. Take missed doses as soon as remembered; doses of isosorbide dinitrate should be taken at least 2 hr apart (6 hr with extended-release preparations); daily doses of isosorbide mononitrate should be taken 7 hr apart. Do not double doses. Do not discontinue abruptly.
- Caution patient to make position changes slowly to minimize orthostatic hypotension.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient to take last dose of day (when taking 2–4 doses/day) no later than 7 pm to prevent the development of tolerance.
- Advise patient to avoid concurrent use of alcohol with this medication. Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, or herbal products.
- Inform patient that headache is a common side effect that should decrease with continuing therapy. Aspirin or acetaminophen may be ordered to treat headache. Notify health care professional if headache is persistent or severe. Do not alter dose to avoid headache.
- Advise patient to notify health care professional if dry mouth or blurred vision occurs.

Evaluation/Desired Outcomes

- Decrease in frequency and severity of anginal attacks.
- Increase in activity tolerance.

REMS

ISotretinoin

(eye-soe-tret-i-noyn)

Absorica, ~~Accutane~~, ~~Accutane~~, Amnesteem, Claravis, ~~Clarus~~, ~~Epuris~~, Myorisan, Sotret, Zenatane

Classification

Therapeutic: antiacne agents
Pharmacologic: retinoids

Indications

Management of severe nodular acne resistant to more conventional therapy, including topical therapy and systemic antibiotics. Not to be used under any circumstances in pregnant patients.

Action

A metabolite of vitamin A (retinol); reduces sebaceous gland size and differentiation. **Therapeutic Effects:** Diminution and resolution of severe acne. May also prevent abnormal keratinization.

Pharmacokinetics

Absorption: Rapidly absorbed following (23–25%) oral administration; absorption ↑ when taken with a high-fat meal.

Distribution: Appears to be widely distributed; crosses the placenta.

Protein Binding: 99.9%.

Metabolism and Excretion: Metabolized by the liver and excreted in the urine and feces.

Half-life: 10–20 hr.

TIME/ACTION PROFILE (diminution of acne)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	up to 8 wk	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to retinoids, glycerin, soybean oil, or parabens; **OB, Lactation:** Pregnancy and lactation; **Rep:** Women of childbearing age who may become or who intend to become pregnant; Patients planning to donate blood.

Use Cautiously in: Pre-existing hypertriglyceridemia; Diabetes mellitus; History of alcohol abuse, psychosis, depression, or suicide attempt; Obese patients; Inflammatory bowel disease; **Pedi:** Children <12 yr (safety not established).

Adverse Reactions/Side Effects

CNS: **SUICIDE ATTEMPT**, behavior changes, depression, **PSEUDOTUMOR CEREBRI**, psychosis, suicidal ideation.

EENT: conjunctivitis, epistaxis, blurred vision, contact lens intolerance, corneal opacities, ↓ night vision, dry eyes. **CV:** edema. **GI:** cheilitis, dry mouth, nausea, vomiting, abdominal pain, anorexia, hepatitis, pancreatitis, ↑ appetite. **Derm:** **STEVENS-JOHNSON SYNDROME**,

TOXIC EPIDERMAL NECROLYSIS, pruritus, palmar desquamation, photosensitivity, skin infections, thinning of hair. **Hemat:** anemia. **Metab:** ↓ high-density lipoprotein cholesterol, hypercholesterolemia, hypertriglyceridemia, hyperglycemia, hyperuricemia. **MS:** arthralgia, back pain, muscle/bone pain (↑ in adolescents), hyperostosis. **Misc:** **SEVERE BIRTH DEFECTS**, ↑ thirst.

Interactions

Drug-Drug: Additive toxicity with vitamin A and drugs having anticholinergic properties. ↑ risk of pseudotumor cerebri with tetracycline or minocycline. Concurrent use with alcohol ↑ risk of hypertriglyceridemia. Drying effects ↑ by concurrent use of benzoyl peroxide, sulfur, tretinoin, and other topical agents.

Drug-Food: Excessive ingestion of foods high in vitamin A may result in additive toxicity.

Route/Dosage

PO (Adults and Children ≥12 yr): 0.5–1 mg/kg/day (up to 2 mg/kg/day) in 2 divided doses for 15–20 wk. Once discontinued, if relapse occurs, therapy may be reinstated after an 8-wk rest period.

Availability (generic available)

Capsules: 10 mg, 20 mg, 25 mg, 30 mg, 35 mg, 40 mg.

NURSING IMPLICATIONS**Assessment**

- Verify that patient receiving isotretinoin is registered with the *iPLEDGE program* and is completing all required interactions with their health care provider.
- Assess skin prior to and periodically during therapy. Transient worsening of acne may occur at initiation of therapy. Note number and severity of cysts, degree of skin dryness, erythema, and itching.
- Assess for allergy to parabens; capsules contain parabens as a preservative.
- **Monitor patient for behavioral changes throughout therapy. May cause depression, psychosis, and suicide ideation. If behavioral changes occur, they usually resolve with discontinuation of therapy.**
- **Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome or toxic epidermal necrolysis. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.**
- **Lab Test Considerations:** Obtain 2 negative sequential serum or urine pregnancy tests with a sensitivity ≥ 25 mIU/mL before receiving initial prescription and monthly before each new Rx.
- Monitor liver function (AST, ALT, and LDH) prior to therapy, after 1 mo of therapy, and periodically thereafter. Inform health care professional if these values become \uparrow therapy may need to be discontinued.
- Monitor blood lipids (cholesterol, HDL, triglycerides) under fasting conditions prior to beginning therapy, at 1–2 wk intervals until lipid response to isotretinoin is established (usually within 1 mo), and periodically thereafter. Report \uparrow cholesterol and triglyceride levels or \downarrow HDL.
- Obtain baseline and periodic CBC, urinalysis, and SMA-12. May cause \uparrow blood glucose, CPK, platelet counts, and sedimentation rate. May \downarrow RBC and WBC parameters. May cause proteinuria, red and white blood cells in urine, and \uparrow uric acid.

Potential Nursing Diagnoses

Risk for impaired skin integrity (Indications, Side Effects)

Disturbed body image (Indications)

Implementation

- **Do not confuse isotretinoin with tretinoin.**
- Isotretinoin is approved for marketing only under the *iPLEDGE program*, a special restricted distribution program approved by the FDA.

- Only patients who meet all requirements of the *iPLEDGE program* may receive isotretinoin.
- Isotretinoin may only be prescribed by health care providers registered and activated with the *iPLEDGE program*.
- Isotretinoin may only be dispensed by pharmacies registered with the *iPLEDGE program*.
- **PO:** Administer with meals. Do not crush or open capsules.

Patient/Family Teaching

- Explain the *iPLEDGE program* and its requirements to patient and parent.
- Instruct patient to take isotretinoin as directed. Do not take more than the amount prescribed. Take missed doses as soon as remembered if not almost time for next dose. Do not double doses. Patients must read *Medication Guide* and sign consent form prior to initiation of therapy.
- Explain to patient that a temporary worsening of acne may occur at beginning of therapy.
- **Rep:** Instruct female patients to use 2 forms of contraception 1 mo before therapy, throughout therapy, and for at least 1 mo after discontinuation of drug. This drug is contraindicated during pregnancy and may cause birth defects. Patient must have 2 negative serum or urine pregnancy tests with a sensitivity ≥ 25 mIU/mL before receiving initial prescription. First test is obtained by prescriber when decision is made to prescribe isotretinoin. Second pregnancy test should be done during first 5 days of menstrual period immediately preceding beginning of therapy. For patients with amenorrhea, second test should be done 11 days after last act of unprotected sexual intercourse. Each mo of therapy patient must have a negative result from a urine or serum pregnancy test. Pregnancy test must be repeated every mo prior to female patient receiving prescription. Manufacturer will make available pregnancy test kits to female patients. Patient should discontinue medication and inform health care professional immediately if pregnancy is suspected. Recommended consent form prepared by manufacturer stresses fetal risk. Parents of minors should also read and sign form. Yellow self-adhesive qualification stickers completed by prescriber must accompany prescription.
- **Advise patient and family to notify health care professional if rash or thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; other unusual changes in behavior or mood occur.**

* = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- May cause sudden decrease in night vision. Caution patient to avoid driving at night until response to the medication is known.
- Advise patient to consult with health care professional before using other acne preparations while taking isotretinoin. Soaps, cosmetics, and shaving lotion may also worsen dry skin.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Inform patient that dry skin and chapped lips will occur. Lubricant to lips may help cheilitis.
- Instruct patient that oral rinses, good oral hygiene, and sugarless gum or candy may help minimize dry mouth. Notify health care professional if dry mouth persists for more than 2 wk.
- Discuss possibility of excessively dry eyes with patients who wear contact lenses. Patient should contact health care professional about eye lubricant. Patient may need to switch to glasses during course of therapy and for up to 2 wk following discontinuation.
- Advise patient to avoid alcoholic beverages while taking isotretinoin, as this may further increase triglyceride levels.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions. Health care professional should be consulted about sunscreen, as some sunscreens may worsen acne.
- Instruct patient not to take vitamin A supplements and to avoid excessive ingestion of foods high in vitamin A (liver; fish liver oils; egg yolks; yellow-orange fruits and vegetables; dark green, leafy vegetables; whole milk; vitamin A–fortified skim milk; butter; margarine) while taking isotretinoin; this may result in hypervitaminosis.
- Advise patient not to donate blood while receiving this medication. After discontinuing isotretinoin, wait at least 1 mo before donating blood to prevent the possibility of a pregnant patient receiving the blood.
- Inform diabetic patients that difficulty controlling blood glucose may occur.
- Instruct patient to report burning of eyes, visual changes, rash, abdominal pain, diarrhea, headache, nausea, and vomiting to health care professional.
- Inform patient of need for medical follow-up. Periodic lab tests may be required.

Evaluation/Desired Outcomes

- Decrease in the number and severity of cysts in severe acne. Therapy may take 4–5 mo before full effects are seen. Therapy is discontinued when the number of cysts is reduced by 70% or after 5 mo. Improvement may occur after discontinuation of therapy; therefore, a delay of at least 8 wk is recommended before a second course of therapy is considered.

ivabradine (eye-vab-ra-deen)

Corlanor,  Lancora

Classification

Therapeutic: heart failure agents

Pharmacologic: hyperpolarization-activated cyclic nucleotide-gated channel blockers

Indications

To decrease the need for hospitalization due to worsening HF in patients with stable, but symptomatic chronic HF (ejection fraction <35%, sinus rhythm \geq 70 bpm, receiving highest tolerated doses of beta-blockers or are unable to tolerate beta-blockers).

Action

Inhibits the cardiac pacemaker I_f -current by acting as a hyperpolarization-activated cyclic nucleoside-gated channel blocker, resulting in \downarrow spontaneous pacemaker activity of sinus node. Decreases heart rate without affecting contractility or ventricular repolarization.

Therapeutic Effects: Lowering of heart rate with reduced need for hospitalization in HF patients.

Pharmacokinetics

Absorption: 40% absorbed following oral administration (undergoes first pass metabolism); food delays absorption and \uparrow blood levels.

Distribution: Unknown.

Metabolism and Excretion: Extensively metabolized, primarily by the CYP3A4 enzyme system. The major metabolite is pharmacologically active and has the same potency as ivabradine. Metabolites excreted equally in urine and feces; 4% excreted unchanged in urine.

Half-life: 6 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1 hr	12 hr

Contraindications/Precautions

Contraindicated in: Acute decompensated heart failure; BP <90/50 mmHg; Sick sinus syndrome, sinoatrial block or 2nd or 3rd degree heart block (unless a functioning demand pacemaker is in place, \uparrow risk of bradycardia); Resting heart rate <60 bpm (before treatment); Severe hepatic impairment; Concurrent use of demand pacemaker set at \geq 60 bpm; Pacemaker dependence; Concurrent use of strong CYP3A4 inhibitors; **OB:** Pregnancy (may cause fetal harm); **Lactation:** Discontinue ivabradine or discontinue breast feeding.

Use Cautiously in: Female patients with reproductive potential (effective contraception required); **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

EENT: phosphenes (luminous phenomena). **CV:** TORSADE DE POINTES, atrial fibrillation, bradycardia,

heart block, hypertension, QT interval prolongation, sinus arrest.

Interactions

Drug-Drug: Strong CYP3A4 inhibitors, including azole antifungals, macrolide anti-infectives, HIV protease inhibitors and nefazodone may ↑ levels; concurrent use contraindicated. Moderate CYP3A4 inhibitors, including diltiazem and verapamil, may ↑ levels and ↑ risk of bradycardia; avoid concurrent use. CYP3A4 inducers, including barbiturates, phenytoin and rifampicin may ↓ levels; avoid concurrent use. ↑ risk of bradycardia with concurrent use of negative chronotropes including amiodarone, beta-blockers, and digoxin; monitor heart rate. Concurrent use of QT-interval prolonging drugs may ↑ risk of QT interval prolongation and torsade de pointes.

Drug-Natural Products: Concurrent use of St. John's wort may ↓ blood levels and effectiveness and should be avoided.

Drug-Food: Concurrent ingestion of grapefruit juice may ↑ blood levels and the risk of adverse effects and should be avoided.

Route/Dosage

PO (Adults): 5 mg twice daily for two weeks, dose may then be adjusted based on heart rate, not to exceed 7.5 mg twice daily; *patients with conduction defects or bradycardia*—2.5 mg twice daily initially.

Availability

Tablets: 5 mg, 7.5 mg.

NURSING IMPLICATIONS

Assessment

- Assess heart rate prior to, after 2 wks, and periodically during therapy. Adjust dose for a resting heart rate 50–60 bpm. *If heart rate >60 bpm*, increase dose by 2.5 mg given twice daily up to 7.5 mg twice daily. *If heart rate 50–60 bpm*, maintain dose. *If heart rate <50 bpm or signs and symptoms of bradycardia (dizziness, fatigue, hypotension) occur*, decrease dose by 2.5 mg given twice daily; if current dose is 2.5 mg given twice daily, discontinue ivabradine.
- Monitor ECG periodically during therapy. May cause atrial fibrillation and torsade de pointes. Discontinue ivabradine if atrial fibrillation occurs.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)

Implementation

- **PO:** Administer twice daily with meals.

Patient/Family Teaching

- Instruct patient to take ivabradine as directed.
- Advise patient to avoid taking grapefruit juice during therapy; may increase risk of side effects.

- Inform patient that ivabradine may cause phosphenes or luminous phenomena, a transiently enhanced brightness in a limited area of the visual field, halos, image decomposition, colored bright lights, or multiple images. Phosphenes are usually triggered by sudden variations in light intensity. Usually begin within first 2 mo of therapy, may occur repeatedly of mild to moderate intensity, and resolve after therapy is discontinued.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any other Rx, OTC, or herbal products, especially St. John's wort.
- May be teratogenic. Advise female patient to use effective contraception during therapy and to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding.

Evaluation/Desired Outcomes

- Lowering of heart rate to prevent hospitalization in patients with HF.

ivacaftor/lumacaftor (eye-va-kaf-tor/loo-ma-kaf-tor) Orkambi

Classification

Therapeutic: cystic fibrosis therapy adjuncts

Pharmacologic: transmembrane conductance regulator potentiators

Indications

⚠ Treatment of cystic fibrosis (CF) in patients who are homozygous for the *F508del* mutation in the *CFTR* gene.

Action

Ivacaftor—acts as a potentiator of the CFTR protein (a chloride channel on the surface of endothelial cells) facilitating chloride transport by increasing the channel-open probability (gating). *Lumacaftor*—improves the conformational stability of *F508del-CFTR* which results in increased processing and trafficking of mature protein to the cell surface. **Therapeutic Effects:** Improved lung function with increased weight, decreased exacerbations and CF symptoms.

Pharmacokinetics

Ivacaftor

Absorption: Some absorption follows oral administration; absorption is enhanced 3-fold by fat-containing foods.

Distribution: Unknown.

Protein Binding: >99%.

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Metabolism and Excretion: Extensively metabolized, mostly by the CYP3A enzyme system; one metabolite (M1) is pharmacologically active; 87.8% eliminated in feces; negligible urinary elimination.

Half-life: 9 hr.

Lumacaftor

Absorption: Some absorption follows oral administration; absorption is enhanced 2–fold by fat-containing foods.

Distribution: Widely distributed.

Protein Binding: >99%.

Metabolism and Excretion: Minimally metabolized via oxidation and glucuronidation; 51% excreted unchanged in feces; <1% excreted unchanged in urine.

Half-life: 26 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Ivacaftor (PO)	within 1 wk	4 hr	12 hr
Lumacaftor (PO)	within 1 wk	4 hr	12 hr

Contraindications/Precautions

Contraindicated in: Concurrent use of strong CYP3A inducers; Concurrent use of sensitive CYP3A substrates or those with a narrow therapeutic index.

Use Cautionly in: Concurrent use of CYP3A inhibitors; Moderate or severe hepatic impairment (dose ↓ recommended); Severe renal impairment (CCr <30 mL/min) or end stage renal disease; **OB:** Use in pregnancy only if clearly needed; **Lactation:** Use cautiously during breast feeding; **Pedi:** Children <6 yr (safety and effectiveness not established).

Adverse Reactions/Side Effects

CNS: fatigue. **CV:** ↑ blood pressure. **Derm:** rash.

EENT: cataracts, rhinorrhea. **GI:** diarrhea, nausea, flatulence, ↑ bilirubin, ↑ liver enzymes. **GU:** amenorrhea, dysmenorrhea, menorrhagia. **MS:** ↑ creatine kinase. **Resp:** dyspnea, chest discomfort.

Interactions

Drug-Drug: Ivacaftor is a CYP3A substrate. Lumacaftor is a strong inducer of CYP3A4. **Strong CYP3A inducers** including rifampin, rifabutin, phenobarbital, carbamazepine and phenytoin may ↓ ivacaftor levels and effectiveness; avoid concurrent use. Lumacaftor may ↓ levels of **CYP3A substrates**, including **hormonal contraceptive agents**; avoid concurrent use with sensitive CYP3A substrates or those with a narrow therapeutic index, including cyclosporine, everolimus, midazolam, sirolimus, tacrolimus, or triazolam. **Strong CYP3A inhibitors** including ketoconazole, itraconazole, posaconazole, voriconazole, and clarithromycin may ↑ ivacaftor levels; no dose adjustment required when initiating CYP3A inhibitor in patients currently receiving ivacaftor/lumacaftor; ↓ initial ivacaftor/lumacaftor dose for 1

wk when starting therapy in patient currently receiving strong CYP3A4 inhibitor and then proceed with recommended dose. Lumacaftor may ↓ levels of **CYP2B6 substrates**, **CYP2C8 substrates**, **CYP2C9 substrates**, and **CYP2C19 substrates**. Ivacaftor may ↑ levels of **CYP2C9 substrates**. May ↑ or ↓ **digoxin** or **warfarin** levels. May ↓ levels of citalopram, clarithromycin, corticosteroids, erythromycin, escitalopram, ibuprofen, itraconazole, ketoconazole, montelukast, posaconazole, proton pump inhibitors, ranitidine, repaglinide, sertraline, sulfonyleureas, voriconazole.

Drug-Natural Products: St. John's wort may ↓ ivacaftor levels and effectiveness; avoid concurrent use.

Route/Dosage

PO (Adults and Children ≥12 yr): Two lumacaftor 200–mg/ivacaftor 125–mg tablets every 12 hr with fat-containing food; *Initiation of therapy in patients receiving strong CYP3A inhibitor*—One lumacaftor 200–mg/ivacaftor 125–mg tablet once daily for 1 wk, then ↑ to two lumacaftor 200–mg/ivacaftor 125–mg tablets every 12 hr.

PO (Children 6–11 yr): Two lumacaftor 100–mg/ivacaftor 125–mg tablets every 12 hr with fat-containing food; *Initiation of therapy in patients receiving strong CYP3A inhibitor*—One lumacaftor 100–mg/ivacaftor 125–mg tablet once daily for 1 wk, then ↑ to two lumacaftor 200–mg/ivacaftor 125–mg tablets every 12 hr.

Hepatic Impairment

(Adults and Children ≥12 yr): *Moderate hepatic impairment (Child-Pugh Class B)*—Two lumacaftor 200–mg/ivacaftor 125–mg tablets in AM and one lumacaftor 200–mg/ivacaftor 125–mg tablet in PM; *Severe hepatic impairment (Child-Pugh Class C)*—One lumacaftor 200–mg/ivacaftor 125–mg tablet in AM and one lumacaftor 200–mg/ivacaftor 125–mg tablet in PM.

Hepatic Impairment

(Adults and Children 6–11 yr): *Moderate hepatic impairment (Child-Pugh Class B)*—Two lumacaftor 100–mg/ivacaftor 125–mg tablets in AM and one lumacaftor 100–mg/ivacaftor 125–mg tablet in PM; *Severe hepatic impairment (Child-Pugh Class C)*—One lumacaftor 100–mg/ivacaftor 125–mg tablet in AM and one lumacaftor 100–mg/ivacaftor 125–mg tablet in PM.

Availability

Tablets: ivacaftor 100 mg/lumacaftor 200 mg, ivacaftor 125 mg/lumacaftor 200 mg.

NURSING IMPLICATIONS

Assessment

- Assess respiratory status (chest discomfort, dyspnea, respiration abnormal) prior to and periodically during therapy.

- Monitor BP periodically during therapy; may cause hypertension.
- Obtain baseline and periodic ophthalmological exams on pediatric patients starting therapy; may cause cataracts.
- **Lab Test Considerations:**  Determine patient's genotype prior to starting therapy. If genotype is unknown, use an FDA-cleared CF mutation test to detect presence of the F508del mutation on both alleles of the CFTR gene.
- Monitor ALT, AST, and bilirubin prior to starting therapy, every 3 mo during 1st year of therapy, and annually thereafter. Monitor patients with a history of ALT, AST, or bilirubin \uparrow more frequently. If \uparrow ALT, AST, or bilirubin occur, monitored closely until resolved. *If ALT or AST $>5 \times$ upper limit of normal (ULN) when not associated \uparrow bilirubin, withhold therapy. If ALT or AST $>3 \times$ ULN when associated with bilirubin $>2 \times$ ULN, withhold therapy. Consider benefits and risks of resuming dosing, once \uparrow levels resolve.*

Potential Nursing Diagnoses

Ineffective breathing pattern (Indications)

Implementation

- **PO:** Administer 2 tablets every 12 hrs with fat-containing food (eggs, avocados, nuts, butter, peanut butter, cheese pizza, whole-milk dairy products [whole milk, cheese, yogurt], etc).

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses within 6 hrs with fat-containing food. If >6 hrs after usual dosing time, omit dose and resume normal schedule for following dose; do not double doses. Advise patient to read *Patient Information* prior to starting and with each Rx refill in case of changes.
- May cause dizziness. Avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional if signs and symptoms of liver problems (pain or discomfort in upper right abdomen, yellowing of skin or white of eyes, loss of appetite, nausea or vomiting, dark, amber-colored urine, confusion) or respiratory problems (shortness of breath, chest tightness) occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding. Use a nonhormonal contraceptive during therapy.

- **Pedi:** Advise patient of childbearing age to use non-hormonal contraception. Ivacaftor/lumacaftor may \downarrow hormonal contraceptive exposure (oral, injectable, transdermal, implantable) \downarrow effectiveness; do not rely upon as effective method of contraception.

Evaluation/Desired Outcomes

- Improved lung function with \uparrow weight, decreased exacerbations and fewer CF symptoms.

ixabepilone (icks-a-bep-i-lone) Ixempra

Classification

Therapeutic: antineoplastics

Pharmacologic: epothilone B analogues

Indications

Combination use with capecitabine for the treatment of metastatic or locally advanced breast cancer currently resistant to a taxane and anthracycline or resistant to a taxane and cannot tolerate further anthracycline. May also be used as monotherapy for breast cancers that are not responding to anthracyclines, taxane, or capecitabine.

Action

Binds to β -tubulin subunits on microtubules; this action blocks cells in mitosis, leading to cell death. Also has antiangiogenic activity. **Therapeutic Effects:** Decreased spread of breast cancer.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Extensively metabolized by the liver, primarily by the CYP3A4 enzyme system. Metabolites are not active and are excreted mainly by the kidneys.

Half-life: 52 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	end of infusion	unknown

Contraindications/Precautions

Contraindicated in: Previous hypersensitivity to any medications containing Cremophor EL or similar derivatives (polyoxyethylated castor oil); Neutrophils <1500 cells/ m^3 or platelets $<100,000$ cells/ m^3 ; Severe hepatic impairment; Use with capecitabine is contraindicated for hepatic impairment (AST or ALT $>2.5 \times$ upper limits of normal or bilirubin $>1 \times$ upper limit of normal) due to \uparrow risk of toxicity and death associated

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

with neutropenia; **OB, Lactation:** Pregnancy or lactation.

Use Cautiously in: Toxicity; dose adjustments may be required for neuropathy/arthralgia/myalgia/fatigue, neutropenia, thrombocytopenia, moderate hepatic impairment or palmar-plantar erythrodysesthesia; Diluent contains dehydrated alcohol; consider possible CNS effects; Diabetes or history of neuropathy (\uparrow risk of severe neuropathy); History of cardiac disease (may \uparrow risk of myocardial ischemia or ventricular dysfunction); **OB:** Patients with childbearing potential; **Pedi:** Effectiveness not established.

Adverse Reactions/Side Effects

CNS: fatigue, weakness, dizziness, headache, insomnia. **EENT:** \uparrow lacrimation. **CV:** chest pain, edema, left ventricular dysfunction, myocardial ischemia. **Resp:** dyspnea. **GI:** abdominal pain, anorexia, constipation, diarrhea, mucositis, nausea, stomatitis, vomiting, altered taste. **Derm:** alopecia, hyperpigmentation, nail disorder, palmar-plantar erythrodysesthesia (combination therapy with capecitabine), exfoliation, pruritus, rash, hot flushes. **Hemat:** MYELOSUPPRESSION. **MS:** arthralgia, musculoskeletal pain, myalgia. **Neuro:** peripheral neuropathy. **Misc:** hypersensitivity reactions.

Interactions

Drug-Drug: Strong CYP3A4 inhibitors including ketoconazole, itraconazole, voriconazole, clarithromycin, atazanavir, delavirdine, ritonavir, saquinavir, nefazodone \uparrow blood levels and the risk of serious toxicities, concurrent use should be avoided if possible. If concurrent use is required, dose reduction of ixabepilone is recommended. Inducers of the CYP3A4 enzyme system including dexamethasone, phenytoin, carbamazepine, phenobarbital, rifampin, rifampicin, or rifabutin may \downarrow levels and effectiveness, avoid if possible.

Drug-Natural Products: St. John's wort may \downarrow blood levels and should be avoided.

Drug-Food: Grapefruit juice may \uparrow blood levels and toxicity; avoid concurrent use.

Route/Dosage

IV (Adults): 40 mg/m² every 3 wk; not to exceed dose greater than that calculated for 2.2 m² (88 mg/dose).

Hepatic Impairment

IV (Adults): Moderate Impairment—20 mg/m² every 3 wk; not to exceed 30 mg/m².

Availability

Powder for injection (requires specific diluent for initial reconstitution): 15-mg vial (contains 16 mg ixabepilone to allow for withdrawal losses) with 8 mL of diluent in a separate vial as a kit, 45-mg vial (contains 47 mg ixabepilone to allow for withdrawal losses) with 23.5 mL of diluent in a separate vial.

NURSING IMPLICATIONS

Assessment

- Monitor for hypersensitivity reaction (flushing, rash, dyspnea, bronchospasm). If severe reactions occur stop infusion and provide aggressive supportive treatment with epinephrine and corticosteroids. In subsequent cycles, add corticosteroids to the pre-medication regimen.
- Monitor for myelosuppression frequently during therapy. Assess for signs of infection during neutropenia. Assess for bleeding (bleeding gums, bruising, petechiae, blood in stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min.
- Assess patient for signs of peripheral neuropathy (burning sensation, hyperesthesia, hypoesthesia, paresthesia, discomfort, neuropathic pain); may occur early during treatment within the first 3 cycles. Patients experiencing new or worsening symptoms may require a reduction or delay in dose of ixabepilone. If neuropathy is Grade 2 (moderate) lasting for ≥ 7 days or Grade 3 (severe) lasting for < 7 days decrease dose by 20%. If neuropathy is Grade 3 lasting ≥ 7 days or is disabling discontinue treatment.
- **Lab Test Considerations:** Monitor CBC and platelets frequently during therapy. If neutrophil count is < 500 cells/mm³ for ≥ 7 days or patient has febrile neutropenia or if platelet count is $< 25,000$ /mm³ or platelets are $< 50,000$ /mm³ with bleeding decrease the dose by 20%. Begin new treatment cycle only if neutrophil count is at least 1500 cells/mm³ and nonhematologic toxicities have improved to Grade 1 (mild) or resolved. May also cause leukopenia and anemia.
- Monitor hepatic function prior to therapy. Patients with decreased hepatic function require a decreased dose. If AST and ALT $\leq 2.5 \times$ the upper limits of normal (ULN) and bilirubin $\leq 1 \times$ ULN administer ixabepilone at 40 mg/m². If AST and ALT $\leq 10 \times$ the upper limits of normal (ULN) and bilirubin $\leq 1 \times$ ULN administer ixabepilone at 32 mg/m². If AST and ALT $\leq 10 \times$ the upper limits of normal (ULN) and bilirubin $> 1.5 \times$ ULN— $\leq 3 \times$ ULN administer ixabepilone at 20–30 mg/m².

Potential Nursing Diagnoses

Risk for injury (Adverse Reactions)

Implementation

- Premedicate patient with an H₁ and an H₂ antagonist approximately 1 hr before ixabepilone infusion. Patients who experienced a hypersensitivity reaction in a previous ixabepilone cycle should also be premedicated with corticosteroids and extension of the infusion time should be considered.
- To minimize risk of dermal exposure, wear impervious gloves when handling ixabepilone vials regardless of setting (unpacking and inspection, transport

within a facility, dose preparation and administration).

IV Administration

- **Intermittent Infusion:** Remove *Ixempra kit* (containing ixabepilone vial and diluent vial) from refrigerator and allow to stand at room temperature for 30 min prior to diluting. *Ixempra kit* must be stored in refrigerator. When vials are first removed from refrigerator, a white precipitate may be observed in the diluent vial; precipitate will dissolve to form a clear solution once diluent warms to room temperature. Use only diluent supplied in kit for reconstitution. Reconstitute 15-mg vial with 8 mL and 45-mg vial with 23.5 mL of diluent. Gently swirl and invert vial until powder is completely dissolved. **Diluent:** Prior to administration, dilute constituted solution further with only LR supplied in DEHP-free bags. Dilute as soon as possible after constitution, but may be stored at room temperature and room light for up to 1 hr. For most doses use 250 mL bag of LR, 0.9% NaCl (pH adjusted 6.0–9.0 with sodium bicarbonate), or Plasma-lyte A injection (pH 7.4). **Concentration:** If final concentration is not between 0.2 mg/mL and 0.6 mg/mL, add to appropriate size bag of LR. Thoroughly mix infusion bag by manual rotation. Diluted solution is stable for up to 6 hr at room temperature and room light; must complete infusion during 6-hr period. Administer through an in-line filter with a microporous membrane of 0.2–1.2 microns. DEHP-free infusion containers and administration sets must be used. Discard remaining solution. **Rate:** Infuse over 3 hr.

Patient/Family Teaching

- Advise patient to avoid grapefruit juice during therapy; may lead to increased levels and side effects.
- Solution contains alcohol and may cause drowsiness or dizziness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- **Instruct patient to notify health care professional promptly if fever >100.5°F; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; burning, painful or difficulty urination; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patients to use a soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDs; may precipitate bleeding.**
- Instruct patient to notify health care professional promptly if signs and symptoms of hypersensitivity (hives, urticaria, pruritus, rash, flushing, swelling, dyspnea, chest tightness), peripheral neuropathy

(numbness and tingling in hands and feet), or cardiac adverse reactions (chest pain, difficulty breathing, palpitations, unusual weight gain) occur.

- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, or herbal products, especially St. John's wort.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Discuss the possibility of hair loss with patient. Explore methods of coping. Regrowth usually occurs 2–3 mo after discontinuation of therapy.
- Advise women of childbearing potential to use effective contraception during therapy and to avoid breast feeding during therapy.

Evaluation/Desired Outcomes

- Decreased progression of breast cancer.

ixazomib (ix-az-oh-mib) Ninlaro

Classification

Therapeutic: antineoplastics

Pharmacologic: proteasome inhibitors

Indications

Treatment of multiple myeloma in patients whose disease has relapsed despite receiving ≥ 1 previous drug therapy (in combination with lenalidomide and dexamethasone).

Action

Acts as a proteasome inhibitor by binding to sites on the 20S proteasome. Has antiproliferative and proapoptotic activity. **Therapeutic Effects:** Delayed progression of multiple myeloma.

Pharmacokinetics

Absorption: 58% absorbed following oral administration; bioavailability ↓ by high-fat foods.

Distribution: Extensively distributed to tissues.

Protein Binding: 99%.

Metabolism and Excretion: Metabolized by multiple CYP450 enzymes (including CYP1A2, CYP2B6, CYP2C8, CYP2C9, CYP2C19, CYP2D6, and CYP3A4). 62% excreted in urine (<3.5% as unchanged drug), 22% excreted in feces.

Half-life: 9.5 days.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1 hr	unknown

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Contraindications/Precautions

Contraindicated in: Concurrent use of strong CYP3A inducers; **OB:** May cause fetal harm; **Lactation:** Avoid breast feeding.

Use Cautiously in: Moderate or severe hepatic impairment (↓ dose recommended); Severe renal impairment or end stage renal disease (↓ dose recommended); **Rep:** Women and men of reproductive potential; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CV: edema. **Derm:** rash. **EENT:** blurred vision, conjunctivitis, dry eye. **GI:** HEPATOTOXICITY, constipation, diarrhea, nausea, vomiting. **Hemat:** NEUTROPENIA, THROMBOCYTOPENIA. **MS:** back pain. **Neuro:** peripheral neuropathy. **Misc:** herpes zoster infection.

Interactions

Drug-Drug: Strong CYP3A4 inducers, including carbamazepine, phenytoin, and rifampin, may ↓ levels and effectiveness; avoid concurrent use.

Drug-Natural Products: St. John's wort may ↓ levels and effectiveness; avoid concurrent use.

Route/Dosage

PO (Adults): 4 mg once a wk on Days 1, 8, and 15 of a 28-day treatment cycle.

Renal Impairment

(Adults): *CCr <30 mL/min or requiring dialysis* — 3 mg once a wk on Days 1, 8, and 15 of a 28-day treatment cycle.

Hepatic Impairment

(Adults): *Moderate or severe hepatic impairment (total bilirubin >1.5 x ULN)* — 3 mg once a wk on Days 1, 8, and 15 of a 28-day treatment cycle.

Availability

Capsules: 2.3 mg, 3 mg, 4 mg.

NURSING IMPLICATIONS

Assessment

- Assess for rash (usually maculopapular or macular) periodically during therapy. *If Grade 2 or 3 rash occurs*, withhold lenalidomide until rash recovers to ≤Grade 1, then resume lenalidomide at next lower dose. *If Grade 2 or 3 rash occurs again*, withhold ixazomib and lenalidomide until rash ≤Grade 1, then resume ixazomib at next lower dose and resume lenalidomide at most recent dose. *If Grade 4 rash occurs*, discontinue therapy.
- Assess for signs and symptoms of peripheral neuropathy (numbness, tingling, burning, pain in feet or hands, or weakness in arms or legs) periodically during therapy. *If Grade 1 peripheral neuropathy with pain or Grade 2 peripheral neuropathy occurs*, withhold ixazomib until peripheral neuropathy recovers to ≤Grade 1 without pain or patient's baseline, then resume ixazomib at most recent dose. *If Grade 2 peripheral neuropathy with pain or*

Grade 3 peripheral neuropathy occurs, withhold ixazomib until return to patient's baseline condition or ≤Grade 1 peripheral neuropathy, then resume ixazomib at next lower dose. *If Grade 4 peripheral neuropathy occurs*, discontinue therapy.

- **Lab Test Considerations:** Prior to each 28-day cycle, absolute neutrophil count (ANC) should be ≥1,000/mm³, platelet count should be ≥75,000/mm³, and non-hematologic toxicities should be recovered to patient's baseline condition or ≤Grade 1. For patients taking ixazomib, lenalidomide, and dexamethasone, *if ANC <500/mm³*, withhold ixazomib and lenalidomide until ANC ≥500/mm³, then resume lenalidomide at next lower dose and resume ixazomib at most recent dose. Consider adding granulocyte stimulating factor (G-CSF) as per clinical guidelines. *If ANC <500/mm³ again*, withhold ixazomib and lenalidomide until ANC ≥500/mm³, then resume ixazomib at next lower dose and resume lenalidomide at most recent dose.
- Monitor platelet counts at least monthly during therapy and more frequently during 1st three cycles. Nadir of thrombocytopenia usually occurs Days 14-21 of each 28-day cycle and recovery to baseline by start of next cycle. *If platelet count ≤30,000/mm³*, withhold ixazomib and lenalidomide until platelet count is ≥30,000/mm³, then resume lenalidomide at next lower dose and resume ixazomib at most recent dose. *If platelet count <30,000/mm³ again*, withhold ixazomib and lenalidomide until platelet count is ≥30,000/mm³, then resume ixazomib at next lower dose and resume lenalidomide at most recent dose.
- Monitor hepatic enzymes periodically during therapy and adjust dosing for Grade 3 or 4 symptoms.

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- Consider starting antiviral prophylaxis prior therapy to decrease risk of herpes zoster infection.
- **PO:** Administer once weekly on same day and at same time for first 3 wks of four wk cycle. Take capsules at least 1 hr before or at least 2 hrs after food. Swallow capsule whole with water; do not open, crush, or chew.
- Dexamethasone should be taken with food and not with ixazomib.

Patient/Family Teaching

- Instruct patient to take ixazomib as directed. Take delayed or missed doses only if next scheduled dose is ≥72 hrs away. Do not take within 72 hrs of next scheduled dose and do not double doses. If vomiting occurs after taking dose, omit dose and resume dosing at time of next scheduled dose. Advise patient to read *Patient Information* sheet prior to starting therapy and with each Rx refill in case of changes.

- Caution patient to avoid direct contact with capsule contents. If powder accidentally gets on skin, wash area well with soap and water. If in eyes, flush eyes well with water.
- Advise patient to notify health care professional if signs and symptoms of thrombocytopenia (bleeding, easy bruising), GI problems (diarrhea, constipation, nausea, vomiting), peripheral neuropathy (tingling, numbness, pain, burning in feet or hands, weakness in arms or legs), liver problems (yellowing of skin or whites of eyes, pain in right upper abdomen), swelling in arms, hands, legs, ankles, or feet, or weight gain from swelling, new or worsening rash, or back pain occurs.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort.
- **Rep:** May be teratogenic. Advise male and female patients to avoid pregnancy and breast feeding and use effective nonhormonal contraception during and for at least 90 days following therapy.

Evaluation/Desired Outcomes

- Delayed progression of multiple myeloma signs and symptoms.

ixekizumab (ix-ee-kiz-ue-mab)

Taltz

Classification

Therapeutic: antipsoriatics

Pharmacologic: interleukin antagonists

Indications

Moderate-to-severe plaque psoriasis in patients who are candidates for systemic therapy or phototherapy.

Action

A monoclonal antibody that acts as an antagonist of interleukin (IL)-17A by selectively binding to it and preventing its interaction with the IL-17 receptor. Antagonism prevents the production of inflammatory cytokines and chemokines. **Therapeutic Effects:** Decreased plaque formation and spread.

Pharmacokinetics

Absorption: Well absorbed (60–81%) following subcut administration.

Distribution: Minimally distributed to tissues.

Metabolism and Excretion: Catabolized into small peptides and amino acids.

Half-life: 13 days.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Subcut	unknown	4 days	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Active tuberculosis.

Use Cautiously in: **OB, Lactation, Pedi:** Safety not established.

Adverse Reactions/Side Effects

GI: inflammatory bowel disease, nausea. **Hemat:** neutropenia, thrombocytopenia. **Local:** injection site reactions. **Misc:** **HYPERSENSITIVITY** (including anaphylaxis, angioedema, and urticaria), **INFECTIONS** (including reactivation tuberculosis).

Interactions

Drug-Drug: May ↓ antibody response to **live-virus vaccine** and ↑ risk of adverse reactions (do not administer concurrently). May affect activity of CYP450 enzymes and may alter the effectiveness/toxicity of drugs that are substrates of CYP450 (including **warfarin** and **cyclosporine**); close monitoring is recommended to make any necessary dose modifications.

Route/Dosage

Subcut (Adults): 160 mg (as two 80-mg injections) at Wk 0, then 80 mg at Wks 2, 4, 6, 8, 10, and 12, then 80 mg every 4 wk.

Availability

Solution for injection (in single-dose prefilled autoinjector): 80 mg/mL. **Solution for injection (in single-dose prefilled syringe):** 80 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess for tuberculosis infection before starting therapy; do not administer to patient with active TB infection. Initiate treatment of latent TB before administering ixekizumab. In patient with previous history of TB in whom adequate course cannot be confirmed, consider anti-TB therapy before starting ixekizumab.
- Monitor for signs and symptoms of infection (fever, sweats, chills, muscle aches, cough, dyspnea, blood in mucus, weight loss, warm, red, or painful skin or sores, diarrhea or stomach pain, burning or frequency of urination) before and periodically during therapy.
- Monitor for signs and symptoms of hypersensitivity (urticaria, feeling faint, swelling of face, eyelids, lips, mouth, tongue, or throat, dyspnea, throat tightness, chest tightness, rash) during therapy. If hypersensitivity reaction occurs, discontinue ixekizumab immediately and begin supportive therapy.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Monitor for onset or exacerbation of inflammatory bowel disease (abdominal pain, diarrhea with or without blood, weight loss) during therapy.
- **Lab Test Considerations:** May cause neutropenia and thrombocytopenia.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)

Implementation

- Consider completing all age appropriate immunizations prior to starting therapy.
- **Subcut:** Allow to reach room temperature (30 min) before injection; do not microwave, run under hot water, or leave in sunlight to warm. Solution is clear and colorless to slightly yellow; do not administer solutions that are discolored or contain a precipitate. For *prefilled syringe*, pinch skin and inject into upper arm, thigh, or abdomen at a 45° angle, let go of skin pinch before injecting. Place *autoinjector* flat against skin at injection site before injecting. Avoid areas where skin is bruised, tender, erythematous, indurated or affected by psoriasis. Rotate injection sites.

Patient/Family Teaching

- Instruct patient and caregiver in proper technique for self-injection and care and disposal of equipment. Administer missed doses as soon as possible and resume regular dosing schedule. Advise patient to read *Medication Guide and Instructions for Use* prior to starting therapy and with each Rx refill in case of chances.
- Advise patient to notify health care professional if signs and symptoms of allergic reaction, infection, or inflammatory bowel disease occur.
- Advise patient to avoid use of live vaccines during therapy.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- **Rep:** Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decreased plaque formation and spread in patients with plaque psoriasis.

ketoprofen, See ANTIFUNGALS (TOPICAL).

ketoprofen (kee-toe-proe-fen)

Classification

Therapeutic: antipyretics, antirheumatics, nonopioid analgesics, nonsteroidal anti-inflammatory agents

Pharmacologic: nonopioid analgesics

Indications

Inflammatory disorders, including: Rheumatoid arthritis, Osteoarthritis. Mild to moderate pain, including dysmenorrhea and fever.

Action

Inhibits prostaglandin synthesis. **Therapeutic Effects:** Suppression of pain and inflammation. Reduction of fever.

Pharmacokinetics

Absorption: Well absorbed from the GI tract.

Distribution: Unknown.

Protein Binding: 99%.

Metabolism and Excretion: Mostly (60%) metabolized by the liver; some renal excretion.

Half-life: 2–4 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO (analgesic)	within 60 min	1 hr	4–6 hr
PO (anti-inflammatory)	few days–1 wk	unknown	up to 24 hr (SR products)

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity may exist with other NSAIDs, including aspirin; Active GI bleeding; Ulcer disease; Some products contain tartrazine and should be avoided in patients with known intolerance; Peri-operative pain from coronary artery bypass graft (CABG) surgery; **OB:** Should not be used in late pregnancy (may cause premature closure of the ductus arteriosus).

Use Cautiously in: Cardiovascular disease or risk factors for cardiovascular disease (may ↑ risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke, especially with prolonged use or use of higher doses); Severe renal or hepatic disease; History of ulcer disease; Renal impairment (dosage ↓ suggested); **Geri:** Extended-release product should not be used in geriatric patients, patients of small stature, or patients with renal impairment; ↑ risk of bleeding;

Chronic alcohol use/abuse; **Lactation, Pedi:** Safety not established.

Adverse Reactions/Side Effects

CNS: drowsiness, headache, dizziness. **EENT:** blurred vision, tinnitus. **CV:** HF, MYOCARDIAL INFARCTION, STROKE, edema, hypertension. **GI:** DRUG-INDUCED HEPATITIS, GI BLEEDING, constipation, diarrhea, dyspepsia, nausea, vomiting, anorexia, discomfort, flatulence. **GU:** cystitis, hematuria, renal failure. **Derm:** EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, photosensitivity, rashes. **Endo:** gynecostasia. **Hemat:** blood dyscrasias, prolonged bleeding time. **MS:** myalgia. **Misc:** allergic reactions including ANAPHYLAXIS, fever.

Interactions

Drug-Drug: Aspirin alters distribution, metabolism, and excretion of ketoprofen (concurrent use not recommended). ↑ adverse GI effects with other NSAIDs, corticosteroids, or alcohol. Chronic use with acetaminophen may ↑ risk of adverse renal reactions. May ↓ effectiveness of diuretics or antihypertensives. May ↑ hypoglycemic effects of insulin or sulfonylurea oral hypoglycemic agents. May ↑ serum lithium levels and risk of toxicity. ↑ risk of toxicity from methotrexate. Probenecid ↑ risk of toxicity from ketoprofen (concurrent use not recommended). ↑ risk of bleeding with cefotetan, valproic acid, thrombolytic agents, clopidogrel, eptifibatid, tirofiban, or anticoagulants. ↑ risk of adverse hematologic reactions with antineoplastics or radiation therapy. ↑ risk of nephrotoxicity with cyclosporine.

Drug-Natural Products: ↑ bleeding risk with arnica, chamomile, clove, dong quai, feverfew, garlic, ginger, ginkgo, and Panax ginseng.

Route/Dosage

PO (Adults): Anti-inflammatory—150–300 mg/day in 3–4 divided doses or 150–200 mg once daily as extended-release product; Analgesic—25–50 mg q 6–8 hr.

Availability (generic available)

Capsules: 25 mg, 50 mg, 75 mg. **Extended-release capsules:** 100 mg, 150 mg, 200 mg.

NURSING IMPLICATIONS

Assessment

- Patients who have asthma, aspirin-induced allergy, and nasal polyps are at increased risk for developing hypersensitivity reactions. Assess for rhinitis, wheezing, and urticaria.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome or toxic epidermal necrolysis. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, mus-

* = Canadian drug name. † = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; _____ indicate most frequent.

cle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.

- **Arthritis:** Assess pain and range of motion prior to and 1 hr following administration.
- **Pain:** Assess pain (note type, location, and intensity) prior to and 1 hr following administration.
- **Fever:** Monitor temperature; note signs associated with fever (diaphoresis, tachycardia, malaise).
- **Lab Test Considerations:** Evaluate BUN, serum creatinine, CBC, and liver function tests periodically in patients receiving prolonged therapy.
- Serum potassium, BUN, serum creatinine, alkaline phosphatase, LDH, AST, and ALT tests may show ↑ levels. Blood glucose, hemoglobin and hematocrit concentrations, leukocyte and platelet counts, and CCr may be ↓.
- May prolong bleeding time by 3–4 min.
- May alter results of urine albumin, bilirubin, 17-ketosteroid, and 17-hydroxycorticosteroid determinations.

Potential Nursing Diagnoses

Acute pain (Indications)

Impaired physical mobility (Indications)

Implementation

- Administration in higher-than-recommended doses does not provide increased effectiveness but may cause increased side effects. Use lowest effective dose for shortest period of time.
- Coadministration with opioid analgesics may have additive analgesic effects and may permit lower opioid doses.
- Analgesic is more effective if given before pain becomes severe.
- **PO:** For rapid initial effect, administer 30 min before or 2 hr after meals. Capsules may be administered with food, milk, or antacids containing aluminum hydroxide and magnesium hydroxide to decrease GI irritation.
- Extended-release capsules should be swallowed whole; do not open or chew.
- **Dysmenorrhea:** Administer as soon as possible after the onset of menses.

Patient/Family Teaching

- Advise patient to take this medication with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Instruct patient to take medication exactly as directed. Take missed doses as soon as remembered but not if almost time for the next dose. Do not double doses.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid the concurrent use of alcohol, aspirin, acetaminophen, or other OTC medications without consulting health care professional.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.

- Caution patient to wear sunscreen and protective clothing to prevent photosensitivity reactions.
- Instruct patients not to take OTC ketoprofen preparations for more than 10 days for pain or more than 3 days for fever and to consult health care professional if symptoms persist or worsen.
- **Caution patient that use of ketoprofen with 3 or more glasses of alcohol may increase risk of GI bleeding.**
- Advise patient to consult health care professional if rash, itching, visual disturbances, tinnitus, weight gain, edema, black stools, persistent headache, or influenza-like syndrome (chills, fever, muscle aches, pain) occurs.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Improved joint mobility.
- Decrease in severity of pain. Improvement in arthritis may be seen in a few days to 1 wk; 1–2 wk may be required for maximum effectiveness. Patients who do not respond to one NSAID may respond to another.
- Reduction of fever.

ketorolac† (kee-toe-role-ak)
Sprix, Toradol, ★ Toradol

Classification

Therapeutic: nonsteroidal anti-inflammatory agents, nonopioid analgesics

Pharmacologic: pyrroline carboxylic acid

†See Appendix C for ophthalmic use

Indications

Short-term management of pain (not to exceed 5 days total for all routes combined).

Action

Inhibits prostaglandin synthesis, producing peripherally mediated analgesia. Also has antipyretic and anti-inflammatory properties. **Therapeutic Effects:** Decreased pain.

Pharmacokinetics

Absorption: Rapidly and completely absorbed following all routes of administration.

Distribution: Enters breast milk in low concentrations.

Protein Binding: 99%.

Metabolism and Excretion: Primarily metabolized by the liver. Ketorolac and its metabolites are excreted primarily by the kidneys (92%); 6% excreted in feces.

Half-life: 4.5 hr (range 3.8–6.3 hr; ↑ in geriatric patients and patients with impaired renal function).

TIME/ACTION PROFILE (analgesic effects)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–3 hr	4–6 hr or longer
IM, IV	10 min	1–2 hr	6 hr or longer
IN	unknown	unknown	6–8 hr or longer

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with other NSAIDs may exist; Preoperative use; Active or history of peptic ulcer disease or GI bleeding; Known alcohol intolerance (injection only); Coronary artery bypass graft (CABG) surgery; Cerebrovascular bleeding; Advanced renal impairment or at risk for renal failure due to volume depletion; Concurrent use of pentoxifylline or probenecid; **OB:** Chronic use in 3rd trimester may cause constriction of ductus arteriosus. May inhibit labor and ↑ maternal bleeding at delivery.

Use Cautiously in: Cardiovascular disease or risk factors for cardiovascular disease (may ↑ risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke, especially with prolonged use or use of higher doses); avoid use in patients with recent MI or HF; Heart failure; Coagulation disorders; Mild-to-moderate renal impairment (↓ dose may be required); Hepatic impairment; **Pedi:** Safety not established in neonates; **Geri:** Appears on Beers list; ↑ risk of GI bleeding; **Lactation:** Lactation.

Adverse Reactions/Side Effects

CNS: drowsiness, abnormal thinking, dizziness, euphoria, headache. **EENT:** ↑ lacrimation (spray), nasal discomfort (spray), throat irritation (spray). **Resp:** asthma, dyspnea. **CV:** HF, MYOCARDIAL INFARCTION, STROKE, edema, pallor, vasodilation. **GI:** GI BLEEDING, abnormal taste, diarrhea, dry mouth, dyspepsia, GI pain, ↑ liver enzymes, nausea. **GU:** oliguria, renal toxicity, urinary frequency. **Derm:** EXPLOSIIVE DERMATITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, pruritus, purpura, sweating, urticaria. **F and E:** hyperkalemia. **Hemat:** prolonged bleeding time. **Local:** injection site pain. **Neuro:** paresthesia. **Misc:** allergic reactions including, anaphylaxis.

Interactions

Drug-Drug: **Probenecid** ↑ levels and the risk of adverse reactions; concurrent use is contraindicated. ↑ risk of bleeding when used with **pentoxifylline**; concurrent use is contraindicated. Concurrent use with **aspirin** may ↓ effectiveness. ↑ adverse GI effects with **aspirin**, other NSAIDs, **potassium supplements**, **corticosteroids**, or **alcohol**. May ↓ effectiveness of **diuretics** or **antihypertensives**. May ↑ serum **lithium** levels and ↑ risk of toxicity. ↑ risk of toxicity from **methotrexate**. ↑ risk of bleeding with **anticoagu-**

lants, aspirin, clopidogrel, ticagrelor, prasugrel, corticosteroids, fibrinolytics, SNRIs, or SSRIs. ↑ risk of adverse hematologic reactions with **antineoplastics** or **radiation therapy**. May ↑ risk of nephrotoxicity from **cyclosporine**.

Drug-Natural Products: ↑ bleeding risk with **arnica, chamomile, clove, dong quai, feverfew, garlic, ginger, ginkgo, Panax ginseng.**

Route/Dosage

Oral therapy is indicated only as a continuation of parenteral therapy. Total duration of therapy by all routes should not exceed 5 days.

PO (Adults <65 yr): 20 mg initially, followed by 10 mg q 4–6 hr (not to exceed 40 mg/day).

PO (Adults ≥65 yr, <50 kg, or with renal impairment): 10 mg q 4–6 hr (not to exceed 40 mg/day).

PO (Children 2–16 yr, <50 kg): 1 mg/kg as a single dose. No data available for multiple doses.

IM (Adults <65 yr): *Single dose*—60 mg. *Multiple dosing*—30 mg q 6 hr (not to exceed 120 mg/day).

IM (Adults ≥65 yr, <50 kg, or with renal impairment): *Single dose*—30 mg. *Multiple dosing*—15 mg q 6 hr (not to exceed 60 mg/day).

IM (Children 2–16 yr, <50 kg): *Single dose*—0.4–1 mg/kg (maximum: 30 mg/dose). *Multiple dosing*—0.5 mg/kg q 6 hr.

IV (Adults <65 yr): *Single dose*—30 mg. *Multiple dosing*—30 mg q 6 hr (not to exceed 120 mg/day).

IV (Adults ≥65 yr, <50 kg, or with renal impairment): *Single dose*—15 mg. *Multiple dosing*—15 mg q 6 hr (not to exceed 60 mg/day).

IV (Children 2–16 yr, <50 kg): *Single dose*—0.4–1 mg/kg (maximum: 15 mg/dose). *Multiple dosing*—0.5 mg/kg q 6 hr.

Intranasal (Adults <65 yr): 1 spray in each nostril q 6–8 hr (not to exceed 4 sprays in each nostril/day).

Intranasal (Adults ≥65 yr, <50 kg, or with renal impairment): 1 spray in only one nostril q 6–8 hr (not to exceed 4 sprays in one nostril/day).

Availability (generic available)

Tablets: 10 mg. **Solution for injection:** 15 mg/mL, 30 mg/mL. **Nasal spray (Sprix):** 15.75 mg/spray in 1.7–g bottle (delivers 8 sprays).

NURSING IMPLICATIONS

Assessment

- Patients who have asthma, aspirin-induced allergy, and nasal polyps are at increased risk for developing hypersensitivity reactions. Assess for rhinitis, asthma, and urticaria.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome or toxic epidermal necrolysis. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, mus-

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

cle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.

- Monitor BP during initiation and periodically during therapy. May cause fluid retention and edema leading to new onset or worsening hypertension.
- **Pain:** Assess pain (note type, location, and intensity) prior to and 1–2 hr following administration.
- **Lab Test Considerations:** Evaluate liver function tests, especially AST and ALT, periodically in patients receiving prolonged therapy. May cause ↑ levels.
- May cause prolonged bleeding time that may persist for 24–48 hr following discontinuation of therapy.
- May cause ↑ BUN, serum creatinine, or potassium concentrations.

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- Do not confuse Toradol (ketorolac) with tramadol (Ultram).
- Administration in higher-than-recommended doses does not provide increased effectiveness but may cause increased side effects. **Duration of ketorolac therapy, by all routes combined, should not exceed 5 days.** Use lowest effective dose for shortest period of time to minimize risk of cardiovascular thrombotic events.
- Coadministration with opioid analgesics may have additive analgesic effects and may permit lower opioid doses.
- **PO:** Ketorolac therapy should always be given initially by the IM or IV route. Use oral therapy *only* as a continuation of parenteral therapy.

IV Administration

- **IV Push:** Administer undiluted. **Concentration:** 15–30 mg/mL. **Rate:** Administer over at least 15 sec.
- **Y-Site Compatibility:** acetaminophen, alfentanil, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, carboplatin, carmustine, ceftazidime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, enalaprilat, ephedrine, epinephrine, epoetin alfa, eptifibatide, ertapenem, etoposide, etoposide phosphate, famotidine, fentanyl, fluconazole, fludarabine, flurouracil, folic acid, foscarnet, fosphenytoin, furosemide, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, indometha-

cin, insulin, irinotecan, isoproterenol, leucovorin calcium, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, milrinone, mitoxantrone, mivacurium, morphine, moxifloxacin, multivitamins, nafcillin, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, penicillin G, phenobarbital, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, propranolol, ranitidine, remifentanyl, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiopeta, tigecycline, tirofiban, tobramycin, vasopressin, verapamil, vinblastine, vincristine, voriconazole, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, alemtuzumab, amiodarone, amphotericin B colloidal, azithromycin, calcium chloride, caspofungin, chlorpromazine, dacarbazine, dantrolene, daunorubicin hydrochloride, diazepam, diltiazem, diphenhydramine, dobutamine, doxycycline, epirubicin, erythromycin, esmolol, fenoldopam, ganciclovir, gemcitabine, gentuzumab, haloperidol, hydroxyzine, idarubicin, labetalol, levofloxacin, metaraminol, midazolam, nycopenolate, nalbuphine, nicardipine, pantoprazole, papaverine, pentamidine, pentazocine, phenolamine, phenytoin, prochlorperazine, promethazine, protamine, pyridoxine, quinupristin/dalfopristin, rocuronium, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vecuronium, vinorelbine.
- **Solution Compatibility:** D5W, D5/0.9% NaCl, 0.9% NaCl, LR, Plasma-Lyte A, Ringer's injection.
- **Intranasal:** Activate pump before first use by holding bottle arm's length away with index finger and middle finger resting on top of finger flange and thumb supporting base. Press down evenly and release pump 5 times to activate. Prior to each use, blow nose gently to clear nostrils. Sit up straight or stand. Tilt head slightly forward. Insert tip of container into nostril. Point container away from center of nose. Push down to spray. Bottles are for 24 hr use; discard bottle no more than 24 hours after taking first dose, even if the bottle still contains some liquid.

Patient/Family Teaching

- Instruct patient on how and when to ask for and take pain medication.
- Instruct patient to take medication exactly as directed. Take missed doses as soon as remembered if not almost time for next dose. Do not double doses. Do not take more than prescribed or for longer than 5 days.

- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Caution patient to avoid the concurrent use of alcohol, aspirin, NSAIDs, acetaminophen, or other OTC medications without consulting health care professional.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Advise patient to consult health care professional if rash, itching, visual disturbances, tinnitus, weight gain, edema, black stools, persistent headache, or

influenza-like syndrome (chills, fever, muscle aches, pain) occurs.

- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- **Intranasal:** Instruct patient on correct technique for administration, need to open a new bottle every 24 hr, and the 5 day limit for use.

Evaluation/Desired Outcomes

- Decrease in severity of pain. Patients who do not respond to one NSAID may respond to another.

HIGH ALERT

labetalol (la-bet-a-lole)

*Trandate

Classification

Therapeutic: antihypertensives

Pharmacologic: beta blockers

Indications

Management of hypertension.

ActionBlocks stimulation of beta₁ (myocardial)- and beta₂ (pulmonary, vascular, and uterine)-adrenergic receptor sites. Also has alpha₁-adrenergic blocking activity, which may result in more orthostatic hypotension.**Therapeutic Effects:** Decreased BP.**Pharmacokinetics****Absorption:** Well absorbed but rapidly undergoes extensive first-pass hepatic metabolism, resulting in 25% bioavailability.**Distribution:** Some CNS penetration; crosses the placenta.**Protein Binding:** 50%.**Metabolism and Excretion:** Undergoes extensive hepatic metabolism.**Half-life:** 3–8 hr.

TIME/ACTION PROFILE (cardiovascular effects)

ROUTE	ONSET	PEAK	DURATION
PO	20 min–2 hr	1–4 hr	8–12 hr
IV	2–5 min	5 min	16–18 hr

Contraindications/Precautions**Contraindicated in:** Uncompensated HF; Pulmonary edema; Cardiogenic shock; Bradycardia or heart block.**Use Cautiously in:** Renal impairment; Hepatic impairment; Pulmonary disease (including asthma); Diabetes mellitus (may mask signs of hypoglycemia); Thyrotoxicosis (may mask symptoms); Patients with a history of severe allergic reactions (intensity of reactions may be ↑); **OB:** May cause fetal/neonatal bradycardia, hypotension, hypoglycemia, or respiratory depression; **Lactation:** Usually compatible with breast feeding (AAP); **Pedi:** Limited data available; **Ger:** ↑ sensitivity to beta blockers (↑ risk of orthostatic hypotension); initial dosage ↓ recommended.**Adverse Reactions/Side Effects****CNS:** fatigue, weakness, anxiety, depression, dizziness, drowsiness, insomnia, memory loss, mental status changes, nightmares. **EENT:** blurred vision, dry eyes, intraoperative floppy iris syndrome, nasal stuffiness.**Resp:** bronchospasm, wheezing. **CV:** ARRHYTHMIAS, BRADYCARDIA, CHF, PULMONARY EDEMA, orthostatic hypotension. **GI:** constipation, diarrhea, nausea. **GU:** erectile dysfunction, ↓ libido. **Derm:** itching, rashes.**Endo:** hyperglycemia, hypoglycemia. **MS:** arthralgia, back pain, muscle cramps. **Neuro:** paresthesia.**Interactions****Drug-Drug:** **General anesthesia** and **verapamil** may cause additive myocardial depression. Additive bradycardia may occur with **digoxin**, **verapamil**, or **diltiazem**. Additive hypotension may occur with other **antihypertensives**, acute ingestion of **alcohol**, or **nitrates**. Concurrent **thyroid** administration may ↓ effectiveness. May alter the effectiveness of **insulin** or **oral hypoglycemic agents** (dose adjustments may be necessary). May ↓ the effectiveness of **adrenergic bronchodilators** and **theophylline**. May ↓ beneficial beta cardiovascular effects of **dopamine** or **dobutamine**. Use cautiously within 14 days of **MAO inhibitor** therapy (may result in hypertension). Effects may be ↑ by **propranolol** or **cimetidine**. Concurrent **NSAIDs** may ↓ antihypertensive action.**Route/Dosage****PO (Adults):** 100 mg twice daily initially, may be ↑ by 100 mg twice daily q 2–3 days as needed (usual range 400–800 mg/day in 2–3 divided doses; doses up to 1.2–2.4 g/day have been used).**PO (Infants and Children):** 1–3 mg/kg/day divided BID (maximum dose: 10–12 mg/kg/day, up to 1200 mg/day).**IV (Adults):** 20 mg (0.25 mg/kg) initially, additional doses of 40–80 mg may be given q 10 min as needed (not to exceed 300 mg total dose) or 2 mg/min infusion (range 50–300 mg total dose required).**IV (Infants and Children):** 0.2–1 mg/kg/dose (maximum: 40 mg/dose).**Availability (generic available)****Tablets:** 100 mg, 200 mg, 300 mg. **Injection:** 5 mg/mL.**NURSING IMPLICATIONS****Assessment**

- **Monitor BP and pulse frequently during dose adjustment and periodically during therapy.** Assess for orthostatic hypotension when assisting patient up from supine position.
- Check frequency of refills to determine compliance.
- Patients receiving *labetalol* IV must be supine during and for 3 hr after administration. Vital signs should be monitored every 5–15 min during and for several hours after administration.
- **Monitor intake and output ratios and daily weight.** Assess patient routinely for evidence of fluid overload (peripheral edema, dyspnea, rales/crackles, fatigue, weight gain, jugular venous distention).

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.*CAPITALS indicates life-threatening; underlines indicate most frequent.

- **Lab Test Considerations:** May cause ↑ BUN, serum lipoprotein, potassium, triglyceride, and uric acid levels.
- May cause ↑ ANA titers.
- May cause ↑ in blood glucose levels.
- May cause ↑ serum alkaline phosphatase, LDH, AST, and ALT levels. Discontinue if jaundice or laboratory signs of hepatic function impairment occur.
- **Toxicity and Overdose:** Monitor patients receiving beta blockers for signs of overdose (bradycardia, severe dizziness or fainting, severe drowsiness, dyspnea, bluish fingernails or palms, seizures). Notify health care professional immediately if these signs occur.
- Glucagon has been used to treat bradycardia and hypotension.

Potential Nursing Diagnoses

Decreased cardiac output (Side Effects)

Noncompliance (Patient/Family Teaching)

Implementation

- **High Alert:** IV vasoactive medications are inherently dangerous. Before administering intravenously, have second practitioner independently check original order, dosage calculations, and infusion pump settings.
- Do not confuse labetalol with Lamictal.
- Discontinuation of concurrent clonidine should take place gradually, with beta blocker discontinued first. Then, after several days, discontinue clonidine.
- **PO:** Take apical pulse prior to administering. If <50 bpm or if arrhythmia occurs, withhold medication and notify health care professional.
- Administer with meals or directly after eating to enhance absorption.

IV Administration

- **IV Push:** **Diluent:** Administer undiluted. **Concentration:** 5 mg/mL. **Rate:** Administer slowly over 2 min.
- **Continuous Infusion:** **Diluent:** Add 200 mg of labetalol to 160 mL of diluent. May also be administered as undiluted drug. Compatible diluents include D5W, 0.9% NaCl, D5/0.9% NaCl, and LR. **Concentration:** Diluted: 1 mg/mL; Undiluted: 5 mg/mL. **Rate:** Administer at a rate of 2 mg/min. Titrate for desired response. Infuse via infusion pump to ensure accurate dose.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, amikacin, aminocaproic acid, aminophylline, amiodarone, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, ceftazidime, chlorpromazine, cisplatin, clonidine, cyanocobalamin, cyclophosphamide, cyclosporine, dactinomycin, daptomycin, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel,

dopamine, doxorubicin hydrochloride, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin lactobionate, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, irinotecan, isoproterenol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, methoxamine, methylglucamine, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, multivitamins, mycophenolate, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, nitroepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, pentamidine, pentazocine, pentobarbital, phenobarbital, phenolamine, phenylephrine, phytonadione, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxime, quinupristin/dalfopristin, ranitidine, rocuronium, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, telavancin, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, tolazoline, trimetaphan, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vinoxaline, voriconazole, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, amphotericin B cholesteryl, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, azathioprine, cefotaxime, cefotetan, cefoxitin, ceftazolin, ceftriaxone, cefuroxime, dantrolene, dexamethasone sodium phosphate, diazepam, diazoxide, hydrocortisone sodium succinate, indomethacin, insulin, ketorolac, micafungin, nesiritide, paclitaxel, pantoprazole, penicillin G, phenytoin, piperacillin/tazobactam, thiopental, warfarin.

Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day, even if feeling well; do not skip or double up on missed doses. Take missed doses as soon as possible up to 8 hr before next dose. **Abrupt withdrawal may precipitate life-threatening arrhythmias, hypertension, or myocardial ischemia.**
- Advise patient to make sure enough medication is available for weekends, holidays, and vacations. A written prescription may be kept in wallet in case of emergency.
- Teach patient and family how to check pulse and BP. Instruct them to check pulse daily and BP biweekly. Advise patient to hold dose and contact health care professional if pulse is <50 bpm or BP changes significantly.

- May cause drowsiness or dizziness. Caution patients to avoid driving or other activities that require alertness until response to the drug is known. Caution patients receiving labetalol IV to call for assistance during ambulation or transfer.
- Advise patients to make position changes slowly to minimize orthostatic hypotension, especially during initiation of therapy or when dose is increased. Patients taking oral labetalol should be especially cautious when drinking alcohol, standing for long periods, or exercising, and during hot weather, because orthostatic hypotension is enhanced.
- Caution patient that this medication may increase sensitivity to cold.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any Rx, OTC, or herbal products, especially cold preparations, concurrently with this medication. Patients on antihypertensive therapy should also avoid excessive amounts of coffee, tea, and cola.
- Patients with diabetes should closely monitor blood glucose, especially if weakness, malaise, irritability, or fatigue occurs. Medication may mask tachycardia and increased BP as signs of hypoglycemia, but dizziness and sweating may still occur.
- Advise patient to notify health care professional if slow pulse, difficulty breathing, wheezing, cold hands and feet, dizziness, light-headedness, confusion, depression, rash, fever, sore throat, unusual bleeding, or bruising occurs.
- Instruct patient to inform health care professional of medication regimen prior to treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- **Hypertension:** Reinforce the need to continue additional therapies for hypertension (weight loss, sodium restriction, stress reduction, regular exercise, moderation of alcohol consumption, and smoking cessation). Medication controls but does not cure hypertension.

Evaluation/Desired Outcomes

- Decrease in BP.

lacosamide (la-kose-a-mide)

Vimpat

Classification

Therapeutic: anticonvulsants

Schedule V

Indications

Treatment of partial-onset seizures as either monotherapy or adjunctive therapy.

Action

Mechanism is not known, but may involve enhancement of slow inactivation of sodium channels with resultant membrane stabilization. **Therapeutic Effects:** Decreased incidence and severity of partial-onset seizures.

Pharmacokinetics

Absorption: 100% absorbed following oral administration; IV administration results in complete bioavailability.

Distribution: Unknown.

Protein Binding: <15%.

Metabolism and Excretion: Partially metabolized by the liver; 40% excreted in urine as unchanged drug, 30% as a metabolite.

Half-life: 13 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–4 hr	12 hr
IV	unknown	end of infusion	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Severe hepatic impairment; **Lactation:** Lactation.

Use Cautiously in: CCr <30 mL/min (use lower daily dose); All patients (may ↑ risk of suicidal thoughts/behaviors); Hepatic or renal impairment and taking strong inhibitor of CYP3A4 or CYP2C9 (dose ↓ may be needed); Mild to moderate hepatic impairment; titrate dose carefully, use lower daily dose; Known cardiac conduction problems or severe cardiac disease (heart block or sick sinus syndrome without a pacemaker, Brugada syndrome, taking medications that prolong PR interval, MI or HF); Diabetic neuropathy or cardiac disease (↑ risk for atrial fibrillation/flutter); **OB:** Use only if potential benefit justifies risk to the fetus; **Pedi:** Children <17 yr (safety and effectiveness not established); **Geri:** Titrate dose carefully.

Adverse Reactions/Side Effects

CNS: **SUICIDAL THOUGHTS**, dizziness, headache, hallucinations, syncope, vertigo. **EENT:** diplopia. **CV:** atrial fibrillation/flutter, bradycardia, heart block, syncope.

Derm: **DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS)**, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, rash. **GI:** nausea, vomiting. **Hemat:** AGRANULOCYTOSIS. **Neuro:** ataxia. **Misc:** physical dependence, psychological dependence, multiorgan hypersensitivity reactions (Drug Reaction with Eosinophilia and Systemic Symptoms—DRESS).

Interactions

Drug-Drug: Use cautiously with other drugs that affect cardiac conduction.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Route/Dosage

PO, IV (Adults): *Monotherapy*—100 mg twice daily; may be ↑ weekly by 100 mg/day in two divided doses up to a maintenance dose of 300–400 mg/day given in two divided doses; may also initiate therapy with 200 mg single loading dose followed 12 hr later by 100 mg twice daily; may be ↑ weekly by 100 mg/day in two divided doses up to a maintenance dose of 300–400 mg/day given in two divided doses; *Adjunctive therapy*—50 mg twice daily; may be ↑ weekly by 100 mg/day in two divided doses up to a maintenance dose of 200–400 mg/day given in two divided doses; may also initiate therapy with 200 mg single loading dose followed 12 hr later by 100 mg twice daily for 1 wk; may be ↑ weekly by 100 mg/day in two divided doses up to a maintenance dose of 400 mg/day given in two divided doses.

Hepatic/Renal Impairment

PO, IV (Adults): *CCr* ≤ 30 mL/min or mild to moderate hepatic impairment—Do not exceed 300 mg/day.

Availability (generic available)

Tablets: 50 mg, 100 mg, 150 mg, 200 mg. **Solution for injection:** 10 mg/mL. **Oral solution:** 10 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess location, duration, and characteristics of seizure activity. Institute seizure precautions.
- Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- Assess patient for skin rash frequently during therapy. Discontinue at first sign of rash; may be life-threatening. Stevens-Johnson syndrome may develop. Treat symptomatically; may recur once treatment is stopped.
- Monitor for signs and symptoms of DRESS (fever, rash, lymphadenopathy, and/or facial swelling, associated with involvement of other organ systems (hepatitis, nephritis, hematologic abnormalities, myocarditis, myositis) during therapy. May resemble an acute viral infection. Eosinophilia is often present. Discontinue therapy if signs occur.
- **IV:** Assess ECG prior to therapy in patients with pre-existing cardiac disease. Monitor patients with cardiac conduction problems, on medications that prolong PR interval, or with severe cardiac disease (myocardial ischemia, heart failure) closely, as IV lacosamide may cause bradycardia or AV block.
- **Lab Test Considerations:** May cause ↑ALT, which may return to normal without treatment.
- Monitor CBC and platelets periodically during therapy.

Potential Nursing Diagnoses

Risk for injury (Indications)

Implementation

- IV administration is indicated for short term replacement (up to 5 days) when PO administration is not feasible. When switching from PO to IV, initial total daily dose should be equivalent to total daily dose and frequency of PO therapy. At end of IV period, may switch to PO at equivalent daily dose and frequency of IV therapy.
- When switching from another antiepileptic drug to lacosamide, administer 150 mg–200 mg twice daily for at least 3 days before beginning withdrawal of other antiepileptic drug. Gradually decrease other antiepileptic drug over 6 wks.
- When administering loading dose, monitor for CNS adverse reactions (dizziness, headache, nausea, somnolence, fatigue). May occur more frequently.
- When discontinuing lacosamide, gradually decrease dose over 1 wk.
- **PO:** May be administered with or without food.
- Use a calibrated measuring device for accurate dosing of oral solution; household measures are not accurate.

IV Administration

- **Intermittent Infusion:** *Diluent:* May be administered undiluted or diluted with 0.9% NaCl, D5W, or LR. *Concentration:* 10 mg/mL. Solution is clear and colorless; do not administer solutions that are discolored or contain a precipitate. Solution is stable for 4 hr at room temperature. Discard unused portion. *Rate:* Infuse over 15–60 min, preferably 30–60 min.

Patient/Family Teaching

- Instruct patient to take lacosamide around the clock, as directed. Medication should be gradually discontinued over at least 1 wk to prevent seizures. Advise patient to read the *Medication Guide* before starting therapy and with each Rx refill.
- May cause dizziness, ataxia, and syncope. Caution patient to avoid driving or other activities requiring alertness until response to medication is known. Tell patient not to resume driving until physician gives clearance based on control of seizure disorder. If syncope occurs, advise patient to lay down with legs raised until recovered and notify health care professional.
- Inform patients and families of risk of suicidal thoughts and behavior and advise that behavioral changes, emergency or worsening signs and symptoms of depression, unusual changes in mood, or emergence of suicidal thoughts, behavior, or thoughts of self-harm, rash, or signs and symptoms of DRESS should be reported to health care professional immediately.
- Instruct patient to notify health care professional if signs of multiorgan hypersensitivity reactions (fever, rash, fatigue, jaundice, dark urine) occur.
- Advise patient to consult health care professional before taking other Rx, OTC, or herbal preparation and

to avoid taking alcohol or other CNS depressants concurrently with lacosamide.

- **Rep:** Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding. Encourage pregnant patients to enroll in the pregnancy registry by calling 1-888-233-2334, call must be made by patient. Information on registry can be found at the website <http://www.aedpregnancyregistry.org/>.

Evaluation/Desired Outcomes

- Decreased seizure activity.

lactulose (lak-tyoo-lose)
Cholac, Constilac, Constulose, Enulose, Generlac, Kristalose

Classification

Therapeutic: laxatives

Pharmacologic: osmotics

Indications

Treatment of chronic constipation. Adjunct in the management of portal-systemic (hepatic) encephalopathy (PSE).

Action

Increases water content and softens the stool. Lowers the pH of the colon, which inhibits the diffusion of ammonia from the colon into the blood, thereby reducing blood ammonia levels. **Therapeutic Effects:** Relief of constipation. Decreased blood ammonia levels with improved mental status in PSE.

Pharmacokinetics

Absorption: Less than 3% absorbed after oral administration.

Distribution: Unknown.

Metabolism and Excretion: Absorbed lactulose is excreted unchanged in the urine. Unabsorbed lactulose is metabolized by colonic bacteria to lactic, acetic, and formic acids.

Half-life: Unknown.

TIME/ACTION PROFILE (relief of constipation)

ROUTE	ONSET	PEAK	DURATION
PO	24–48 hr	unknown	unknown

Contraindications/Precautions

Contraindicated in: Patients on low-galactose diets.

Use Cautiously in: Diabetes mellitus; Excessive or prolonged use (may lead to dependence); **OB, Lactation:** Safety not established.

Adverse Reactions/Side Effects

GI: belching, cramps, distention, flatulence, diarrhea.

Endo: hyperglycemia (diabetic patients).

Interactions

Drug-Drug: Should not be used with other laxatives in the treatment of hepatic encephalopathy (leads to inability to determine optimal dose of lactulose). **Anti-infectives** may ↓ effectiveness in treatment of hepatic encephalopathy.

Route/Dosage

Constipation

PO (Adults): 15–30 mL/day up to 60 mL/day as liquid or 10–20 g as powder for oral solution (up to 40 g/day has been used).

PO (Children): 7.5 mL daily after breakfast (unlabeled).

PSE

PO (Adults): 30–45 mL 3–4 times/day; may be given q 1–2 hr initially to induce laxation.

PO (Infants): 2.5–10 mL daily in 3–4 divided doses (unlabeled).

PO (Children and Adolescents): 40–90 mL daily in 3–4 divided doses (unlabeled).

Rect (Adults): 300 mL diluted and administered as a retention enema q 4–6 hr.

Availability (generic available)

Oral solution: 10 g lactulose/15 mL. **Rectal solution:** 10 g lactulose/15 mL. **Single-use packets (Kristalose):** 10 g (equal to 15 mL liquid lactulose), 20 g (equal to 30 mL liquid lactulose).

NURSING IMPLICATIONS

Assessment

- Assess patient for abdominal distention, presence of bowel sounds, and normal pattern of bowel function.
- Assess color, consistency, and amount of stool produced.
- **PSE:** Assess mental status (orientation, level of consciousness) before and periodically throughout course of therapy.
- **Lab Test Considerations:** ↓ blood ammonia concentrations by 25–50%.
- May cause ↑ blood glucose levels in diabetic patients.
- Monitor serum electrolytes periodically when used chronically. May cause diarrhea with resulting hypokalemia and hypernatremia.

Potential Nursing Diagnoses

Constipation (Indications)

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Implementation

- When used in hepatic encephalopathy, adjust dose until patient averages 2–3 soft bowel movements per day. During initial therapy, 30–45 mL may be given hourly to induce rapid laxation.
- Darkening of solution does not alter potency.
- **PO:** Mix with fruit juice, water, milk, or carbonated citrus beverage to improve flavor. Administer with a full glass (240 mL) of water or juice. May be administered on an empty stomach for more rapid results.
- Dissolve single dose packets (Kristalose) in 4 oz of water. Solution should be colorless to slightly pale yellow.
- **Rect:** To administer enema, use rectal balloon catheter. Mix 300 mL of lactulose with 700 mL of water or 0.9% NaCl. Enema should be retained for 30–60 min. If inadvertently evacuated, may repeat administration.

Patient/Family Teaching

- Encourage patients to use other forms of bowel regulation, such as increasing bulk in the diet, increasing fluid intake, and increasing mobility. Normal bowel habits are individualized and may vary from 3 times/day to 3 times/wk.
- Caution patients that this medication may cause belching, flatulence, or abdominal cramping. Health care professional should be notified if this becomes bothersome or if diarrhea occurs.

Evaluation/Desired Outcomes

- Passage of a soft, formed bowel movement, usually within 24–48 hr.
- Clearing of confusion, apathy, and irritation and improved mental status in PSE. Improvement may occur within 2 hr after enema and 24–48 hr after oral administration.

lamivudine (la-mi-vyoo-deen)

★ 3TC, Epivir, Epivir-HBV, ★ Heptovir

Classification

Therapeutic: antiretrovirals, antivirals

Pharmacologic: nucleoside reverse transcriptase inhibitors

Indications

HIV infection (with other antiretrovirals). Chronic hepatitis B infection. **Unlabeled Use:** Part of HIV-post-exposure prophylaxis with zidovudine and indinavir.

Action

After intracellular conversion to its active form (lamivudine-5-triphosphate), inhibits viral DNA synthesis by inhibiting the enzyme reverse transcriptase. **Therapeutic Effects:** Slows the progression of HIV infection and decreases the occurrence of its sequelae. Increases CD4 cell counts and decreases viral load. Protection from liver damage caused by chronic hepatitis B infection; decreases viral load.

Pharmacokinetics

Absorption: Well absorbed after oral administration (86% in adults, 66% in infants and children).

Distribution: Distributes into the extravascular space. Some penetration into CSF; remainder of distribution unknown.

Metabolism and Excretion: Mostly excreted unchanged in urine; <5% metabolized by the liver.

Half-life: *Adults*—3.7 hr; *children*—2 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	0.9 hr†	12 hr

†On an empty stomach; peak levels occur at 3.2 hr if lamivudine is taken with food. Food does not affect total amount of drug absorbed.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of antiretroviral combination products containing lamivudine or emtricitabine; **Lactation:** Breast feeding not recommended for HIV positive mothers.

Use Cautiously in: Impaired renal function (↑ dosing interval/↓ dose if CrCl <50 mL/min); Women, prolonged exposure, obesity, history of liver disease (↑ risk of lactic acidosis and severe hepatomegaly with steatosis); Coinfection with hepatitis B (hepatitis may recur after discontinuation of lamivudine); **OB, PEDI:** Pregnancy or children <3 mo (safety not established); **Geri:** ↓ dose may be necessary due to age-related ↓ in renal function.

Exercise Extreme Caution in: **PEDI:** Pediatric patients with a history of or significant risk factors for pancreatitis (use only if no alternative).

Adverse Reactions/Side Effects

Noted for combination of lamivudine plus zidovudine.

CNS: SEIZURES, fatigue, headache, insomnia, malaise, depression, dizziness. **Resp:** cough. **GI:** HEPATOMEGALY WITH STEATOSIS, PANCREATITIS (↑ in pediatric patients), anorexia, diarrhea, nausea, vomiting, abdominal discomfort, ↑ liver enzymes, dyspepsia. **Derm:** alopecia, erythema multiforme, rash, urticaria. **Endo:** fat redistribution, hyperglycemia. **F and E:** lactic acidosis. **Hemat:** anemia, neutropenia, pure red cell aplasia. **MS:** musculoskeletal pain, arthralgia, muscle weakness, myalgia, rhabdomyolysis. **Neuro:** neuropathy. **Misc:** hypersensitivity reactions including ANAPHYLAXIS, immune reconstitution syndrome.

Interactions

Drug-Drug: Trimethoprim/sulfamethoxazole ↑ levels (dose alteration may be necessary in renal impairment). ↑ risk of pancreatitis with concurrent use of other drugs causing pancreatitis. ↑ risk of neuropathy with concurrent use of other drugs causing neuropathy. Combination therapy with tenofovir and abacavir may lead to virologic nonresponse and should not be used.

Route/Dosage

HIV infection

PO (Adults and Children >16 yr and ≥50 kg): 150 mg twice daily or 300 mg once daily.

PO (Adults <50 kg): 2 mg/kg twice daily.

PO (Children 3 mo–16 yr): *Oral solution*—4 mg/kg twice daily or 8 mg/kg once daily (up to 300 mg/day); *Tablets*—14–19 kg: 75 mg twice daily or 150 mg once daily; 20–24 kg: 75 mg in AM, 150 mg in PM or 225 mg once daily; ≥25 kg: 150 mg twice daily or 300 mg once daily.

Renal Impairment

PO (Adults): *CCr 30–49 mL/min*—150 mg once daily; *CCr 15–29 mL/min*—150 mg first dose, then 100 mg once daily; *CCr 5–14 mL/min*—150 mg first dose, then 50 mg once daily; *CCr <5 mL/min*—50 mg first dose, then 25 mg once daily.

Chronic Hepatitis B

PO (Adults): 100 mg once daily.

Renal Impairment

PO (Adults): *CCr 30–49 mL/min*—100 mg first dose, then 50 mg once daily; *CCr 15–29 mL/min*—100 mg first dose, then 25 mg once daily; *CCr 5–14 mL/min*—35 mg first dose, then 15 mg once daily; *CCr <5 mL/min*—35 mg first dose, then 10 mg once daily.

PO (Children 2–17 yr): 3 mg/kg once daily (up to 100 mg/day).

Availability (generic available)

Epivir

Tablets: 150 mg, 300 mg. **Oral solution (strawberry-banana flavor):** 10 mg/mL. **In combination with:** abacavir (Epizcom); zidovudine (Combivir); zidovudine and abacavir (Trizivir); abacavir and dolutegravir (Triumeq). See Appendix B.

Epivir-HBV

Tablets: 100 mg. **Oral solution (strawberry-banana flavor):** 5 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess patient, especially pediatric patients, for signs of pancreatitis (nausea, vomiting, abdominal pain) periodically during therapy. May require discontinuation of therapy.
- **HIV:** Assess patient for change in severity of symptoms of HIV infection and for symptoms of opportunistic infection during therapy.
- Monitor patient for signs and symptoms of peripheral neuropathy (tingling, burning, numbness, or pain in hands or feet); may be difficult to differenti-

ate from peripheral neuropathy of severe HIV disease. May require discontinuation of therapy.

- **Chronic Hepatitis B Infection:** Monitor signs of hepatitis (jaundice, fatigue, anorexia, pruritus) during therapy.
- **Lab Test Considerations:** Monitor viral load and CD4 levels before and periodically during therapy.
- **Monitor serum amylase, lipase, and triglycerides** periodically during therapy. Elevated serum levels may indicate pancreatitis and require discontinuation.
- **Monitor liver function.** May cause ↑ levels of AST, ALT, CPK, bilirubin, and alkaline phosphatase, which usually resolve after interruption of therapy. Lactic acidosis may occur with hepatic toxicity causing hepatic steatosis; may be fatal, especially in women.
- May rarely cause neutropenia and anemia.

Potential Nursing Diagnoses

Risk for infection (Indications)

Implementation

- Do not confuse lamivudine with lamotrigine. Do not confuse Epivir tablets and oral solution with Epivir-HBV tablets and oral solutions. Epivir Tablets and Oral Solution contain a higher dose of the same active ingredient (lamivudine) than in Epivir-HBV Tablets and Oral Solution. Epivir-HBV was developed for patients with hepatitis B and should not be used for patients dually infected with HIV and hepatitis B; use may lead to lamivudine-resistant HIV due to subtherapeutic dose.
- **PO:** May be administered without regard to food.

Patient/Family Teaching

- Instruct patient to take lamivudine as directed, every 12 hr. Explain the difference between Epivir and Epivir-HBV to patients. Emphasize the importance of compliance with full course of therapy, not taking more than the prescribed amount, and not discontinuing without consulting health care professional. Take missed doses as soon as possible unless almost time for next dose. Do not double doses. Caution patient not to share medication with others.
- Inform patient that lamivudine does not cure HIV disease or prevent associated or opportunistic infections. Lamivudine does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom during sexual contact and avoid sharing needles or donating blood to prevent spreading HIV to others. Advise patient that the long-term effects of lamivudine are unknown at this time.
- Instruct patient to notify health care professional promptly if signs of peripheral neuropathy, pancreatitis, or Immune Reconstitution Syndrome (signs and symptoms of an infection, *Mycobacterium avium* infection, cytomegalovirus, *Pneumocystis jirovecii* pneumonia, tuberculosis) occur.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Inform patient that redistribution and accumulation of body fat may occur, causing central obesity, dorsocervical fat enlargement (buffalo hump), peripheral wasting, breast enlargement, and cushingoid appearance. The cause and long-term effects are not known.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, or herbal products.
- **Rep:** Instruct females using hormonal contraceptives to use an alternative nonhormonal method of contraception. Advise patient to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding. If pregnant patient is exposed to lamivudine, register patient in *Antiretroviral Pregnancy Registry* by calling 1-800-258-4263.
- Emphasize the importance of regular follow-up exams and blood tests to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Slowing of the progression of HIV infection and its sequelae.
- Decrease in viral load and improvement in CD4 levels in patients with advanced HIV infection.
- Protection from liver damage caused by chronic hepatitis B infection; decreases viral load.

lamotrigine (la-moe-tri-jeen)
LaMICtal, LaMICtal CD, LaMICtal ODT,
LaMICtal XR

Classification

Therapeutic: anticonvulsants

Indications

Adjunct treatment of partial seizures in adults and children with epilepsy (immediate-release, extended-release, chewable, and orally disintegrating tablets). Lennox-Gastaut syndrome (immediate-release, chewable, and orally disintegrating tablets only). Adjunct treatment of primary generalized tonic-clonic seizures in adults and children (immediate-release, extended-release, chewable, and orally disintegrating tablets). Conversion to monotherapy in adults with partial seizures receiving carbamazepine, phenytoin, phenobarbital, primidone, or valproate as the single antiepileptic drug (immediate-release, extended-release, chewable, and orally disintegrating tablets only). Maintenance treatment of bipolar disorder (immediate-release, chewable, and orally disintegrating tablets only).

Action

Stabilizes neuronal membranes by inhibiting sodium transport. **Therapeutic Effects:** Decreased incidence of seizures. Delayed time to recurrence of mood episodes in bipolar disorder.

Pharmacokinetics

Absorption: 98% absorbed following oral administration.

Distribution: Enters breast milk. Highly bound to melanin-containing tissues (eyes, pigmented skin).

Metabolism and Excretion: Mostly metabolized by the liver via glucuronidation to inactive metabolites; 10% excreted unchanged by the kidneys.

Half-life: Children taking enzyme-inducing antiepileptic drugs (AEDs): 7–10 hr; Children taking enzyme inducers and valproic acid: 15–27 hr; Children taking valproic acid: 44–94 hr; Adults: 25.4 hr (during chronic therapy of lamotrigine alone).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1.4–4.8 hr; 4–10 hr (XR)	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Acute manic or mixed episodes.

Use Cautiously in: All patients (may ↑ risk of suicidal thoughts/behaviors); Patients with renal impairment, impaired cardiac function, and hepatic impairment (lower maintenance doses may be required); Prior history of rash to lamotrigine; **OB:** Exposure during first trimester may ↑ risk of cleft lip/palate; **Lactation:** Enters breast milk; use cautiously during lactation; **Pedi:** Immediate-release, chewable, and orally disintegrating tablets not safe for children <2 yr; extended-release tablets not approved for use in children <13 yr.

Adverse Reactions/Side Effects

CNS: ASEPTIC MENINGITIS, SUICIDAL THOUGHTS, ataxia, dizziness, headache, behavior changes, depression, drowsiness, insomnia, tremor. **EENT:** blurred vision, double vision, rhinitis. **GI:** HEPATIC FAILURE, nausea, vomiting. **GU:** vaginitis. **Derm:** photosensitivity, rash (higher incidence in children, patients taking valproic acid, high initial doses, or rapid dose increases). **MS:** arthralgia. **Misc:** MULTI-ORGAN HYPERSENSITIVITY REACTIONS, STEVENS-JOHNSON SYNDROME.

Interactions

Drug-Drug: Concurrent use with carbamazepine may ↑ levels of an active metabolite of carbamazepine. Concurrent use with drugs that induce glucuronidation, including phenobarbital, phenytoin, primidone, carbamazepine, estrogen-containing oral contraceptives rifampin, lopinavir/ritonavir, or atazanavir/ritonavir may ↓ levels; lamotrigine dose adjustments may be necessary when starting and stopping oral contraceptive or atazanavir/ritonavir therapy. Concurrent use with drugs that inhibit glucuronidation, including valproic acid, may ↑ levels and ↑ incidence of rash; may also ↓ valproic acid levels (↓ lamotrigine dose by at least 50%).

Route/Dosage

Epilepsy

In Combination with Other Antiepileptic Agents

PO (Adults and Children >12 yr; Immediate-release, chewable, or orally disintegrating tablets):

Patients taking anti-epileptic drugs other than carbamazepine, phenobarbital, phenytoin, primidone, or valproate—25 mg daily for first 2 wk, then 50 mg daily for next 2 wk; then ↑ by 50 mg/day every 1–2 wk to maintenance dose of 225–375 mg/day (in 2 divided doses); *Patients taking carbamazepine, phenobarbital, phenytoin, or primidone (and not valproate)*—50 mg daily for first 2 wk, then 50 mg twice daily for next 2 wk; then ↑ by 100 mg/day every 1–2 wk to maintenance dose of 300–500 mg/day (in 2 divided doses); *Patients taking regimen containing valproate*—25 mg every other day for first 2 wk, then 25 mg daily for next 2 wk; then ↑ by 25–50 mg/day every 1–2 wk to maintenance dose of 100–400 mg/day (in 1–2 divided doses) (maintenance dose of 100–200 mg/day if receiving valproate alone).

PO (Adults and Children ≥13 yr; Extended-release tablets): *Patients taking anti-epileptic drugs other than carbamazepine, phenobarbital, phenytoin, primidone, or valproate*—25 mg daily for first 2 wk, then 50 mg daily for next 2 wk; then 100 mg daily for 1 wk, then 150 mg daily for 1 wk, then 200 mg daily for 1 wk, then ↑ by 100 mg/day every wk to maintenance dose of 300–400 mg daily; *Patients taking carbamazepine, phenobarbital, phenytoin, or primidone (and not valproate)*—50 mg daily for first 2 wk, then 100 mg daily for next 2 wk, then 200 mg daily for 1 wk, then 300 mg daily for 1 wk, then 400 mg daily for 1 wk, then ↑ by 100 mg/day every wk to maintenance dose of 400–600 mg daily; *Patients taking regimen containing valproate*—25 mg every other day for first 2 wk, then 25 mg daily for next 2 wk, then 50 mg daily for 1 wk, then 100 mg daily for 1 wk, then 150 mg daily for 1 wk, then maintenance dose of 200–250 mg daily.

PO (Children 2–12 yr; Immediate-release, chewable, or orally disintegrating tablets): *Patients taking anti-epileptic drugs other than carbamazepine, phenobarbital, phenytoin, primidone, or valproate*—0.3 mg/kg/day in 1–2 divided doses (rounded down to nearest whole tablet) for first 2 wk, then 0.6 mg/kg/day in 2 divided doses (rounded down to nearest whole tablet) for next 2 wk; then ↑ by 0.6 mg/kg/day (rounded down to nearest whole tablet) every 1–2 wk to maintenance dose of 4.5–7.5 mg/kg/day (not to exceed 300 mg/day in 2 divided doses); *Patients taking carbamazepine, phenobarbital, phenytoin, or primidone (and not valproate)*—0.6 mg/kg/day in 2 divided doses (rounded down to nearest

whole tablet) for first 2 wk, then 1.2 mg/kg/day in 2 divided doses (rounded down to nearest whole tablet) for next 2 wk; then ↑ by 1.2 mg/kg/day (rounded down to nearest whole tablet) every 1–2 wk to maintenance dose of 5–15 mg/kg/day (not to exceed 400 mg/day in 2 divided doses). *Patients taking regimen containing valproate*—0.15 mg/kg/day in 1–2 divided doses (rounded down to nearest whole tablet) for first 2 wk, then 0.3 mg/kg in 1–2 divided doses (rounded down to nearest whole tablet) for next 2 wk; then ↑ by 0.3 mg/kg/day (rounded down to nearest whole tablet) every 1–2 wk to maintenance dose of 1–5 mg/kg/day (not to exceed 200 mg/day in 1–2 divided doses) (maintenance dose of 1–3 mg/kg/day if receiving valproate alone).

Conversion to Monotherapy

PO (Adults and Children ≥16 yr; Immediate-release, chewable, or orally disintegrating tablets):

Patients taking carbamazepine, phenobarbital, phenytoin, or primidone (and not valproate)—After achieving a dose of 500 mg/day (as per dosing guidelines above), ↓ dose of other antiepileptic by 20% weekly over 4 wk; *Patients taking regimen containing valproate*—After achieving a dose of 200 mg/day (as per dosing guidelines above), ↓ valproate dose by 500 mg/day on a weekly basis until a dose of 500 mg/day is achieved. Maintain the valproate dose of 500 mg/day and the lamotrigine dose of 500 mg/day for 1 wk. Then ↑ lamotrigine dose to 300 mg/day and ↓ valproate dose to 250 mg/day, and maintain these doses for 1 wk. Then discontinue valproate and ↑ lamotrigine dose by 100 mg/day every wk until maintenance dose of 500 mg/day is achieved.

PO (Adults and Children ≥13 yr; Extended-release tablets): *Patients taking carbamazepine, phenobarbital, phenytoin, or primidone (and not valproate)*—After achieving a dose of 500 mg/day (as per dosing guidelines above), ↓ dose of other antiepileptic by 20% weekly over 4 wk. Two wk later, ↓ dose of lamotrigine by 100 mg/day every wk to achieve maintenance dose of 250–300 mg/day; *Patients taking regimen containing valproate*—After achieving a dose of 150 mg/day (as per dosing guidelines above), ↓ valproate dose by 500 mg/day on a weekly basis until a dose of 500 mg/day is achieved. Maintain the valproate dose of 500 mg/day and the lamotrigine dose of 150 mg/day for 1 wk. Then ↑ lamotrigine dose to 200 mg/day and ↓ valproate dose to 250 mg/day, and maintain these doses for 1 wk. Then discontinue valproate and ↑ lamotrigine dose to 250–300 mg/day; *Patients taking anti-epileptic drugs other than carbamazepine, phenobarbital, phenytoin, primidone, or valproate*—After achieving a dose of 250–300 mg/day (as per dosing guidelines above), ↓ dose of other antiepileptic by 20% weekly over 4 wk.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Bipolar Disorder

Escalation Regimen

PO (Adults): *Patients not taking carbamazepine, phenobarbital, phenytoin, primidone, rifampin, or valproate*—25 mg daily for first 2 wk, then 50 mg daily for next 2 wk, then 100 mg daily for 1 wk, then 200 mg daily; *Patients taking valproate*—25 mg every other day for first 2 wk, then 25 mg daily for next 2 wk, then 50 mg daily for 1 wk, then 100 mg daily; *Patients taking carbamazepine, phenobarbital, phenytoin, primidone, or rifampin (and not valproate)* 50 mg daily for first 2 wk, then 100 mg/day (in divided doses) for next 2 wk, then 200 mg/day (in divided doses) for one wk, then 300 mg/day (in divided doses) for 1 wk, then up to 400 mg/day (in divided doses).

Dosage Adjustment Following Discontinuation of Other Psychotropics

PO (Adults): *Following discontinuation of valproate (if current dose 100 mg/day)*—↑ to 150 mg/day for 1 wk, then 200 mg/day; *Following discontinuation of carbamazepine, phenobarbital, phenytoin, primidone, or rifampin (if current dose 400 mg/day)*—400 mg/day for 1 wk, then 300 mg/day for 1 wk, then 200 mg/day; *Following discontinuation of other psychotropics*—maintain previous dose.

Availability (generic available)

Immediate-release tablets: 25 mg, 100 mg, 150 mg, 200 mg. **Cost:** *Generic*—25 mg \$415.96/100, 100 mg \$475.12/100, 150 mg \$312.44/100, 200 mg \$340.15/100. **Chewable dispersible tablets:** 2 mg, 5 mg, 25 mg. **Cost:** *Generic*—5 mg \$305.33/100, 25 mg \$319.80/100. **Orally disintegrating tablets:** 25 mg, 50 mg, 100 mg, 200 mg. **Cost:** 25 mg \$218.27/30, 50 mg \$233.78/30, 100 mg \$249.29/30, 200 mg \$297.47/30. **Extended-release tablets:** 25 mg, 50 mg, 100 mg, 200 mg, 250 mg, 300 mg. **Cost:** *Generic*—25 mg \$196.43/30, 50 mg \$392.81/30, 100 mg \$420.77/30, 200 mg \$448.70/30, 250 mg \$611.88/30, 300 mg \$673.07/30.

NURSING IMPLICATIONS

Assessment

- Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- Assess patient for skin rash frequently during therapy. Discontinue lamotrigine at first sign of rash; may be life-threatening. Stevens-Johnson syndrome or toxic epidermal necrolysis may develop. Rash usually occurs during the initial 2–8 wk of therapy and is more frequent in patients taking multiple antiepileptic agents, especially valproic acid, and much more frequent in patients <16 yr.
- Monitor for signs and symptoms of multiorgan hypersensitivity reactions—DRESS (rash, fever, lymphadenopathy). May be associated with other organ involvement (hepatitis, hepatic failure, blood dyscrasias, acute multiorgan failure). If cause cannot be determined, discontinue lamotrigine immediately.

sias, acute multiorgan failure). If cause cannot be determined, discontinue lamotrigine immediately.

- **Seizures:** Assess location, duration, and characteristics of seizure activity.
- **Bipolar disorders:** Assess mood, ideation, and behaviors frequently. Initiate suicide precautions if indicated.
- **Lab Test Considerations:** Lamotrigine plasma concentrations may be monitored periodically during therapy, especially in patients concurrently taking other anticonvulsants. Therapeutic plasma concentration range has not been established, proposed therapeutic range: 1–5 mcg/mL.
- May cause false-positive results for phencyclidine (PCP) in some rapid urine drug screens. Use a more specific analytical method to confirm results.

Potential Nursing Diagnoses

Risk for impaired skin integrity (Adverse Reactions)
Risk for injury (Side Effects)

Implementation

- Do not confuse lamotrigine with lamivudine, levacetam, or levothyroxine. Do not confuse Lamical with Lamisil (terbinafine).
 - When converting from immediate-release to XR form, initial dose of XR should match the total daily dose of immediate-release lamotrigine; monitor closely and adjust as needed.
 - **PO:** May be administered without regard to meals. Swallow XR tablets whole; do not break, crush, or chew.
 - Lamotrigine should be discontinued gradually over at least 2 wk, unless safety concerns require a more rapid withdrawal. Abrupt discontinuation may cause increase in seizure frequency.
 - **Orally Disintegrating Tablets:** Place on the tongue and move around the mouth. Tablet will rapidly disintegrate, can be swallowed with or without water, and can be taken with or without food.
 - **Chewable/Dispersible Tablets:** May be swallowed whole, chewed, or dispersed in water or dispersed in fruit juice. If chewed, follow with water or fruit juice to aid in swallowing. Only use whole tablets, do not attempt to administer partial quantities of dispersible tablets.
- ### Patient/Family Teaching
- Instruct patient to take medication exactly as directed. Take missed doses as soon as possible unless almost time for next dose. Do not double doses. Do not discontinue abruptly; may cause increase in frequency of seizures. Instruct patient to read the *Medication Guide* before starting and with each Rx refill, changes may occur.
 - Advise patient to notify health care professional immediately if skin rash, fever, or swollen lymph glands occur or if frequency of seizures increases.
 - May cause dizziness, drowsiness, and blurred vision. Caution patient to avoid driving or activities requiring

ing alertness until response to medication is known. Do not resume driving until physician gives clearance based on control of seizure disorder.

- Caution patient to wear sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; other unusual changes in behavior or mood or if symptoms of aseptic meningitis (headache, fever, nausea, vomiting, and nuchal rigidity, rash, photophobia, myalgia, chills, altered consciousness, somnolence) occur.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Instruct patient to notify health care professional of medication regimen prior to treatment or surgery.
- **Rep:** Advise female patients to use a nonhormonal form of contraception while taking lansoprazole, to avoid breast feeding, and to notify health care professional if pregnancy is planned or suspected or if breast feeding. Encourage patients who become pregnant to enroll in the North American Antiepileptic Drug Pregnancy Registry. Must be done by patients themselves by calling 1-888-233-2334 or on the website <http://www.aedpregnancyregistry.org>.
- Advise patient to carry identification at all times describing disease process and medication regimen.

Evaluation/Desired Outcomes

- Decrease in the frequency of or cessation of seizures.
- Delay in time to occurrence of mood episodes (depression, mania, hypomania, mixed episodes) in patients with Bipolar I disorder.

lansoprazole (lan-soe-pra-zole)

Prevacid, Prevacid 24 Hr, Prevacid SoluTab

Classification

Therapeutic: antiulcer agents

Pharmacologic: proton-pump inhibitors

Indications

Erosive esophagitis. Duodenal ulcers (with or without anti-infectives for *Helicobacter pylori*). Active benign gastric ulcer. Short-term treatment of symptomatic GERD. Healing and risk reduction of NSAID-associated gastric ulcer. Pathologic hypersecretory conditions, in-

cluding Zollinger-Ellison syndrome. **OTC:** Heartburn occurring \geq twice/wk.

Action

Binds to an enzyme in the presence of acidic gastric pH, preventing the final transport of hydrogen ions into the gastric lumen. **Therapeutic Effects:** Diminished accumulation of acid in the gastric lumen, with lessened acid reflux. Healing of duodenal ulcers and esophagitis.

Pharmacokinetics

Absorption: 80% absorbed after oral administration.

Distribution: Unknown.

Protein Binding: 97%.

Metabolism and Excretion: Extensively metabolized by the liver to inactive compounds. Converted intracellularly to at least two other antisecretory compounds.

Half-life: Children: 1.2–1.5 hr; Adults: 1.3–1.7 hr (\uparrow in geriatric patients and patients with impaired hepatic function).

TIME/ACTION PROFILE (acid suppression)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1.7 hr	more than 24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Solutabs contain aspartame; use caution when used in phenylketonurics; Severe hepatic impairment (not to exceed 30 mg/day in these patients); Patients using high-doses for >1 year (\uparrow risk of hip, wrist, or spine fractures); Patients using therapy for >3 yr (\uparrow risk of vitamin B₁₂ deficiency; **OB, Lactation:** Safety not established; **Pedi:** Children <1 yr (safety not established); **Geri:** Maintenance dose not to exceed 30 mg/day unless additional acid suppression is required.

Adverse Reactions/Side Effects

CNS: dizziness, headache. **GI:** CLOSTRIDIUM DIFFICILE-ASSOCIATED DIARRHEA (CDAD), diarrhea, abdominal pain, nausea. **Derm:** cutaneous lupus erythematosus, rash. **F and E:** hypomagnesemia (especially if treatment duration ≥ 3 mo). **GU:** acute interstitial nephritis.

Hemat: vitamin B₁₂ deficiency. **MS:** bone fracture.

Misc: systemic lupus erythematosus.

Interactions

Drug-Drug: Sucralfate \downarrow absorption of lansoprazole (take 30 min before sucralfate). May \downarrow absorption of drugs requiring acid pH, including ketoconazole, itraconazole, atazanavir, nelfinavir, ampicillin esters, iron salts, erlotinib, and mycophenolate

* = Canadian drug name. \boxtimes = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

mofetil; avoid concurrent use with **atazanavir** and **nelonavir**. May ↑ levels of **digoxin tacrolimus**, and **methotrexate**. May ↑ risk of bleeding with **warfarin** (monitor INR/PT). Hypomagnesemia ↑ risk of **digoxin** toxicity.

Route/Dosage

PO (Adults and children ≥12 yr): *Short-term treatment of duodenal ulcer*—15 mg once daily for 4 wk; *H. pylori eradication to reduce the risk of duodenal ulcer recurrence*—30 mg twice daily with clarithromycin 500 mg twice daily and amoxicillin 1000 mg twice daily for 10–14 days (triple therapy) or 30 mg 3 times daily with 1000 mg amoxicillin 3 times daily for 14 days (dual therapy); *Maintenance of healed duodenal ulcers*—15 mg once daily; *Short-term treatment of gastric ulcers/healing of NSAID-associated gastric ulcer*—30 mg once daily for up to 8 wk; *Risk reduction of NSAID-associated gastric ulcer*—15 mg once daily for up to 12 wk; *Short-term treatment of symptomatic GERD*—15 mg once daily for up to 8 wk; *Short-term treatment of erosive esophagitis*—30 mg once daily for up to 8 wk (8 additional wks may be necessary); *Maintenance of healing of erosive esophagitis*—15 mg once daily; *Pathologic hypersecretory conditions*—60 mg once daily initially, up to 90 mg twice daily (daily dose >120 mg should be given in divided doses).

PO (Adults): *OTC*—15 mg once daily for up to 14 days (14 day course may be repeated every 4 mo).

PO (Children 1–11 yr and >30 kg): *GERD*—30 mg once to twice daily.

PO (Children 1–11 yr and 10–30 kg): *GERD*—15 mg once or twice daily.

PO (Children 1–11 yr and <10 kg): *GERD*—7.5 mg once daily.

Availability (generic available)

Delayed-release capsules: 15 mg^{Rx, OTC}, 30 mg. **Delayed-release orally disintegrated tablets (Solu-Tabs):** 15 mg^{Rx, OTC}, 30 mg. **In combination with:** amoxicillin and clarithromycin as part of a compliance package (Prevpac). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess patient routinely for epigastric or abdominal pain and for frank or occult blood in stool, emesis, or gastric aspirate.
- **Monitor bowel function.** Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of *Clostridium difficile*-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- **Lab Test Considerations:** May cause abnormal liver function tests, including ↑ AST, ALT, alkaline phosphatase, LDH, and bilirubin.
- May cause ↑ serum creatinine and ↑ or ↓ electrolyte levels.

- May alter RBC, WBC, and platelet levels.
- May also cause ↑ gastrin levels, abnormal A/G ratio, hyperlipidemia, and ↑ or ↓ cholesterol.
- Monitor INR and prothrombin time in patients taking warfarin.
- May cause hypomagnesemia. Monitor serum magnesium prior to and periodically during therapy.
- May cause vitamin B₁₂ deficiency with long term use (>3 yrs).

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- **PO: Delayed-release capsules:** Administer before meals. Swallow whole; do not crush or chew capsule contents. Capsules may be opened and sprinkled on 1 tsp of applesauce, *Ensure* pudding, cottage cheese, yogurt or strained pears and swallowed immediately for patients with difficulty swallowing.
- For patients with an NG tube, capsules may be opened and intact granules may be mixed in 40 mL of apple juice and injected through the NG tube into stomach. Flush NG tube with additional apple juice to clear tube.
- **Orally disintegrating tablets** may be placed on tongue, allowed to disintegrate and swallowed with or without water. Do not cut or break tablet. For administration via oral syringe or nasogastric tube, *Prevacid SoluTab* can be administered by placing a 15-mg tablet in oral syringe and drawing up 4 mL of water, or a 30-mg tablet in oral syringe and drawing up 10 mL of water. Shake gently to allow for a quick dispersal. After tablet has dispersed, administer the contents within 15 minutes. Refill syringe with 2 mL (5 mL for the 30-mg tablet) of water, shake gently, and administer any remaining contents and flush nasogastric tube.
- Antacids may be used concurrently.

Patient/Family Teaching

- Instruct patient to take medication as directed for the full course of therapy, even if feeling better. Take missed doses as soon as remembered unless almost time for next dose; do not double doses.
- May occasionally cause dizziness. Caution patient to avoid driving and other activities that require alertness until response to medication is known.
- Advise patient to avoid alcohol, products containing aspirin or NSAIDs, and foods that may cause an increase in GI irritation.
- Advise patient to report onset of black, tarry stools; diarrhea; or abdominal pain to health care professional promptly. **Instruct patient to notify health care professional immediately if rash, diarrhea, abdominal cramping, fever, or bloody stools occur and not to treat with antidiarrheals without consulting health care professional.**
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal prod-

ucts being taken and consult health care professional before taking any new medications.

- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in abdominal pain or prevention of gastric irritation and bleeding. Healing of duodenal ulcers can be seen on x-ray examination or endoscopy. Therapy is continued for at least 2–4 wk. Therapy for pathologic hypersecretory conditions may be long term.
- Healing in patients with erosive esophagitis. Therapy is continued for up to 8 wk, and an additional 8-wk course may be used for patients who do not heal in 8 wk or whose ulcer recurs.

lanthanum carbonate (lan-than-um)

Fosrenol

Classification

Therapeutic: hypophosphatemics

Pharmacologic: phosphate binders

Indications

Reduction of serum phosphate levels associated with end-stage renal disease.

Action

Dissociates in the upper GI tract forming lanthanate ions, which form an insoluble complex with phosphate.

Therapeutic Effects: Decreased serum phosphate levels.

Pharmacokinetics

Absorption: Negligible absorption.

Distribution: Stays within the GI tract.

Metabolism and Excretion: Eliminated almost entirely in feces.

Half-life: 53 hr (in plasma).

TIME/ACTION PROFILE (effect on phosphate levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–3 wk	unknown

Contraindications/Precautions

Contraindicated in: Bowel obstruction; Ileus; Fecal impaction; **OB:** Congenital abnormalities noted in animal studies; **Pedi:** Potential negative effect on developing bone.

Use Cautiously in: Patients with risk factors for GI obstruction or perforation, including history of GI surgery, colon cancer, or GI ulceration, diverticular dis-

ease, peritonitis, constipation, ileus, diabetic gastroparesis, or taking medications that cause constipation;

Lactation: Safety not established.

Adverse Reactions/Side Effects

GI: nausea, vomiting, diarrhea, fecal impaction, GI obstruction, GI perforation, ileus. **F and E:** hypocalcemia.

Interactions

Drug-Drug: May ↓ absorption of **fluoroquinolones**, **tetracyclines**, and **levothyroxine**; administer at least 1 hr before or 3 hr after lanthanum carbonate.

Route/Dosage

PO (Adults): 1500 mg/day in divided doses; may be titrated upward every 2–3 wk in increments of 750 mg/day up to 4500 mg/day (usual range 1500–3000 mg/day).

Availability (generic available)

Chewable tablets: * 250 mg, 500 mg, 750 mg, 1000 mg. **Oral powder:** 750 mg/pkt, 1000 mg/pkt.

NURSING IMPLICATIONS

Assessment

- Assess patient for nausea and vomiting during therapy.
- **Lab Test Considerations:** Monitor serum phosphate levels prior to and periodically during therapy.

Potential Nursing Diagnoses

Nausea (Side Effects)

Implementation

- **Do not confuse lanthanum carbonate with lithium carbonate.**
- Divide total daily dose and administer with meals.
- **PO:** Administer with or immediately after meals. Tablets should be crushed or chewed completely before swallowing; intact tablets should not be swallowed.
- Sprinkle powder on small quantity of applesauce or other similar food; consume immediately. Consider powder formulation for patients with poor dentition or who have difficulty chewing tablets.

Patient/Family Teaching

- Instruct patient to take lanthanum as directed.

Evaluation/Desired Outcomes

- Decrease in serum phosphate to below 6.0 mg/dL in patients with end stage renal disease.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

lapatinib (la-pat-i-nib)

Tykerb

Classification

Therapeutic: antineoplastics

Pharmacologic: enzyme inhibitors, kinase inhibitors

Indications

Advanced or metastatic breast cancer with tumor overexpression of the Human Epidermal Receptor Type 2 (HER2) and past therapy with an anthracycline, a taxane and trastuzumab (used in combination with capecitabine). Postmenopausal women with hormone-receptor positive metastatic breast cancer that overexpresses HER2 for whom hormonal therapy is indicated (used in combination with letrozole).

Action

Acts as an inhibitor of intracellular tyrosine kinase affecting Epidermal Growth Factor (EGFR, ErbB1) and HER2 (ErbB2). Inhibits the growth of ErbB-driven tumors. Effect is additive with capecitabine. **Therapeutic Effects:** Decreased/slowed spread of metastatic breast cancer.

Pharmacokinetics

Absorption: Incompletely and variably absorbed following oral administration; blood levels ↑ by food.

Distribution: Unknown.

Protein Binding: >99%.

Metabolism and Excretion: Extensively metabolized by, mostly by CYP3A4 and CYP3A5 enzyme systems; <2% excreted by kidneys.

Half-life: 24 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	4 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; ↓ left ventricular ejection fraction (Grade 2 or greater); **OB, Lactation:** Pregnancy or lactation.

Use Cautiously in: Concurrent use of CYP3A4 inhibitors including ketoconazole, itraconazole, clarithromycin, atazanavir, indinavir, nefazodone, nelfinavir, ritoonavir, saquinavir, telithromycin, and voriconazole should be avoided (if necessary, ↓ lapatinib dose); Concurrent use of CYP3A4 inducers including dexamethasone, phenytoin, carbamazepine, rifampin, rifabutin, rifapentin, phenobarbital, and St. John's wort should be avoided (if necessary, ↑ lapatinib dose); Severe hepatic impairment (dose ↓ recommended for Child-Pugh Class C); Known QTc interval prolongation or co-existing risk factors for QTc interval prolongation including hypokalemia, hypomagnesemia, concurrent antiarrhythmics or medications that are known to prolong

the QTc interval; **Geri:** May be more sensitive to effects; **Pedi:** Safety not established.

Adverse Reactions/Side Effects

CNS: fatigue, insomnia. **Resp:** dyspnea, interstitial lung disease, pneumonitis. **CV:** ↓ left ventricular ejection fraction, QT interval prolongation. **GI:** **DIARRHEA, HEPATOTOXICITY, nausea, vomiting, dyspepsia, ↑ liver enzymes, stomatitis.** **Derm:** **ERYTHEMA MULTIFORM, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, palmar-plantar erythrodysesthesia, rash, dry skin, nail disorders.** **Hemat:** neutropenia. **MS:** back pain, extremity pain.

Interactions

Drug-Drug: Lapatinib inhibits CYP3A4, CYP28 and P-glycoprotein; concurrent use of drugs, which are substrates for these enzymes should be undertaken with caution. May ↑ effects of **midazolam, paclitaxel, and digoxin.** Concurrent use of **strong CYP3A4 inhibitors** including **ketoconazole, itraconazole, clarithromycin, atazanavir, indinavir, nefazodone, nelfinavir, ritoonavir, saquinavir, and voriconazole** may ↑ blood levels and the risk of toxicity. Concurrent use should be avoided, but if necessary, dose of lapatinib should be ↓. Concurrent use of **strong CYP3A4 inducers** including **dexamethasone, phenytoin, carbamazepine, rifampin, rifabutin, rifapentin, and phenobarbital** may ↓ blood levels and effectiveness. Concurrent use should be avoided, but if necessary, dose of lapatinib should be ↑.

Drug-Natural Products: Concurrent use of **St. John's wort** may ↓ blood levels and effectiveness. Concurrent use should be avoided, but if necessary dose of lapatinib should be ↑.

Drug-Food: Concurrent **grapefruit juice** may ↑ blood levels and the risk of toxicity and should be avoided.

Route/Dosage

PO (Adults): **HER2 positive metastatic breast cancer**—1250 mg once daily for 21 days; **Hormone receptor positive, HER2 positive metastatic breast cancer**—1500 mg once daily; **Concurrent use of strong CYP3A4 inhibitor**—↓ dose to 500 mg once daily; **Concurrent use of strong CYP3A4 inducer**—HER2 positive metastatic breast cancer: Gradually titrate dose from 1250 mg once daily up to 4500 mg once daily as tolerated; **Hormone receptor positive, HER2 positive metastatic breast cancer:** Gradually titrate dose from 1500 mg once daily up to 5500 mg once daily as tolerated.

Hepatic Impairment

PO (Adults): **Severe hepatic impairment**—HER2 positive metastatic breast cancer: 750 mg/day; **Hormone receptor positive, HER2 positive metastatic breast cancer:** 1000 mg/day.

Availability

Tablets: 250 mg.

NURSING IMPLICATIONS

Assessment

- Evaluate left ventricular ejection fraction (LVEF) prior to therapy to determine if within institution's normal limits. Continue to monitor periodically during therapy to ensure it does not fall below limits. If LVEF decreases to Grade 2 or greater discontinue therapy. If returns to normal and patient is asymptomatic after 2 wk, may restart therapy at a reduced dose of 1000 mg/day (with cabicitabine) or 1250 mg/day (with ledipasvir).
- Monitor for diarrhea; usually occurs within first 6 days of therapy and lasts 4–5 days. Treat with anti-diarrheals (loperamide) after first loose stool. If diarrhea is severe, treat with oral or intravenous fluids, antibiotics (fluoroquinolones) especially if diarrhea persists >24 hrs or accompanied by fever; may require interruption or discontinuation of therapy. If accompanied by moderate to severe abdominal cramping, nausea or vomiting, decreased performance status, fever, sepsis, neutropenia, frank bleeding, or dehydration, interrupt therapy and reintroduce at lower dose (from 1,250 mg/day to 1,000 mg/day or from 1,500 mg/day to 1,250 mg/day) when diarrhea <Grade 1. If Grade 4 diarrhea occurs, discontinue therapy.
- Monitor ECG prior to and periodically during therapy to monitor QT.
- Monitor for respiratory status for symptoms of interstitial lung disease and pneumonitis (dyspnea, cough); may require discontinuation of therapy.
- Monitor for signs and symptoms of skin reactions (progressive skin rash often with blisters or mucosal lesions). Discontinue lapatinib if erythema multiforme, Stevens-Johnson syndrome, or toxic epidermal necrolysis are suspected.
- **Lab Test Considerations:** Monitor liver function tests prior to initiation and every 4–6 wk during therapy and as clinically indicated. Discontinue and do not restart lapatinib if patients experience severe changes in liver function tests.
- Monitor serum potassium and magnesium prior to and periodically during therapy.

Potential Nursing Diagnoses

Diarrhea (Adverse Reactions)

Implementation

- Correct hypokalemia and hypomagnesemia prior to therapy.
- **PO:** Administer tablets once daily at least 1 hr before or 1 hr after a meal for 21 days. Do not divide daily dose.

Patient/Family Teaching

- Instruct patient to take lapatinib as directed and to review the *Patient Information Sheet* prior to ther-

apy and with each refill for new information. If a dose is missed take as soon remembered that day. If a day is missed, skip the dose; do not double doses. Caution patient not to share this medication with others, even with same condition; may be harmful.

- Advise patient to avoid drinking grapefruit juice or eating grapefruit during therapy.
- Advise patient to report signs or decreased LVEF (shortness of breath, palpitations, fatigue) and skin rash to health care professional promptly.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort.
- Advise patient that lapatinib may cause diarrhea, which may become severe. Instruct patient in how to prevent and manage diarrhea and to notify health care professional if severe.
- Advise female patients to notify health care professional if pregnancy is planned or suspected; therapy may be teratogenic.

Evaluation/Desired Outcomes

- Decreased/slowed spread of metastatic breast cancer.

ledipasvir/sofosbuvir
(led-i-pas-vir/soe-fos-bue-vir)
Harvoni

Classification

Therapeutic: antivirals

Pharmacologic: NS5A inhibitors, polymerase inhibitors

Indications

Treatment of chronic hepatitis C (CHC) genotype 1, 4, 5, or 6 infection.

Action

Ledipasvir—inhibits NS5A, a protein required for viral replication. *Sofosbuvir*—inhibits RNA-dependent RNA polymerase, resulting in inhibition of viral replication.

Therapeutic Effects: Decreased HCV RNA levels with decreased severity and sequelae of CHC.

Pharmacokinetics

Ledipasvir

Absorption: Well absorbed following oral administration.

Distribution: Unknown.

Protein Binding: >99.8%.

Metabolism and Excretion: Minimal metabolism, undergoes biliary excretion. Mostly excreted unchanged in feces (86%), 1% eliminated in urine.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Half-life: 47 hr.

Sofosbuvir

Absorption: Rapidly metabolized following absorption (extensive first-pass effect).

Distribution: Unknown.

Protein Binding: 61–65%.

Metabolism and Excretion: Extensively metabolized with much conversion to GS-461203, an active antiviral moiety, then converted GS-331007, which does not have antiviral activity. 80% excreted in urine mostly as GS-331007 (3.5% as unchanged drug), 14% excreted in feces, 2.5% excreted in expired air.

Half-life: *Sofosbuvir*—0.4 hr; *GS-331007*—27 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
ledipasvir	unknown	4–5 hr	24 hr
sofosbuvir	unknown	0.8–1 hr†	24 hr

† Sofosbuvir (2–4 hr for GS-331007).

Contraindications/Precautions

Contraindicated in: Should not be used with other drugs/regimens that already containing sofosbuvir; Concurrent use of P-gp inducers, some anticonvulsants, some antivirals and rosuvastatin; Severe renal impairment (eGFR <30 mL/min/1.73 m²) or end stage renal disease (no dose recommendation); Any condition in which ribavirin is contraindicated.

Use Cautiously in: Receiving immunosuppressant or chemotherapy medications (↑ risk of hepatitis B virus reactivation); **Geri:** May be more sensitive to drug effects; **Lactation:** Weigh benefits of breast feeding against possible adverse effects; **OB:** Use only if potential benefit justifies fetal risk; **Pedi:** Children <12 yr (safety and effectiveness not established).

Adverse Reactions/Side Effects

CNS: fatigue, headache, insomnia. **GI:** diarrhea, nausea. **Misc:** hepatitis B virus reactivation.

Interactions

Drug-Drug: Concurrent use of P-gp inducers including rifampin ↓ levels and effectiveness of both ledipasvir and sofosbuvir; concurrent use contraindicated. Ledipasvir inhibits P-gp and may ↑ levels of substrates of P-gp. Amiodarone may ↑ risk of symptomatic bradycardia; concurrent use not recommended; if amiodarone necessary, monitor patients in inpatient setting for first 48 hr of concomitant use and then monitor heart rate on outpatient basis for at least the first 2 wk of treatment (follow same monitoring procedure if discontinuing amiodarone immediately before initiation of ledipasvir/sofosbuvir therapy).

Acid-reducing agents may ↓ levels of ledipasvir; separate antacids including magnesium and aluminum hydroxide by 4 hr, administer H₂-receptor antagonists including famotidine simultaneously or 12 hr apart (dose of antagonist should not exceed famotidine 40 mg twice daily or equivalent), proton-pump in-

hibitors including omeprazole 20 mg daily or equivalent may be given simultaneously. May ↑ levels/effects/risk of toxicity with digoxin (therapeutic monitoring recommended). Level and effectiveness ↓ by carbamazepine, phenytoin, phenobarbital and oxcarbazepine concurrent use in not recommended. Levels and effectiveness may be ↓ by concurrent use of rifabutin and rifapentine; concurrent use not recommended. ↑ levels and risk of adverse reactions from tenofovir and tenofovir-containing combinations (dosage adjustments may be necessary, consider alternative regimens). Levels and effectiveness are ↓ by tipranavir/ritonavir; concurrent use not recommended. Concurrent use with simeprevir may ↑ levels of simeprevir and ledipasvir; concurrent use not recommended. ↑ levels and risk of myopathy/rhabdomyolysis with rosvastatin; concurrent use not recommended.

Drug-Natural Products: Concurrent use with St. John's wort ↓ blood levels and effectiveness; concurrent use contraindicated.

Route/Dosage

PO (Adults): *Genotype 1 (treatment-naïve without cirrhosis or with compensated cirrhosis [Child-Pugh A])*—Ledipasvir 90 mg/sofosbuvir 400 mg (one tablet) once daily for 12 wk; *Genotype 1 (treatment-experienced without cirrhosis)*—Ledipasvir 90 mg/sofosbuvir 400 mg (one tablet) once daily for 12 wk; *Genotype 1 (treatment-experienced with compensated cirrhosis [Child-Pugh A])*—Ledipasvir 90 mg/sofosbuvir 400 mg (one tablet) once daily for 24 wk; *Genotype 1 (treatment-naïve or treatment-experienced with decompensated cirrhosis [Child-Pugh B or C])*—Ledipasvir 90 mg/sofosbuvir 400 mg (one tablet) once daily with ribavirin for 12 wk; *Genotype 1 or 4 (treatment-naïve or treatment-experienced liver transplant recipients without cirrhosis or with compensated cirrhosis [Child-Pugh A])*—Ledipasvir 90 mg/sofosbuvir 400 mg (one tablet) once daily with ribavirin for 12 wk; *Genotypes 4, 5, or 6 (treatment-naïve or treatment-experienced without cirrhosis or with compensated cirrhosis [Child-Pugh A])*—Ledipasvir 90 mg/sofosbuvir 400 mg (one tablet) once daily for 12 wk.

PO (Children 12–17 yr or ≥35 kg): *Genotype 1 (treatment-naïve without cirrhosis or with compensated cirrhosis [Child-Pugh A])*—Ledipasvir 90 mg/sofosbuvir 400 mg (one tablet) once daily for 12 wk; *Genotype 1 (treatment-experienced without cirrhosis)*—Ledipasvir 90 mg/sofosbuvir 400 mg (one tablet) once daily for 12 wk; *Genotype 1 (treatment-experienced with compensated cirrhosis [Child-Pugh A])*—Ledipasvir 90 mg/sofosbuvir 400 mg (one tablet) once daily for 24 wk; *Genotypes 4, 5, or 6 (treatment-naïve or treatment-experienced without cirrhosis or with compensated cirrhosis [Child-Pugh A])*—Ledipasvir 90 mg/sofosbuvir 400 mg (one tablet) once daily for 12 wk.

Availability

Tablets: ledipasvir 90 mg/sofosbuvir 400 mg.

NURSING IMPLICATIONS**Assessment**

- Monitor symptoms of hepatitis during therapy.
- **Lab Test Considerations:** Determine current or prior HBV infection by measuring hepatitis B surface antigen (HBsAg) and hepatitis B core antibody (anti-HBc) before initiating HCV therapy.
- May cause ↑ serum bilirubin and lipase levels.

Potential Nursing Diagnoses

Risk for infection (Indications)

Implementation

- **PO:** Administer once daily with or without food.

Patient/Family Teaching

- Instruct patient to take ledipasvir/sofosbuvir at the same time each day for the full course of therapy. Take missed doses as soon as remembered on same day; do not take more than 1 tablet in a day. Do not stop taking ledipasvir/sofosbuvir without consulting health care professional. Advise patient to read *Patient Information* prior to starting therapy and with each Rx refill in case of changes.
- Inform patient that ledipasvir/sofosbuvir may not reduce the risk of transmission of CHC to others; use appropriate precautions to prevent transmission.
- Instruct patient that ledipasvir/sofosbuvir should not be shared with others; may be harmful.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort.
- Instruct patient to take antacids containing aluminum or magnesium 4 hrs before or 4 hrs after ledipasvir/sofosbuvir.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decreased HCV RNA levels with decreased severity and sequelae of CHC.

leflunomide (le-flu-noe-mide)

Arava

Classification

Therapeutic: antirheumatics (DMARDs)
Pharmacologic: immune response modifiers, pyrimidine synthesis inhibitors

Indications

Rheumatoid arthritis (disease-modifying agent).

Action

Inhibits an enzyme required for pyrimidine synthesis; has antiproliferative and anti-inflammatory effects.

Therapeutic Effects: Decreased pain and inflammation, slowed structural progression and improved physical function.

Pharmacokinetics

Absorption: Tablets are 80% absorbed following oral administration; rapidly converted to the M1 metabolite, which is responsible for pharmacologic activity.

Distribution: Crosses the placenta.

Protein Binding: 99%.

Metabolism and Excretion: Extensively metabolized with metabolites excreted in urine (43%) and feces (48%). Also undergoes biliary recycling.

Half-life: 14–18 days.

TIME/ACTION PROFILE (antirheumatic effect)

ROUTE	ONSET	PEAK	DURATION
PO	1 mo	3–6 mo	wk–mos†

†Due to persistence of active metabolite.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to leflunomide or teriflunomide; Compromised immune function, including bone marrow dysplasia or severe uncontrolled infection; Concurrent vaccination with live vaccines; Hepatic impairment; **OB:** May cause fetal abnormalities or death. Contact Pregnancy Registry if accidental exposure occurs; **Lactation:** Lactation.

Use Cautiously in: Renal insufficiency; History of interstitial lung disease; Patients >60 yr, with diabetes, or taking neurotoxic medications (↑ risk of peripheral neuropathy); **Pedi:** Safety and effectiveness not established; **OB:** Women with childbearing potential must use two forms of birth control. Should not be used in men attempting to father a child.

Exercise Extreme Caution in: Concurrent use of other hepatotoxic agents (↑ risk of hepatotoxicity).

Adverse Reactions/Side Effects

CNS: headache, dizziness, weakness. **Resp:** **INTERSTITIAL LUNG DISEASE**, bronchitis, cough, pharyngitis, pneumonia, respiratory infection, rhinitis, sinusitis. **CV:** chest pain, hypertension. **GI:** **HEPATOTOXICITY**, diarrhea, nausea, abdominal pain, anorexia, dyspepsia, gastroenteritis, ↑ liver enzymes, mouth ulcers, vomiting. **GU:** urinary tract infection. **Derm:** **STEVENS-JOHNSON SYNDROME**, **TOXIC EPIDERMAL NECROLYSIS**, alopecia, rash, dry skin, eczema, pruritus. **F and E:** hypokalemia. **Metab:** weight loss. **MS:** arthralgia, back pain, joint disorder, leg cramps, synovitis, tenosynovitis. **Neuro:** paresthesia, peripheral neuropathy. **Misc:** **DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS)**, allergic reactions, flu syndrome, infec-

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

tions including sepsis and tuberculosis reactivation, pain.

Interactions

Drug-Drug: Cholestyramine and activated charcoal cause a rapid and significant ↓ in blood levels of active metabolite. Concurrent use of methotrexate and other hepatotoxic drugs ↑ risk of hepatotoxicity. Concurrent administration of rifampin ↑ blood levels of the active metabolite. May ↑ risk of bleeding with warfarin.

Route/Dosage

PO (Adults): *Loading dose*—100 mg daily for 3 days; *maintenance dosing*—20 mg/day (if intolerance occurs, dose may be ↓ to 10 mg/day).

Availability (generic available)

Tablets: 10 mg, 20 mg, 100 mg.

NURSING IMPLICATIONS

Assessment

- Assess range of motion and degree of swelling and pain in affected joints before and periodically during therapy.
- Monitor for signs and symptoms of interstitial lung disease (new onset or worsening cough or dyspnea, associated with fever). May require discontinuation of therapy; consider drug elimination procedure if needed.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome or toxic epidermal necrolysis. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.
- **Lab Test Considerations:** Monitor liver function throughout therapy. Assess ALT at baseline, then monthly during initial 6 mo of therapy, then every 6–8 wk. If given concurrently with methotrexate, monitor ALT, AST, and serum albumin monthly. May cause ↑ ALT and AST, which are usually reversible with reduction in dose or discontinuation, but may be fatal. If ALT is 2–3 times the upper limit of normal, reduce dose to 10 mg/day and continue therapy. Monitor closely after dose reduction; plasma levels may not ↓ for several wk due to long half-life. If ALT ↑ of 2–3 times the upper limit of normal persists despite dose reduction or if ALT >3 times the upper limit of normal occurs, discontinue leflunomide and administer cholestyramine (see Toxicity and Overdose). Monitor closely and readminister cholestyramine as indicated.
- Monitor CBC with platelets monthly for 6 mo following initiation of therapy and every 6–8 wk thereafter. If used with methotrexate or other immunosuppressive therapy continue monitoring monthly. If bone marrow depression occurs, discontinue leflunomide and begin decreasing levels with cholestyramine (see Implementation).

- May rarely cause ↑ of alkaline phosphatase and bilirubin.
- **Toxicity and Overdose:** If overdose or significant toxicity occurs, cholestyramine 8 g 3 times a day for 24 hr, or activated charcoal orally or via nasogastric tube, 50 g every 6 hr for 24 hr, is recommended to accelerate elimination.

Potential Nursing Diagnoses

Impaired physical mobility (Indications)

Acute pain (Indications)

Implementation

- Administer a tuberculin skin test prior to administration of leflunomide. Patients with active latent TB should be treated for TB prior to therapy.
- **PO:** Initiate therapy with loading dose of 100 mg/day for 3 days, followed by 20 mg/day dose. May decrease to 10 mg/day if not well tolerated.
- **Drug Elimination Procedure:** Recommended to achieve nondetectable plasma levels <0.02 mg/L after stopping treatment with leflunomide. Administer cholestyramine 8 g 3 times daily for 11 days. (Days do not need to be consecutive unless rapid lowering of levels is desired.) Verify plasma levels <0.02 mg/L by 2 separate tests at least 14 days apart. If plasma levels >0.02 mg/L, consider additional cholestyramine treatment. Plasma levels may take up to 2 yr to reach nondetectable levels without drug elimination procedure.

Patient/Family Teaching

- Instruct patient to take leflunomide as directed.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to consult health care professional prior to taking other Rx, OTC, or herbal products concurrently with leflunomide. Aspirin, NSAIDs, or low-dose corticosteroids may be continued during therapy, but other agents for treatment of rheumatoid arthritis may require discontinuation.
- Discuss the possibility of hair loss with patient. Explore methods of coping.
- Advise patient to notify health care professional if rash, mucous membrane lesions, unusual tiredness, abdominal pain, jaundice, or symptoms of interstitial lung disease occur.
- Instruct patient to avoid vaccinations with live vaccines during and following therapy without consulting health care professional.
- **Rep:** Caution patients of childbearing age that leflunomide has teratogenic effects. Women wishing to become pregnant must undergo the drug elimination procedure (see Implementation) and verify that the M1 metabolite plasma levels are <0.02 mg/L. Men wishing to father a child should also take cholestyramine 8 g 3 times daily for 11 days to minimize any possible risk.
- Emphasize the importance of routine lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in signs and symptoms of rheumatoid arthritis and slowing of structural damage as evidenced by x-ray erosions and joint narrowings.
- Improved physical function.

REMS

lenalidomide (le-na-lid-o-mide) Revlimid

Classification

Therapeutic: antianemics

Pharmacologic: immune response modifiers

Indications

Transfusion-dependent anemia due to specific myelodysplastic syndromes associated with deletion 5q cytogenetic abnormality. Treatment of multiple myeloma (with dexamethasone). Maintenance therapy in patients with multiple myeloma after autologous hematopoietic stem cell transplantation (auto-HSCT). Treatment of mantle cell lymphoma in patients whose disease has relapsed or progressed after 2 prior therapies (including bortezomib).

Action

Lenalidomide is a structural analog of thalidomide. Inhibits secretion of pro-inflammatory cytokines and increases secretion of anti-inflammatory cytokines.

Therapeutic Effects: Decreased anemia in certain myelodysplastic syndromes with a decreased requirement for transfusions. Slows progression of multiple myeloma.

Pharmacokinetics

Absorption: Well absorbed following oral administration. Levels are higher in multiple myeloma patients.

Distribution: Crosses the placenta.

Metabolism and Excretion: 66% excreted unchanged in urine, some renal excretion involves active secretion.

Half-life: 3 hr.

TIME/ACTION PROFILE (↓ need for transfusions)

ROUTE	ONSET	PEAK	DURATION
PO	within 3 mo	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Chronic lymphocytic leukemia (↑ risk of mortality); **OB:** Pregnancy (contraception must be used in males and females);

Lactation: Lactation.

Use Cautiously in: **OB:** Patients with childbearing potential; Renal impairment (may ↑ risk of adverse re-

actions; dose ↓ recommended if CCr <60 mL/min);

Geri: Consider age-related ↓ in renal function; **Pedi:**

Safety not established.

Adverse Reactions/Side Effects

CNS: dizziness, fatigue, headache, insomnia, depression. **Resp:** cough, pharyngitis. **CV:** DVT, MI, PULMONARY EMBOLISM, STROKE, edema, chest pain, deep vein thrombosis, palpitations. **GI:** HEPATOTOXICITY, abdominal pain, constipation, diarrhea, nausea, vomiting, abnormal taste, anorexia, dry mouth. **Derm:** STEVENSON-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, pruritus, rash, dry skin, sweating. **Endo:** hyperthyroidism, hypothyroidism. **F and E:** hypokalemia, hypomagnesemia. **Hemat:** NEUTROPENIA, THROMBOCYTOPENIA. **MS:** arthralgia, myalgia. **Misc:** ANGIOEDEMA, MALIGNANCY, fever, chills, tumor flare reaction, tumor lysis syndrome.

Interactions

Drug-Drug: Risk of neutropenia and thrombocytopenia may ↑ with **antineoplastics**, **immunosuppressants**, and **radiation therapy**. May ↑ **digoxin** levels. **Erythropoietin**, **darbepoietin**, and **estrogens** may ↑ risk of thromboembolic events.

Route/Dosage

Myelodysplastic Syndromes

PO (Adults): 10 mg once daily; dose alteration required for hematologic toxicity.

Renal Impairment

PO (Adults): CCr 30–60 mL/min—5 mg once daily; CCr <30 mL/min (not on dialysis)—2.5 mg once daily; CCr <30 mL/min (requiring dialysis)—2.5 mg once daily (give after dialysis on dialysis days).

Multiple Myeloma

PO (Adults): 25 mg once daily on days 1–21 of repeated 28–day cycles (with dexamethasone); if patients not eligible for auto-HSCT, continue treatment until disease progression or unacceptable toxicity; for patients eligible for auto-HSCT, hematopoietic stem cell mobilization should take place within 4 cycles.

Renal Impairment

PO (Adults): CCr 30–50 mL/min—10 mg once daily; may ↑ to 15 mg once daily after 2 cycle if patient tolerates; CCr <30 mL/min (not on dialysis)—15 mg every 48 hr; CCr <30 mL/min (requiring dialysis)—5 mg once daily (give after dialysis on dialysis days).

Maintenance Therapy for Multiple Myeloma Following Auto-HSCT

PO (Adults): After adequate hematologic recovery (ANC ≥ 1000/mcL and/or platelet counts ≥ 75,000/mcL), initiate therapy with 10 mg once daily continuously on Days 1–28 of repeated 28–day cycles; after 3

* = Canadian drug name. † = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

cycles, dose may be ↑ to 15 mg once daily, if tolerated; continue treatment until disease progression or unacceptable toxicity.

Renal Impairment

PO (Adults): *CCr* 30–60 mL/min—5 mg once daily; *CCr* <30 mL/min (not on dialysis)—2.5 mg once daily; *CCr* <30 mL/min (requiring dialysis)—2.5 mg once daily (give after dialysis on dialysis days).

Mantle Cell Lymphoma

PO (Adults): 25 mg once daily on days 1–21 of repeated 28–day cycles; continue treatment until disease relapse or unacceptable toxicity develops; dose alteration required for hematologic toxicity.

Renal Impairment

PO (Adults): *CCr* 30–60 mL/min—10 mg once daily; *CCr* <30 mL/min (not on dialysis)—15 mg every 48 hr; *CCr* <30 mL/min (requiring dialysis)—5 mg once daily (give after dialysis on dialysis days).

Availability

Capsules: 2.5 mg, 5 mg, 10 mg, 15 mg, 20 mg, 25 mg.

NURSING IMPLICATIONS

Assessment

- Assess for signs of deep venous thrombosis and pulmonary edema (dyspnea, chest pain, arm or leg swelling) periodically during therapy; risk is greater when lenalidomide is administered with dexamethasone.
- Assess for skin rash. Discontinue lenalidomide if rash occurs; may cause Stevens-Johnson syndrome or Toxic Epidermal Necrolysis.
- Monitor for signs and symptoms of tumor flare reaction (tender lymph node swelling, low-grade fever, pain rash) in patients with Mantle Cell Lymphoma; may mimic disease progression. *Grade 1 and 2 tumor flare reaction (TFR):* Lenalidomide may be continued in patients without interruption or modification, at health care professional's discretion. May also be treated with corticosteroids, nonsteroidal anti-inflammatory drugs (NSAIDs) and/or opioid analgesics. *Grade 3 or 4 TFR:* withhold treatment with lenalidomide until TFR resolves to ≤ Grade 1. May be treated for management of symptoms per the guidance for treatment of Grade 1 and 2 TFR.
- **Lab Test Considerations:** Assess pregnancy status prior to starting therapy. Pregnancy tests with a sensitivity of at least 50 mIU/mL) must be done within 10–14 days and within 24 hrs of starting therapy. Once treatment has started pregnancy tests should occur weekly during first 4 wk of use, then every 4 wk in females with a regular menstrual cycle and every 2 wk in females with an irregular cycle.
- *Patients taking lenalidomide with dexamethasone or as maintenance therapy:* Monitor CBC every 7 days for first 2 cycles, on days 1 and 15 of Cycle 3, and every 28 days thereafter. *Patients tak-*

ing lenalidomide for Myelodysplastic Syndrome: Monitor CBC with differential, platelet count, hemoglobin and hematocrit weekly for first 8 wk of therapy and at least monthly thereafter. *Patients taking lenalidomide for Mantle Cell Lymphoma:* Monitor CBC weekly for first 28 days, every 2 wks during Cycles 2–4, and monthly thereafter. May require dose interruption and/or reduction and use of blood support and/or growth factors.

- May cause neutropenia with an onset of 42 days (range 4–411 days) and recovery time of 17 days (range 2–170 days). *For Multiple Myeloma* starting dose is 25 mg/day — If neutropenia develops and neutrophils fall to <1000/mcl interrupt therapy, follow CBC weekly. When neutrophils return to ≥1000/mcl and neutropenia is the only toxicity, resume lenalidomide at 25 mg daily. If neutrophils return to ≥1000/mcl and if other toxicity, resume lenalidomide at next lower dose. For each subsequent drop <1000/mcl interrupt therapy. If neutrophils return to ≥1000/mcl, resume at next lower dose. Do not administer doses below 2.5 mg. *For Myelodysplastic Syndrome* starting dose is 10 mg/day — if neutropenia develops within 4 wk of starting at a 10 mg/day dose in a patient with a baseline neutrophil count (ANC) ≥1000/mcl and ANC falls to <750/mcl interrupt lenalidomide therapy and resume at 5 mg/day dose when ANC returns to ≥1000/mcl. If baseline ANC is <1000/mcl and ANC falls to <500/mcl, interrupt therapy and resume at 5 mg/day dose when ANC returns to ≥500/mcl. If neutropenia develops after 4 wk of therapy at 10 mg/day dose, and ANC <500/mcl for ≥7 days or <500/mcl associated with fever ≥38.5°C, interrupt therapy and resume at 5 mg/day when ANC returns to ≥500/mcl. If neutropenia develops at 5 mg/day dose and ANC <500/mcl for ≥7 days or <500/mcl associated with fever ≥38.5°C, interrupt therapy and resume at 2.5 mg daily when ANC returns to ≥500/mcl. *For Mantle Cell Lymphoma* starting dose is 25 mg/day on days 1–21 of repeated 28–day cycles — If neutrophils fall to <1000/mcl for at least 7 days or fall to <1000/mcl with fever ≥38.5°C or fall to <500/mcl, interrupt therapy and follow CBC weekly. If neutrophils return to ≥1000/mcl resume at 5 mg less than previous dose. Do not administer doses below 5 mg.
- May cause thrombocytopenia with an onset of 28 days (range 8–290 days) and a recovery in 22 days (range 5–224 days). *For Multiple Myeloma* starting dose is 25 mg/day— If platelets fall to <30,000/mcl interrupt therapy and follow CBC weekly. When platelets return to ≥30,000/mcl restart lenalidomide at next lower dose. For each subsequent drop <30,000/mcl interrupt therapy. When platelets return to ≥30,000/mcl resume at next lower dose. Do not administer doses below 2.5 mg. *For Myelodysplastic Syndrome* starting dose is 10 mg/day — If thrombocytopenia develops within 4 wk of starting a 10 mg dose in a patient with a baseline of

≥100,000/mcL, and platelets fall to <50,000/mcL interrupt lenalidomide therapy and resume at 5 mg/day dose when platelets return to >50,000/mcL. If baseline was <100,000/mcL and platelets fall to 50% of baseline value interrupt therapy. If baseline ≥60,000/mcL and returns to ≥50,000/mcL or if baseline is <60,000/mcL and returns to ≥30,000/mcL resume therapy at 5 mg/day. If thrombocytopenia develops after 4 wk of treatment at 10 mg/day and platelets are <30,000/mcL or <50,000/mcL with platelet transfusions, interrupt therapy. When platelets return to ≥30,000/mcL without hemostatic failure resume therapy at 2.5 mg/day. *For Mantle Cell Lymphoma* starting dose is 25 mg/day on days 1–21 of repeated 28-day cycles — if platelets fall to <50,000/mcL interrupt therapy and follow CBC weekly. If platelets return to ≥50,000/mcL resume at 5 mg less than previous dose. Do not administer doses below 5 mg.

- Monitor liver enzymes periodically during therapy. Stop therapy if enzymes are elevated; may resume when return to normal or decrease dose.
- May cause anemia and leukopenia.
- May cause hypokalemia, hypomagnesemia, and ↑ ALT levels.

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- Patients must meet the following conditions before receiving therapy: they must understand the risks and be able to carry out instructions, must be capable of complying with patient registration and patient survey in the *Revlimid REMS program*, must comply with contraceptive measures, have received both oral and written warnings of the risks of contraceptive failure and the need for two reliable forms of contraception (females) or the risks of exposing a fetus to the drug and the need to use a latex condom during sexual conduct with a female with childbearing potential (male), acknowledge understanding of these warnings in writing, and if the patient is between 12 and 18 years of age, their parent or legal guardian is to read the educational materials and agree to try to ensure compliance with conditions.
- Lenalidomide can only be prescribed by health care providers registered in the *Revlimide REMS program* and only be dispensed by a pharmacy that is registered in the *Revlimid REMS program*.
- Patients with multiple myeloma who are eligible for autologous stem cell transplantation should have stem cell mobilization performed within 4 cycles of therapy.

- **PO:** Administer once daily, at the same time each day, with water. Capsules should be swallowed whole; do not open, break, or chew.

Patient/Family Teaching

- Instruct patient to take lenalidomide as directed and to comply with all aspects of the *Revlimid REMS program*. Take missed doses as soon as remembered within 12 hr of dose missed. If more than 12 hrs, skip dose and return to next scheduled dose; do not administer 2 doses within 12 hrs. Inform patient that they are required to participate in a telephone survey and patient registry while taking lenalidomide. Details are available at www.REVLIMID.com.
- Caution patient not to share lenalidomide with anyone, even someone who has similar symptoms.
- Advise patient to notify health care professional if rash, shortness of breath, chest pain, or arm or leg swelling, signs of infection (fever, dyspnea), rash, **unusual bleeding or bruising occur**.
- May cause dizziness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise patient that they cannot donate blood during and for 1 mo following therapy and male patients cannot donate sperm while taking lenalidomide.
- Inform patient of risk of new cancers during therapy.
- **Rep:** Inform female patients of reproductive potential that they must use one highly effective method (IUD, hormonal contraceptive, tubal ligation, partner's vasectomy) and one additional method (latex condom, diaphragm, cervical cap) **AT THE SAME TIME** for at least 4 wk before, during therapy and interruptions of therapy, and for 4 wk following discontinuation of therapy. Male patients receiving lenalidomide must always use a latex condom during and for up to 28 days following discontinuation during any contact with females with childbearing potential, even if they have undergone a successful vasectomy. Effective contraception must be used for at least 4 wk prior to initiating therapy, during therapy, during dose interruptions, and for 4 wk following discontinuation of therapy, even with a history of infertility unless due to a hysterectomy or patient has been postmenopausal naturally for 24 consecutive mo. Lenalidomide must be discontinued if pregnancy is suspected or confirmed. Suspected fetal exposure must be reported to FDA via MedWatch at 1-800-FDA-1088 and to manufacturer at 1-888-668-2528.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Evaluation/Desired Outcomes

- Decreased anemia in deletion 5q myelodysplastic syndromes with a decreased requirement for transfusion.
- Slowing of multiple myeloma progression.
- Slowing progression of mantle cell lymphoma.

lenvatinib (len-va-ti-nib)

Lenvima

Classification

Therapeutic: antineoplastics

Pharmacologic: kinase inhibitors

Indications

Treatment of locally recurrent or metastatic/progressive, radioactive-iodine-refractory differentiated thyroid cancer. Treatment of advanced renal cell carcinoma following one previous anti-angiogenic therapy (in combination with everolimus).

Action

Acts as a receptor tyrosine kinase inhibitor; inhibits kinase activities of various vascular endothelial growth factor receptors, resulting in decreased pathogenic angiogenesis, tumor growth and spread. **Therapeutic Effects:** Decreased progression and improved survival of differentiated thyroid cancer and renal cell carcinoma.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Unknown.

Protein Binding: 98–99%.

Metabolism and Excretion: Metabolized by CYP3A and aldehyde oxidase; 64% eliminated in feces, 25% in urine.

Half-life: 28 hr.

TIME/ACTION PROFILE (improvement in progression-free survival)

ROUTE	ONSET	PEAK	DURATION
PO	within 2 mo	8 mo	throughout treatment

Contraindications/Precautions

Contraindicated in: **Lactation:** Discontinue lenvatinib or discontinue breast feeding; **OB:** Pregnancy (may cause fetal harm).

Use Cautiously in: Hypertension (control BP before initiating treatment, may need to withhold/discontinue for life-threatening elevation); History of heart failure (may need to withhold/discontinue for worsening HF); History of congenital long QTc syndrome, HF, bradyarrhythmias, concurrent use of drugs that prolong QTc, including Class Ia and III antiarrhythmics (↑ risk of further QTc prolongation and serious arrhyth-

mias, may require interruption/discontinuation of lenvatinib); Severe hepatic or renal impairment (lower dose required); Dehydration/volume depletion (↑ risk of renal impairment, may need to withhold/discontinue for worsening renal function); Hypocalcemia (replace calcium, if persistent may require dose adjustment/interruption); History of reversible posterior leukoencephalopathy syndrome (may require dose adjustment/interruption); May damage male reproductive tissue resulting in decreased fertility; **Rep:** Women of reproductive potential; **Pedi:** Safe and effective use in children has not been established.

Adverse Reactions/Side Effects

CNS: CAROTID ARTERY HEMORRHAGE, REVERSIBLE POSTERIOR LEUKOENCEPHALOPATHY SYNDROME (RPLS), fatigue, insomnia, headache. **Resp:** cough. **CV:** ARTERIAL THROMBOEMBOLIC EVENTS, HF, QTc PROLONGATION, hypertension, hypotension. **EENT:** dysphonia, epistaxis. **GI:** GASTROINTESTINAL PERFORATION/FISTULA FORMATION, HEPATOTOXICITY, abdominal pain, ↓ appetite, diarrhea, dry mouth, dysgeusia, nausea, stomatitis, vomiting, ↑ liver enzymes. **GU:** NEPHROTIC SYNDROME, proteinuria, renal impairment, ↓ fertility. **Derm:** alopecia, palmar-plantar erythrodysesthesia syndrome, rash, hyperkeratosis. **Endo:** hypothyroidism. **F and E:** dehydration, hypocalcemia, hypokalemia. **Hemat:** hemorrhagic events, thrombocytopenia. **Metab:** ↓ weight. **MS:** arthralgia/myalgia.

Interactions

Drug-Drug: Concurrent use of drugs that prolong QTc, including Class Ia and III antiarrhythmics may ↑ risk of further QTc prolongation and serious arrhythmias (may require interruption/discontinuation of lenvatinib).

Route/Dosage

Differentiated Thyroid Cancer

PO (Adults): 24 mg once daily. Continue until disease progression or unacceptable toxicity.

Renal Impairment

PO (Adults): *CCr* <30 mL/min—14 mg once daily.

Hepatic Impairment

PO (Adults): *Child–Pugh C*—14 mg once daily.

Renal Cell Carcinoma

PO (Adults): 18 mg once daily. Continue until disease progression or unacceptable toxicity.

Renal Impairment

PO (Adults): *CCr* <30 mL/min—10 mg once daily.

Hepatic Impairment

PO (Adults): *Child–Pugh C*—10 mg once daily.

Availability

Capsules: 4 mg, 10 mg.

NURSING IMPLICATIONS

Assessment

- Assess BP prior to and after 1 wk, then every 2 wks for first 2 mo, and then at least monthly thereafter during therapy. Initiate or adjust medication management to control BP. Withhold lenvatinib for Grade 3 hypertension that persists despite anti-hypertensive therapy. Resume at a reduced dose (*1st occurrence*—20 mg/day; *2nd occurrence*—14 mg/day; *3rd occurrence*—10 mg/day) when hypertension is controlled or \leq Grade 2. Discontinue lenvatinib for life-threatening hypertension.
- Monitor for clinical signs and symptoms of cardiac decompensation (shortness of breath, swollen ankles) during therapy. Withhold lenvatinib for Grade 3 cardiac dysfunction until improved to Grade 0 or 1 or baseline. Resume at reduced dose (*1st occurrence*—20 mg/day; *2nd occurrence*—14 mg/day; *3rd occurrence*—10 mg/day) or discontinue depending on severity and persistence of cardiac dysfunction.
- Monitor for signs and symptoms of arterial thromboembolic events (chest pain, acute neurologic symptoms of MI or stroke) during therapy. Discontinue lenvatinib if event occurs.
- Assess for signs and symptoms of gastrointestinal perforation or fistula formation (severe abdominal pain) during therapy. Discontinue lenvatinib if gastrointestinal perforation or fistula occurs.
- Monitor ECG for patients with congenital long QT syndrome, congestive heart failure, bradyarrhythmias, or those taking drugs known to prolong QT interval. Withhold lenvatinib for development of \geq Grade 3 QT interval prolongation. Resume at reduced dose (*1st occurrence*—20 mg/day; *2nd occurrence*—14 mg/day; *3rd occurrence*—10 mg/day) when QT prolongation resolves to Grade 0 or 1.
- Monitor for signs and symptoms of reversible posterior leukoencephalopathy syndrome (RPLS) (severe headache, seizures, weakness, confusion, blindness or change in vision) during therapy. If symptoms occur, confirm diagnosis with MRI. Withhold lenvatinib for RPLS until fully resolved. Resume at reduced dose (*1st occurrence*—20 mg/day; *2nd occurrence*—14 mg/day; *3rd occurrence*—10 mg/day) or discontinue depending on severity and persistence of neurologic symptoms.
- Monitor for bleeding (severe and persistent nose bleeds, vomiting blood, red or black stools, coughing up blood or blood clots, heavy or new onset vaginal bleeding) during therapy. Withhold lenvatinib for Grade 3 hemorrhage until resolved to Grade 0 or 1. Resume at reduced dose (*1st occurrence*—20 mg/day; *2nd occurrence*—14 mg/day; *3rd occurrence*—10 mg/day) or discontinue depending

on severity and persistence of hemorrhage. Discontinue lenvatinib if Grade 4 hemorrhage occurs.

- **Lab Test Considerations:** Monitor serum ALT and AST levels for hepatotoxicity prior to and every 2 wks for first 2 mo, and at least monthly thereafter during therapy. Withhold lenvatinib for Grade 3 cardiac dysfunction until improved to Grade 0 or 1 or baseline. Resume at reduced dose (*1st occurrence*—20 mg/day; *2nd occurrence*—14 mg/day; *3rd occurrence*—10 mg/day) or discontinue depending on severity and persistence of hepatotoxicity. May cause hypoalbuminemia, \uparrow alkaline phosphatase, and hyperbilirubinemia.
- Monitor for proteinuria prior to and periodically during therapy. If urine dipstick proteinuria $\geq 2+$ is detected, obtain 24 hr urine protein. Withhold lenvatinib for ≥ 2 g proteinuria/24 hrs and resume at reduced dose (*1st occurrence*—20 mg/day; *2nd occurrence*—14 mg/day; *3rd occurrence*—10 mg/day) when proteinuria < 2 g/24 hrs. Discontinue lenvatinib for nephrotic syndrome.
- Monitor BUN and creatinine prior to and periodically during therapy. Withhold lenvatinib for Grade 3 or 4 renal failure/impairment until resolved to Grade 0 or 1 or baseline. Resume at reduced dose (*1st occurrence*—20 mg/day; *2nd occurrence*—14 mg/day; *3rd occurrence*—10 mg/day) or discontinue depending on severity and persistence of renal impairment.
- Monitor and correct electrolyte abnormalities. Monitor serum calcium levels at least monthly and replace calcium as needed during therapy. Interrupt and adjust lenvatinib dose based on severity, presence of ECG changes, and persistence of hypocalcemia. May cause hypokalemia, hypomagnesemia, hypoglycemia, hypercalcemia, and hyperkalemia.
- Monitor TSH levels monthly and adjust thyroid replacement medication as needed in patients with \downarrow thyroid levels.
- May cause \uparrow serum lipase and amylase, hypercholesterolemia, and \downarrow platelet count.

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Adverse Reactions)

Implementation

- **PO:** Administer two 10-mg capsules and one 4-mg capsule to make 24 mg at the same time each day without regard to food. Swallow capsules whole; do not open, crush, or chew. For patients with difficulty swallowing, open capsule and dissolve capsule in small glass of liquid. Measure 1 tablespoon of water or apple juice and put capsule in liquid without breaking or crushing. Leave capsule in liquid for at least 10 min. Stir for at least 3 min, then drink mixture. After drinking, add same amount (1 table-

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

spoon) of water or apple juice to glass. Swirl contents and swallow additional liquid.

Patient/Family Teaching

- Instruct patient to take letrozole as directed at the same time each day. Take missed dose within 12 hrs or omit and take next dose at usual time; do not double doses. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Advise patient to notify health care professional promptly if signs and symptoms of high BP, heart problems, blood clots (severe chest pain or pressure; pain in arms, back, or jaw; shortness of breath; numbness or weakness on 1 side of body; trouble talking; sudden severe headache; sudden vision changes), liver problems (yellow skin or whites of eyes, dark tea colored urine, light-colored bowel movements), severe stomach pain, RPLS, or bleeding occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- **Rep:** May be teratogenic. May cause fertility problems in males and females. Advise female patient to use effective contraception during and for at least 2 wks following completion of therapy and to notify health care professional if pregnancy is planned or suspected. Advise patient to avoid breast feeding during therapy.
- Emphasize importance of lab tests to monitor for adverse reactions.

Evaluation/Desired Outcomes

- Decreased progression of thyroid cancer.

letrozole (let-roe-zole)

Femara

Classification

Therapeutic: antineoplastics

Pharmacologic: aromatase inhibitors

Indications

First-line or second-line treatment of postmenopausal women with hormone receptor positive or hormone receptor unknown advanced breast cancer. Adjuvant treatment of postmenopausal women with hormone receptor positive early breast cancer. Extended adjuvant treatment of postmenopausal early breast cancer already treated with 5 yr of tamoxifen.

Action

Inhibits the enzyme aromatase, which is partially responsible for conversion of precursors to estrogen.

Therapeutic Effects: Lowers levels of circulating estrogen, which may halt progression of estrogen-sensitive breast cancer. Decreased risk of recurrence/metastatic disease.

Pharmacokinetics

Absorption: Rapidly and completely absorbed.

Distribution: Unknown.

Metabolism and Excretion: Mostly metabolized by the liver.

Half-life: 2 days.

TIME/ACTION PROFILE (effect on lowering of serum estradiol levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–3 days	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Premenopausal women; **OB:** Potential for fetal harm.

Use Cautiously in: Severe hepatic impairment; **Lactation, PEDI:** Safety not established.

Adverse Reactions/Side Effects

CNS: anxiety, depression, dizziness, drowsiness, fatigue, headache, vertigo, weakness. **Resp:** coughing, dyspnea, pleural effusion. **CV:** chest pain, edema, hypertension, cerebrovascular events, thromboembolic events. **GI:** nausea, abdominal pain, anorexia, constipation, diarrhea, dyspepsia, vomiting. **Derm:** alopecia, hot flashes, ↑ sweating, pruritus, rash. **F and E:** hypercalcemia. **Metab:** hypercholesterolemia, weight gain. **MS:** musculoskeletal pain, arthralgia, ↓ bone density, fractures.

Interactions

Drug-Drug: None significant.

Route/Dosage

PO (Adults): 2.5 mg daily.

Hepatic Impairment

PO (Adults): Severe hepatic impairment—2.5 mg every other day.

Availability (generic available)

Tablets: 2.5 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for pain and other side effects periodically throughout therapy.
- **Lab Test Considerations:** May cause elevated AST, ALT, alkaline phosphatase, bilirubin, GGT and cholesterol levels.

Potential Nursing Diagnoses

Acute pain (Side Effects)

Implementation

- Do not confuse Femara (letrozole) with Femhrt (ethinyl estradiol/norethindrone).
- **PO:** May be taken without regard to food.

Patient/Family Teaching

- Instruct patient to take medication as directed.
- May cause dizziness and fatigue. Caution patient to avoid driving and other activities requiring awareness until response to medication is known.
- Inform patient of potential for adverse reactions and advise her to notify health care professional if side effects are problematic.
- Caution women who are perimenopausal or who recently became menopausal to use adequate contraception during therapy; letrozole may cause fetal harm.

Evaluation/Desired Outcomes

- Slowing of disease progression in women with advanced breast cancer.
- Decreased risk of recurrence/metastatic disease.

leucovorin calcium (loo-koe-vor-in)

Classification

Therapeutic: antidotes (for methotrexate), vitamins
Pharmacologic: folic acid analogues

Indications

Minimizes hematologic effects of high-dose methotrexate therapy (leucovorin rescue). Advanced colorectal carcinoma (with 5-fluorouracil). Management of overdoses/prevention of toxicity from folic acid antagonists (pyrimethamine, trimethoprim). Folic acid deficiency (megaloblastic anemia) unresponsive to oral replacement.

Action

The reduced form of folic acid that serves as a cofactor in the synthesis of DNA and RNA. **Therapeutic Effects:** Reversal of toxic effects of folic acid antagonists. Reversal of folic acid deficiency.

Pharmacokinetics

Absorption: Well absorbed (38%) following PO administration. ↓ bioavailability with larger doses. Oral absorption is saturated at doses >25 mg.

Distribution: Widely distributed. Concentrates in the CNS and liver.

Metabolism and Excretion: Extensively converted to tetrahydrofolic derivatives, including 5-methyltetrahydrofolate, a major storage form.

Half-life: 3.5 hr.

TIME/ACTION PROFILE (serum folate levels)

ROUTE	ONSET	PEAK	DURATION
PO	20–30 min	unknown	3–6 hr
IM	10–20 min	unknown	3–6 hr
IV	<5 min	unknown	3–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **Pedi:** Preparations containing benzyl alcohol should not be used in neonates.

Use Cautiously in: Undiagnosed anemia (may mask the progression of pernicious anemia); **OB, Lactation:** Safety not established but has been used safely to treat megaloblastic anemia in pregnancy; **Coadministration with high-dose methotrexate requires crucial timing of dosing and knowledge of methotrexate levels;** Ascites; Renal failure; Dehydration; Pleural effusions; Urine pH <7.

Adverse Reactions/Side Effects

Hemat: thrombocytosis. **Misc:** allergic reactions (rash, urticaria, wheezing).

Interactions

Drug-Drug: May ↓ anticonvulsant effect of **barbiturates, phenytoin, or primidone**. High doses of the liquid contain significant **alcohol** and may cause ↑ CNS depression when used with **CNS depressants**. Concurrent use with **trimethoprim/sulfamethoxazole** may result in ↓ anti-infective efficacy and poor therapeutic outcome when used to treat *Pneumocystis jirovecii* pneumonia in HIV patients. May ↑ therapeutic effects and toxicity of **fluorouracil**; therapy may be combined for this purpose.

Route/Dosage

High-Dose Methotrexate—Leucovorin Rescue. Must start within 24 hr of methotrexate.

PO, IM, IV (Adults and Children): *Normal methotrexate elimination*—10 mg/m² q 6 hr (1st dose IV/IM, then change to PO) until methotrexate level is <5 × 10⁻⁸ M (0.05 micromolar). Larger doses/longer duration may be required in patients with aciduria, ascites, dehydration, renal impairment, GI obstruction, pleural/peritoneal effusions. Dose of leucovorin should be determined on the basis of plasma methotrexate levels.

Advanced Colorectal Cancer

IV (Adults): 200 mg/m² followed by 5-fluorouracil 370 mg/m² or leucovorin 20 mg/m² is followed by 5-fluorouracil 425 mg/m². Regimen is given daily for 5 days q 4–5 wk.

Prevention of Hematologic Toxicity from Pyrimethamine

PO, IV (Adults and Children): 5–15 mg/day.

Inadvertent Overdose of Folic Acid Antagonists

IM, IV (Adults and Children): *Methotrexate—large doses*—75 mg IV followed by 12 mg IM q 6 hr for 4 doses; *methotrexate—average doses*—6–12 mg IM q

* = Canadian drug name. † = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; underline indicate most frequent.

6 hr for 4 doses; *other folic acid antagonists*—amount equal in mg to folic acid antagonist.

Megaloblastic Anemia

PO, IM, IV (Adults and Children): Up to 1 mg/day (up to 6 mg/day for dihydrofolate reductase deficiency).

Availability (generic available)

Tablets: 5 mg, 10 mg, 15 mg, 25 mg. **Solution for injection (preservative-free):** 10 mg/mL. **Powder for injection:** 50 mg/vial, 100 mg/vial, 200 mg/vial, 350 mg/vial, 500 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess patient for nausea and vomiting secondary to methotrexate therapy or folic acid antagonists (pyrimethamine and trimethoprim) overdose. Parenteral route may be necessary to ensure that patient receives dose.
- Monitor for development of allergic reactions (rash, urticaria, wheezing). Notify health care professional if these occur.
- **Megaloblastic Anemia:** Assess degree of weakness and fatigue.
- **Lab Test Considerations: Leucovorin rescue:** Monitor serum methotrexate levels to determine dose and effectiveness of therapy. Leucovorin calcium levels should be equal to or greater than methotrexate level. Rescue continues until serum methotrexate level is $<5 \times 10M$.
- Monitor CCr and serum creatinine prior to and every 24 hr during therapy to detect methotrexate toxicity. An increase $>50\%$ over the pretreatment concentration at 24 hr is associated with severe renal toxicity.
- Monitor urine pH every 6 hr during therapy; pH should be maintained >7 to decrease nephrotoxic effects of high-dose methotrexate. Sodium bicarbonate or acetazolamide may be ordered to alkalize urine.
- **Megaloblastic anemia**—Monitor plasma folic acid levels, hemoglobin, hematocrit, and reticulocyte count prior to and periodically during therapy.

Potential Nursing Diagnoses

Risk for injury (Indications)

Imbalanced nutrition: less than body requirements (Indications)

Implementation

- **Do not confuse folic acid (leucovorin calcium) with folic acid. Do not confuse leucovorin calcium with levoleucovorin (Fusilev). Do not confuse leucovorin with Leukeran (chlorambucil).**
- Make sure leucovorin calcium is available before administering high-dose methotrexate. **Administration must be initiated within 24 hr of methotrexate therapy.**
- Administer as soon as possible after toxic dose of folic acid antagonists (pyrimethamine and trimetho-

prim). Effectiveness of therapy begins to decrease 1 hr after overdose.

- **PO:** Parenteral therapy should be used in patients with GI toxicity, with nausea and vomiting, or with doses >25 m g.
- **IM:** IM route is preferred for treatment of megaloblastic anemia. Ampules of leucovorin calcium injection for IM use do not require reconstitution.

IV Administration

- **IV Push:** Bacteriostatic water or sterile water. Do not use product containing benzyl alcohol. Use immediately if reconstituted with sterile water for injection. Stable for 7 days when reconstituted with bacteriostatic water. **Concentration:** reconstitute 50-mg, 100-mg, and 200-mg vials to a concentration of 10 mg/mL; reconstitute 350-mg vial to a concentration of 20 mg/mL. **Rate:** Administer by slow injection over a minimum of 3 min; not to exceed 160 mg/min.
- **Intermittent Infusion: Diluent:** May be diluted in 100–500 mL of D5W, D10W, 0.9% NaCl, Ringier's, or LR. Stable for 24 hr.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, azithromycin, aztreonam, bivalirudin, bleomycin, bumetamide, buprenorphine, busulfan, butorphanol, calcium acetate, calcium chloride, calcium gluconate, carmustine, caspofungin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, cefuroxime, chloramphenicol, ciprofloxacin, cisatracurium, cisplatin, cladribine, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, enalaprilat, ephedrine, epinephrine, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarcicline, fluorouracil, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, methotrexate, methylodopate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, mycophenolate, nafcillin, nalbuphine, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pancuronium, pemetrexed,

pentazocine, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, ranitidine, remifentanyl, rituximab, rocuronium, sodium acetate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, trimethoprim/sulfamethoxazole, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine.

- **Y-Site Incompatibility:** amiodarone, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, carboplatin, ceftriaxone, chlorpromazine, dantrolene, diazepam, droperidol, epirubicin, foscarnet, methylprednisolone, naloxone, pamidronate, pantoprazole, pentamidine, phenytoin, potassium phosphates, quinupristin/dalfopristin, sodium bicarbonate, thiopental, vancomycin.

Patient/Family Teaching

- Explain purpose of medication to patient. Emphasize need to take exactly as ordered. Advise patient to contact health care professional if a dose is missed.
- **Leucovorin Rescue:** Instruct patient to drink at least 3 liters of fluid each day during leucovorin rescue.
- **Folic Acid Deficiency:** Encourage patient to eat a diet high in folic acid (meat proteins; bran; dried beans; and green, leafy vegetables).

Evaluation/Desired Outcomes

- Reversal of bone marrow and GI toxicity in patients receiving methotrexate or in overdose of folic acid antagonists.
- Increased sense of well-being and increased production of normoblasts in patients with megaloblastic anemia.

leuprolide (loo-proe-lide)

Eligard, ~~Lupron~~,  Lupron, Lupron Depot, Lupron Depot-Ped

Classification

Therapeutic: antineoplastics
Pharmacologic: hormones, gonadotropin-releasing hormones

Indications

Advanced prostate cancer in patients who are unable to tolerate orchiectomy or estrogen therapy (may be used in combination with flutamide or bicalutamide). Central precocious puberty (CPP). Endometriosis. Uterine fibroids (with iron therapy).

Action

A synthetic analogue of luteinizing hormone–releasing hormone (LHRH). Initially causes a transient increase in testosterone; however, with continuous administration, testosterone levels are decreased. Reduces gonadotropins, testosterone, and estradiol. **Therapeutic Effects:** Decreased testosterone levels and resultant decrease in spread of prostate cancer. Reduction of pain/lesions in endometriosis. Decreased growth of fibroids. Delayed puberty.

Pharmacokinetics

Absorption: Rapidly and almost completely absorbed following subcut administration. More slowly absorbed following IM administration of depot form.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: 3 hr.

TIME/ACTION PROFILE (effect on hormone levels)

ROUTE	ONSET†	PEAK‡	DURATION§
Subcut	within 1st wk	2–4 wk	4–12 wk
IM	within 1st wk	2–4 wk	4–12 wk
IM-depot	within 1st wk	2–4 wk	4–12 wk

†Initial transient ↑ in testosterone and estradiol levels.

‡Maximum decline in testosterone and estradiol levels.

§Restoration of normal pituitary–gonadal function; in amenorrheic patients, normal menses usually returns 60–90 days after treatment is discontinued.

Contraindications/Precautions

Contraindicated in: Intolerance to synthetic analogues of LHRH (GnRH); **OB:** Potential for fetal harm or spontaneous abortion; **Lactation:** Potentially serious adverse effects.

Use Cautiously in: Hypersensitivity to benzyl alcohol (results in induration and erythema at subcut site); Congenital long QT syndrome, HF, electrolyte abnormalities, or concurrent use of other drugs known to prolong the QT interval; Seizures, cerebrovascular disorders, CNS tumor, or concurrent use of bupropion or selective serotonin reuptake inhibitors.

Adverse Reactions/Side Effects

CNS: SEIZURES, STROKE, aggression, anger, dizziness, headache, impatience, irritability, syncope; **Depot,** depression, drowsiness, personality disorder; **Subcut,** anxiety, blurred vision, lethargy, memory disorder, mood swings. **EENT:** blurred vision; **Subcut,** hearing disorder. **Resp:** hemoptysis; **Depot,** epistaxis, throat nodules; **Subcut,** cough, pleural rub, pulmonary fibrosis, pulmonary infiltrate. **CV:** MYOCARDIAL INFARCTION,

* = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

PULMONARY EMBOLI, angina, arrhythmias; *Depot*, **QT INTERVAL PROLONGATION**, vasodilation. **GI**: anorexia, diarrhea, dysphagia, nausea, vomiting; *Depot*, **HEPATOTOXICITY**, gingivitis; *Subcut*, **GI BLEEDING**, hepatic dysfunction, peptic ulcer, rectal polyps, taste disorders. **GU**: ↓ testicular size, dysuria, incontinence, testicular pain; *Depot*, cervix disorder; *Subcut*, bladder spasm, penile swelling, prostate pain, urinary obstruction. **Derm**: *Depot*—hair growth, rash; *Subcut*, dry skin, hair loss, pigmentation, skin cancer, skin lesions. **Endo**: breast swelling, breast tenderness, hyperglycemia. **F and E**: hypercalcemia, lower extremity edema. **Local**: burning, itching, swelling at injection site. **Meat**: *Depot*—hyperuricemia, ↓ bone density. **MS**: fibromyalgia, transient ↑ in bone pain (prostate cancer only); *Subcut*, ankylosing spondylitis, joint pain, pelvic fibrosis, temporal bone pain. **Neuro**: *Subcut*—peripheral neuropathy. **Misc**: hot flashes, chills, ↓ libido, fever; *Depot*, body odor, epistaxis.

Interactions

Drug-Drug: ↑ antineoplastic effects with **antiandrogens**, (megestrol, flutamide). Concurrent use with **buspion** or **SSRIs** may ↑ risk of seizures.

Route/Dosage

Prostate Cancer

Subcut (Adults): *Leuprolide acetate*—1 mg/day or *Eligard*—7.5 mg once monthly, 22.5 mg every 3 mo, 30 mg q 4 mo, or 45 mg q 6 mo.

IM (Adults): *Lupron Depot*—7.5 mg once monthly or 22.5 mg q 3 mo or 30 mg q 4 mo or 45 mg q 6 mo.

Endometriosis

IM (Adults): *Lupron Depot*—3.75 mg once monthly for up to 6 mo or 11.25 mg q 3 mo for up to 2 doses.

Uterine Fibroids (with iron therapy)

IM (Adults): *Lupron Depot*—3.75 mg once monthly for up to 3 mo or 11.25 mg single injection.

Central Precocious Puberty (CPP)

Subcut (Children): *Leuprolide acetate*—50 mcg/kg/day, may ↑ by 10 mcg/kg/day as required.

IM (Children >37.5 kg): *Lupron Depot-Ped*—15 mg q 4 wk; may ↑ by 3.75 mg q 4 wk as required.

IM (Children 26–37.5 kg): *Lupron Depot-Ped*—11.25 mg q 4 wk; may ↑ by 3.75 mg q 4 wk as required.

IM (Children ≤25 kg): *Lupron Depot-Ped*—7.5 mg q 4 wk; may ↑ by 3.75 mg q 4 wk as required.

IM (Children): *Lupron Depot-Ped*—11.25 or 30 mg q 3 mo.

Availability (generic available)

Solution for subcut injection (leuprolide acetate): 5 mg/mL. **Lyophilized microspheres for**

depot injection (Lupron Depot): 3.75 mg, 7.5 mg, 11.25 mg, 22.5 mg, 30 mg, 45 mg. **Lyophilized microspheres for pediatric depot injection (Lupron Depot-Ped)**: 7.5 mg, 11.25 mg, 15 mg, 30 mg. **Polymeric matrix injectable formulation for subcut injection (Eligard)**: 7.5 mg, 22.5 mg, 30 mg, 45 mg.

NURSING IMPLICATIONS

Assessment

- **Monitor ECG periodically in patients at risk for QT interval prolongation.**
- **Prostate Cancer**: Assess for an increase in bone pain, especially during the first few wk of therapy. Monitor patients with vertebral metastases for increased back pain and decreased sensory/motor function.
- Monitor intake and output ratios; assess for bladder distention in patients with urinary tract obstruction during initiation of therapy.
- **Fibroids**: Assess for severity of symptoms (bloating, pelvic pain, pressure, excessive vaginal bleeding) periodically during therapy.
- **Endometriosis**: Assess for endometrial pain prior to and periodically during therapy.
- **CPP**: Prior to therapy, diagnosis of CPP should be confirmed by onset of secondary sex characteristics in girls <8 yr or boys <9 yr; a complete physical and endocrinologic examination, including height, weight, hand and wrist x-ray; total sex steroid level (estradiol or testosterone); adrenal steroid level; beta human chorionic gonadotropin level; GnRH stimulation test; and computerized tomography of the head must be performed. These parameters are monitored after 1–2 mo and every 6–12 mo during therapy.
- Assess for signs of precocious puberty (menses, breast development, testicular growth) periodically during therapy. Dose is increased until no progression of the disease is noted either clinically or by lab test parameters, then usually maintained throughout therapy. Discontinuation of therapy should be considered before age 11 in girls and age 12 in boys.
- **Lab Test Considerations**: Initially ↑, then ↓ luteinizing hormone (LH) and follicle-stimulating hormone (FSH). This leads to castration levels of testosterone in boys 2–4 wk after initial increase in concentrations.
- Monitor testosterone, prostatic acid phosphate, and prostate-specific antigen (PSA) levels to evaluate response to therapy. Transient ↑ in levels may occur during the 1st mo of therapy for prostate cancer.
- Monitor electrolytes before starting and periodically during therapy. May cause ↑ BUN, serum calcium, uric acid, hypoproteinemia, LDH, alkaline phosphatase, AST, hyperglycemia, hyperlipidemia, hyper-

phosphatemia, WBC, PT, or PTT. May also cause ↓ platelets and serum potassium.

- Monitor blood sugar and glycosylated hemoglobin periodically during therapy.

Potential Nursing Diagnoses

Sexual dysfunction (Side Effects)

Implementation

- **Do not confuse Lupron Depot with Lupron Depot-Ped.**
- Norethindrone acetate 5 mg daily may be used to prevent bone density loss from leuprolide.
- Correct electrolyte abnormalities before starting therapy.
- **Subcut Eligard subcut formulation: Bring to room temperature before mixing. Assemble the Eligard kit and reconstitute solution using syringes provided, as directed by manufacturer. Wearing gloves, mix in syringes as directed by manufacturer, do not shake. Solution must reach room temperature before administration and must be administered within 30 min of mixing, or be discarded. Solution is light tan to tan in color. Inject into abdomen, upper buttocks, or anywhere that has adequate amounts of subcut tissue without excessive pigment, nodules, lesions, or hair. Vary site with each injection. Store in refrigerator; may also be stored at room temperature in original packing for up to 8 wks before mixing.**
- **IM:** Use syringe supplied by manufacturer. Rotate sites.
- Leuprolide depot is *only* for IM injection.
- **Lupron Depot formulation:** To prepare for injection screw white plunger into end stopper until stopper begins to turn. Hold syringe upright; release diluent by slowly pushing, over 6–8 seconds, until the first stopper is at the blue line in the middle of the barrel. Keep syringe upright. Mix microspheres by shaking syringe until power forms a unified suspension. Tap syringe if caking or clumping occurs. Suspension will appear milky. Do not use if powder does not go into suspension. Keep syringe upright, remove cap and expel air. Inject at 90° angle in gluteal area, anterior thigh, or deltoid; rotate injection sites. Suspension settles very quickly; mix and administer immediately.
- Store at room temperature; stable for 24 hr following reconstitution.

Patient/Family Teaching

- Advise patient that medication may cause hot flashes. Notify health care professional if these become bothersome.
- Leuprolide depot usually causes a temporary discontinuation of menstruation. Advise patient to notify

health care professional if menstruation persists or if intermittent bleeding occurs.

- Inform patient of the possibility of the development or worsening of depression and occurrence of memory disorders.
- **Prostate Cancer:** Instruct patient and family on subcut injection technique. Review patient insert provided with leuprolide patient-administration kit.
- Instruct patient to take medication exactly as directed. Take missed doses as soon as remembered unless not remembered until next day.
- Advise patient that bone pain may increase at initiation of therapy, but will resolve with time. Patient should discuss with health care professional use of analgesics to control pain.
- Instruct patient to notify health care professional promptly if difficulty urinating, weakness, or numbness occurs.
- **Endometriosis:** Advise patient to use a form of contraception other than oral contraceptives during therapy. Inform patient that amenorrhea is expected but does not guarantee contraception. Advise patient breast feeding should be avoided during therapy.
- **Central Precocious Puberty:** Instruct patient and family on the proper technique for subcut injection. Emphasize the importance of administering the medication at the same time each day. Rotate injection sites periodically.
- Inform patient and parents that if injections are not given daily, pubertal process may be reactivated.
- Advise patient and parents that during the first 2 mo of therapy patient may experience a light menstrual flow or spotting. Health care professional should be notified if this continues beyond 2nd mo.
- Instruct patient and parents to notify health care professional immediately if irritation at the injection site or unusual signs or symptoms occur.

Evaluation/Desired Outcomes

- Decrease in the spread of prostate cancer.
- Decrease in lesions and pain in endometriosis.
- Resolution of the signs of CPP.
- Improvement in preoperative hematologic parameters in patients with anemia from uterine fibroids.

levalbuterol

(leev-al-byoo-ter-ole)
Xopenex, Xopenex HFA

Classification

Therapeutic: bronchodilators
Pharmacologic: adrenergics

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Indications

Bronchospasm due to reversible airway disease (short-term control agent).

Action

R-enantiomer of racemic albuterol. Binds to beta-2 adrenergic receptors in airway smooth muscle leading to activation of adenylylase and increased levels of cyclic-3', 5'-adenosine monophosphate (cAMP). Increases in cAMP activate kinases, which inhibit the phosphorylation of myosin and decrease intracellular calcium. Decreased intracellular calcium relaxes bronchial smooth muscle. **Therapeutic Effects:** Relaxation of airway smooth muscle with subsequent bronchodilation. Relatively selective for beta-2 (pulmonary) receptors.

Pharmacokinetics

Absorption: Some absorption occurs following inhalation.

Distribution: Unknown.

Metabolism and Excretion: Metabolized in the liver to an inactive sulfate and 3–6% excreted unchanged in the urine.

Half-life: 3.3–4 hr.

TIME/ACTION PROFILE (bronchodilation)

ROUTE	ONSET	PEAK	DURATION
Inhaln	10–17 min	90 min	5–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to levalbuterol or albuterol.

Use Cautiously in: Cardiovascular disorders (including coronary insufficiency, hypertension, and arrhythmias); History of seizures; Hypokalemia; Hyperthyroidism; Diabetes mellitus; Unusual sensitivity to adrenergic amines; **OB, Lactation, Pedi:** Pregnancy, lactation, or children <6 yr (for nebulized solution) or <4 yr (for metered-dose inhaler) (safety not established).

Exercise Extreme Caution in: Concurrent use or use within 2 wk of **tricyclic antidepressants** or **MAO inhibitors** (may ↑ risk of adverse cardiovascular reactions).

Adverse Reactions/Side Effects

CNS: anxiety, dizziness, headache, nervousness.

Resp: **PARADOXICAL BRONCHOSPASM** (excessive use of inhalers), increased cough, turbinate edema. **CV:** tachycardia. **GI:** dyspepsia, vomiting. **Endo:** hyperglycemia. **F and E:** hypokalemia. **Neuro:** tremor.

Interactions

Drug-Drug: Concurrent use or use within 2 wk of **tricyclic antidepressants** or **MAO inhibitors** may ↑ risk of adverse cardiovascular reactions (use with

extreme caution). **Beta blockers** block the beneficial pulmonary effects of adrenergic bronchodilators (choose cardioselective beta blockers if necessary and with caution). May ↑ risk of hypokalemia from **potassium-losing diuretics**. May ↓ serum **digoxin** levels. May ↑ risk of arrhythmias with **hydrocarbon inhalation anesthetics** or **cocaine**.

Drug-Natural Products: Use with caffeine-containing herbs (**guarana, tea, coffee**) ↑ stimulant effect.

Route/Dosage

Inhaln (Adults and Children ≥4 yr): 2 inhalations q 4–6 hr; some patients may respond to 1 inhalation q 4 hr.

Inhaln (Adults and Children >12 yr): 0.63 mg via nebulization 3 times daily (every 6–8 hr); may be ↑ to 1.25 mg 3 times daily (every 6–8 hr).

Inhaln (Children 6–11 yr): 0.31 mg via nebulization 3 times daily (not to exceed 0.63 mg 3 times daily).

Availability (generic available)

Metered-dose inhaler: 45 mcg/actuation in 15-g (200 metered actuations) canisters. **Cost:** \$54.23/15 g.

Inhalation solution: 0.31 mg/3 mL in green foil pouch containing 12 vials, 0.63 mg/3 mL in yellow foil pouch containing 12 vials, 1.25 mg/3 mL in red foil pouch containing 12 vials, 1.25 mg/0.5 mL in unit-dose vials. **Cost:** *Generic*—All strengths \$6.71/3 mL.

NURSING IMPLICATIONS

Assessment

- Assess lung sounds, pulse, and BP before administration and during peak of medication. Note amount, color, and character of sputum produced. Closely monitor patients on higher dose for adverse effects.
- Monitor pulmonary function tests before initiating therapy and periodically during course to determine effectiveness of medication.
- **Observe for paradoxical bronchospasm (wheezing, dyspnea, tightness in chest).** If condition occurs, **withhold medication and notify health care provider immediately.**
- **Lab Test Considerations:** May cause ↑ serum glucose and ↓ serum potassium.

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)

Implementation

- **Inhaln:** Allow at least 1 min between inhalations of aerosol medication.
- For nebulization, levalbuterol solution does not require dilution prior to administration. Once the foil

pouch is opened, vials must be used within 2 weeks; open vials may be stored for 1 week. Discard vial if solution is not clear or colorless.

Patient/Family Teaching

- Instruct patient in the proper use of metered-dose inhaler and nebulizer (see Appendix D) and to take levalbuterol as directed. Caution patient not to exceed recommended dose; may cause adverse effects, paradoxical bronchospasm, or loss of effectiveness of medication.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any OTC medications or alcoholic beverages concurrently with this therapy. Caution patient also to avoid smoking and other respiratory irritants.
- Instruct patient to contact health care professional immediately if shortness of breath is not relieved by medication or is accompanied by diaphoresis, dizziness, palpitations, or chest pain.
- Advise patients to use levalbuterol first if using other inhalation medications, and allow 5 min to elapse before administering other inhalant medications unless otherwise directed.
- Advise patient to rinse mouth with water after each inhalation dose to minimize dry mouth.
- Instruct patient to notify health care professional if no response to the usual dose of levalbuterol.

Evaluation/Desired Outcomes

- Prevention or relief of bronchospasm.

levETIRAcetam

(le-ve-teer-a-se-tam)

Keppra, Keppra XR, Roweepra, Spritam

Classification

Therapeutic: anticonvulsants

Pharmacologic: pyrrolidines

Indications

Partial onset seizures (adjunct). Primary generalized tonic-clonic seizures (adjunct) (immediate-release and injection only). Myoclonic seizures in patients with juvenile myoclonic epilepsy (adjunct) (immediate-release and injection only). **Unlabeled Use:** Status epilepticus.

Action

Appears to inhibit burst firing without affecting normal neuronal excitability and may selectively prevent hypersynchronization of epileptiform burst firing and propa-

gation of seizure activity. **Therapeutic Effects:** Decreased incidence and severity of seizures.

Pharmacokinetics

Absorption: Rapidly and completely absorbed following oral administration.

Distribution: Unknown.

Protein Binding: <10%.

Metabolism and Excretion: 66% excreted unchanged by the kidneys; some metabolism by the liver (metabolites inactive).

Half-life: 7.1 hr (↑ in renal impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1–1.5 hr†‡	12 hr

† 1 hr in the fasting state, 1.5 hr when taken with food.

‡ 4 hr with extended-release.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **Lactation:** Lactation.

Use Cautiously in: All patients (may ↑ risk of suicidal thoughts/behaviors); Renal impairment (dose ↓ recommended if CCr ≤80 mL/min); **Pedi:** Safety and effectiveness not established in children <16 yr (injection), <12 yr (extended-release); **OB:** Use only if potential benefit justifies potential risk to fetus; blood levels may be ↓ during pregnancy (especially during 3rd trimester); **Geri:** ↓ renal elimination (dose ↓ may be necessary).

Adverse Reactions/Side Effects

CNS: SUICIDAL THOUGHTS, aggression, agitation, anger, anxiety, apathy, depersonalization, depression, dizziness, drowsiness, fatigue, hostility, irritability, personality disorder, psychosis, weakness, hyperkinesia. **CV:** hypertension. **Neuro:** coordination difficulties (adults only). **Derm:** STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS. **Hemat:** AGRANULOCYTOSIS, anemia, eosinophilia, neutropenia. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema), DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS).

Interactions

Drug-Drug: None noted.

Route/Dosage

Only the oral solution should be used in patients ≤20 kg.

* = Canadian drug name. † = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; _____ indicate most frequent.

Partial Onset Seizures

PO, IV (Adults and Children ≥ 16 yr): 500 mg 2 times daily initially; may \uparrow by 1000 mg/day at 2-wk intervals up to 3000 mg/day (in 2 divided doses).

PO (Adults and Children ≥ 12 yr): *Extended-release*—1000 mg daily; may \uparrow by 1000 mg/day at 2-wk intervals up to 3000 mg/day.

PO (Adults and Children ≥ 4 yr and >40 kg): *Tablets for oral suspension*—500 mg twice daily; may \uparrow by 1000 mg/day at 2-wk intervals up to 3000 mg/day in 2 divided doses.

PO, IV (Children 4–15 yr): 10 mg/kg twice daily; \uparrow by 20 mg/kg/day at 2-wk intervals to recommended dose of 30 mg/kg twice daily (maximum dose: 3000 mg/day in 2 divided doses).

PO (Children ≥ 4 yr and 20–40 kg): *Tablets for oral suspension*—250 mg twice daily; may \uparrow by 500 mg/day at 2-wk intervals up to 1500 mg/day in 2 divided doses.

PO, IV (Children 6 mo–3 yr): 10 mg/kg twice daily; \uparrow by 20 mg/kg/day at 2-wk intervals to recommended dose of 25 mg/kg twice daily.

PO, IV (Children 1–5 mo): 7 mg/kg twice daily; \uparrow by 14 mg/kg/day at 2-wk intervals to recommended dose of 21 mg/kg twice daily.

Primary Generalized Tonic-Clonic Seizures

PO, IV (Adults and Children ≥ 16 yr): 500 mg twice daily initially; \uparrow by 1000 mg/day at 2-wk intervals to recommended dose of 3000 mg/day.

PO (Adults and Children ≥ 6 yr and >40 kg): *Tablets for oral suspension*—500 mg twice daily; may \uparrow by 1000 mg/day at 2-wk intervals up to 3000 mg/day in 2 divided doses.

PO, IV (Children 6–15 yr): 10 mg/kg twice daily; \uparrow by 20 mg/kg/day at 2-wk intervals to recommended dose of 30 mg/kg twice daily.

PO (Children ≥ 6 yr and 20–40 kg): *Tablets for oral suspension*—250 mg twice daily; may \uparrow by 500 mg/day at 2-wk intervals up to 1500 mg/day in 2 divided doses.

Myoclonic Seizures

PO, IV (Adults and Children ≥ 12 yr): 500 mg twice daily initially; \uparrow by 1000 mg/day at 2-wk intervals to recommended dose of 3000 mg/day (in 2 divided doses).

Status Epilepticus

IV (Infants and Children <16 yr): 50 mg/kg/dose followed by maintenance dose of 30–55 mg/kg/day IV/PO divided BID.

IV (Neonates): 20–30 mg/kg/dose loading followed by neonatal seizure dosing.

Renal Impairment

PO, IV (Adults): *CCr 50–80 mL/min*—500–1000 mg q 12 hr (1000–2000 mg q 24 hr for extended-

release); *CCr 30–50 mL/min*—250–750 mg q 12 hr (500–1500 mg q 24 hr for extended-release); *CCr <30 mL/min*—250–500 mg q 12 hr (500–1000 mg q 24 hr for extended-release); *Dialysis (immediate-release and injection)*—500–1000 mg q 24 hr with a 250–500-mg supplemental dose after dialysis.

Availability (generic available)

Tablets: 250 mg, 500 mg, 750 mg, 1000 mg. **Cost:** *Generic*—250 mg \$29.94/100, 500 mg \$43.36/100, 750 mg \$55.11/100, 1000 mg \$148.42/180. **Tablets for oral suspension (Spritam) (spearmint-flavored):** 250 mg, 500 mg, 750 mg, 1000 mg. **Extended-release tablets:** 500 mg, 750 mg. **Cost:** *Generic*—500 mg \$266.82/60, 750 mg \$400.64/60. **Oral solution (grape-flavored):** 100 mg/mL. **Cost:** *Generic*—\$307.74/473 mL. **Solution for injection:** 100 mg/mL. **Premixed infusion:** 500 mg/100 mL 0.82% NaCl, 1000 mg/100 mL 0.75% NaCl, 1500 mg/100 mL 0.54% NaCl.

NURSING IMPLICATIONS

Assessment

- Assess location, duration, and characteristics of seizure activity.
- Assess patient for CNS adverse effects throughout therapy. These adverse effects are categorized as somnolence and fatigue (asthenia), coordination difficulties (ataxia, abnormal gait, or incoordination), and behavioral abnormalities (agitation, hostility, anxiety, apathy, emotional lability, depersonalization, depression) and usually occur during the first 4 wk of therapy.
- **Monitor mood changes.** Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- **Assess for rash periodically during therapy.** May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.
- **Monitor for signs and symptoms of DRESS** (fever, rash, lymphadenopathy, and/or facial swelling, associated with involvement of other organ systems (hepatitis, nephritis, hematologic abnormalities, myocarditis, myositis) during therapy. May resemble an acute viral infection. Eosinophilia is often present. Discontinue therapy if signs occur.
- **Monitor for signs and symptoms of anaphylaxis** (dyspnea, wheezing, facial swelling). Discontinue levetiracetam if symptoms occur.
- **Pedi:** Monitor patients 1 mo to <4 years of age for increases in diastolic BP.
- **Lab Test Considerations:** May cause \downarrow RBC and WBC and abnormal liver function tests.

Potential Nursing Diagnoses

Risk for injury (Side Effects)

Implementation

- **Do not confuse Keppra (levetiracetam) with Kaletra (lopinavir/ritonavir) or Keflex (cephalexin). Do not confuse levetiracetam with levocarnitine or levofloxacin.**
- IV doses should be used temporarily when oral route is not feasible. To convert IV to PO, equivalent dose and frequency may be used.
- **PO:** May be administered without regard to meals.
- Administer tablets whole; do not administer partial tablets. Do not break, crush, or chew XR tablets.
- **Pedi:** Patients <20 kg should receive oral solution. Administer with calibrated measuring device for accurate dose.
- Discontinue gradually to minimize the risk of increase in seizure frequency.

IV Administration

- **Intermittent Infusion:** **Diluent:** Dilute dose in 100 mL of 0.9% NaCl, D5W, or LR. If a smaller volume is required (e.g. pediatric patients), concentration should not exceed 15 mg/mL. Do not administer solutions that are cloudy or contain particulate matter. **Rate:** Infuse over 15 min.
- **Y-Site Compatibility:** diazepam, lorazepam, valproate.

Patient/Family Teaching

- Instruct patient to take medication as directed. **Pedi:** Explain to parents the importance of using calibrated measuring device for accurate dosing. Take missed doses as soon as possible unless almost time for next dose. Do not double doses. Do not discontinue abruptly; may cause increase in frequency of seizures. Advise patient to read the *Medication Guide* prior to starting therapy and with each Rx refill in case of changes.
- May cause dizziness and somnolence. Caution patient to avoid driving or activities requiring alertness until response to medication is known. Do not resume driving until physician gives clearance based on control of seizure disorder.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; other unusual changes in behavior or mood or if skin rash occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products

being taken and to consult with health care professional before taking other medications.

- Instruct patient to notify health care professional of medication regimen prior to treatment or surgery.
- **Rep:** Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding. Encourage pregnant patients to enroll in the North American Antiepileptic Drug (NAAED) Pregnancy Registry by calling 1-888-233-2334; information is available at www.aedpregnancyregistry.org.
- Advise patient to carry identification describing disease process and medication regimen at all times.

Evaluation/Desired Outcomes

- Decrease in the frequency of or cessation of seizures.

levomilnacipran (lee-voe-mil-na-si-pran) Fetzima

Classification

Therapeutic: antidepressants
Pharmacologic: selective serotonin/norepinephrine reuptake inhibitors

Indications

Treatment of major depressive disorder.

Action

Inhibits neuronal reuptake of norepinephrine and serotonin in the CNS (SNRI). **Therapeutic Effects:** Decrease in depressive symptomatology, with fewer relapses/recurrences.

Pharmacokinetics

Absorption: Well absorbed (92%) following oral administration.

Distribution: Widely distributed.

Metabolism and Excretion: 58% eliminated unchanged in urine; 42% metabolized, primarily by the CYP3A4 enzyme system; metabolites are renally eliminated.

Half-life: 12 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	Unknown	6–8 hr (blood level)	Unknown

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to levomilnacipran or milnacipran; Uncontrolled narrow-angle glaucoma; Concurrent use of or in close temporal proximity to MAO inhibitors, linezolid or methylene blue (risk of serotonin syndrome); Concurrent use of alcohol.

Use Cautiously in: History of hypertension, cardiovascular or cerebrovascular disease (BP should be controlled prior to treatment); History of bipolar disorder (may activate mania/hypomania); Renal impairment (dose ↓ required for $CCr < 60$ mL/min); **Geri:** Consider age-related ↓ in renal function, chronic disease state and concurrent drug therapy; may have ↑ risk of hyponatremia; **OB:** Use only if clearly required during pregnancy weighing benefit to mother versus potential harm to fetus; **Lactation:** Potential for serious adverse reactions in infant; discontinue drug or discontinue breast feeding; **Pedi:** ↑ risk of suicidal thinking and behavior (suicidality) in adolescents and young adults up to 24 yrs with MDD.

Exercise Extreme Caution in: Concurrent use with other serotonergic drugs (↑ risk of serotonin syndrome especially during initiation and dose adjustment).

Adverse Reactions/Side Effects

CNS: activation of mania/hypomania. **EENT:** mydriasis. **CV:** hypertension, hypotension, palpitations, tachycardia. **GI:** nausea, ↓ appetite, constipation, vomiting. **GU:** ejaculation disorder, erectile dysfunction, testicular pain, urinary hesitation/retention. **Derm:** hot flush, hyperhidrosis, rash. **F and E:** hyponatremia (in association with syndrome of inappropriate antidiuretic hormone [SIADH]). **Hemat:** bleeding. **Misc:** SEROTONIN SYNDROME.

Interactions

Drug-Drug: Concurrent use with MAO inhibitors used for psychiatric disorders may result in serious, potentially fatal reactions; wait at least 14 days following discontinuation of MAO inhibitor before initiation of levomilnacipran. Wait at least 7 days after discontinuing levomilnacipran before initiation of MAO inhibitor. Concurrent use with MAO-inhibitor like drugs, such as linezolid or methylene blue, may ↑ risk of serotonin syndrome; concurrent use contraindicated; do not start therapy in patients receiving linezolid or methylene blue; if linezolid or methylene blue need to be started in a patient receiving levomilnacipran, immediately discontinue levomilnacipran and monitor for signs/symptoms of serotonin syndrome for 2 wk or until 24 hr after last dose of linezolid or methylene blue, whichever comes first (may resume levomilnacipran therapy 24 hr after last dose of linezolid or methylene blue). Drugs that affect serotonergic neuro-

transmitter systems, including tricyclic antidepressants, SNRIs, fentanyl, buspirone, tramadol, amphetamines, and triptans ↑ risk of serotonin syndrome. Concurrent use of NSAIDs, aspirin, warfarin or other drugs that affect coagulation may ↑ the risk of bleeding. Blood levels and risk of toxicity ↑ by concurrent use of CYP3A4 inhibitors including ketoconazole, clarithromycin, ritonavir; daily dose should not exceed 80 mg. Concurrent use of other medications that may ↑ BP may ↑ risk of hypertension. Concurrent use with alcohol may cause a rapid release of drug and should be avoided. Concurrent use with other CNS-active medications, especially other NSRIs.

Drug-Natural Products: Concurrent use with St. John's wort or tryptophan may ↑ the risk of serotonin syndrome; also ↑ risk of coronary vasoconstriction and hypertension.

Route/Dosage

PO (Adults): 20 mg once daily for two days, then increase to 40 mg once daily, may then be ↑ by 40 mg every two or more days; may be ↑ up to 120 mg/day; Concurrent use of CYP3A4 inhibitors (including ketoconazole, clarithromycin, ritonavir) — not to exceed 80 mg/day.

Renal Impairment

PO (Adults): CCr 30–59 mL/min — not to exceed 80 mg/day; CCr 15–29 mL/min — not to exceed 40 mg/day.

Availability

Extended-release capsules: 20 mg, 40 mg, 80 mg, 120 mg.

NURSING IMPLICATIONS

Assessment

- Monitor BP and heart rate before and periodically during therapy. Treat pre-existing hypertension and cardiac disease prior to therapy. Sustained hypertension may require discontinuation of therapy.
- Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyperreflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).
- **Lab Test Considerations:** May cause hyponatremia.

Potential Nursing Diagnoses

Ineffective coping (Indications)
Risk for suicide (Adverse Reactions)

Implementation

- **High Alert:** Do not confuse Fetzima with Farxiga.
- **PO:** Administer daily without regard to food. Swallow capsule whole; do not open, crush, or chew.

Patient/Family Teaching

- Instruct patient to take levomilnacipran as directed at the same time each day. Take missed doses as soon as possible unless time for next dose; do not double dose. Do not stop abruptly; must be decreased gradually. Abrupt discontinuation may cause dysphoric mood, irritability, agitation, dizziness, paresthesia, electric shock sensation, anxiety, confusion, headache, lethargy, emotional lability, insomnia, hypomania, tinnitus and seizures. Advise patient to read *Medication Guide* prior to therapy and with each Rx refill in case of changes.
- May cause drowsiness and may affect ability to make decisions or react quickly. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient, family, and caregivers to look for activation of mania/hypomania and suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide; new or worse depression or anxiety; agitation or restlessness; panic attacks; insomnia; new or worse irritability; aggressiveness; acting on dangerous impulses, mania, or other changes in mood or behavior or if symptoms of serotonin syndrome occur.
- Caution patient of the risk of serotonin syndrome (agitation, hallucinations, changes in mental status, muscle twitching, fast heartbeat, high or low BP, sweating or fever, nausea or vomiting, diarrhea, muscle stiffness or tightness), especially when taking triptans, tramadol, tryptophan supplements and other serotonergic or antipsychotic agents.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to avoid concurrent use of Rx, OTC, and herbal products, especially NSAIDs, aspirin, and warfarin, without consulting health care professional; may increase bleeding.
- Instruct patient to notify health care professional if signs of hyponatremia (headache, difficulty concentrating, memory impairment, confusion, weakness, unsteadiness) occur.
- Advise patient to avoid taking alcohol during levomilnacipran therapy.
- Instruct patient to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy.
- Encourage patient to maintain routine follow-up visits with health care provider to determine effectiveness.

Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings. Need for therapy should be periodically reassessed.

levonorgestrel, See CONTRACEPTIVES, HORMONAL.

levothyroxine

(lee-voe-thye-rox-een)

★ Eltroxin, ★ Euthyrox, Levo-T, Levovoxyl, Synthroid, T₄, Tirosint, Unithroid

Classification

Therapeutic: hormones

Pharmacologic: thyroid preparations

Indications

Thyroid supplementation in hypothyroidism. Treatment or suppression of euthyroid goiters. Adjunctive treatment for thyrotropin-dependent thyroid cancer.

Action

Replacement of or supplementation to endogenous thyroid hormones. Principal effect is increasing metabolic rate of body tissues: Promote gluconeogenesis, increase utilization and mobilization of glycogen stores, stimulate protein synthesis, promote cell growth and differentiation, aid in the development of the brain and CNS. **Therapeutic Effects:** Replacement in hypothyroidism to restore normal hormonal balance. Suppression of thyroid cancer.

Pharmacokinetics

Absorption: Levothyroxine is variably (40–80%) absorbed from the GI tract.

Distribution: Distributed into most body tissues. Thyroid hormones do not readily cross the placenta; minimal amounts enter breast milk.

Protein Binding: >99%.

Metabolism and Excretion: Metabolized by the liver and other tissues to active T₃. Thyroid hormone undergoes enterohepatic recirculation and is excreted in the feces via the bile.

Half-life: 6–7 days.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
Levothyroxine PO	unknown	1–3 wk	1–3 wk
Levothyroxine IV	6–8 hr	24 hr	unknown

★ = Canadian drug name. ⚡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Recent MI; Hyperthyroidism.

Use Cautiously in: Cardiovascular disease (initiate therapy with lower doses); Severe renal insufficiency; Uncorrected adrenocortical disorders; **Pedi:** Monitor neonates and infants for cardiac overload, arrhythmias, and aspiration during first 2 wk of therapy; **Geri:** Extremely sensitive to thyroid hormones; initial dose should be ↓.

Adverse Reactions/Side Effects

Usually only seen when excessive doses cause iatrogenic hyperthyroidism.

CNS: headache, insomnia, irritability. **CV:** angina pectoris, arrhythmias, tachycardia. **GI:** abdominal cramps, diarrhea, vomiting. **Derm:** sweating. **Endo:** hyperthyroidism, menstrual irregularities. **Metab:** heat intolerance, weight loss. **MS:** accelerated bone maturation in children.

Interactions

Drug-Drug: Cholestyramine, colestevam, colestipol, sodium polystyrene sulfonate, and sevelamer may bind to and ↓ absorption of orally administered levothyroxine; administer levothyroxine ≥4 hr prior to these medications. Absorption may be ↓ by **oralistat**, **proton pump inhibitors**, **sucralfate**, **antacids**, and **simethicone**. May ↑ the effects of **warfarin**. May ↑ requirement for **insulin** or **oral hypoglycemic agents** in diabetics. Concurrent **estrogen** therapy may ↑ thyroid replacement requirements. ↑ cardiovascular effects with **adrenergics** (sympathomimetics).

Drug-Food: Foods or supplements containing calcium, iron, magnesium, or zinc may bind levothyroxine and prevent complete absorption.

Route/Dosage

PO (Adults): *Hypothyroidism*—50 mcg as a single dose initially; may be ↑ q 2–3 wk by 25 mcg/day; usual maintenance dose is 75–125 mcg/day (1.5 mcg/kg/day).

PO (Geriatric Patients and Patients with Increased Sensitivity to Thyroid Hormones): 12.5–25 mcg as a single dose initially; may be ↑ q 6–8 wk; usual maintenance dose is 75 mcg/day.

PO (Children >12 yr): 2–3 mcg/kg/day (≥150 mcg/day).

PO (Children 6–12 yr): 4–5 mcg/kg/day (100–125 mcg/day).

PO (Children 1–5 yr): 5–6 mcg/kg/day (75–100 mcg/day).

PO (Children 6–12 mo): 6–8 mcg/kg/day (50–75 mcg/day).

PO (Infants 3–6 mo): 8–10 mcg/kg/day (25–50 mcg/day).

PO (Infants 0–3 mo or Infants at Risk for Cardiac Failure): 10–15 mcg/kg/day or 25 mcg/day; may be ↑ after 4–6 wk to 50 mcg.

IM, IV (Adults): *Hypothyroidism*—50–100 mcg/day as a single dose. *Myxedema coma/stupor*—300–500 mcg IV; additional 100–300 mcg may be given on 2nd day, followed by daily administration of smaller doses.

IM, IV (Children): *Hypothyroidism*—50–80% of the oral dose.

Availability (generic available)

Capsules (Tirosint): 13 mcg, 25 mcg, 50 mcg, 75 mcg, 88 mcg, 100 mcg, 112 mcg, 125 mcg, 137 mcg, 150 mcg. **Tablets:** 25 mcg, 50 mcg, 75 mcg, 88 mcg, 100 mcg, 112 mcg, 125 mcg, 137 mcg, 150 mcg, 175 mcg, 200 mcg, 300 mcg. **Powder for injection:** 100 mcg/vial, 200 mcg/vial, 500 mcg/vial.

NURSING IMPLICATIONS

Assessment

- **Assess apical pulse and BP prior to and periodically during therapy.** Assess for tachyarrhythmias and chest pain.
- **Children:** Monitor height, weight, and psychomotor development.
- **Lab Test Considerations:** Monitor thyroid function studies prior to and during therapy. Monitor thyroid-stimulating hormone serum levels in adults 8–12 wks after changing from one brand to another.
- Monitor blood and urine glucose in diabetic patients. Insulin or oral hypoglycemic dose may need to be increased.
- **Toxicity and Overdose:** Overdose is manifested as hyperthyroidism (tachycardia, chest pain, nervousness, insomnia, diaphoresis, tremors, weight loss). Usual treatment is to withhold dose for 2–6 days then resume at a lower dose. Acute overdose is treated by induction of emesis or gastric lavage, followed by activated charcoal. Sympathetic overstimulation may be controlled by antiadrenergic drugs (beta blockers), such as propranolol. Oxygen and supportive measures to control symptoms are also used.

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- **High Alert:** Do not confuse levothyroxine with lamotrigine or Lanoxin (digoxin). Do not confuse levothyroxine with liothyronine.
- **PO:** Administer with a full glass of water, on an empty stomach, 30–60 min before breakfast, to prevent insomnia.

- Initial dose is low, especially in geriatric and cardiac patients. Dose is increased gradually, based on thyroid function tests.
- For patients with difficulty swallowing, tablets can be crushed and placed in 5–10 mL of water and administered immediately via dropper or spoon; do not store suspension.

IV Administration

- **IV Push:** Reconstitute the 200-mcg and 500-mcg vials with 2 or 5 mL, respectively, of 0.9% NaCl without preservatives (diluent usually provided). **Concentration:** 100 mcg/mL. Shake well to dissolve completely. Administer solution immediately after preparation; discard unused portion. **Rate:** Administer at a rate of 100 mcg over 1 min. Do not add to IV infusions; may be administered through Y-tubing.
- **Y-Site Incompatibility:** Do not admix with other IV solutions.

Patient/Family Teaching

- Instruct patient to take medication as directed at the same time each day. Take missed doses as soon as remembered unless almost time for next dose. If more than 2–3 doses are missed, notify health care professional. Do not discontinue without consulting health care professional.
- Explain to patient that medication does not cure hypothyroidism; it provides a thyroid hormone supplement. Therapy is lifelong.
- Advise patient to notify health care professional if headache, nervousness, diarrhea, excessive sweating, heat intolerance, chest pain, increased pulse rate, palpitations, weight loss >2 lb/wk, or any unusual symptoms occur.
- Caution patient to avoid taking other medications concurrently with thyroid preparations unless instructed by health care professional. Advise patient to take 4 hrs apart from antacids, iron, and calcium supplements.
- Instruct patient to inform health care professionals of thyroid therapy.
- Emphasize importance of follow-up exams to monitor effectiveness of therapy. Thyroid function tests are performed at least yearly.
- **Pedi:** Discuss with parents the need for routine follow-up studies to ensure correct development. Inform patient that partial hair loss may be experienced by children on thyroid therapy. This is usually temporary.

Evaluation/Desired Outcomes

- Resolution of symptoms of hypothyroidism and normalization of hormone levels.

LIDOCAINE

lidocaine (parenteral) (lye-doe-kane)

Xylocaine, ❄️ Xylocard

lidocaine (local anesthetic)

Xylocaine

lidocaine (mucosal)

❄️ Jampocaine Viscous, Xylocaine Viscous

lidocaine (transdermal)

Lidoderm

lidocaine (topical)

❄️ Betacaine, ❄️ Cathejell, Glydo,
❄️ Lidodan, L-M-X 4, L-M-X 5,
❄️ Lyracaine, ❄️ Maxilene, ❄️ Stallion,
❄️ Topicaïne, Xylocaine

Classification

Therapeutic: anesthetics (topical/local), antiarrhythmics (class IB)

Indications

IV: Ventricular arrhythmias. **IM:** Self-injected or when IV unavailable (during transport to hospital facilities).

Local: Infiltration/mucosal/topical anesthetic. **Transdermal:** Pain due to post-herpetic neuralgia.

Action

IV, IM: Suppresses automaticity and spontaneous depolarization of the ventricles during diastole by altering the flux of sodium ions across cell membranes with little or no effect on heart rate. **Local:** Produces local anesthesia by inhibiting transport of ions across neuronal membranes, thereby preventing initiation and conduction of normal nerve impulses. **Therapeutic Effects:** Control of ventricular arrhythmias. Local anesthesia.

Pharmacokinetics

Absorption: Well absorbed after administration into the deltoid muscle; some absorption follows local use.

Distribution: Widely distributed. Concentrates in adipose tissue. Crosses the blood-brain barrier and placenta; enters breast milk.

Metabolism and Excretion: Mostly metabolized by the liver; <10% excreted in urine as unchanged drug.

Half-life: Biphasic—initial phase, 7–30 min; terminal phase, 90–120 min; ↑ in HF and liver impairment.

❄️ = Canadian drug name. ⚡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

TIME/ACTION PROFILE (IV, IM = antiarrhythmic effects; local = anesthetic effects)

ROUTE	ONSET	PEAK	DURATION
IV	immediate	immediate	10–20 min (up to several hours after continuous infusion)
IM	5–15 min	20–30 min	60–90 min
Local	rapid	unknown	1–3 hr

Contraindications/Precautions

Applies mainly to systemic use

Contraindicated in: Hypersensitivity; cross-sensitivity may occur; Third-degree heart block; Wolff-Parkinson-White syndrome; **Pedi:** Children <3 yr (↑ risk of seizures, cardiac arrest and death with viscous lidocaine); viscous lidocaine should not be used for teething pain; should only be used for other indications when safer alternatives are not available or have failed.

Use Cautiously in: Liver disease, HF, patients weighing <50 kg, and geriatric patients (↓ bolus and/or maintenance dose); Respiratory depression; Shock; Heart block; **OB, Lactation:** Use only if the potential benefit justifies the potential risk to the fetus; **Pedi:** Safety not established for transdermal patch.

Adverse Reactions/Side Effects

Applies mainly to systemic use.

CNS: SEIZURES, confusion, drowsiness, agitation, blurred vision, dizziness, slurred speech. **EENT:** mucosal use—↓ or absent gag reflex. **CV:** CARDIAC ARREST, arrhythmias, bradycardia, heart block, hypotension. **GI:** nausea, vomiting. **Resp:** bronchospasm.

Hemat: methemoglobinemia. **Local:** stinging, burning, contact dermatitis, erythema. **MS:** chondrolysis.

Neuro: paresthesia, tremor. **Misc:** allergic reactions, including ANAPHYLAXIS.

Interactions

Applies mainly to systemic use.

Drug-Drug: ↑ cardiac depression and toxicity with phenytoin, amiodarone, quinidine, procainamide, or propranolol. Cimetidine, azole antifungals, clarithromycin, erythromycin, fluoxetine, fluvoxamine, nefazodone, paroxetine, protease inhibitors, propofol, ritonavir, verapamil, and propranolol may ↓ metabolism and ↑ risk of toxicity. Lidocaine may ↑ levels of calcium channel blockers, certain benzodiazepines, cyclosporine, fluoxetine, lovastatin, simvastatin, mirtazapine, paroxetine, ritonavir, tacrolimus, theophylline, tricyclic antidepressants, and venlafaxine. Effects of lidocaine may be ↓ by carbamazepine, phenobarbital, phenytoin, and rifampin.

Route/Dosage

Ventricular Tachycardia (with a Pulse) or Pulseless Ventricular Tachycardia/Ventricular Fibrillation

IV (Adults): 1–1.5 mg/kg bolus; may repeat doses of 0.5–0.75 mg/kg q 5–10 min up to a total dose of 3 mg/kg; may then start continuous infusion of 1–4 mg/min.

Endotracheal (Adults): Give 2–2.5 times the IV loading dose down the endotracheal tube, followed by a 10 mL saline flush.

IV (Children): 1 mg/kg bolus (not to exceed 100 mg), followed by 20–50 mcg/kg/min continuous infusion (range 20–50 mcg/kg/min); may administer second bolus of 0.5–1 mg/kg if delay between bolus and continuous infusion.

Endotracheal (Children): Give 2–3 mg/kg down the endotracheal tube followed by a 5 mL saline flush.

IM (Adults and Children ≥50 kg): 300 mg (4.5 mg/kg); may be repeated in 60–90 min.

Local

Infiltration (Adults and Children): Infiltrate affected area as needed (increased amount and frequency of use increases likelihood of systemic absorption and adverse reactions).

Topical (Adults): Apply to affected area 2–3 times daily.

Mucosal (Adults): For anesthetizing oral surfaces—20 mg as 2 sprays/quadrant (not to exceed 30 mg/quadrant) may be used. 15 mL of the viscous solution may be used q 3 hr for oral or pharyngeal pain. For anesthetizing the female urethra—3–5 mL of the jelly or 20 mg as 2% solution may be used. For anesthetizing the male urethra—5–10 mL of the jelly or 5–15 mL of 2% solution may be used before catheterization or 30 mL of jelly before cystoscopy or similar procedures. Topical solutions may be used to anesthetize mucous membranes of the larynx, trachea, or esophagus.

Mucosal (Children ≥3 yr): Do not exceed 4.5 mg/kg/dose (or 300 mg/dose) of viscous solution; swish in the mouth and spit out no more frequently than q 3 hr (maximum: 4 doses per 12-hour period).

Mucosal (Children <3 yr): ≤1.2 mL applied to area with a cotton-tipped applicator no more frequently than q 3 hr (maximum: 4 doses per 12-hour period); use only if the underlying condition requires treatment with product volume of ≤1.2 mL.

Patch (Adults): Up to 3 patches may be applied once for up to 12 hr in any 24-hr period; consider smaller areas of application in geriatric or debilitated patients.

Availability (generic available)

Autoinjector for IM injection: 300 mg/3 mL. IV push injection: 5 mg/mL (0.5%), 10 mg/mL (1%), 15 mg/mL (1.5%), 20 mg/mL (2%). For IV admixture: 100 mg/mL (10%). Premixed solution for IV infu-

sion: 200 mg/100 mL D5W (0.2%), 400 mg/100 mL D5W (0.4%), 1000 mg/250 mL D5W (0.4%), 2000 mg/500 mL D5W (0.4%), 800 mg/100 mL D5W (0.8%), 2000 mg/250 mL D5W (0.8%). **Injection for local infiltration/nerve block:** 0.5%, 1%, 2%, 4%.

In combination with: epinephrine for local infiltration. **Cream:** 4% ^{OTC}; **Gel:** 0.5% ^{OTC}, 2.5% ^{OTC}; **Jelly:** 2%. **Liquid:** 5%. **Ointment:** 5%. **Transdermal system:** 5% patch. **Cost:** \$309.45/30. **Solution:** 4%. **Spray:** 10%. **Viscous solution:** 2%. **In combination with:** prilocaine (as EMLA cream, Oraquix); with tetracaine (Synera); with bupivacaine (Duocaine); with epinephrine (LidoSite).

NURSING IMPLICATIONS

Assessment

- **Antiarrhythmic:** Monitor ECG continuously and BP and respiratory status frequently during administration.
- **Anesthetic:** Assess degree of numbness of affected part.
- **Transdermal:** Monitor for pain intensity in affected area periodically during therapy.
- **Lab Test Considerations:** Serum electrolyte levels should be monitored periodically during prolonged therapy.
- IM administration may cause ↑ CPK levels.
- **Toxicity and Overdose:** Monitor serum lidocaine levels periodically during prolonged or high-dose IV therapy. Therapeutic serum lidocaine levels range from 1.5 to 5 mcg/mL.
- Signs and symptoms of toxicity include confusion, excitation, blurred or double vision, nausea, vomiting, ringing in ears, tremors, twitching, seizures, difficulty breathing, severe dizziness or fainting, and unusually slow heart rate.
- If symptoms of overdose occur, stop infusion and monitor patient closely.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)
Acute pain (Indications)

Implementation

- **High Alert:** Lidocaine is readily absorbed through mucous membranes. Inadvertent overdose of lidocaine jelly and spray has resulted in patient harm or death from neurologic and/or cardiac toxicity. Do not exceed recommended doses.
- **Throat Spray:** Ensure that gag reflex is intact before allowing patient to drink or eat.
- **IM:** IM injections are recommended only when ECG monitoring is not available and benefits outweigh risks. Administer IM injections only into deltoid muscle while frequently aspirating to prevent IV injection.

IV Administration

- **IV Push:** Only 1% and 2% solutions are used for IV push injection. **Diluent:** Administer undiluted. **Rate:** Administer loading dose over 2–3 min. Follow by IV continuous infusion.
- **Continuous Infusion:** **Diluent:** Lidocaine vials need to be further diluted. Dilute 2 g of lidocaine in 250 mL or 500 mL of D5W or 0.9% NaCl. Admixed infusion stable for 24 hr at room temperature. Premixed infusions are already diluted and ready to use. **Concentration:** 4–8 mg/mL. **Rate:** See Route/Dosage section. Administer via infusion pump for accurate dose.
- **Y-Site Compatibility:** acetaminophen, acyclovir, alemtuzumab, alfentanil, alteplase, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, atropine, azithromycin, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefoxitin, ceftriaxone, cefazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, epifibatidate, ertapenem, erythromycin, esmolol, etomidate, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, indomethacin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, levofloxacin, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, mesna, methotrexate, methylodopate, methylprednisolone, metoclopramide, metronidazole, micafungin, midazolam, mitoxantrone, morphine, moxifloxacin, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nifedipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, pentazocine, phenolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, proprano-

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

lol, protamine, pyridoxine, quinupristin/dalfopristin, ranitidine, remifentanyl, rocuronium, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiopental, tigecycline, tirofiban, tobramycin, trimetaphan, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, vitamin B complex with C, voriconazole, warfarin, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, amphotericin B colloidal, azathioprine, caspofungin, dantrolene, diazepam, ganciclovir, milrinone, pantoprazole, pen-tobarbital, phenobarbital, phenytoin, thiopental, trimethoprim/sulfamethoxazole.
- **Infiltration:** Lidocaine with epinephrine may be used to minimize systemic absorption and prolong local anesthesia.
- **Transdermal:** When used concomitantly with other products containing local anesthetic agents, consider amount absorbed from all formulations.

Patient/Family Teaching

- May cause drowsiness and dizziness. Advise patient to call for assistance during ambulation and transfer.
- **IM:** Available in LidoPen Auto-Injector for use outside the hospital setting. Advise patient to telephone health care professional immediately if symptoms of a heart attack occur. Do not administer unless instructed by health care professional. To administer, remove safety cap and place back end on thickest part of thigh or deltoid muscle. Press hard until needle prick is felt. Hold in place for 10 sec, then massage area for 10 sec. Do not drive after administration unless absolutely necessary.
- **Topical:** Apply *Lidoderm Patch* to intact skin to cover the most painful area. Patch may be cut to smaller sizes with scissors before removing release liner. Clothing may be worn over patch. Avoid contact with water (bathing, swimming, showering), may not stick if it gets wet. If irritation or burning sensation occurs during application, remove patch until irritation subsides. Wash hands after application; avoid contact with eyes. Dispose of used patch to avoid access by children or pets.
- Caution women to consult health care professional before using a topical anesthetic for a mammogram or other procedures. If recommended, use lowest drug concentration, and apply sparingly. Do not apply to broken or irritated skin, do not wrap skin, and do not apply heat to area (heating pad/electric blanket), to decrease chance that drug may be absorbed into the body. May result in seizures, cardiac arrhythmias, respiratory failure, coma, and death.
- Advise patient referred for MRI test to discuss patch with referring health care professional and MRI facility to determine if removal of patch is necessary prior to test and for directions for replacing patch.
- **Mucosal:** Caution parent to administer as directed, not to use more or more often than directed, and to

use measuring device for accurate dose in children younger than 3 yrs. Advise parent that if signs and symptoms of toxicity (lethargy, shallow breathing, seizure activity) occur to seek emergency attention and not to administer more lidocaine.

- Caution parents that oral lidocaine causes numbness and may impair swallowing; do not administer food and/or chewing gum for at least 60 min after administration.

Evaluation/Desired Outcomes

- Decrease in ventricular arrhythmias.
- Local anesthesia.

lidocaine/prilocaine (lye-doe-kane/pri-loe-kane) EMLA, Oraqix

Classification

Therapeutic: anesthetics (topical/local)

Indications

Produces local anesthesia prior to minor painful procedures including: Insertion of cannulae or needles, Arterial/venous/lumbar puncture, Intramuscular injections, Subcutaneous injections, Dermal procedures, Laser treatments, Circumcision. When applied to genital mucous membranes in preparation for superficial minor surgery or as preparation for infiltration anesthesia. Produces localized anesthesia in periodontal pockets during scaling and/or root planing (Oraqix only).

Action

Produces local anesthesia by inhibiting transport of ions across neuronal membranes, thereby preventing initiation and conduction of normal nerve impulses. Combination of two anesthetics is applied as a system consisting of a cream under an occlusive dressing. Active drug is released into the dermal and epidermal skin layers, resulting in accumulation of local anesthetic in the regions of dermal pain receptors and nerve endings. **Therapeutic Effects:** Anesthetic action localized to the area of the application.

Pharmacokinetics

Absorption: Small amounts are systemically absorbed.

Distribution: Small amounts absorbed are widely distributed and cross the placenta and blood-brain barrier.

Metabolism and Excretion: *Lidocaine*—mostly metabolized by the liver. *Prilocaine*—metabolized by the liver and kidneys.

Half-life: *Lidocaine*—90–120 min (EMLA); 2–6 hr (Oraqix). *Prilocaine*—10–50 min (EMLA); 2–6 hr (Oraqix).

TIME/ACTION PROFILE (local anesthesia)

ROUTE	ONSET	PEAK	DURATION
Top	1 hr (EMLA); 30 sec (Oraqix)	30 3 hr (EMLA)	1–2 hr (EMLA)† 20 min (Oraqix)

†Following removal of occlusive dressing.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to lidocaine, prilocaine, or any other amide-type local anesthetic; Hypersensitivity to any other product in the formulation; Should not be applied to middle ear, mucous membranes, or broken/inflamed skin; **Pedi:** Congenital or idiopathic methemoglobinemia; Infants <1 mo if gestational age is <37 weeks; Infants <12 mo receiving methemoglobin-inducing agents.

Use Cautiously in: Repeated use or use on large areas of skin (more likely to result in systemic absorption); Acutely ill, or debilitated patients (↑ risk of absorption and systemic effects); Severe liver disease; Any conditions associated with methemoglobinemia (including glucose-6-phosphate dehydrogenase deficiency); **OB:** Use only if clearly needed; **Lactation:** Usually compatible with breast feeding (AAP); **Pedi:** Area/duration of treatment should be limited in neonates and children <20 kg or 37 wk gestation (↑ susceptibility to methemoglobinemia); **Ger:** May have ↑ absorption and risk of systemic effects.

Adverse Reactions/Side Effects

Local: blanching, redness, alteration in temperature sensation, edema, itching, rash, hyperpigmentation.

Misc: allergic reactions including **ANAPHYLAXIS**.

Interactions

Drug-Drug: Concurrent use with class I antiarrhythmics including **mexiletine** may result in adverse cardiovascular effects. Concurrent use with other **local anesthetics** may result in ↑ toxicity. Concurrent use with **sulfonamides**, **acetaminophen**, **chloroquine**, **nitroglycerin**, **nitroprusside**, **phenobarbital**, **phenytoin**, or **quinine** in children ↑ the risk of methemoglobinemia (avoid concurrent use in children <12 mo).

Route/Dosage**EMLA**

Topical (Adults and Children): *Minor dermal procedures including venipuncture and IV cannulation*—2.5 g (½ of the 5-g tube) applied to 20–25 cm² (2 in. by 2 in.) area of skin, covered with an occlusive dressing applied for at least 1 hr. *Major dermal procedures including split-thickness skin graft harvesting*—2 g/10 cm² area of skin, covered with an occlusive dressing for at least 2 hr. *Adult male genital*

skin—as an adjunct prior to local anesthetic infiltration, apply a thick layer (1 g/10 cm²) to skin surface for 15 min; local infiltration anesthesia should be performed immediately after removal of cream. *Adult female genital mucous membranes*—apply a thick layer (5–log) for 5–10 min.

Topical (Children 7–12 yr and >20 kg): Dose should not exceed 20 g over more than 200 cm² for more than 4 hr.

Topical (Children 1–6 yr and >10 kg): Dose should not exceed 10 g over more than 100 cm² for more than 4 hr.

Topical (Children 3 mo–12 mo and >5 kg): Dose should not exceed 2 g over more than 20 cm² for more than 4 hr.

Topical (Children 0–3 mo or <5 kg): Dose should not exceed 1 g over more than 10 cm² for more than 1 hr.

Oraqix

Topical (Adults): Apply on gingival margin around the selected teeth using the blunt-tipped applicator included in package; wait 30 seconds, then fill the periodontal pockets with gel using the blunt-tipped applicator until the gel becomes visible at the gingival margin; wait another 30 seconds before starting treatment; maximum recommended dose at one treatment session is 5 cartridges (8.5 g).

Availability (generic available)

Cream: 2.5% lidocaine with 2.5% prilocaine. **Periodontal gel:** 2.5% lidocaine with 2.5% prilocaine; 1.7 g/dental cartridge.

NURSING IMPLICATIONS**Assessment**

- Assess application site for open wounds. Apply only to intact skin.
- Assess application site for anesthesia following removal of system and prior to procedure.

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- **Topical:** **EMLA:** When used for minor dermal procedures (venipuncture, IV cannulation, arterial puncture, lumbar puncture), apply the 2.5-g tube of cream (½ of the 5-g tube) to each 2 in. by 2 in. area of skin in a *thick* layer at the site of the impending procedure. Remove the center cutout piece from an occlusive dressing (supplied with the 5-g tube) and peel the paper liner from the paper-framed dressing. Cover the lidocaine/prilocaine cream so that there is a *thick* layer of cream underneath the occlusive dressing. Do not spread out or rub in the cream. Smooth the dressing edges carefully and ensure it is

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

secure to avoid leakage. Remove the paper frame and mark the time of application on the occlusive dressing. Lidocaine/prilocaine cream must be applied *at least 1 hr* before the start of a minor dermal procedure (venipuncture, IV cannulation). Anesthesia may be more profound with 90 min–2 hr application. Remove the occlusive dressing and wipe off the lidocaine/prilocaine cream. Clean the entire area with antiseptic solution and prepare the patient for the procedure.

- For major dermal procedures (skin graft harvesting), follow the same procedure using larger amounts of lidocaine/prilocaine cream and the appropriate-size occlusive dressing. Lidocaine/prilocaine cream must be applied *at least 2 hr* before major dermal procedures.

Patient/Family Teaching

- Explain the purpose of cream and occlusive dressing to patient and parents. Inform the patient that lidocaine/prilocaine cream may block all sensations in the treated skin. Caution patient to avoid trauma to the area from scratching, rubbing, or exposure to extreme heat or cold temperatures until all sensation has returned.
- **Home Care Issues:** Instruct patient or parent in proper application. Provide a diagram of location for application.

Evaluation/Desired Outcomes

- Anesthesia in the area of application.

linagliptin (lin-a-glip-tin)

Trajenta,  Trajenta

Classification

Therapeutic: antidiabetics

Pharmacologic: dipeptidyl peptidase-4 (DDP-4) inhibitors, enzyme inhibitors

Indications

Adjunct to diet and exercise in the management of type 2 diabetes mellitus.

Action

Inhibits the enzyme dipeptidyl peptidase-4 (DPP-4), which slows the inactivation of incretin hormones, resulting in increased levels of active incretin hormones. These hormones are released by the intestine throughout the day, and are involved in regulation of glucose. Increased/prolonged incretin levels increase insulin release and decrease glucagon levels. **Therapeutic Effects:** Improved control of blood glucose.

Pharmacokinetics

Absorption: 30% absorbed following oral administration.

Distribution: Extensively distributed to tissues.

Metabolism and Excretion: Approximately 90% excreted unchanged in urine; minimally metabolized.

Half-life: >100 hr (due to saturable binding to DPP-4).

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1.5 hr†	24 hr

† Blood level.

Contraindications/Precautions

Contraindicated in: Hypersensitivity. Cross-sensitivity may exist with sitagliptin, alogliptin, or saxagliptin; Type 1 diabetes mellitus; Diabetic ketoacidosis.

Use Cautiously in: History of pancreatitis; **Ger:** Elderly may have greater sensitivity to drug effects; **OB:** Use during pregnancy only if clearly needed; **Lactation:** Excretion in breast milk unknown, use cautiously; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

Resp: bronchial hyperreactivity. **GI:** PANCREATITIS, ↑ lipase. **Derm:** bullous pemphigoid, localized exfoliation, urticaria. **Metab:** hypoglycemia, hypertriglyceridemia. **MS:** arthralgia. **Misc:** hypersensitivity reactions including ANGIOEDEMA, ANAPHYLAXIS, EXFOLIATIVE SKIN CONDITIONS, URTICARIA, OR BRONCHOSPASM.

Interactions

Drug-Drug: ↑ risk of hypoglycemia with sulfonylureas or insulin; dose ↓ of sulfonylurea or insulin may be necessary. Concurrent use of P-glycoprotein or CYP3A4 inducers, including rifampin may ↓ blood levels and effectiveness and should be avoided.

Route/Dosage

PO (Adults): 5 mg once daily.

Availability

Tablets: 5 mg. **In combination with:** empagliflozin (Glyxambi); metformin (Jentadueto); metformin XR (Jentadueto XR). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Observe patient for signs and symptoms of hypoglycemic reactions (abdominal pain, sweating, hunger, weakness, dizziness, headache, tremor, tachycardia, anxiety).
- Monitor for signs of pancreatitis (nausea, vomiting, anorexia, persistent severe abdominal pain, sometimes radiating to the back) during therapy. If pancreatitis occurs, discontinue linagliptin and monitor serum and urine amylase, amylase/creatinine clearance ratio, electrolytes, serum calcium, glucose, and lipase.
- Monitor for arthralgia. Severe joint pain usually disappears with discontinuation of linagliptin.
- **Lab Test Considerations:** Monitor hemoglobin A1C prior to and periodically during therapy.
- May cause ↑ uric acid levels.

Potential Nursing Diagnoses

Imbalanced nutrition: more than body requirements (Indications)
Noncompliance (Patient/Family Teaching)

Implementation

- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- **PO:** May be administered without regard to food.

Patient/Family Teaching

- Instruct patient to take linagliptin as directed. Take missed doses as soon as remembered, unless it is almost time for next dose; do not double doses. Advise patient to read the *Patient Package Insert* before starting and with each Rx refill in case of changes.
- Explain to patient that linagliptin helps control hyperglycemia but does not cure diabetes. Therapy is usually long term.
- Instruct patient not to share this medication with others, even if they have the same symptoms; it may harm them.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hyperglycemic or hypoglycemic episodes.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water, and notify health care professional.
- Instruct patient in proper testing of blood glucose and urine ketones. These tests should be monitored closely during periods of stress or illness and health care professional notified if significant changes occur.
- Advise patient to notify health care professional promptly if signs and symptoms of pancreatitis or if rash; hives; blisters; or swelling of face, lips, or throat occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially other oral hypoglycemic medications.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Improved hemoglobin A1C, fasting plasma glucose and 2-hr post-prandial glucose levels.

lindane (lin-dane)

gamma benzene hexachloride,  GBH,  Hexit,  PMS Lindane

Classification

Therapeutic: pediculocides, scabicides

Indications

Second-line treatment of parasitic arthropod infestation (scabies and head, body, and crab lice) for use only in patients who are intolerant to or do not respond to less toxic agents.

Action

Causes seizures and death in parasitic arthropods.

Therapeutic Effects: Cure of infestation by parasitic arthropods.

Pharmacokinetics

Absorption: Significant systemic absorption (9–13%) greater with topical application to damaged skin.

Distribution: Stored in fat.

Metabolism and Excretion: Metabolized by the liver.

Half-life: 17–22 hr (infants and children).

TIME/ACTION PROFILE (antiparasitic action)

ROUTE	ONSET	PEAK	DURATION
Top	rapid	6 hr	190 min

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Areas of skin rash, abrasion, or inflammation (absorption is increased); History of seizures; **Lactation:** Potentially toxic to infants; may ↓ milk supply; **Pedi:** Premature neonates (↑ risk of CNS toxicity).

Use Cautiously in: Patients with skin conditions (↑ risk of systemic absorption); **OB:** Do not exceed recommended dose; do not use >2 courses of therapy; **Pedi, Geri:** Children ≤2 yr and geriatric patients (↑ risk of systemic absorption and CNS side effects).

Adverse Reactions/Side Effects

All adverse reactions except dermatologic are signs of systemic absorption and toxicity.

CNS: SEIZURES, headache. **CV:** tachycardia. **GI:** nausea, vomiting. **Derm:** contact dermatitis (repeated application), local irritation.

Interactions

Drug-Drug: Concurrent use of medications that lower seizure threshold (may ↑ risk of seizures). Simultaneous topical use of skin, scalp, or hair products may ↑ systemic absorption.

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Route/Dosage

Scabies

Topical (Adults and Children >1 mo): 1% lotion applied to all skin surfaces from neck to toes; wash off 6 hr after application in infants, after 6–8 hr in children or after 8–12 hr in adults; may require a 2nd treatment 1 wk later.

Head Lice or Crab Lice

Topical (Adults and Children): 15–30 mL of shampoo applied and lathered for 4 min; may require a 2nd treatment 1 wk later.

Availability (generic available)

Lotion: 1%. **Shampoo:** 1%.

NURSING IMPLICATIONS

Assessment

- Assess skin and hair for signs of infestation before and after treatment.
- Examine family members and close contacts for infestation. When used in treatment of pediculosis pubis or scabies, sexual partners should receive concurrent prophylactic therapy.

Potential Nursing Diagnoses

Risk for impaired skin integrity (Indications)

Implementation

- Due to serious side effects, no more than 2 oz may be dispensed at a time and no refills are allowed.
- **Topical:** When applying medication to another person, wear gloves to prevent systemic absorption.
- Do not apply to open wounds (scratches, cuts, sores on skin or scalp) to minimize systemic absorption. Avoid contact with the eyes. If eye contact occurs, flush thoroughly with water and notify physician or other health care professional.
- Institute appropriate isolation techniques.
- **Lotion:** Instruct patient to bathe with soap and water. Dry skin well and allow to cool before application. Apply lotion in amount sufficient to cover entire body surface with a thin film from neck down (60 mL for an adult). Leave medication on for an age appropriate time frame (see dosing), then remove by washing. If rash, burning, or itching develops, wash off medication and notify physician or other health care professional.
- **Shampoo:** Use a sufficient amount of shampoo to wet hair and scalp (30 mL for short hair, 45 mL for medium hair, 60 mL for long hair). Rub thoroughly into hair and scalp and leave in place for 4 min. Then use enough water to work up a good lather; follow with thorough rinsing and drying. If applied in shower or bath, do not let shampoo run down on other parts of body or into water in which patient is sitting. When hair is dry, use fine-toothed comb to remove remaining nits or nit shells. Shampoo may also be used on combs and brushes to prevent spread of infestation.

Patient/Family Teaching

- Instruct patient on application technique and provide with a medication guide. Patient should repeat therapy only at the recommendation of health care professional. Discuss hygienic measures to prevent and to control infestation. Discuss potential for infectious contacts with patient. Explain why household members should be examined and sexual partners treated simultaneously.
- Instruct patient to wash all recently worn clothing and used bed linens and towels in very hot water or to dry clean to prevent reinfestation or spreading.
- Instruct patient not to apply other oils or creams during therapy; these increase the absorption of lindane and may lead to toxicity.
- Explain to patient that itching may persist after treatment; consult health care professional about use of topical hydrocortisone or systemic antihistamines.
- Advise patient that eyelashes can be treated by applying petroleum jelly 3 times/day for 1 wk.
- **Instruct patient not to reapply sooner than 1 wk if live mites appear.**
- **Shampoo:** Advise patient that shampoo should not be used as a regular shampoo in the absence of infestation. Emphasize need to avoid contact with eyes.
- **Pedi:** Advise parents to monitor young children closely for evidence of CNS toxicity (seizures, dizziness, clumsiness, fast heartbeat, muscle cramps, nervousness, restlessness, irritability, nausea, vomiting) during and immediately after treatment.
- **Pedi:** Cover hands of young children to prevent accidental ingestion from thumbsucking.

Evaluation/Desired Outcomes

- Resolution of signs of infestation with scabies or lice.

linezolid (li-nez-o-lid)

Zyvox,  Zyvoxam

Classification

Therapeutic: anti-infectives
Pharmacologic: oxazolidinones

Indications

Treatment of: Infections caused by vancomycin-resistant *Enterococcus faecium*, Nosocomial pneumonia caused by *Staphylococcus aureus* (methicillin-susceptible and -resistant strains), Complicated skin/skin structure infections caused by *Staphylococcus aureus* (methicillin-susceptible and -resistant strains), *Streptococcus pyogenes* or *Streptococcus agalactiae* (including diabetic foot infections), Uncomplicated skin/skin structure infections caused by *Staphylococcus aureus* (methicillin-susceptible and -resistant strains), *Streptococcus pyogenes*, Community-acquired pneumonia caused by *Streptococcus pneumoniae* (including multi-drug resistant strains) or *Staphylococcus aureus* (methicillin-susceptible strains only).

Action

Inhibits bacterial protein synthesis at the level of the 23S ribosome of the 50S subunit. **Therapeutic Effects:** Bactericidal action against streptococci; bacteriostatic action against enterococci and staphylococci.

Pharmacokinetics

Absorption: Rapidly and extensively (100%) absorbed following oral administration.

Distribution: Readily distributes to well-perfused tissues.

Metabolism and Excretion: 65% metabolized, mostly by the liver; 30% excreted unchanged by the kidneys.

Half-life: 6.4 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1–2 hr	12 hr
IV	rapid	end of infusion	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Phenylketonuria (suspension contains aspartame); Uncontrolled HTN, pheochromocytoma, thyrotoxicosis, or concurrent use of sympathomimetic agents, vasopressors, or dopaminergic agents (↑ risk of hypertensive response); Concurrent or recent (<2 wk) use of monoamine oxidase (MAO) inhibitors (↑ risk of hypertensive response); Carcinoid syndrome or concurrent use of SSRIs, TCAs, triptans, meperidine, or buspirone (↑ risk of serotonin syndrome).

Use Cautiously in: Thrombocytopenia, concurrent use of antiplatelet agents or bleeding diathesis (platelet counts should be monitored more frequently); Diabetes (↑ risk of hypoglycemia); **OB:** Safety not established; use only if maternal benefit outweighs potential risk to fetus; **Lactation:** Lactation.

Adverse Reactions/Side Effects

CV: headache, insomnia. **EENT:** teeth discoloration, tongue discoloration. **GI:** CLOSTRIDIUM DIFFICILE-ASSOCIATED DIARRHEA (CDAD), diarrhea, ↑ liver enzymes, nausea, taste alteration, vomiting. **Endo:** hypoglycemia. **F and E:** lactic acidosis. **Hemat:** thrombocytopenia. **Neuro:** optic neuropathy, peripheral neuropathy. **Misc:** SEROTONIN SYNDROME.

Interactions

Drug-Drug: ↑ risk of hypertensive response with MAO inhibitors, sympathomimetics (e.g., pseudoephedrine), vasopressors (e.g., epinephrine, norepinephrine), and dopaminergic agents (e.g., dopamine, dobutamine); concurrent or recent use should be avoided. ↑ risk of serotonin syndrome with SSRIs, TCAs, triptans, meperidine, bupropion, or

buspirone; avoid concurrent use. Rifampin, carbamazepine, phenytoin, and phenobarbital may ↓ levels. Concurrent use with oral hypoglycemics or insulin may ↑ risk of hypoglycemia.

Drug-Food: Because of monoamine oxidase inhibitory properties, consumption of large amounts of foods or beverages containing tyramine should be avoided (↑ risk of pressor response. See Appendix K).

Route/Dosage

Vancomycin-Resistant *Enterococcus faecium* Infections

PO, IV (Adults): 600 mg every 12 hr for 14–28 days.

PO, IV (Children birth–11 yr): (in the first wk of life, pre-term neonates may initially receive 10 mg/kg every 12 hr).

Pneumonia, Complicated Skin/Skin Structure Infections

PO, IV (Adults): 600 mg every 12 hr for 10–14 days.

PO, IV (Children birth–11 yr): 10 mg/kg every 8 hr for 10–14 days (in the first wk of life, pre-term neonates may initially receive 10 mg/kg every 12 hr).

Uncomplicated Skin/Skin Structure Infections

PO (Adults): 400 mg q 12 hr for 10–14 days.

PO, IV (Children 5–11 yr): 10 mg/kg every 12 hr for 10–14 days.

PO, IV (Children <5 yr): 10 mg/kg every 8 hr for 10–14 days (in the first wk of life, pre-term neonates may initially receive 10 mg/kg every 12 hr).

Availability (generic available)

Oral suspension: (orange-flavored): 20 mg/mL.

Tablets: 600 mg. **Premixed infusion:** 200 mg/100 mL, 400 mg/200 mL, 600 mg/300 mL.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.
- Obtain specimens for culture and sensitivity prior to initiating therapy. First dose may be given before receiving.
- May cause lactic acidosis. Notify health care professional if recurrent nausea and vomiting, unexplained acidosis or low bicarbonate levels occur.
- Monitor visual function in patients receiving linezolid for ≥3 mo or who report visual symptoms (changes in acuity or color vision, blurred vision, visual field defect) regardless of length of therapy. If optic neuropathy occurs therapy should be reconsidered.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be re-

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

ported to health care professional promptly as a sign of Clostridium difficile-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.

- Monitor patient taking serotonergic drugs for signs of serotonin syndrome (hyperthermia, rigidity, myoclonus, autonomic instability, mental status changes (extreme agitation progressing to delirium and coma) for two wk (five wk if fluoxetine was taken) or until 24 hours after the last dose of linezolid, whichever comes first.
- **Lab Test Considerations:** May cause bone marrow suppression, anemia, leukopenia, pancytopenia. Monitor CBC and platelet count weekly, especially in patients at risk for increased bleeding, having pre-existing bone marrow suppression, receiving concurrent medications that may cause myelosuppression, or requiring >2 wk of therapy. Discontinue therapy if bone marrow suppression occurs or worsens.
- May cause ↑ AST, ALT, LDH, alkaline phosphatase and BUN.
- May cause hypoglycemia requiring decrease in dose of antidiabetic agent or discontinuation of linezolid.

Potential Nursing Diagnoses

Risk for infection (Indications)

Diarrhea (Adverse Reactions)

Implementation

- **High Alert:** Do not confuse Zyvox with Vioxx or Zovirax.
- Dose adjustment is not necessary when switching from IV to oral dose.
- **PO:** May be administered with or without food.
- Before using oral solution gently invert 3–5 times to mix; do not shake. Store at room temperature.

IV Administration

- **Intermittent Infusion:** **Diluent:** Premixed infusions are already diluted and ready to use. Solution is yellowish in color which may intensify over time without affecting its potency. **Concentration:** 2 mg/mL. **Rate:** Infuse over 30–120 minutes. Flush line before and after infusion.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium acetate, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride,

dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, epifibatidate, ertapenem, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, fosfarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, pentazocine, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, ranitidine, remifentanyl, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, tepiposide, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** amphotericin B colloidal, chlorpromazine, dantrolene, diazepam, pantoprazole, pentamidine, phenytoin, thiopental.

Patient/Family Teaching

- Advise patients taking oral linezolid to take as directed, for full course of therapy, even if feeling better. Take missed doses as soon as remembered unless almost time for next dose; do not double dose.
- Instruct patient to avoid large quantities of foods or beverages containing tyramine (See Appendix K). May cause hypertensive response.
- Instruct patient to notify health care professional if patient has a history of hypertension or seizures.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially cold remedies, decongestants, or antidepressants.
- **Instruct patient to notify health care professional if changes in vision occur or immediately if diarrhea, abdominal cramping, fever, or bloody stools occur**

and not to treat with antidiarrheals without consulting health care professionals.

- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Advise patient to notify health care professional if no improvement is seen in a few days.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of infection. Length of time for complete resolution depends on organism and site of infection.

REMS

liraglutide (lir-a-gloo-tide)

Saxenda, Victoza

Classification

Therapeutic: antidiabetics
Pharmacologic: glucagon-like peptide-1 (GLP-1) receptor agonists

Indications

Victoza: Adjunct treatment to diet and exercise in the management of adults with type 2 diabetes mellitus; not recommended as first line therapy, as a substitute for insulin, in patients with type 1 diabetes, or for ketoacidosis. **Saxenda:** Chronic weight management in patients in patients who are obese (body mass index [BMI] ≥ 30 kg/m²) or are overweight (BMI ≥ 27 kg/m²) with ≥ 1 weight-related comorbid condition (e.g. hypertension, dyslipidemia, type 2 diabetes).

Action

Acts as an acylated human glucagon-like peptide-1 (GLP-1, an incretin) receptor agonist; increases intracellular cyclic AMP (cAMP) leading to insulin release when glucose is elevated, which then subsides as blood glucose decreases toward euglycemia. Also decreases glucagon secretion and delays gastric emptying. Also helps to suppress appetite, leading to decreased caloric intake. **Therapeutic Effects:** Improved glycemic control. Reduction in body weight.

Pharmacokinetics

Absorption: 55% absorbed following subcutaneous injection.

Distribution: Unknown.

Protein Binding: >98%.

Metabolism and Excretion: Endogenously metabolized.

Half-life: 13 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
Subcut	within 4 wk† within 2 wk‡	8 wk† 40 wk‡	unk†‡

† ↓ in HbA1c.

‡ ↓ in body weight.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Personal or family history of medullary thyroid carcinoma; Multiple Endocrine Neoplasia syndrome type 2; Type 1 diabetes (Victoza only); Diabetic ketoacidosis (Victoza only); History of suicidal attempts or suicidal thoughts (Saxenda only); **OB:** Weight loss not recommended during pregnancy (Saxenda only); **Lactation:** Avoid use; **Pedi:** Not recommended.

Use Cautiously in: History of pancreatitis; History of angioedema to another GLP-1 receptor agonist; Hepatic/renal impairment; **OB:** Use only if potential benefit justifies potential risk to fetus (Victoza only).

Adverse Reactions/Side Effects

CNS: SUICIDAL BEHAVIOR/IDEATION (Saxenda only), headache. **CV:** tachycardia. **Derm:** pruritis, rash.

Endo: THYROID C-CELL TUMORS. **GI:** PANCREATITIS, diarrhea, nausea, vomiting, cholecystitis (Saxenda only), cholelithiasis (Saxenda only), constipation. **GU:** acute renal failure. **Local:** HYPERSENSITIVITY REACTIONS INCLUDING ANAPHYLAXIS AND ANGIOEDEMA, injection site reactions.

Interactions

Drug-Drug: Concurrent use with agents that increase insulin secretion including sulfonylureas may ↑ the risk of serious hypoglycemia, use cautiously and consider dose ↓ of agent increasing insulin secretion. May alter absorption of concomitantly administered oral medications due to delayed gastric emptying.

Route/Dosage

Victoza

Subcut (Adults): 0.6 mg once daily initially for 1 wk, then 1.2 mg once daily for 1 wk; may then ↑ dose, if needed up to 1.8 mg once daily.

Saxenda

Subcut (Adults): 0.6 mg once daily for 1 wk (Wk 1), then 1.2 mg once daily for 1 wk (Wk 2), then 1.8 mg once daily for 1 wk (Wk 3), then 2.4 mg once daily for 1 wk (Wk 4), then 3 mg once daily.

Availability

Solution for subcutaneous injection (Victoza): Pre-filled, multi-dose pen that delivers doses of 0.6 mg,

* = Canadian drug name. † = Genetic implication. ~~through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

1.2 mg, or 1.8 mg. **Solution for subcutaneous injection (Saxenda):** Pre-filled, multi-dose pen that delivers doses of 0.6 mg, 1.2 mg, 1.8 mg, 2.4 mg, or 3 mg. **In combination with:** insulin degludec (Xultophy). See Appendix B.

NURSING IMPLICATIONS

Assessment

- If thyroid nodules or elevated serum calcitonin are noted, patient should be referred to an endocrinologist.
- Monitor for pancreatitis (persistent severe abdominal pain, sometimes radiating to the back, with or without vomiting). If pancreatitis is suspected, discontinue liraglutide; if confirmed, do not restart liraglutide.
- **Victoza:** Observe patient taking concurrent insulin for signs and symptoms of hypoglycemic reactions (sweating, hunger, weakness, dizziness, tremor, tachycardia, anxiety).
- **Saxenda:** Monitor patients for weight loss and adjust concurrent medications (antihypertensives, antidiabetics, lipid-lowering agents) as needed.
- **Lab Test Considerations:** Monitor serum HbA1c periodically during therapy to evaluate effectiveness.

Potential Nursing Diagnoses

Imbalanced nutrition: more than body requirements (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- **Subcut:** Administer once daily at any time of the day, without regard to food. Inject into abdomen, thigh, or upper arm. Solution should be clear and colorless; do not administer solutions that are discolored or contain particulate matter.
- Initial dose of 0.6 mg/day is increased after 1 wk to 1.2 mg/day. If glycemic control is not acceptable, increase to 1.8 mg/day. Available in a prefilled pen without needle; patient may require Rx for needles.
- **First Time Use for Each New Pen**—Follow manufacturer's instructions only once with each new pen or if pen is dropped.

Patient/Family Teaching

- Instruct patient on use of pen injector and to take liraglutide as directed. If a dose is missed, omit and take next dose as scheduled; do not double doses. If >3 days dosing missed, reinstate with 0.6 mg dose; titrate at direction of health care professional. Pen should never be shared between patients, even if needle is changed. Store pen in refrigerator; do not freeze. After initial use, pen may be stored at room temperature or refrigerated up to 30 days. Keep pen cap on when not in use. Protect from excessive heat and sunlight. Remove and safely discard needle after

each injection and store pen without needle attached. Advise patient to read the *Patient Medication Guide* before starting liraglutide and with each Rx refill.

- If a dose is missed do not make up, skip and take next scheduled dose the next day. If more than 3 days are missed, reinstate at 0.6 mg to minimize GI effects. Notify health care professional and increase dose as directed.
- Inform patient that nausea is the most common side effect, but usually decreases over time.
- Advise patient taking insulin and liraglutide to never mix insulin and liraglutide together. Give as 2 separate injections. Both injections may be given in the same body area, but should not be given right next to each other.
- Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long-term.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water and notify health care professional.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hypoglycemic or hyperglycemic episodes.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness, and health care professional should be notified if significant changes occur.
- Advise patient to tell health care professional what medications they are taking and to avoid taking new Rx, OTC, vitamins, or herbal products without consulting health care professional.
- Advise patient to notify discontinue liraglutide and health care professional immediately if signs of pancreatitis (nausea, vomiting, abdominal pain) occur.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Inform patient of risk of benign and malignant thyroid C-cell tumors. Advise patient to notify health care professional if symptoms of thyroid tumors (lump in neck, hoarseness, trouble swallowing, shortness of breath) or if signs of allergic reaction (swelling of face, lips, tongue, or throat; fainting or feeling dizzy; very rapid heartbeat; problems breathing or swallowing; severe rash or itching) occur.
- Insulin is the preferred method of controlling blood glucose during pregnancy. Counsel female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Advise patient to carry a form of sugar (sugar packets, candy) and identification describing disease process and medication regimen at all times.
- Emphasize the importance of routine follow-up exams.

Evaluation/Desired Outcomes

- Improved glycemic control.
- Reduction in body weight. If patient has not lost at least 4% of body weight after 16 wks of therapy, it is unlikely that patient will achieve and sustain clinically meaningful weight loss with continued treatment.

lisinopril, See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.

lithium (lith-ee-um)

★ Carbolith, ★ Lithane, ★ Lithmax, Lithobid

Classification

Therapeutic: mood stabilizers

Indications

Manic episodes of bipolar I disorder (treatment, maintenance, prophylaxis).

Action

Alters cation transport in nerve and muscle. May also influence reuptake of neurotransmitters. **Therapeutic Effects:** Prevents/decreases incidence of acute manic episodes.

Pharmacokinetics

Absorption: Completely absorbed after oral administration.

Distribution: Widely distributed into many tissues and fluids; CSF levels are 50% of plasma levels. Crosses the placenta; enters breast milk.

Metabolism and Excretion: Excreted almost entirely unchanged by the kidneys.

Half-life: 20–27 hr.

TIME/ACTION PROFILE (antimanic effects)

ROUTE	ONSET	PEAK	DURATION
PO, PO-ER	5–7 days	10–21 days	days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Severe cardiovascular or renal disease; Dehydrated or debilitated patients; Sodium depletion; Brugada syndrome; Should be used only where therapy, including blood levels, may be closely monitored; Some products contain alcohol or tartrazine and should be avoided in patients with known hypersensitivity or intolerance; **Lactation:** Lactation.

Use Cautiously in: Any degree of cardiac, renal, or thyroid disease; Diabetes mellitus; **OB:** Fetal cardiac

anomalies are associated with lithium use; however, potential maternal benefit may warrant use in some pregnant women; **Geri:** Initial dosage ↓ recommended.

Adverse Reactions/Side Effects

CNS: SEIZURES, fatigue, headache, impaired memory, ataxia, sedation, confusion, dizziness, drowsiness, psychomotor retardation, restlessness, stupor. **EENT:** aphasia, blurred vision, dysarthria, tinnitus. **CV:** ECG changes, arrhythmias, edema, hypotension, unmasking of Brugada syndrome. **GI:** abdominal pain, anorexia, bloating, diarrhea, nausea, dry mouth, metallic taste. **GU:** polyuria, glycosuria, nephrogenic diabetes insipidus, renal toxicity. **Derm:** acneiform eruption, folliculitis, alopecia, diminished sensation, pruritus. **Endo:** hypothyroidism, goiter, hyperglycemia, hyperthyroidism. **F and E:** hyponatremia. **Hemat:** leukocytosis. **Metab:** weight gain. **MS:** muscle weakness, hyperirritability, rigidity. **Neuro:** tremors.

Interactions

Drug-Drug: May prolong the action of **neuromuscular blocking agents**. ↑ risk of neurologic toxicity with **calcium channel blockers** or **carbamazepine**. **Diuretics**, **NSAIDs**, **ACE inhibitors**, **angiotensin II receptor blockers**, and **metronidazole** may ↑ levels and risk of toxicity. Hypothyroid effects may be additive with **potassium iodide** or **antithyroid agents**. **Aminophylline**, **acetazolamide**, **theophylline**, and **sodium bicarbonate** ↑ renal elimination and ↓ effectiveness. **Psyllium** can ↓ lithium levels.

Drug-Natural Products: Caffeine-containing herbs (**cola nut**, **guarana**, **mate**, **tea**, **coffee**) may ↓ lithium serum levels and efficacy.

Drug-Food: Large changes in **sodium** intake may alter the renal elimination of lithium. ↑ sodium intake will ↑ renal excretion.

Route/Dosage

Precise dosing is based on serum lithium levels. 300 mg lithium carbonate contains 8–12 mEq lithium.

PO (Adults and children ≥12 yr): *Tablets/capsules*—300–600 mg 3 times daily initially; usual maintenance dose is 300 mg 3–4 times daily. *Extended-release tablets*—450–900 mg twice daily or 300–600 mg 3 times daily initially; usual maintenance dose is 450 mg twice daily or 300 mg 3 times daily.

PO (Children <12 yr): 15–20 mg (0.4–0.5 mEq)/kg/day in 2–3 divided doses; dosage may be adjusted weekly.

Availability (generic available)

Capsules: 150 mg, 300 mg, 600 mg. **Cost:** *Generic*—150 mg \$13.97/100, 300 mg \$17.91/100, 600 mg \$39.11/100. **Tablets:** 300 mg. **Cost:** *Generic*—\$21.52/100. **Extended-release tablets:** 300 mg, 450 mg. **Cost:** *Generic*—300 mg \$46.52/100, 450 mg

★ = Canadian drug name. ⚡ = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

\$50.05/100. **Oral solution:** 300 mg (8 mEq lithium)/5 mL.

NURSING IMPLICATIONS

Assessment

- Assess mental status (orientation, mood, behavior) initially and periodically. **Initiate suicide precautions if indicated.**
- Monitor intake and output ratios. Report significant changes in totals. Unless contraindicated, fluid intake of at least 2000–3000 mL/day should be maintained. Weight should also be monitored at least every 3 mo.
- **Lab Test Considerations:** Evaluate renal and thyroid function, WBC with differential, serum electrolytes, and glucose periodically during therapy.
- **Toxicity and Overdose:** Monitor serum lithium levels twice weekly during initiation of therapy and every 2 mo during chronic therapy. Draw blood samples in the morning immediately before next dose. Therapeutic levels range from 0.5 to 1.5 mEq/L for acute mania and 0.6–1.2 mEq/L for long term control. Serum concentrations should not exceed 2.0 mEq/L.
- Assess patient for signs and symptoms of lithium toxicity (vomiting, diarrhea, slurred speech, decreased coordination, drowsiness, muscle weakness, or twitching). If these occur, report before administering next dose.

Potential Nursing Diagnoses

Disturbed thought process (Indications)

Ineffective coping (Indications)

Imbalanced nutrition: for more than body requirements (Side Effects)

Implementation

- **Do not confuse lithium carbonate with lanthanum carbonate. Do not confuse lithium with Ultram (tramadol).**
- **PO:** Administer with food or milk to minimize GI irritation. Extended-release preparations should be swallowed whole; do not break, crush, or chew.

Patient/Family Teaching

- Instruct patient to take medication as directed, even if feeling well. Take missed doses as soon as remembered unless within 2 hr of next dose (6 hr if extended release).
- Lithium may cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Low sodium levels may predispose patient to toxicity. Advise patient to drink 2000–3000 mL fluid each day and eat a diet with consistent and moderate sodium intake. Excessive amounts of coffee, tea, and cola should be avoided because of diuretic effect. Avoid activities that cause excess sodium loss (heavy

exertion, exercise in hot weather, saunas). Notify health care professional of fever, vomiting, and diarrhea, which also cause sodium loss.

- Advise patient that weight gain may occur. Review principles of a low-calorie diet.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially NSAIDs.
- Review side effects and symptoms of toxicity with patient. Instruct patient to stop medication and report signs of toxicity to health care professional promptly.
- Advise patient to notify health care professional if fainting, irregular pulse, or difficulty breathing occurs.
- Advise patient to use contraception and to consult health care professional if pregnancy is planned or suspected or if breast feeding. Lithium may be teratogenic.
- Emphasize the importance of periodic lab tests to monitor for lithium toxicity.

Evaluation/Desired Outcomes

- Resolution of the symptoms of mania (hyperactivity, pressured speech, poor judgment, need for little sleep).
- Decreased incidence of mood swings in bipolar disorders.
- Improved affect in unipolar disorders. Improvement in condition may require 1–3 wk.
- Decreased incidence of acute manic episodes.

lixisenatide (lix-i-sen-a-tide)

Adlyxin

Classification

Therapeutic: antidiabetics

Pharmacologic: glucagon-like peptide-1 (GLP-1) receptor agonists

Indications

Adjunct to diet and exercise in the treatment of type 2 diabetes mellitus.

Action

Acts as an agonist at the glucagon-like peptide-1 (GLP-1) receptor resulting in augmented glucose-dependent insulin secretion and slowing of gastric emptying.

Therapeutic Effects: Improved glycemic control.

Pharmacokinetics

Absorption: Bioavailability following subcut injection unknown.

Distribution: Extensively distributed to tissues.

Metabolism and Excretion: Degraded by proteolytic enzymes and excreted primarily through urine.

Half-life: 3 hr.

TIME/ACTION PROFILE (effect on postprandial blood glucose)

ROUTE	ONSET	PEAK	DURATION
Subcut	unknown	1–3 hr	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; End-stage renal disease.

Use Cautiously in: Renal impairment (monitor renal function during initiation and dose escalation); History of cholelithiasis or alcohol abuse (↑ risk of pancreatitis); **Geri:** May be more sensitive to drug effects; **OB:** Use only if potential benefit to mother exceeds risk to fetus; **Lactation:** Consider breast feeding only if potential benefit outweighs risks to infant; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: dizziness, headache. **Endo:** hypoglycemia. **GI:** PANGREATITIS, nausea, vomiting, abdominal distention, abdominal pain, constipation, diarrhea, dyspepsia. **GU:** renal impairment (in association with nausea, vomiting, diarrhea, or dehydration). **Local:** injection site reactions. **Misc:** HYPERSENSITIVITY REACTIONS.

Interactions

Drug-Drug: ↑ risk of hypoglycemia with other anti-diabetic agents, especially insulin and sulfonylureas (dose ↓ of insulin or sulfonylureas may be warranted). May alter the absorption of concurrently administered oral medications (take oral contraceptives ≥ 1 hr before or ≥ 11 hr after lixisenatide).

Route/Dosage

Subcut (Adults): 10 mcg once daily for 14 days, then ↑ to 20 mcg once daily starting on Day 15.

Availability

Solution for subcut injection (in prefilled pens): 50 mcg/mL (10 mcg/dose), 100 mcg/mL (20 mcg/dose). **In combination with:** insulin glargine (Soliqua). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Observe for signs and symptoms of hypoglycemic reactions (abdominal pain, sweating, hunger, weakness, dizziness, headache, drowsiness, tremor, tachycardia, anxiety, confusion, irritability, jitteriness), especially when combined with oral sulfonylureas or basal infusion. May require dose ↓ of sulfonylurea or basal infusion.
- Monitor for signs and symptoms of hypersensitivity reactions (rash, swelling of face, lips, tongue or throat, difficulty breathing or swallowing, feeling faint or dizzy, tachycardia, hypotension, laryngeal edema, bronchospasm), especially in patient with

history of anaphylaxis or angioedema with another GLP-1 receptor agonist.

- Monitor for signs and symptoms of pancreatitis (persistent severe abdominal pain, sometimes radiating to back and may or may not be accompanied by vomiting). Promptly discontinue lixisenatide and initiate treatment if pancreatitis is suspected. Do not restart lixisenatide if pancreatitis is confirmed. Consider other antidiabetic therapies in patients with a history of pancreatitis.
- **Lab Test Considerations:** Monitor serum glucose and glycosylated hemoglobin periodically during therapy to evaluate effectiveness of therapy.
- Monitor renal function when starting or ↑ lixisenatide dose in patients with renal impairment and in patients with severe GI reactions.

Potential Nursing Diagnoses

Imbalanced nutrition: more than body requirements (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- **Subcut:** Activate pen before first use. Administer within 1 hr before first meal of day, preferably the same meal each day. Pinch skin and inject in abdomen, thigh, or upper arm; slowly count to 2 before removing needle from skin. Rotate injection sites with each dose. Solution is clear and colorless; do not administer solutions that are discolored or contain particulate matter. Keep pen in original packaging; discard 14 days after 1st use.

Patient/Family Teaching

- Instruct patient in proper technique for administration, timing of dose and concurrent oral medications, storage of medication, and disposal of used needles. Training should include a practice injection. Administer missed doses within 1 hr of next meal. Advise patient to read *Medication Guide and Instructions for Use* before starting therapy and with each Rx refill in case of changes.
- Inform patient that pen needles are not included with pen and must be purchased separately. Advise patient which needle length and gauge should be used. Caution patient not to share pen and needles, even if needle is changed. May cause transmission of blood-borne pathogens.
- Advise patient to stop taking lixisenatide and notify health care professional immediately if signs and symptoms of hypersensitivity or pancreatitis occur.
- Explain to patient that lixisenatide helps control hyperglycemia but does not cure diabetes. Therapy is usually long term.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hyperglycemic or hypoglycemic episodes.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water, and notify health care professional. Risk of hypoglycemia is ↑ if sulfonylureas or basal infusion are taken concurrently with lixisenatide.
- Caution patient to maintain adequate hydration (2 L liquid/day) to minimize risk or renal failure.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- **Rep:** Advise female patient taking oral contraceptives to take them at ≥1 hr before or 11 hr after lixisenatide dose. Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Improved glycemic control in patients with type 2 diabetes.

loperamide (loe-per-a-mide)

❁ Imodium, Imodium A-D

Classification

Therapeutic: antidiarrheals

Indications

Adjunctive therapy of acute diarrhea. Chronic diarrhea associated with inflammatory bowel disease. Decreases the volume of ileostomy drainage.

Action

Inhibits peristalsis and prolongs transit time by a direct effect on nerves in the intestinal muscle wall. Reduces fecal volume, increases fecal viscosity and bulk while diminishing loss of fluid and electrolytes. **Therapeutic Effects:** Relief of diarrhea.

Pharmacokinetics

Absorption: Not well absorbed following oral administration.

Distribution: Unknown. Does not cross the blood-brain barrier.

Protein Binding: 97%.

Metabolism and Excretion: Metabolized partially by the liver, undergoes enterohepatic recirculation; 30% eliminated in the feces. Minimal excretion in the urine.

Half-life: 10.8 hr.

TIME/ACTION PROFILE (relief of diarrhea)

ROUTE	ONSET	PEAK	DURATION
PO	1 hr	2.5–5 hr	10 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Patients in whom constipation must be avoided; Abdominal pain of unknown cause, especially if associated with fever; Alcohol intolerance (liquid only).

Use Cautiously in: Hepatic dysfunction; **Lactation:** Usually compatible with breast feeding; **OB:** Safety not established; **Pedi:** Children <2 yr (safety not established); **Geri:** ↑ sensitivity to effects.

Adverse Reactions/Side Effects

CNS: drowsiness, dizziness. **CV:** **CARDIAC ARREST, QT INTERVAL PROLONGATION, TORSADES DE POINTES, VENTRICULAR ARRHYTHMIAS**, syncope. **GI:** constipation, abdominal pain/distention/discomfort, dry mouth, nausea, vomiting. **Misc:** allergic reactions.

Interactions

Drug-Drug: ↑ CNS depression with other CNS depressants, including alcohol, antihistamines, opioid analgesics, and sedative/hypnotics. ↑ anticholinergic properties with other drugs having anticholinergic properties, including antidepressants and antihistamines. Concurrent use of cimetidine, clarithromycin, erythromycin, gemfibrozil, itraconazole, ketoconazole, quinidine, ranitidine, or ritonavir may ↑ levels and risk of cardiac arrhythmias.

Drug-Natural Products: Kava-kava, valerian, skullcap, chamomile, or hops can ↑ CNS depression.

Route/Dosage

Acute and Chronic Diarrhea

PO (Adults and Children >12 yr): 4 mg initially, then 2 mg after each loose stool. Maintenance dose usually 4–8 mg/day in divided doses (not to exceed 8 mg/day for OTC use or 16 mg/day for Rx use).

Acute Diarrhea

PO (Children 9–11 yr or 30–47 kg): 2 mg initially; then 1 mg after each loose stool (not to exceed 6 mg/24 hr; OTC use should not exceed 2 days).

PO (Children 6–8 yr or 24–30 kg): 1 mg initially, then 1 mg after each loose stool (not to exceed 4 mg/24 hr; OTC use should not exceed 2 days).

PO (Children 2–5 yr or 13–20 kg): 1 mg initially, then 0.1 mg/kg after each loose stool (not to exceed 3 mg/24 hr; OTC use should not exceed 2 days).

Chronic Diarrhea

PO (Children): 0.08–0.24 mg/kg/day divided 2–3 times/day (not to exceed 2 mg/dose).

Availability (generic available)

Tablets: 2 mg^{OTC}. **Capsules:** 2 mg. **Oral liquid (mint):** 1 mg/5 mL^{OTC}, 1 mg/7.5 mL^{OTC}. **In combination with:** simethicone (Imodium Multi-Symptom Relief^{OTC}, see Appendix B).

NURSING IMPLICATIONS

Assessment

- Assess frequency and consistency of stools and bowel sounds prior to and during therapy.
- Assess fluid and electrolyte balance and skin turgor for dehydration.

Potential Nursing Diagnoses

Diarrhea (Indications)

Risk for injury (Side Effects)

Implementation

- **PO:** Administer with clear fluids to help prevent dehydration, which may accompany diarrhea.

Patient/Family Teaching

- Instruct patient to take medication as directed. Do not take missed doses, and do not double doses. In acute diarrhea, medication may be ordered after each unformed stool. Advise patient not to exceed the maximum number of doses.
- May cause drowsiness. Advise patient to avoid driving or other activities requiring alertness until response to drug is known.
- Advise patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may relieve dry mouth.
- Caution patient to avoid using alcohol and other CNS depressants concurrently with this medication.
- Instruct patient to notify health care professional if diarrhea persists or if fever, abdominal pain, or distention occurs.

Evaluation/Desired Outcomes

- Decrease in diarrhea.
- In acute diarrhea, treatment should be discontinued if no improvement is seen in 48 hr.
- In chronic diarrhea, if no improvement has occurred after at least 10 days of treatment with maximum dose, loperamide is unlikely to be effective.

lopinavir/ritonavir

(loe-pin-a-veer/ri-toe-na-veer)

Kaletra

Classification

Therapeutic: antiretrovirals

Pharmacologic: protease inhibitors, metabolic inhibitors

Indications

HIV infection (with other antiretrovirals).

Action

Lopinavir: Inhibits HIV viral protease. **Ritonavir:** Although ritonavir has antiretroviral activity of its own (inhibits the action of HIV protease and prevents the

cleavage of viral polypeptides), it is combined with lopinavir to inhibit the metabolism of lopinavir thus increasing its plasma levels. **Therapeutic Effects:** Increased CD4 cell counts and decreased viral load with subsequent slowed progression of HIV infection and its sequelae.

Pharmacokinetics

Absorption: Well absorbed following oral administration; food enhances absorption.

Distribution: *Ritonavir*—poor CNS penetration.

Protein Binding: *Lopinavir*—98–99% bound to plasma proteins.

Metabolism and Excretion: *Lopinavir*—completely metabolized in the liver by cytochrome P450 3A (CYP450 3A); ritonavir is a potent inhibitor of this enzyme. *Ritonavir*—highly metabolized by the liver (by CYP450 3A and CYP2D6 enzymes); one metabolite has antiretroviral activity; 3.5% excreted unchanged in urine.

Half-life: *Lopinavir*—5–6 hr *Ritonavir*—3–5 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Lopinavir PO	rapid	4 hr	12 hr
Ritonavir PO	rapid	4 hr*	12 hr

*Non-fasting.

Contraindications/Precautions

Contraindicated in: Hypersensitivity (including toxic epidermal necrolysis, Stevens-Johnson syndrome, or erythema multiforme); Concurrent use of colchicine, dihydroergotamine, dronedarone, elbasvir/grazoprevir, ergotamine, lovastatin, lurasidone, methylergonovine, midazolam (PO), pimozide, sildenafil (Revatio), alfuzosin, simvastatin, and triazolam (may result in serious and/or life-threatening events); Concurrent use with St. John's wort or rifampin (may lead to ↓ virologic response and possible resistance); Hypersensitivity or intolerance to alcohol or castor oil (present in liquid); Congenital long QT syndrome, concurrent use of QT-interval prolonging drugs, or hypokalemia (↑ risk of QT interval prolongation); **OB:** Not recommended in pregnancy if ≥ 1 lopinavir resistance-associated substitution present; **Lactation:** Breast feeding not recommended in HIV-infected patients; **Pedi:** Preterm infants (should be avoided until 14 days after their due date) or full-term infants < 14 days old (↑ risk of toxicity from alcohol and propylene glycol in oral solution).

Use Cautiously in: Known alcohol intolerance (oral solution contains alcohol); Impaired hepatic function, history of hepatitis (for ritonavir content); Pre-existing conduction system disease (marked first-degree AV block or second- or third-degree AV block), ischemic heart disease, or concurrent use of other drugs that increase the PR interval (especially those

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

metabolized by CYP3A4 including verapamil or diltiazem); **OB:** Once daily regimen should not be used in pregnancy; **Pedi:** Children ≤ 6 mo (\uparrow risk of toxicity from alcohol and propylene glycol in oral solution); should not be used once daily in children.

Adverse Reactions/Side Effects

CNS: headache, insomnia, weakness. **CV:** **TORSADES DE POINTES**, \uparrow PR interval, heart block, QT interval prolongation. **GI:** **HEPATOTOXICITY**, **PANCREATITIS**, **diarrhea** (\uparrow in children), abdominal pain, nausea, **taste aversion** (in children), vomiting (\uparrow in children). **Derm:** **ERYTHEMA MULTIFORME**, **STEVENS JOHNSON SYNDROME**, **TOXIC EPIDERMAL NECROLYSIS**, rash. **Endo:** hyperglycemia. **Misc:** immune reconstitution syndrome.

Interactions

Drug-Drug: **Dronedaron**, **ergot derivatives** (dihydroergotamine, ergotamine, methylergonovine), **elbasvir/grazoprevir**, **pimozide**, **sildenafil (Revatio)**, **alfuzosin**, **simvastatin**, **lovastatin**, **lurasidone**, **midazolam (oral)**, and **triazolam** \uparrow levels and risk of toxicity; concurrent use contraindicated. May \uparrow **colchicine** levels; concurrent use in patients with renal or hepatic impairment contraindicated; \downarrow dose of colchicine in patients without renal or hepatic impairment. Concurrent use of **Rifampin** \downarrow levels and effectiveness; concurrent use contraindicated. \uparrow risk of myopathy with **atorvastatin** or **rosuvastatin**; use lowest possible dose of statin; do not exceed rosuvastatin dose of 10 mg/day. Concurrent use with **efavirenz** or **nevirapine** \downarrow lopinavir/ritonavir levels and effectiveness; dose \uparrow recommended; once daily lopinavir/ritonavir regimen not recommended when these drugs are used. **Delavirdine** \uparrow lopinavir levels. May \uparrow **tenofovir** and **zidovudine** levels. May \downarrow **abacavir**, **etravirine**, and **rilpivirine** levels. Concurrent use with **fosamprenavir** \downarrow lopinavir and **fosamprenavir** levels. Concurrent use with **nelfinavir** \downarrow lopinavir levels and \uparrow **nelfinavir** levels; \uparrow dose of lopinavir/ritonavir; once daily lopinavir/ritonavir regimen not recommended when these drugs are used. \uparrow **indinavir** levels; indinavir dose should be \downarrow . \uparrow **saquinavir** levels. **Tipranavir** \downarrow lopinavir levels. \uparrow **maraviroc** levels; maraviroc dose should be \downarrow to 150 mg twice daily. \uparrow levels of **amiodarone**, **lidocaine**, and **quinidine** (blood level monitoring recommended, if possible). Concurrent use of **carbamazepine**, **phenobarbital**, or **phenytoin** may \downarrow effectiveness of lopinavir (blood level monitoring recommended; once daily lopinavir/ritonavir regimen not recommended when these drugs are used); lopinavir may also \downarrow **phenytoin** levels. May \downarrow **bupropion** levels/effects. \uparrow levels/effects of **trazodone**. \uparrow levels of dihydropyridine calcium channel blockers including **felodipine**, **nifedipine**, **amlodipine**, and **nicardipine**. May alter levels and effectiveness of **warfarin**. \uparrow levels of **clarithromycin** (dose \downarrow recommended for patients with $CCr \leq 60$ mL/min). \uparrow levels of **itraconazole**, **ketoconazole**, and **isavuconazonium**; high doses of itraconazole or ketoconazole not recom-

mended. \downarrow levels of **voriconazole**; concurrent use not recommended. \uparrow levels of **rifabutin** (dose \downarrow recommended). \downarrow levels of **atovaquone** (may require dose \uparrow). May \uparrow levels of **bedaquiline**. **Dexamethasone** \downarrow levels/effectiveness of lopinavir. Oral solution contains alcohol may produce intolerance when administered with **disulfiram** or **metronidazole**. May \uparrow levels and risk of toxicity with immunosuppressants including **cyclosporine**, **tacrolimus**, or **sirolimus** (blood level monitoring recommended). May \downarrow levels and effects of **methadone** (dose of **methadone** may need to be \uparrow). May \uparrow levels and effects of **fentanyl**; monitor for respiratory depression. May \downarrow levels and contraceptive efficacy of some estrogen-based **hormonal contraceptives** including **ethinyl estradiol** (alternative or additional methods of contraception recommended). \uparrow levels of **fluticasone** and **budesonide**; avoid concurrent use. May \uparrow **vincristine** and **vinblastine** levels; consider holding or switching to another antiretroviral regimen that does not contain a CYP3A or P-glycoprotein inhibitor. May \uparrow **dasatinib** and **nilotinib** levels; may need to \downarrow doses of dasatinib and nilotinib. Concurrent use of other **drugs known to** \uparrow PR interval may \uparrow risk of heart block. Concurrent use of other **drugs known to** \uparrow QT interval should be avoided. May \uparrow risk of adverse effects with **salmeterol**; concurrent use not recommended. May \uparrow **bosentan** levels; initiate bosentan at 62.5 mg once daily or every other day; if patient already receiving bosentan, discontinue bosentan at least 36 hr before initiation of tipranavir and then restart bosentan at least 10 days later at 62.5 mg once daily or every other day. May \uparrow levels of **sildenafil (Viagra)**, **ildenafil**, **tadalafil (Cialis)** or **avanafil**; may result in hypotension, syncope, visual changes, and prolonged erection (\downarrow dose of sildenafil to 25 mg q 48 hr, vardenafil to 2.5 mg q 72 hr, and tadalafil to 10 mg q 72 hr recommended; do not use with avanafil). May \uparrow **tadalafil (Adcirca)** levels; initiate tadalafil (Adcirca) at 20 mg once daily; if patient already receiving tadalafil (Adcirca), discontinue tadalafil (Adcirca) at least 24 hr before initiation of tipranavir and then restart tadalafil (Adcirca) at least 7 days later at 20 mg once daily. May \uparrow levels of **simeprevir**, **ombitasvir**, and **paritaprevir**; avoid concurrent use. May \downarrow levels of **valproate** and **lamotrigine**; may need to \uparrow dose of valproate or lamotrigine. May \uparrow levels of **rivaroxaban**; avoid concurrent use. May \uparrow **quetiapine** levels; \downarrow quetiapine dose to $\frac{1}{2}$ of current dose.

Drug-Natural Products: Concurrent use with **St. John's wort** may \downarrow levels and beneficial effect of lopinavir/ritonavir (contraindicated).

Route/Dosage

Without Concurrent Efavirenz, Nevirapine, or Nelfinavir

PO (Adults): *Patients with <3 lopinavir resistance-associated substitutions*—400/100 mg (two 200/50-mg tablets or 5 mL oral solution) twice daily or 800/

200 mg (four 200/50-mg tablets or 10 mL oral solution) once daily; *Patients with ≥ 3 lopinavir resistance-associated substitutions*—400/100 mg (two 200/50-mg tablets or 5 mL oral solution) twice daily; *Pregnant women with no lopinavir resistance-associated substitutions*—400/100 mg (two 200/50-mg tablets) twice daily; *Pregnant women with ≥ 1 lopinavir resistance-associated substitution*—Not recommended.

PO (Children 14 days–6 mo): *Oral solution*—16/4 mg/kg lopinavir/ritonavir content twice daily.

PO (Children ≥ 6 mo and < 15 kg): *Oral solution*—12/3 mg/kg lopinavir/ritonavir twice daily.

PO (Children ≥ 6 mo and 15–40 kg): *Oral solution*—10/2.5 mg/kg lopinavir/ritonavir twice daily.

PO (Children ≥ 6 mo): *Tablets*—15–25 kg: 200/50 mg (two 100/25-mg tablets) twice daily; 26–35 kg: 300/75 mg (three 100/25-mg tablets) twice daily; > 35 kg: 400/100 mg (four 100/25-mg tablets or two 200/50-mg tablets) twice daily.

With Concurrent Efavirenz, Nevirapine, or Nelfinavir

PO (Adults): *Therapy-naïve or therapy-experienced*—500/125 mg (two 200/50-mg tablets and one 100/25-mg tablet or 6.5 mL oral solution) twice daily.

PO (Children 14 days–6 mo): Not recommended for concomitant administration with these drugs.

PO (Children ≥ 6 mo and < 15 kg): *Oral solution*—13/3.25 mg/kg lopinavir/ritonavir twice daily.

PO (Children ≥ 6 mo and 15–45 kg): *Oral solution*—11/2.75 mg/kg lopinavir/ritonavir twice daily.

PO (Children ≥ 6 mo): *Tablets*—15–20 kg: 200/50 mg (two 100/25-mg tablets) twice daily; 21–30 kg: 300/75 mg (three 100/25-mg tablets) twice daily; 31–45 kg: 400/100 mg (four 100/25-mg tablets or two 200/50-mg tablets) twice daily.

Availability (generic available)

Tablets: 100 mg lopinavir/25 mg ritonavir, 200 mg lopinavir/50 mg ritonavir. **Oral solution:** 80 mg lopinavir/20 mg ritonavir per mL (contains 42.4% alcohol).

NURSING IMPLICATIONS

Assessment

- Assess for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.
- Assess patient for signs of pancreatitis (nausea, vomiting, abdominal pain, increased serum lipase or amylase) periodically during therapy. May require discontinuation of therapy.
- Assess patient for rash (mild to moderate rash usually occurs in the 2nd wk of therapy and resolves within 1–2 wk of continued therapy). If rash is severe (extensive erythematous or maculopapular rash

with moist desquamation or angioedema) or accompanied by systemic symptoms (serum sickness-like reaction, Stevens-Johnson syndrome, toxic epidermal necrolysis), therapy must be discontinued immediately.

- **Lab Test Considerations:** Monitor viral load and CD4 counts regularly during therapy.
- Monitor triglyceride and cholesterol levels prior to initiating therapy and periodically during therapy.
- May cause hyperglycemia.
- Monitor liver function before and during therapy, especially in patients with underlying hepatic disease, including hepatitis B and hepatitis C, or marked transaminase elevations. May cause \uparrow serum AST, ALT, GGT, and total bilirubin concentrations.
- Monitor serum lipase and amylase levels during therapy.
- Monitor blood glucose during therapy. May cause hyperglycemia.

Potential Nursing Diagnoses

Risk for infection (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- Do not confuse Kaletra (lopinavir/ritonavir) with Keppra (levetiracetam).
- Patients taking didanosine with Kaletra solution should take didanosine 1 hr before or 2 hr after taking lopinavir/ritonavir.
- **PO:** Tablets may be administered with or without food. Swallow whole, do not break, crush, or chew.
- Oral solution must be taken with food. Oral solution is light yellow to orange. Solution is stable if refrigerated until expiration date on label or 2 mo at room temperature. Oral solution should be avoided in premature babies until 14 days after their due date, or in full-term babies younger than 14 days of age unless a health care professional believes that the benefit of using Kaletra oral solution to treat HIV infection immediately after birth outweighs the potential risks. If oral solution is used in babies younger than 14 days, monitor for increases in serum osmolality, serum creatinine, and other signs of toxicity.
- **Feeding Tube:** Oral solution contains ethanol and propylene glycol. Use only compatible feeding tubes (silicone and polyvinyl chloride (PVC)); avoid use with polyurethane feeding tubes due to potential incompatibility. Follow instructions for use of the feeding tube to administer the medicine.

Patient/Family Teaching

- Emphasize the importance of taking lopinavir/ritonavir as directed, at evenly spaced times throughout day. Do not take more than prescribed amount, and do not stop taking this or other antiretrovirals without consulting health care professional. Take missed

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

doses as soon as remembered; do not double doses. Advise patient to read the *Patient Information* prior to taking this medication and with each Rx refill in case of changes.

- Instruct parent/patient to measure oral solution carefully.
- Instruct patient that lopinavir/ritonavir should not be shared with others.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort.
- Inform patient that lopinavir/ritonavir does not cure AIDS or prevent associated or opportunistic infections. Lopinavir/ritonavir does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom during sexual contact and to avoid sharing needles or donating blood to prevent spreading the AIDS virus to others. Advise patient that the long-term effects of lopinavir/ritonavir are unknown at this time.
- **Instruct patient to notify health care professional immediately if rash, symptoms of lactic acidosis (tiredness or weakness, unusual muscle pain, trouble breathing, stomach pain with nausea and vomiting, cold especially in arms or legs, dizziness, fast or irregular heartbeat) or if signs of hepatotoxicity (yellow skin or whites of eyes, dark urine, light-colored stools, lack of appetite for several days or longer, nausea, abdominal pain) occur.**
- Inform patient that lopinavir/ritonavir may cause hyperglycemia. Advise patient to notify health care professional if increased thirst or hunger; unexplained weight loss; or increased urination occurs.
- Caution patients taking sildenafil, vardenafil, or tadalafil of increased risk of associated side effects (hypotension, visual changes, sustained erection). Notify health care professional promptly if these occur.
- Inform patient that redistribution and accumulation of body fat may occur causing central obesity, dorsocervical fat enlargement (buffalo hump), peripheral wasting, breast enlargement, and cushingoid appearance. The cause and long-term effects are not known.
- **Rep:** Advise patients taking oral contraceptives to use a nonhormonal method of birth control during lopinavir/ritonavir therapy. Instruct patient to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding. Encourage pregnant women exposed to lopinavir/ritonavir to enroll in the Antiviral Pregnancy Registry by calling 1-800-258-4263 to monitor maternal/fetal outcomes.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and improvement in CD4 cell counts.

loratadine (lor-a-ta-deen)

Alavert Allergy 24 Hour, Alavert Children's Allergy, ✱ Claritin, Claritin 24-Hour Allergy, Claritin Children's Allergy, Claritin Liqui-Gels 24-Hour Allergy, Claritin Reditabs 24 Hour Allergy, Loradamed, Tavist ND Allergy

Classification

Therapeutic: antihistamines

Indications

Relief of symptoms of seasonal allergies. Management of chronic idiopathic urticaria. Management of hives.

Action

Blocks peripheral effects of histamine released during allergic reactions. **Therapeutic Effects:** Decreased symptoms of allergic reactions (nasal stuffiness; red, swollen eyes, itching).

Pharmacokinetics

Absorption: Rapidly absorbed after oral administration (80%).

Distribution: Unknown.

Protein Binding: Loratadine—97%; descarboethoxyloratadine—73–77%.

Metabolism and Excretion: Rapidly and extensively metabolized during first pass through the liver. Much is converted to descarboethoxyloratadine, an active metabolite.

Half-life: Loratadine—8.4 hr; descarboethoxyloratadine—28 hr.

TIME/ACTION PROFILE (antihistaminic effects)

ROUTE	ONSET	PEAK	DURATION
PO	1–3 hr	8–12 hr	>24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Hepatic impairment or CCr <30 mL/min (↓ dose to 10 mg every other day); **Lactation:** Usually compatible with breast feeding (AAP); **OB, Pedi:** Pregnancy or children <2 yr (safety not established). Syrup contains sodium benzoate, avoid use in neonates; **Geri:** ↑ risk of adverse reactions.

Adverse Reactions/Side Effects

CNS: confusion, drowsiness (rare), paradoxical excitation. **EENT:** blurred vision. **GI:** dry mouth, GI upset.

Derm: photosensitivity, rash. **Metab:** weight gain.

Interactions

Drug-Drug: The following interactions may occur, but are less likely to occur with loratadine than with more sedating antihistamines. **MAO inhibitors** may intensify and prolong effects of antihistamines. ↑ CNS depression may occur with other **CNS depressants**, including **alcohol**, **antidepressants**, **opioid analgesics**, and **sedative/hypnotics**. **Amiodarone** may ↑ loratadine levels and ↑ risk of QTc interval prolongation.

Drug-Natural Products: **Kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression.

Route/Dosage

PO (Adults and Children ≥6 yr): 10 mg once daily.

PO (Children ≥2–5 yr): 5 mg once daily.

Renal Impairment

PO (Adults): *CCr* <30 mL/min—10 mg every other day.

Hepatic Impairment

PO (Adults): 10 mg every other day.

Availability (generic available)

Rapidly disintegrating tablets (mint): 10 mg^{OTC}.

Tablets: 10 mg^{OTC}. **Capsules:** 10 mg^{OTC}. **Chewable**

tablets: 5 mg^{OTC} (grape flavored). **Syrup (grape, fruit):** 5 mg/5 mL^{OTC}. **In combination with:** pseudoephedrine (Claritin-D)^{OTC}. See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess allergy symptoms (rhinitis, conjunctivitis, hives) before and periodically during therapy.
- Assess lung sounds and character of bronchial secretions. Maintain fluid intake of 1500–2000 mL/day to decrease viscosity of secretions.
- **Lab Test Considerations:** May cause false-negative result on allergy skin testing.

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)

Risk for injury (Adverse Reactions)

Implementation

- **Do not confuse Claritin (loratadine) with Claritin Eye (ketotifen fumarate).**
- **PO:** Administer once daily.
- **For rapidly disintegrating tablets (Alavert, Claritin Reditabs)**—place on tongue. Tablet disintegrates rapidly. May be taken with or without water.

Patient/Family Teaching

- Instruct patient to take medication as directed.
- May cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.

- Advise patient to avoid taking alcohol or other CNS depressants concurrently with this drug.
- Advise patient that good oral hygiene, frequent rinsing of mouth with water, and sugarless gum or candy may minimize dry mouth. Patient should notify dentist if dry mouth persists >2 wk.
- Instruct patient to contact health care professional immediately if dizziness, fainting, or fast or irregular heartbeat occurs or if symptoms persist.

Evaluation/Desired Outcomes

- Decrease in allergic symptoms.
- Management of chronic idiopathic urticaria.
- Management of hives.

LORazepam (lor-az-e-pam)

Ativan

Classification

Therapeutic: anesthetic adjuncts, antianxiety agents, sedative/hypnotics

Pharmacologic: benzodiazepines

Schedule IV

Indications

PO: Anxiety disorder. **IM, IV** Status epilepticus, Preanesthetic to produce sedation, decrease preoperative anxiety and induce amnesia.

Action

Depresses the CNS, probably by potentiating GABA, an inhibitory neurotransmitter. **Therapeutic Effects:** Sedation. Decreased anxiety. Decreased seizures.

Pharmacokinetics

Absorption: Well absorbed following oral administration. Rapidly and completely absorbed following IM administration. Sublingual absorption is more rapid than oral and is similar to IM.

Distribution: Widely distributed. Crosses the blood-brain barrier. Crosses the placenta; enters breast milk.

Metabolism and Excretion: Highly metabolized by the liver.

Half-life: Full-term neonates: 18–73 hr; Older children: 6–17 hr; Adults: 10–16 hr.

TIME/ACTION PROFILE (sedation)

ROUTE	ONSET	PEAK	DURATION
PO	15–60 min	1–6 hr	8–12 hr
IM	30–60 min	1–2 hr†	8–12 hr
IV	15–30 min	15–20 min	8–12 hr

†Amnestic response.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with other benzodiazepines may exist; Comatose

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

patients or those with pre-existing CNS depression; Uncontrolled severe pain; Angle-closure glaucoma; Severe hypotension; Sleep apnea; **OB, Lactation:** Use in pregnancy and lactation may cause CNS depression, flaccidity, feeding difficulties, hypothermia, seizures, and respiratory problems in the neonate; discontinue drug or bottle-feed; IV use may affect child's brain development when used during 3rd trimester.

Use Cautiously in: Severe hepatic/renal/pulmonary impairment; Myasthenia gravis; Depression; Psychosis; History of suicide attempt or drug abuse/substance use disorder; COPD; Sleep apnea; **Pedi:** Safety and effectiveness not established in children <18 yr (IV) or <12 yr (PO); in ↑ doses, benzyl alcohol in injection may cause potentially fatal "gaspings syndrome" in neonates; IV use may affect brain development in children <3 yr; **Geri:** Lower doses recommended for geriatric or debilitated patients.

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, lethargy, hangover, headache, ataxia, slurred speech, forgetfulness, confusion, mental depression, rhythmic myoclonic jerking in pre-term infants, paradoxical excitation. **EENT:** blurred vision. **Resp:** respiratory depression. **CV:** rapid IV use only — APNEA, CARDIAC ARREST, bradycardia, hypotension. **GI:** constipation, diarrhea, nausea, vomiting, weight gain (unusual). **Derm:** rashes. **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Use with opioids or other CNS depressants, including other benzodiazepines, non-benzodiazepine sedative/hypnotics, anxiolytics, general anesthetics, muscle relaxants, antipsychotics, and alcohol may cause profound sedation, respiratory depression, coma, and death; reserve concurrent use for when alternative treatment options are inadequate. May ↓ the efficacy of levodopa. Smoking may ↑ metabolism and ↓ effectiveness. Valproate and probenecid can ↑ levels; ↓ dose by 50%. Oral contraceptives may ↓ levels.

Drug-Natural Products: Concomitant use of kava-kava, valerian, or chamomile can ↑ CNS depression.

Route/Dosage

Status Epilepticus

IV, IM (Adults): 4 mg; may be repeated after 10–15 min.

Preanesthetic

IM (Adults): 0.05 mg/kg (not to exceed 4 mg) ≥2 hr before surgery.

IV (Adults): 0.044 mg/kg (not to exceed 2 mg) 15–20 min before surgery.

Anxiety

PO (Adults): Anxiety—1–3 mg 2–3 times daily (up to 10 mg/day). *Insomnia*—2–4 mg at bedtime.

PO (Geriatric Patients or Debilitated Patients):

Anxiety—0.5–2 mg/day in divided doses initially. *Insomnia*—0.25–1 mg initially, ↑ as needed.

Availability (generic available)

Tablets: 0.5 mg, 1 mg, 2 mg. **Cost:** *Generic*—0.5 mg \$6.99/100, 1 mg \$9.73/100, 2 mg \$10.34/100. **Concentrated oral solution:** 2 mg/mL. **Cost:** *Generic*—\$39.80/30 mL. **Sublingual tablets:** ♦ 0.5 mg, ♦ 1 mg, ♦ 2 mg. **Solution for injection:** 2 mg/mL, 4 mg/mL.

NURSING IMPLICATIONS

Assessment

- Conduct regular assessment of continued need for treatment.
- **Pedi:** Assess neonates for prolonged CNS depression related to inability to metabolize lorazepam.
- **Geri:** Assess geriatric patients carefully for CNS reactions as they are more sensitive to these effects. Assess falls risk.
- **Anxiety:** Assess degree and manifestations of anxiety and mental status (orientation, mood, behavior) prior to and periodically throughout therapy.
- Prolonged high-dose therapy may lead to psychological or physical dependence. Restrict amount of drug available to patient.
- **Status Epilepticus:** Assess location, duration, characteristics, and frequency of seizures. Institute seizure precautions.
- **Lab Test Considerations:** Patients on high-dose therapy should receive routine evaluation of renal, hepatic, and hematologic function.
- **Toxicity and Overdose:** If overdose occurs, flumazenil (Romazicon) is the antidote. Do not use with patients with seizure disorder. May induce seizures.

Potential Nursing Diagnoses

Anxiety (Indications)

Risk for injury (Indications, Side Effects)

Implementation

- Do not confuse lorazepam with alprazolam or clonazepam.
- Following parenteral administration, keep patient supine for at least 8 hr and observe closely.
- **PO:** Tablet may also be given sublingually (unlabeled) for more rapid onset.
- Take concentrated liquid solution with water, soda, pudding, or applesauce.
- **IM:** Administer IM doses deep into muscle mass at least 2 hr before surgery for optimum effect.

IV Administration

- **IV Push:** **Diluent:** Dilute immediately before use with an equal amount of sterile water for injection, D5W, or 0.9% NaCl for injection. **Pedi:** To decrease the amount of benzyl alcohol delivered to neonates, dilute the 4 mg/mL injection with preservative-free

sterile water for injection to make a 0.4 mg/mL dilution for IV use. Do not use if solution is colored or contains a precipitate. **Rate:** Administer at a rate not to exceed 2 mg/min or 0.05 mg/kg over 2–5 min. Rapid IV administration may result in apnea, hypotension, bradycardia, or cardiac arrest.

- **Y-Site Compatibility:** acetaminophen, acyclovir, albumin, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B cholesteryl, amphotericin B colloidal, amphotericin B lipid complex, amscrine, anakinra, anidulafungin, argatroban, atracurium, azithromycin, bleomycin, bumetanide, buprenorphine, bulsulfan, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, ceftazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, ciprofloxacin, cisatracurium, cisplatin, cladribine, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, eptifibatid, ertapenem, erythromycin lactobionate, esmolol, etomidate, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fosphenytoin, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrocortisone sodium succinate, hydromorphone, ifosfamide, insulin, irinotecan, isoproterenol, ketorolac, labetalol, lidocaine, linezolid, magnesium sulfate, mannitol, mechlorethamine, melphalan, meropenem, metaraminol, methadone, methotrexate, methylodopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, mitoxantrone, morphine, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, pentamidine, pentobarbital, phentolamine, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, quinupristin/dalfopristin, ranitidine, remifentanyl, rituximab, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, tacrolimus, teniposide, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** aldesleukin, amphotericin B liposome, ampicillin, ampicillin/sulbactam, aztreonam, dantrolene, doxacurium, fluorouracil, hydralazine, idarubicin, imipenem/cilastatin, meperidine, mitomycin, omeprazole, ondansetron, pantoprazole, phenytoin, potassium phosphates, rocuronium, sargramostim, sufentanil.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed and not to skip or double up on missed doses. If medication is less effective after a few weeks, check with health care professional; do not increase dose.
- Advise patient that lorazepam is usually prescribed for short-term use and does not cure underlying problem.
- Advise patient to decrease lorazepam dose gradually to minimize withdrawal symptoms; abrupt withdrawal may cause tremors, nausea, vomiting, and abdominal and muscle cramps.
- Teach other methods to decrease anxiety, such as increased exercise, support groups, relaxation techniques. Emphasize that psychotherapy is beneficial in addressing source of anxiety and improving coping skills.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Instruct patient to contact health care professional immediately if pregnancy is planned or suspected.
- Emphasize the importance of follow-up exams to determine effectiveness of the medication.

Evaluation/Desired Outcomes

- Increase in sense of well-being.
- Decrease in subjective feelings of anxiety without excessive sedation.
- Reduction of preoperative anxiety.
- Postoperative amnesia.
- Improvement in sleep patterns.

lorcaserin (lor-ca-ser-in) Belviq, Belviq XR

Classification

Therapeutic: weight control agents

Pharmacologic: serotonin 2C receptor agonists

Schedule IV

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Indications

Chronic weight management in patients with a body mass index (BMI) of ≥ 30 kg/m² or 27 kg/m² with a weight-related comorbidity (hypertension, type 2 diabetes, dyslipidemia) (in conjunction with a reduced-calorie diet and increased physical activity).

Action

Acts as a serotonin 2C receptor agonist; increases satiety by activating 5-HT_{2C} receptors located on anorexigenic neurons in the hypothalamus. **Therapeutic Effects:** Decreased appetite with subsequent weight loss and health benefits.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Enters cerebrospinal fluid and central nervous system.

Metabolism and Excretion: Extensively metabolized by the liver; metabolites are mostly excreted in urine (92.3%), minimal amounts in feces (2.2%).

Half-life: 11 hr (immediate-release); 12 hr (extended-release).

TIME/ACTION PROFILE (weight loss)

ROUTE	ONSET	PEAK	DURATION
PO	within 1 mo	6–9 mo	unknown
PO-ER	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Severe renal impairment/end stage renal disease; **OB:** Pregnancy (weight loss may result in fetal harm); **Lactation:** Breast feeding not recommended; **Pedi:** Not recommended (safety and effectiveness not established).

Use Cautiously in: History of priapism or risk of priapism (including sickle-cell anemia, multiple myeloma, leukemia or penile deformity); History of heart failure, bradycardia or 2nd/3rd-degree heart block; History of suicidal thoughts/behavior; History of type 2 diabetes (weight loss may ↑ risk of hypoglycemia); Concurrent use of CYP2D6 substrates; Moderate renal impairment; Severe hepatic impairment; **Geri:** May have ↑ risk of adverse reactions due to age-related ↓ in renal function.

Exercise Extreme Caution in: Concurrent use of serotonergic or antidopaminergic agents.

Adverse Reactions/Side Effects

CNS: NEUROLEPTIC MALIGNANT SYNDROME, SEROTONIN SYNDROME, cognitive impairment, depression, dizziness, euphoria, fatigue, hallucinations, psychiatric disorders, suicidality. **CV:** VALVULOPATHY, bradycardia, hypertension, peripheral edema. **GI:** constipation, dry mouth, nausea. **GU:** priapism. **Endo:** hypoglycemia, ↑ prolactin. **Hemat:** ↓ RBC count.

Interactions

Drug-Drug: Concurrent use with serotonergic medications, including SSRIs, SNRIs, TCAs, MAOIs,

bupropion, linezolid, triptans, dextromethorphan, lithium, or tramadol may ↑ risk of serotonin syndrome or neuroleptic malignant syndrome; use extreme caution. Concurrent use with serotonergic/dopaminergic agents that are potent 5-HT_{2B} agonists may ↑ risk of cardiac valvulopathy. May ↑ blood levels of CYP2D6 substrates, including dextromethorphan.

Route/Dosage

PO (Adults): 10 mg twice daily; discontinue if 5% weight loss has not been observed at 12 wk; *Extended-release*—20 mg once daily.

Availability

Tablets: 10 mg. **Extended-release tablets:** 20 mg.

NURSING IMPLICATIONS

Assessment

- Monitor patients for weight loss and adjust concurrent medications (antihypertensives, antidiabetics, lipid-lowering agents) as needed.
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyper-reflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).
- Monitor for signs and symptoms of neuroleptic malignant syndrome (hyperthermia, muscle rigidity, autonomic instability with possible rapid fluctuation of vital signs, mental status changes) during therapy.
- Assess for signs and symptoms of valvular heart disease (dyspnea, dependent edema, CHF, new cardiac murmur) during therapy. If these develop, consider discontinuing lorcaserin.
- Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression. Discontinue lorcaserin if these occur.
- Monitor for symptoms related to hyperprolactinemia (menstrual abnormalities, galactorrhea, gynecomastia).
- **Lab Test Considerations:** Monitor CBC periodically during therapy. May cause leukopenia, lymphopenia, neutropenia, anemia, and ↓ WBC, hemoglobin, and hematocrit.
- May cause ↑ prolactin levels.
- Monitor blood sugar closely in patients with diabetes.

Potential Nursing Diagnoses

Disturbed body image (Indications)

Imbalanced nutrition: more than body requirements (Indications)

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- **PO:** May be administered with or without food. Swallow extended release tablets whole; do not crush, break, or chew.

Patient/Family Teaching

- Instruct patient to take lorcaserin as directed and not to increase dose.
- May impair cognitive function. Caution patient to avoid driving or other activities that require alertness until response to medication is known.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; other unusual changes in behavior or mood or if symptoms of serotonin syndrome, neuroleptic malignant syndrome, or valvular heart disease occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort.
- Advise patients with diabetes to monitor blood sugar closely during therapy.
- Inform male patient that priapism may occur. If an erection lasts longer than 4 hrs, whether painful or not, immediately discontinue lorcaserin and seek emergency attention.
- Advise patient to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy.

Evaluation/Desired Outcomes

- Decrease in weight and BMI. If 5% of baseline body weight is not lost by Week 12, discontinue lorcaserin, as it is unlikely patient will achieve and sustain clinically meaningful weight loss with continued treatment.

Iosartan, See ANGIOTENSIN II RECEPTOR ANTAGONISTS.

Iovastatin, See HMG-CoA REDUCTASE INHIBITORS (statins).

Iuliconazole, See ANTIFUNGALS (TOPICAL).

lurasidone (loo-ras-i-done)

Latuda

Classification

Therapeutic: antipsychotics

Pharmacologic: benzoisothiazole

Indications

Treatment of schizophrenia. Depressive episodes associated with bipolar I disorder (as monotherapy or with lithium or valproate).

Action

Effect may mediated via effects on central dopamine Type 2 (D₂) and serotonin Type 2 (5HT_{2A}) receptor antagonism. **Therapeutic Effects:** ↓ schizophrenic behavior. ↓ depressive episodes in bipolar I disorder.

Pharmacokinetics

Absorption: 9–19% absorbed following oral administration.

Distribution: Unknown.

Protein Binding: >99%.

Metabolism and Excretion: Mostly metabolized by the CYP3A4 enzyme system. Two metabolites are pharmacologically active; 80% eliminated in feces, 8% in urine primarily as metabolites.

Half-life: 18 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–3 hr*	24 hr

*Blood level.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of strong CYP3A4 inhibitors or inducers.

Use Cautiously in: Moderate or severe renal impairment (dose adjustment recommended); Moderate or severe hepatic impairment (dose adjustment recommended); History of suicide attempt; Diabetes mellitus; Overheating/dehydration (may ↑ risk of serious adverse reactions); Patients at risk for falls; History of leukopenia or previous drug-induced leukopenia/neutropenia; **Ger:** ↑ risk of seizures; ↑ risk of mortality and stroke in elderly patients treated for dementia-related psychosis; use cautiously in elderly females (↑ risk of tardive dyskinesia); **OB:** Use in pregnancy only if potential benefit justifies potential risk to fetus; **Lactation:** Breast feeding should only be considered if potential benefit justifies risk to child; **Pedi:** May ↑ risk of suicide attempt/ideation especially during dose early treatment or dose adjustment; risk may be greater in children, adolescents, and young adults taking antidepressants (safe use in children/adolescents not established).

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Adverse Reactions/Side Effects

CNS: NEUROLEPTIC MALIGNANT SYNDROME, SEIZURES, SUICIDAL THOUGHTS, akathisia, drowsiness, parkinsonism, agitation, anxiety, cognitive/motor impairment, dizziness, dystonia, tardive dyskinesia. **EENT:** blurred vision. **CV:** bradycardia, orthostatic hypotension, syncope, tachycardia. **GI:** nausea, esophageal dysmotility. **Derm:** pruritus, rash. **Endo:** hyperglycemia, hyperprolactinemia. **Hemat:** AGRANULOCYTOSIS, anemia, leukopenia. **Metab:** dyslipidemia, weight gain.

Interactions

Drug-Drug: **Strong CYP3A4 inhibitors**, including ketoconazole, clarithromycin, ritonavir, and voriconazole ↑ blood levels and risk of adverse reactions; concurrent use contraindicated. **Strong CYP3A4 inducers**, including rifampin, phenytoin, and carbamazepine ↓ blood levels and effectiveness; concurrent use contraindicated. **Moderate inhibitors of the CYP3A4 enzyme system**, including diltiazem, atazanavir, erythromycin, fluconazole, and verapamil ↑ blood levels; if used concurrently, dose of lurasidone should not exceed 40 mg/day. ↑ sedation may occur with other CNS depressants, including alcohol, sedative/hypnotics, opioids, some antidepressants and antihistamines.

Drug-Natural Products: **St. John's wort** ↓ blood levels and effectiveness; concurrent use contraindicated.

Drug-Food: **Grapefruit juice** ↑ blood levels and risk of adverse reactions; concurrent use contraindicated.

Route/Dosage

Schizophrenia

PO (Adults): 40 mg once daily (not to exceed 160 mg once daily); *Addition of moderate CYP3A4 inhibitor to existing lurasidone therapy*—↓ lurasidone dose by 50%; *Addition of lurasidone to existing moderate CYP3A4 inhibitor therapy*—20 mg once daily (not to exceed 80 mg once daily).

PO (Children 13–17 yr): 40 mg once daily (not to exceed 80 mg once daily); *Addition of moderate CYP3A4 inhibitor to existing lurasidone therapy*—↓ lurasidone dose by 50%; *Addition of lurasidone to existing moderate CYP3A4 inhibitor therapy*—20 mg once daily (not to exceed 80 mg once daily).

Renal Impairment

PO (Adults and Children 13–17 yr): *CCr <50 mL/min*—20 mg once daily (not to exceed 80 mg once daily).

Hepatic Impairment

(Adults and Children 13–17 yr): *Cbild-Pugh Class B*—20 mg once daily (not to exceed 80 mg once daily); *Cbild-Pugh Class C*—20 mg once daily (not to exceed 40 mg once daily).

Depressive Episodes Associated with Bipolar I Disorder

PO (Adults): 20 mg once daily (not to exceed 120 mg once daily); *Addition of moderate CYP3A4 inhibitor to existing lurasidone therapy*—↓ lurasidone dose by 50%; *Addition of lurasidone to existing moderate CYP3A4 inhibitor therapy*—20 mg once daily (not to exceed 80 mg once daily).

Renal Impairment

PO (Adults): *CCr <50 mL/min*—20 mg once daily (not to exceed 80 mg once daily).

Hepatic Impairment

PO (Adults): *Cbild-Pugh Class B*—20 mg once daily (not to exceed 80 mg once daily); *Cbild-Pugh Class C*—20 mg once daily (not to exceed 40 mg once daily).

Availability

Tablets: 20 mg, 40 mg, 60 mg, 80 mg, 120 mg.

NURSING IMPLICATIONS

Assessment

- Monitor patient's mental status (orientation, mood, behavior) before and periodically during therapy.
- Assess weight and BMI initially and throughout therapy.
- Monitor mood changes. Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- Monitor BP (sitting, standing, lying down) and pulse before and frequently during initial dose titration. May cause tachycardia and orthostatic hypotension. If hypotension occurs, dose may need to be ↓.
- Observe patient when administering medication to ensure medication is swallowed and not hoarded or cheeked.
- Monitor patient for onset of extrapyramidal side effects (*akathisia*—restlessness; *dystonia*—muscle spasms and twisting motions; or *pseudoparkinsonism*—mask-like face, rigidity, tremors, drooling, shuffling gait, dysphagia). Report these symptoms; reduction of dose or discontinuation may be necessary. Trihexyphenidyl or benztropine may be used to control symptoms.
- Monitor for tardive dyskinesia (involuntary rhythmic movement of mouth, face, and extremities). Report immediately; may be irreversible.
- Monitor for symptoms related to hyperprolactinemia (menstrual abnormalities, galactorrhea, sexual dysfunction).
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness). Notify health care professional immediately if these symptoms occur.
- Monitor for symptoms of hyperglycemia (polydipsia, polyuria, polyphagia, weakness) periodically during therapy.

- Assess for falls risk. Drowsiness, orthostatic hypotension, and motor and sensory instability increase risk. Institute prevention if indicated.
- **Lab Test Considerations:** May cause ↑ serum prolactin levels.
- May cause ↑ CPK.
- Obtain fasting blood glucose and cholesterol levels initially and periodically during therapy.
- Monitor CBC frequently during initial mo of therapy in patients with pre-existing or history of low WBC. May cause leukopenia, neutropenia, or agranulocytosis. Discontinue therapy if this occurs.

Potential Nursing Diagnoses

Risk for self-directed violence (Indications)

Disturbed thought process (Indications)

Risk for injury (Side Effects)

Implementation

- **High Alert:** Do not confuse Latuda with Lantus.
- **PO:** Administer once daily with food of at least 350 calories. Use beyond 6 wks has not been studied.

Patient/Family Teaching

- Instruct patient to take medication as directed. Emphasize the caloric food needs for taking medication.
- Inform patient of the possibility of extrapyramidal symptoms. Instruct patient to report these symptoms immediately to health care professional.
- Advise patient to change positions slowly to minimize orthostatic hypotension. Protect from falls.
- May cause drowsiness and cognitive and motor impairment. Caution patient to avoid driving or other

activities requiring alertness until response to medication is known.

- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme ↑ in activity and talking, other unusual changes in behavior or mood occur.
- Advise patient to avoid extremes in temperature; this drug impairs body temperature regulation.
- Advise patient to tell health care professional what medications they are taking and to avoid taking new Rx, OTC, vitamins, or herbal products without consulting health care professional, especially alcohol and other CNS depressants.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Instruct patient to notify health care professional promptly if sore throat, fever, unusual bleeding or bruising, rash, or tremors occur.
- Advise female patients to notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- Emphasize the importance of routine follow up exams to monitor side effects.

Evaluation/Desired Outcomes

- ↓ in symptoms of schizophrenia (delusions, hallucinations, social withdrawal, flat, blunted affects).
- ↓ depressive episodes in bipolar I disorder.

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

magaldrate, See MAGNESIUM AND ALUMINUM SALTS.

MAGNESIUM AND ALUMINUM SALTS

magaldrate (with simethicone)
(mag-al-drate)
Riopan Plus

magnesium hydroxide/aluminum hydroxide

(mag-nee-zhum hye-drox-ide/ a-loo-mi-num hye-drox-ide)
Alamag,  Diovol Plus, Maalox, Rulox

Classification

Therapeutic: antiulcer agents
Pharmacologic: antacids

Indications

Useful in a variety of GI complaints, including: Hyperacidity, Indigestion, GERD, Heartburn.

Action

Neutralize gastric acid following dissolution in gastric contents. Inactivate pepsin if pH is raised to ≥ 4 . **Therapeutic Effects:** Neutralization of gastric acid with healing of ulcers and decrease in associated pain.

Pharmacokinetics

Absorption: During routine use, antacids are nonabsorbable. With chronic use, 15–30% of magnesium and smaller amounts of aluminum may be absorbed.

Distribution: Small amounts absorbed are widely distributed, cross the placenta, and appear in breast milk. Aluminum concentrates in the CNS.

Metabolism and Excretion: Excreted by the kidneys.

Half-life: Unknown.

TIME/ACTION PROFILE (effect on gastric pH)

ROUTE	ONSET	PEAK	DURATION
Aluminum PO	slightly delayed	30 min	30 min–1 hr (empty stomach); 3 hr (after meals)
Magnesium PO	slightly delayed	30 min	30 min–1 hr (empty stomach); 3 hr (after meals)

Contraindications/Precautions

Contraindicated in: Severe abdominal pain of unknown cause, especially if accompanied by fever; Renal failure (CrCl < 30 mL/min); Products containing tartrazine or sugar in patients with known intolerance.

Use Cautiously in: Antacids containing magnesium in patients with any degree of renal insufficiency; \downarrow bowel motility; Dehydration; Upper GI hemorrhage;

Pedi: Children < 12 yr (safety not established).

Adverse Reactions/Side Effects

GI: *aluminum salts*—constipation; *magnesium salts*, diarrhea. **F and E:** *magnesium salts*—hyper-magnesemia; *aluminum salts*, hypophosphatemia.

Interactions

Drug-Drug: Absorption of tetracyclines, phenothiazines, ketoconazole, itraconazole, iron salts, fluoroquinolones, and isoniazid may be \downarrow (separate by at least 2 hr).

Route/Dosage

Magaldrate/Simethicone

PO (Adults): 5–10 mL (540–1080 mg) between meals and at bedtime.

Magnesium Hydroxide/Aluminum Hydroxide

PO (Adults and Children ≥ 12 yr): 5–30 mL or 1–2 tablets 1–3 hr after meals and at bedtime.

Availability

Magaldrate/Simethicone (generic available)

Suspension: 540 mg magaldrate/20 mg simethicone/5 mL^{OTC}, 1080 mg magaldrate/40 mg simethicone/5 mL^{OTC}.

Magnesium Hydroxide/Aluminum Hydroxide (generic available)

Chewable Tablets: 300 mg aluminum hydroxide/150 mg magnesium hydroxide^{OTC}. **Suspension:** 225 mg aluminum hydroxide/200 mg magnesium hydroxide/5 mL^{OTC}, 500 mg aluminum hydroxide/500 mg magnesium hydroxide/5 mL^{OTC}. **In combination with:** simethicone^{OTC}. See Appendix B.

NURSING IMPLICATIONS

Assessment

- **Antacid:** Assess for heartburn and indigestion as well as location, duration, character, and precipitating factors of gastric pain.
- **Lab Test Considerations:** Monitor serum phosphate, potassium, and calcium levels periodically during chronic use. May cause \uparrow serum calcium and \downarrow serum phosphate concentrations.

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- Magnesium and aluminum are combined as antacids to balance the constipating effects of aluminum with the laxative effects of magnesium.
- **PO:** To prevent tablets from entering small intestine in undissolved form, they must be chewed thoroughly before swallowing. Follow with at least ½ glass of water.
- Shake suspensions well before administration.
- For an antacid effect, administer 1–3 hr after meals and at bedtime.

Patient/Family Teaching

- Caution patient to consult health care professional before taking antacids for more than 2 wk if problem is recurring, if relief is not obtained, or if symptoms of gastric bleeding (black, tarry stools; coffee-ground emesis) occur.
- Advise patient not to take this medication within 2 hr of taking other medications.
- **Pedi:** Aluminum- or magnesium-containing medicines can cause serious side effects in children, especially when given to children with renal disease or dehydration. Advise parents or caregivers not to administer OTC antacids to children without consulting health care professional.

Evaluation/Desired Outcomes

- Relief of gastric pain and irritation.

magnesium salicylate, See SALICYLATES.**MAGNESIUM SALTS (ORAL)**

magnesium chloride (12% Mg; 9.8 mEq Mg/g)

(mag-nee-zhum klor-ide)
Chloromag, Slo-Mag

magnesium citrate (16.2% Mg; 4.4 mEq Mg/g)

(mag-nee-zhum si-trate)
Citrate of Magnesia, Citroma,
* Citromag

magnesium gluconate (5.4% Mg; 4.4 mEq/g)

(mag-nee-zhum gloo-con-ate)
Magtrate, Magonate

magnesium hydroxide (41.7% Mg; 34.3 mEq Mg/g)

(mag-nee-zhum hye-drox-ide)
Dulcolax Magnesia Tablets, Phillips Magnesia Tablets, Phillips Milk of Magnesia, MOM

magnesium oxide (60.3% Mg; 49.6 mEq Mg/g)

(mag-nee-zhum ox-ide)
Mag-Ox 400, Uro-Mag

Classification

Therapeutic: mineral and electrolyte replacements/supplements, laxatives

Pharmacologic: salines

Indications

Treatment/prevention of hypomagnesemia. As a: Laxative, Bowel evacuant in preparation for surgical/radiographic procedures. Milk of Magnesia has also been used as an antacid.

Action

Essential for the activity of many enzymes. Play an important role in neurotransmission and muscular excitability. Are osmotically active in GI tract, drawing water into the lumen and causing peristalsis. **Therapeutic Effects:** Replacement in deficiency states. Evacuation of the colon.

Pharmacokinetics

Absorption: Up to 30% may be absorbed orally.

Distribution: Widely distributed. Cross the placenta and are present in breast milk.

Metabolism and Excretion: Excreted primarily by the kidneys.

Half-life: Unknown.

TIME/ACTION PROFILE (laxative effect)

ROUTE	ONSET	PEAK	DURATION
PO	3–6 hr	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypermagnesemia; Hypocalcemia; Anuria; Heart block; **OB:** Unless used for pre-term labor, use during active labor or within 2 hr of delivery may ↑ potential for magnesium toxicity in newborn.

Use Cautiously in: Any degree of renal insufficiency.

Adverse Reactions/Side Effects

GI: diarrhea. **Derm:** flushing, sweating.

Interactions

Drug-Drug: Potentiates neuromuscular blocking agents. May ↓ absorption of fluoroquinolones, nitrofurantoin, and tetracyclines and penicillamine.

Route/Dosage

Prevention of Deficiency (in mg of Magnesium)

PO (Adults and Children >10 yr): *Adolescent and adult men*—270–400 mg/day; *adolescent and adult women*—280–300 mg/day; *pregnant women*—320 mg/day; *breast-feeding women*—340–355 mg/day.

PO (Children 7–10 yr): 170 mg/day.

PO (Children 4–6 yr): 120 mg/day.

PO (Children birth–3 yr): 40–80 mg/day.

Treatment of Deficiency (Expressed as mg of Magnesium)

PO (Adults): 200–400 mg/day in 3–4 divided doses.

PO (Children 6–11 yr): 3–6 mg/kg/day in 3–4 divided doses.

Laxative

PO (Adults): *Magnesium citrate*—240 mL; *magnesium hydroxide (Milk of Magnesia)*—30–60 mL single or divided dose or 10–20 mL as concentrate.

PO (Children 6–12 yr): *Magnesium citrate*—100 mL; *magnesium hydroxide (Milk of Magnesia)*—15–30 mL single or divided dose.

PO (Children 2–5 yr): *magnesium hydroxide (Milk of Magnesia)*—5–15 mL single or divided dose.

Availability

Magnesium Chloride (generic available)

Sustained-release tablets: 535 mg (64 mg magnesium)^{OTC}. **Enteric-coated tablets:** 833 mg (100 mg magnesium)^{OTC}.

Magnesium Citrate (generic available)

Oral solution: 240-, 296-, and 300-mL bottles (77 mEq magnesium/100 mL)^{OTC}.

Magnesium Gluconate (generic available)

Tablets: 500 mg^{OTC}. **Liquid:** 54 mg/5 mL^{OTC}.

Magnesium Hydroxide (generic available)

Liquid: 400 mg/5 mL (164 mg magnesium/5 mL)^{OTC}. **Concentrated liquid:** 800 mg/5 mL (328 mg magnesium/5 mL)^{OTC}. **Chewable tablets:** 300 mg (130 mg magnesium)^{OTC}, 600 mg (260 mg magnesium)^{OTC}.

Magnesium Oxide (generic available)

Tablets: 400 mg (241.3 mg magnesium)^{OTC}. **Cap-sules:** 140 mg (84.5 mg magnesium)^{OTC}.

NURSING IMPLICATIONS

Assessment

- **Laxative:** Assess patient for abdominal distention, presence of bowel sounds, and usual pattern of bowel function.

- Assess color, consistency, and amount of stool produced.
- **Antacid:** Assess for heartburn and indigestion as well as location, duration, character, and precipitating factors of gastric pain.

Potential Nursing Diagnoses

Constipation (Indications)

Implementation

- **PO:** To prevent tablets entering small intestine in undissolved form, they must be chewed thoroughly before swallowing. Follow with ½ glass of water.
- **Magnesium citrate:** Refrigerate solutions to ensure they retain potency and palatability. May be served over ice. Magnesium citrate in an open container will lose carbonation upon standing; this will not affect potency but may reduce palatability.
- **Magnesium hydroxide:** Shake solution well before administration.
- **Antacid:** Administer 1–3 hr after meals and at bedtime.
- Powder and liquid forms are considered more effective than tablets.
- **Laxative:** Administer on empty stomach for more rapid results. Follow all oral laxative doses with a full glass of liquid to prevent dehydration and for faster effect. Do not administer at bedtime or late in the day.

Patient/Family Teaching

- Advise patient not to take this medication within 2 hr of taking other medications, especially fluoroquinolones, nitrofurantoin, and tetracyclines.
- **Antacids:** Caution patient to consult health care professional before taking antacids for more than 2 wk if problem is recurring, if relief is not obtained, or if symptoms of gastric bleeding (black, tarry stools; coffee-ground emesis) occur.
- **Laxatives:** Advise patient that laxatives should be used only for short-term therapy. Long-term therapy may cause electrolyte imbalance and dependence.
- Encourage patient to use other forms of bowel regulation, such as increasing bulk in the diet, fluid intake, and mobility. Normal bowel habits are individualized; frequency of bowel movement may vary from 3 times/day to 3 times/wk.
- Advise patient to notify health care professional if unrelieved constipation, rectal bleeding, or symptoms of electrolyte imbalance (muscle cramps or pain, weakness, dizziness) occur.

Evaluation/Desired Outcomes

- Relief of gastric pain and irritation.
- Passage of a soft, formed bowel movement, usually within 3–6 hr.
- Prevention and treatment of magnesium deficiency.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

HIGH ALERT

magnesium sulfate (IV, parenteral) (9.9% Mg; 8.1 mEq Mg/g)
(mag-nee-zhum sul-fate)**Classification**

Therapeutic: mineral and electrolyte replacements/supplements
Pharmacologic: minerals/electrolytes

Indications

Treatment/prevention of hypomagnesemia. Treatment of hypertension. Prevention of seizures associated with severe eclampsia, pre-eclampsia, or acute nephritis.

Unlabeled Use: Preterm labor. Treatment of torsade de pointes. Adjunctive treatment for bronchodilation in moderate to severe acute asthma.

Action

Essential for the activity of many enzymes. Plays an important role in neurotransmission and muscular excitability. **Therapeutic Effects:** Replacement in deficiency states. Resolution of eclampsia.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability; well absorbed from IM sites.

Distribution: Widely distributed. Crosses the placenta and is present in breast milk.

Metabolism and Excretion: Excreted primarily by the kidneys.

Half-life: Unknown.

TIME/ACTION PROFILE (anticonvulsant effect)

ROUTE	ONSET	PEAK	DURATION
IM	60 min	unknown	3–4 hr
IV	immediate	unknown	30 min

Contraindications/Precautions

Contraindicated in: Hypermagnesemia; Hypocalcemia; Anuria; Heart block; **OB:** Avoid using for more than 5–7 days for preterm labor (may ↑ risk of hypocalcemia and bone changes in newborn); avoid continuous use during active labor or within 2 hr of delivery due to potential for magnesium toxicity in newborn.

Use Cautiously in: Any degree of renal insufficiency; **Ger:** May require ↓ dosage due to age-related ↓ in renal function.

Adverse Reactions/Side Effects

CNS: drowsiness. **Resp:** ↓ respiratory rate. **CV:** arrhythmias, bradycardia, hypotension. **GI:** diarrhea.

MS: muscle weakness. **Derm:** flushing, sweating.

Metab: hypothermia.

Interactions

Drug-Drug: May potentiate calcium channel blockers and neuromuscular blocking agents.

Route/Dosage**Treatment of Deficiency (Expressed as mg of Magnesium)**

IM, IV (Adults): Severe deficiency—8–12 g/day in divided doses; mild deficiency—1 g q 6 hr for 4 doses or 250 mg/kg over 4 hr.

IM, IV (Children >1 mo): 25–50 mg/kg/dose q 4–6 hr for 3–4 doses, maximum single dose: 2 g.

IV (Neonates): 25–50 mg/kg/dose q 8–12 hr for 2–3 doses.

Seizures/Hypertension

IM, IV (Adults): 1 g q 6 hr for 4 doses as needed.

IM, IV (Children): 20–100 mg/kg/dose q 4–6 hr as needed, may use up to 200 mg/kg/dose in severe cases.

Torsade de Pointes

IV (Infants and Children): 25–50 mg/kg/dose, maximum dose: 2 g.

Bronchodilation

IV (Adults): 2 g single dose.

IV (Children): 25 mg/kg/dose, maximum dose: 2 g.

Eclampsia/Pre-Eclampsia

IV, IM (Adults): 4–5 g by IV infusion, concurrently with up to 5 g IM in each buttock; then 4–5 g IM q 4 hr or 4 g by IV infusion followed by 1–2 g/hr continuous infusion (not to exceed 40 g/day or 20 g/48 hr in the presence of severe renal insufficiency).

Part of Parenteral Nutrition

IV (Adults): 4–24 mEq/day.

IV (Children): 0.25–0.5 mEq/kg/day.

Availability (generic available)

Injection: 500 mg/mL (50%). **Premixed infusion:** 1 g/100 mL, 2 g/100 mL, 4 g/50 mL, 4 g/100 mL, 20 g/500 mL, 40 g/1000 mL.

NURSING IMPLICATIONS**Assessment**

- **Hypomagnesemia/Anticonvulsant:** Monitor pulse, BP, respirations, and ECG frequently throughout administration of parenteral magnesium sulfate. Respirations should be at least 16/min before each dose.
- Monitor neurologic status before and throughout therapy. Institute seizure precautions. Patellar reflex (knee jerk) should be tested before each parenteral dose of magnesium sulfate. If response is absent, no additional doses should be administered until positive response is obtained.
- Monitor newborn for hypotension, hyporeflexia, and respiratory depression if mother has received magnesium sulfate.
- Monitor intake and output ratios. Urine output should be maintained at a level of at least 100 mL/4 hr.

- **Lab Test Considerations:** Monitor serum magnesium levels and renal function periodically throughout administration of parenteral magnesium sulfate.

Potential Nursing Diagnoses

Risk for injury (Indications, Side Effects)

Implementation

- **High Alert:** Accidental overdosage of IV magnesium has resulted in serious patient harm and death. Have second practitioner independently double-check original order, dose calculations, and infusion pump settings. Do not confuse milligram (mg), gram (g), or mEq (mEq) dosages.
- **IM:** Administer deep IM into gluteal sites. Administer subsequent injections in alternate sides. Dilute to a concentration of 200 mg/mL prior to injection.

IV Administration

- **IV Push:** **Diluent:** 50% solution must be diluted in 0.9% NaCl or D5W to a concentration of $\leq 20\%$ prior to administration. **Concentration:** $\leq 20\%$. **Rate:** Administer at a rate not to exceed 150 mg/min.
- **Continuous Infusion:** **Diluent:** Dilute in D5W, 0.9% NaCl, or LR. **Concentration:** 0.5 mEq/mL (60 mg/mL) (may use maximum concentration of 1.6 mEq/mL) (200 mg/mL) in fluid-restricted patients). **Rate:** Infuse over 2–4 hr. Do not exceed a rate of 1 mEq/kg/hr (125 mg/kg/hr). When rapid infusions are needed (severe asthma or torsade de pointes) may infuse over 10–20 min.
- **Y-Site Compatibility:** acyclovir, aldesleukin, alemtuzumab, alfentanil, amifostine, amikacin, argatroban, ascorbic acid, atropine, azithromycin, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, caspofungin, cefotaxime, cefoxitin, ceftazidime, chloramphenicol, chlorpromazine, cisatracurium, cisplatin, clindamycin, clonidine, cyanocobalamin, cyclophosphamide, cytarabine, dactinomycin, daptomycin, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxacurium, doxorubicin liposome, doxycycline, enalaprilat, ephedrine, epinephrine, epoetin alfa, eptifibatid, ertapenem, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketamine, ketorolac, labetalol, calcium, lidocaine, linezolid, lorazepam, mannitol, mechloroethamine, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone,

mitoxantrone, morphine, moxifloxacin, multivitamins, mycophenolate, nafcillin, nalbuphine, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, papaverine, pemetrexed, penicillin G, pentazocine, pentobarbital, phenobarbital, phenolamine, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, propofol, propranolol, pyridoxine, quinupristin/dalfopristin, ranitidine, remifentanyl, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, telavancin, teniposide, theophylline, thiamine, thiopeta, tigecycline, tirofiban, tobramycin, tolazoline, trastuzumab, trimetaphan, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, vitamin B complex with C, voriconazole, zoledronic acid.

- **Y-Site Incompatibility:** aminophylline, amphotericin B cholesteryl sulfate, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, azathioprine, calcium chloride, cefepime, ceftriaxone, cefuroxime, ciprofloxacin, dantrolene, dexamethasone sodium phosphate, diazepam, diazoxide, doxorubicin hydrochloride, epirubicin, ganciclovir, haloperidol, indomethacin, methylprednisolone sodium succinate, pentamidine, phenytoin, phytonadione.

Patient/Family Teaching

- Explain purpose of medication to patient and family.

Evaluation/Desired Outcomes

- Normal serum magnesium concentrations.
- Control of seizures associated with toxemias of pregnancy.

mannitol (man-i-to)

Osmitol, Resectisol

Classification

Therapeutic: diuretics

Pharmacologic: osmotic diuretics

Indications

IV: Adjunct in the treatment of: Acute oliguric renal failure, Edema, Increased intracranial or intraocular pressure, Toxic overdose. **GU irrigant:** During transurethral procedures (2.5–5% solution only).

Action

Increases the osmotic pressure of the glomerular filtrate, thereby inhibiting reabsorption of water and electrolytes. Causes excretion of: Water, Sodium, Potassium, Chloride, Calcium, Phosphorus, Magnesium,

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Urea, Uric acid. **Therapeutic Effects:** Mobilization of excess fluid in oliguric renal failure or edema. Reduction of intraocular or intracranial pressure. Increased urinary excretion of toxic materials. Decreased hemolysis when used as an irrigant after transurethral prostatic resection.

Pharmacokinetics

Absorption: IV administration produces complete bioavailability. Some absorption may follow use as a GU irrigant.

Distribution: Confined to the extracellular space; does not usually cross the blood-brain barrier or eye.

Metabolism and Excretion: Excreted by the kidneys; minimal liver metabolism.

Half-life: 100 min.

TIME/ACTION PROFILE (diuretic effect)

ROUTE	ONSET	PEAK	DURATION
IV	30–60 min	1 hr	6–8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Anuria; Dehydration; Active intracranial bleeding; Severe pulmonary edema or congestion.

Use Cautiously in: **OB, Lactation:** Safety not established.

Adverse Reactions/Side Effects

CNS: confusion, headache. **EENT:** blurred vision, rhinitis. **CV:** transient volume expansion, chest pain, HF, pulmonary edema, tachycardia. **GI:** nausea, thirst, vomiting. **GU:** renal failure, urinary retention. **F and E:** dehydration, hyperkalemia, hyponatremia, hypokalemia, hyponatremia. **Local:** phlebitis at IV site.

Interactions

Drug-Drug: Hypokalemia ↑ the risk of digoxin toxicity.

Route/Dosage

IV (Adults): *Edema, oliguric renal failure*—50–100 g as a 5–25% solution; may precede with a test dose of 0.2 g/kg over 3–5 min. *Reduction of intracranial/intraocular pressure*—0.25–2 g/kg as 15–25% solution over 30–60 min (500 mg/kg may be sufficient in small or debilitated patients). *Diuresis in drug intoxications*—50–200 g as a 5–25% solution titrated to maintain urine flow of 100–500 mL/hr.

IV (Children): *Initial*—0.5–1 g/kg as a 15–20% solution; may precede with a test dose of 0.2 g/kg over 3–5 min. *Maintenance*—0.25–0.5 g/kg q 4–6 hrs. *Reduction of intracranial/intraocular pressure*—1–2 g/kg (30–60 g/m²) as a 15–20% solution over 30–60 min (500 mg/kg may be sufficient in small or debilitated patients). *Diuresis in drug intoxications*—up to 2 g/kg (60 g/m²) as a 5–10% solution.

IV (Neonates): *Acute renal failure*—0.5–1 g/kg/dose.

Availability (generic available)

IV injection: 5%, 10%, 15%, 20%, 25%. **GU irrigant:** 5%.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs, urine output, CVP, and pulmonary artery pressures (PAP) before and hourly throughout administration. Assess patient for signs and symptoms of dehydration (decreased skin turgor, fever, dry skin and mucous membranes, thirst) or signs of fluid overload (increased CVP, dyspnea, rales/crackles, edema).
- Assess patient for anorexia, muscle weakness, numbness, tingling, paresthesia, confusion, and excessive thirst. Report signs of electrolyte imbalance.
- **Increased Intracranial Pressure:** Monitor neurologic status and intracranial pressure readings in patients receiving this medication to decrease cerebral edema.
- **Increased Intraocular Pressure:** Monitor for persistent or increased eye pain or decreased visual acuity.
- **Lab Test Considerations:** Renal function and serum electrolytes should be monitored routinely throughout therapy.

Potential Nursing Diagnoses

Excess fluid volume (Indications)

Risk for deficient fluid volume (Side Effects)

Implementation

- Observe infusion site frequently for infiltration. Extravasation may cause tissue irritation and necrosis.
- Do not administer electrolyte-free mannitol solution with blood. If blood must be administered simultaneously with mannitol, add at least 20 mEq NaCl to each liter of mannitol.
- Confer with health care professional regarding placement of an indwelling Foley catheter (except when used to decrease intraocular pressure).
- **IV:** Administer by IV infusion undiluted. If solution contains crystals, warm bottle in hot water and shake vigorously. Do not administer solution in which crystals remain undissolved. Cool to body temperature. Use an in-line filter for 15%, 20%, and 25% infusions.
- **Test Dose:** Administer over 3–5 min to produce a urine output of 30–50 mL/hr. If urine flow does not increase, administer 2nd test dose. If urine output is not at least 30–50 mL/hr for 2–3 hr after 2nd test dose, patient should be re-evaluated.
- **Oliguria:** Administration rate should be titrated to produce a urine output of 30–50 mL/hr. Administer child's dose over 2–6 hr.
- **Increased Intracranial Pressure:** Infuse dose over 30–60 min in adults and children.
- **Intraocular Pressure:** Administer dose over 30 min. When used preoperatively, administer 60–90 min before surgery.

- **Y-Site Compatibility:** acetaminophen, acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, ampicillin, anidulafungin, argatroban, ascorbic acid, atropine, azithromycin, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cisatracurium, cisplatin, cladrubine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin hydrochloride, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, epitifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, indomethacin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, melphalan, meperidine, mesna, methotrexate, methyl dopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitropruside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, pentazocine, pentobarbital, phenobarbital, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procanamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, ranitidine, remifentanyl, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, telavancin, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** amphotericin B liposome, cefepime, dantrolene, diazepam, doxorubicin liposome,

somal, filgrastim, imipenem/cilastatin, phenytoin, trimethoprim/sulfamethoxazole.

- **Irrigation:** Add contents of two 50-mL vials of 25% mannitol to 900 mL of sterile water for injection for a 2.5% solution for irrigation. Use only clear solutions.

Patient/Family Teaching

- Explain purpose of therapy to patient.

Evaluation/Desired Outcomes

- Urine output of at least 30–50 mL/hr or an increase in urine output in accordance with parameters set by health care professional.
- Reduction in intracranial pressure.
- Reduction of intraocular pressure.
- Excretion of certain toxic substances.
- Irrigation during transurethral prostate resection.

meclizine (mek-li-zeen)

Antivert, Bonine, Dramamine Less Drowsy Formula

Classification

Therapeutic: antiemetics, antihistamines

Indications

Management/prevention of: Motion sickness, Vertigo.

Action

Has central anticholinergic, CNS depressant, and antihistaminic properties. Decreases excitability of the middle ear labyrinth and depresses conduction in middle ear vestibular-cerebellar pathways. **Therapeutic Effects:** Decreased motion sickness. Decreased vertigo from vestibular pathology.

Pharmacokinetics

Absorption: Absorbed after oral administration.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: 6 hr.

TIME/ACTION PROFILE (antihistaminic effects)

ROUTE	ONSET	PEAK	DURATION
PO	1 hr	unknown	8–24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **OB:** Has caused congenital malformations (cleft palate) in animal studies.

Use Cautiously in: Prostatic hyperplasia; Angle-closure glaucoma; **Lactation:** Occasional use may be acceptable; prolonged use may expose infant to drug effects or may interfere with milk supply; **Pedi:** Children <12 yr (safety not established); **Ger:** ↑ sensitivity and risk of adverse reactions.

★ = Canadian drug name. † = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; underline indicate most frequent.

Adverse Reactions/Side Effects

CNS: drowsiness, fatigue. **EENT:** blurred vision. **GI:** dry mouth.

Interactions

Drug-Drug: Additive CNS depression with other CNS depressants, including alcohol, other antihistamines, opioid analgesics, and sedative/hypnotics. Additive anticholinergic effects with other drugs possessing anticholinergic properties, including some antihistamines, antidepressants, atropine, haloperidol, phenothiazines, quinidine, and disopyramide. CYP2D6 inhibitors may ↑ levels.

Route/Dosage

PO (Adults and Children ≥12 yr): *Motion sickness*—25–50 mg 1 hr before exposure; may repeat in 24 hr; *vertigo*—25–100 mg/day in divided doses.

Availability (generic available)

Tablets: 12.5 mg, 25 mg^{Rx, OTC}, 50 mg.

NURSING IMPLICATIONS**Assessment**

- Assess patient for level of sedation after administration.
- **Motion Sickness:** Assess patient for nausea and vomiting before and 60 min after administration.
- **Vertigo:** Assess degree of vertigo periodically in patients receiving meclizine for labyrinthitis.
- **Lab Test Considerations:** May cause false-negative results in skin tests using allergen extracts. Discontinue meclizine 72 hr before testing.

Potential Nursing Diagnoses

Risk for injury (Side Effects)

Implementation

- **PO:** Administer oral doses with food, water, or milk to minimize GI irritation.

Patient/Family Teaching

- Instruct patient to take meclizine exactly as directed. If a dose is missed, take as soon as possible unless almost time for next dose. Do not double doses.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Advise patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may decrease dryness of mouth.
- Caution patient to avoid concurrent use of alcohol and other CNS depressants with this medication.
- **Motion Sickness:** When used as prophylaxis for motion sickness, advise patient to take medication at least 1 hr before exposure to conditions that may cause motion sickness.

Evaluation/Desired Outcomes

- Prevention and relief of symptoms in motion sickness.
- Prevention and treatment of vertigo due to vestibular pathology.

medroxyPROGESTERone†

(me-drox-ee-proe-jess-te-rone)
Depo-Provera, Depo-Sub Q Provera
104, Medroxy, Provera

Classification

Therapeutic: antineoplastics, contraceptive hormones

Pharmacologic: hormones, progestins

†For contraceptive use see Contraceptives, Hormonal monograph.

Indications

To decrease endometrial hyperplasia in postmenopausal women receiving concurrent estrogen (0.625 mg/day conjugated estrogens). Treatment of secondary amenorrhea and abnormal uterine bleeding caused by hormonal imbalance. **IM:** Treatment of advanced unsuspicious endometrial or renal carcinoma. †Prevention of pregnancy. Management of endometriosis-associated pain (Depo-Sub Q Provera 104 only). **Unlabeled Use:** Obesity-hypoventilation (pickwickian) syndrome. Sleep apnea. Hypersomnolence.

Action

A synthetic form of progesterone—actions include secretory changes in the endometrium, increases in basal body temperature, histologic changes in vaginal epithelium, relaxation of uterine smooth muscle, mammary alveolar tissue growth, pituitary inhibition, and withdrawal bleeding in the presence of estrogen. **Therapeutic Effects:** Decreased endometrial hyperplasia in postmenopausal women receiving concurrent estrogen (combination with estrogen decreases vasomotor symptoms and prevents osteoporosis). Restoration of hormonal balance with control of uterine bleeding. Management of endometrial or renal cancer. Prevention of pregnancy.

Pharmacokinetics

Absorption: 0.6–10% absorbed after oral administration.

Distribution: Enters breast milk.

Metabolism and Excretion: Metabolized by the liver.

Half-life: 1st phase—52 min; 2nd phase—230 min; *biological*—14.5 hr.

TIME/ACTION PROFILE (IM = antineoplastic effects)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown
IM	wk–mos	mo	unknown†
SC	unknown	1 wk	3 mo

†Contraceptive effect lasts 3 mo.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity to parabens (IM suspension only); Missed abor-

tion; Thromboembolic disease; Cerebrovascular disease; Severe liver disease; Breast or genital cancer; Porphyria; **OB:** May ↑ risk of fetal genitourinary malformation.

Use Cautiously in: History of liver disease; Renal disease; Cardiovascular disease; Seizure disorders; Mental depression; **Lactation:** If used as a contraceptive, wait 6 wk after delivery if breast feeding.

Adverse Reactions/Side Effects

CNS: depression. **EENT:** retinal thrombosis. **CV:** **PULMONARY EMBOLISM**, thromboembolism, thrombophlebitis. **GI:** drug-induced hepatitis, gingival bleeding. **GU:** cervical erosions, dysmenorrhea. **Derm:** chloasma, melasma, rashes. **Endo:** amenorrhea, breakthrough bleeding, breast tenderness, changes in menstrual flow, galactorrhea, hyperglycemia, spotting. **F and E:** edema. **Metab:** bone loss, weight gain, weight loss. **Misc:** allergic reactions including **ANAPHYLAXIS** and **ANGIOEDEMA**, **BREAST CANCER**, injection site reactions.

Interactions

Drug-Drug: Strong **CYP3A4 inhibitors**, including ketoconazole, itraconazole, clarithromycin, atazanavir, indinavir, nefazodone, nelfinavir, ritonavir, saquinavir, and voriconazole may ↑ levels; avoid concurrent use. Strong **CYP3A4 inducers**, including phenytoin, carbamazepine, rifampin, rifabutin, rifapentin, and phenobarbital may ↓ levels; avoid concurrent use. May ↓ effectiveness of **bromocriptine** when used concurrently for galactorrhea/amenorrhea. Contraceptive effectiveness may be ↓ by carbamazepine, phenobarbital, phenytoin, rifampin, or rifabutin.

Drug-Natural Products: St. John's wort may ↓ levels; avoid concurrent use.

Route/Dosage

Postmenopausal Women Receiving Concurrent Estrogen

PO (Adults): 2.5–5 mg daily concurrently with 0.625 mg conjugated estrogens (monophasic regimen) or 5 mg daily on days 15–28 of the cycle with 0.625 mg conjugated estrogens taken daily throughout cycle (biphasic regimen).

Secondary Amenorrhea

PO (Adults): 5–10 mg/day for 5–10 days; start at any time in cycle.

Dysfunctional Uterine Bleeding/Induction of Menses

PO (Adults): 5–10 mg/day for 5–10 days, starting on day 16 or day 21 of menstrual cycle.

Renal or Endometrial Carcinoma

IM (Adults): 400–1000 mg, may be repeated weekly; if improvement occurs, attempt to decrease dose to 400 mg monthly.

Endometriosis-Associated Pain

Subcut (Adults): 104 mg every 12–14 wk (3 mo), beginning on day 5 of normal menses (not recommended for more than 2 yr).

Availability (generic available)

Tablets: 2.5 mg, 5 mg, 10 mg, * 100 mg. **Suspension for depot injection:** * 50 mg/mL, 150 mg/mL, 400 mg/mL. **Suspension for subcutaneous injection (Depo-Sub Q Provera 104):** 104 mg/0.65 mL.

In combination with: conjugated estrogens as Prempro (single combination tablet of 0.626 mg conjugated estrogens plus 2.5 or 5 mg medroxyprogesterone) or Premphase (0.625 mg conjugated estrogens tablet for 14 days followed by combination tablet of 0.625 mg conjugated estrogens plus 5 mg medroxyprogesterone for days 15–28) in convenience packages. See Appendix B.

NURSING IMPLICATIONS

Assessment

- Monitor BP periodically during therapy.
- Assess patient's usual menstrual history. Administration of drug may begin on any day of cycle in patients with amenorrhea and on day 16 or 21 of cycle in patients with dysfunctional bleeding.
- Monitor intake and output ratios and weekly weight. Report significant discrepancies or steady weight gain.
- **Lab Test Considerations:** Monitor hepatic function before and periodically during therapy.
- May cause ↑ alkaline phosphatase levels. May ↓ pregnanediol excretion concentrations.
- May cause ↑ serum LDL concentrations or ↓ HDL concentrations.
- May alter thyroid hormone assays.

Potential Nursing Diagnoses

Sexual dysfunction (Indications)

Ineffective tissue perfusion (Side Effects)

Implementation

- Do not confuse Depo-Provera with Depo-subQ Provera 104. Do not confuse Provera (medroxyprogesterone) with Proscar (finasteride) or Prozac (fluoxetine).
- Only the 150 mg/mL vial or prefilled syringe should be used for contraception.
- Injectable medroxyprogesterone may lead to bone loss, especially in women younger than 21 yr. Injectable medroxyprogesterone should be used for >2 yr only if other methods of contraception are inadequate.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

quate. If used long term, women should use supplemental calcium and vitamin D, and monitor bone mineral density.

- **Subcut:** Shake vigorously before use to form a uniform suspension. Inject slowly (over 5–7 seconds) at a 45° angle into fatty area of anterior thigh or abdomen every 12 to 14 wk. If more than 14 wk elapse between injections, rule out pregnancy prior to administration. **Do not rub area after injection.**
- When switching from other hormonal contraceptives, administer within dosing period (7 days after taking last active pill, removing patch or ring, or within the dosing period for IM injection).
- **IM:** Shake vial or prefilled syringe vigorously before preparing IM dose. Administer deep IM into gluteal or deltoid muscle. Rotate sites with each injection. If period between injections is >14 wk, determine that patient is not pregnant before administering the drug.
- In patients with cancer, IM dose may initially be required weekly. Once stabilized, IM dose may be required only monthly.

Patient/Family Teaching

- Explain the dose schedule. Instruct patient to take medication at the same time each day. Take missed doses as soon as remembered, but do not double doses.
- Advise patients receiving medroxyprogesterone for menstrual dysfunction to anticipate withdrawal bleeding 3–7 days after discontinuing medication.
- **Review patient package insert (PPI) with patient.** Emphasize the importance of notifying health care professional if the following side effects occur: visual changes, sudden weakness, incoordination, difficulty with speech, headache, leg or calf pain, shortness of breath, chest pain, changes in vaginal bleeding pattern, yellow skin, swelling of extremities, depression, or rash. Patients receiving medroxyprogesterone for cancer may not receive PPI.
- Advise patient to keep a 1-mo supply of medroxyprogesterone available at all times.
- Instruct patient in correct method of monthly breast self-examination. Increased breast tenderness may occur.
- Advise patient that gingival bleeding may occur. Instruct patient to use good oral hygiene and to receive regular dental care and examinations.
- Medroxyprogesterone may cause melasma (brown patches of discoloration) on face when patient is exposed to sunlight. Advise patient to avoid sun exposure and to wear sunscreen or protective clothing when outdoors.
- **Rep:** Instruct patient to notify health care professional if menstrual period is missed or if pregnancy is suspected. Patient should not attempt conception for 3 mo after discontinuing medication in order to decrease risk to fetus.
- Emphasize the importance of routine follow-up physical exams, including BP; breast, abdomen, and

pelvic exams; and Papanicolaou smears every 6–12 mo.

- **IM, Subcut:** Advise patient to maintain adequate amounts of dietary calcium and vitamin D to help prevent bone loss.

Evaluation/Desired Outcomes

- Regular menstrual periods.
- Decrease in endometrial hyperplasia in postmenopausal women receiving concurrent estrogen.
- Control of the spread of endometrial or renal cancer.
- Prevention of pregnancy.

medroxyprogesterone, See CONTRACEPTIVES, HORMONAL.

megestrol (me-jess-trole)
Megace, Megace ES, ♣ Megace OS

Classification

Therapeutic: antineoplastics, hormones
Pharmacologic: progestins

Indications

Palliative treatment of endometrial and breast carcinoma, either alone or with surgery or radiation (tablets only). Treatment of anorexia, weight loss, and cachexia associated with AIDS (oral suspension only).

Action

Antineoplastic effect may result from inhibition of pituitary function. **Therapeutic Effects:** Regression of tumor. Increased appetite and weight gain in patients with AIDS.

Pharmacokinetics

Absorption: Well absorbed from the GI tract.

Distribution: Unknown.

Protein Binding: ≥90%.

Metabolism and Excretion: Completely metabolized by the liver.

Half-life: 38 hr (range 13–104 hr).

TIME/ACTION PROFILE (antineoplastic activity)

ROUTE	ONSET	PEAK	DURATION
PO	wk–mos	2 mo	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Undiagnosed vaginal bleeding; Severe liver disease; Suspension contains alcohol and should be avoided in patients with known intolerance; **OB, Lactation:** Pregnancy or lactation.

Use Cautiously in: Diabetes; Mental depression; Renal disease; History of thrombophlebitis; Cardiovascular disease; Seizure disorders.

Adverse Reactions/Side Effects

CV: THROMBOEMBOLISM, edema. **GI:** GI irritation.

Derm: alopecia. **Endo:** asymptomatic adrenal suppression (chronic therapy). **GU:** vaginal bleeding. **Hemat:** thrombophlebitis. **MS:** carpal tunnel syndrome.

Interactions

Drug-Drug: None significant.

Route/Dosage

PO (Adults): *Breast carcinoma*—160 mg/day single dose or divided doses; *Endometrial/ovarian carcinoma*—40–320 mg/day in divided doses; *Anorexia associated with AIDS*—Megace: 800 mg once daily; may ↓ to 400 mg/day after 1 mo (range 400–800 mg/day); Megace ES: 625 mg once daily.

Availability (generic available)

Tablets: 20 mg, 40 mg, 160 mg. **Oral suspension (lemon-lime flavor):** 40 mg/mL, 125 mg/mL (Megace ES).

NURSING IMPLICATIONS

Assessment

- Assess for swelling, pain, or tenderness in legs. Report these signs of deep vein thrombophlebitis.
- **Anorexia:** Monitor weight, appetite, and nutritional intake in patients with AIDS.

Potential Nursing Diagnoses

Imbalanced nutrition: less than body requirements (Indications)

Implementation

- Because of high dose, suspension is most convenient form for patients with AIDS.
- Do not confuse Megace 40 mg/mL with Megace ES 125 mg/mL.
- **PO:** May be administered with meals if GI irritation becomes a problem.
- Shake suspension well before administering.

Patient/Family Teaching

- Instruct patient to take megestrol as directed; do not skip or double up on missed doses. Missed doses may be taken as long as not right before next dose. Gradually decrease dose prior to discontinuation.
- Advise patient to report to health care professional any unusual vaginal bleeding or signs of deep vein thrombophlebitis.
- Discuss with patient the possibility of hair loss. Explore methods of coping.
- Advise patient that this medication may have teratogenic effects. Contraception should be used during and for at least 4 mo after therapy is completed. Advise patient to notify health care professional immediately if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Slowing or arresting the spread of endometrial or breast malignancy. Therapeutic effects usually occur within 2 mo of initiating therapy.
- Increased appetite and weight gain in patients with AIDS.

meloxicam (me-lox-i-kam)

Mobic,  Mobicox, Vivlodex

Classification

Therapeutic: nonsteroidal anti-inflammatory agents

Pharmacologic: nonopioid analgesics

Indications

Relief of signs and symptoms of osteoarthritis and rheumatoid arthritis (including juvenile rheumatoid arthritis).

Action

Inhibits prostaglandin synthesis, probably by inhibiting the enzyme cyclooxygenase. **Therapeutic Effects:** Decreased pain and inflammation associated with osteoarthritis. Also decreases fever.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Unknown.

Protein Binding: 99.4%.

Metabolism and Excretion: Mostly metabolized to inactive metabolites by the liver via the P450 enzyme system; metabolites are excreted in urine and feces.

Half-life: 20.1 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK†	DURATION
PO	unknown	5–6 hr	24 hr

†Blood levels.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity may occur with other NSAIDs, including aspirin; Severe renal impairment (CCr ≤15 mL/min); Concurrent use of aspirin (↑ risk of adverse reactions); Coronary artery bypass graft (CABG) surgery; **OB:** Can cause premature closure of ductus arteriosus if used during third trimester.

Use Cautiously in: Cardiovascular disease or risk factors for cardiovascular disease (may ↑ risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke, especially with prolonged use or use of higher doses); avoid use in patients with recent MI or HF; Dehydration (correct deficits before initiating therapy); Impaired renal function, heart failure, liver

 = Canadian drug name.  = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; _____ indicate most frequent.

dysfunction, concurrent ACE inhibitor or diuretic therapy (↑ risk of renal dysfunction); Coagulation disorders or concurrent anticoagulant therapy (may ↑ risk of bleeding); **Lactation:** Safety not established; **Pedi:** Children <2 yr (safety not established); **Geri:** ↑ risk of GI bleeding and renal dysfunction.

Adverse Reactions/Side Effects

CV: HF, MYOCARDIAL INFARCTION, STROKE, edema, hypertension. **GI:** GI BLEEDING, ↑ liver enzymes, diarrhea, dyspepsia, nausea. **Derm:** EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, pruritus. **F and E:** hyperkalemia. **GU:** delayed ovulation. **Hemat:** anemia, leukopenia, thrombocytopenia.

Interactions

Drug-Drug: May ↓ antihypertensive effects of ACE inhibitors. May ↓ diuretic effects of furosemide or thiazide diuretics. Concurrent use with aspirin ↑ meloxicam blood levels and may ↑ risk of adverse reactions. Concurrent use with cholestyramine ↓ blood levels. ↑ plasma lithium levels (close monitoring recommended when meloxicam is introduced or withdrawn). ↑ risk of bleeding with anticoagulants, aspirin, clopidogrel, ticagrelor, prasugrel, corticosteroids, fibrinolytics, SNRIs, or SSRIs. Concurrent use with sodium polystyrene sulfonate may ↑ risk of colonic necrosis; concurrent use should be avoided.

Route/Dosage

PO (Adults): Capsules—5 mg once daily; some patients may require 10 mg once daily; Tablets—7.5 mg once daily; some patients may require 15 mg once daily.

PO (Children 2–17 yr and >12 kg): 0.125 mg/kg once daily up to 7.5 mg/day.

Availability (generic available)

Capsules: 5 mg, 10 mg. **Tablets:** 7.5 mg, 15 mg.

Cost: Generic—7.5 mg \$9.02/100, 15 mg \$7.41/100.

NURSING IMPLICATIONS

Assessment

- Patients who have asthma, aspirin-induced allergy, and nasal polyps are at increased risk for developing hypersensitivity reactions. Assess for rhinitis, asthma, and urticaria.
- Assess pain and range of motion prior to and 1–2 hr following administration.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome or toxic epidermal necrolysis. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.
- Monitor BP during initiation and periodically during therapy. May cause fluid retention and edema leading to new onset or worsening hypertension.

- **Lab Test Considerations:** Evaluate BUN, serum creatinine, CBC, and liver function periodically in patients receiving prolonged therapy. May cause anemia, thrombocytopenia, leukopenia, and abnormal liver or renal function tests.
- Bleeding time may be prolonged.

Potential Nursing Diagnoses

Acute pain (Indications)

Impaired physical mobility (Indications)

Implementation

- Administration in higher than recommended doses does not provide increased effectiveness but may cause increased side effects. Use lowest effective dose for shortest period of time to minimize risk of cardiovascular thrombotic events.
- **PO:** May be administered without regard to food.

Patient/Family Teaching

- Advise patient to take this medication with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Instruct patient to take medication as directed. Take missed doses as soon as remembered but not if almost time for the next dose. Do not double doses. Instruct parent/caregiver to read the *Medication Guide* prior to use and with each Rx refill in case of changes.
- Caution patient to avoid the concurrent use of alcohol, aspirin, acetaminophen, or other OTC medications without consulting health care professional.
- Inform patient that meloxicam may increase the risk for heart attack and stroke; risk increases with longer use or in patients with heart disease.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery, especially right before or after coronary artery bypass graft (CABG).
- Advise patient to consult health care professional if rash, itching, visual disturbances, weight gain, edema, black stools, or signs of hepatotoxicity (nausea, fatigue, lethargy, jaundice, upper right quadrant tenderness, flu-like symptoms) occur.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding. Avoid especially after 30 wks of pregnancy.

Evaluation/Desired Outcomes

- Relief of pain.
- Improved joint mobility. Patients who do not respond to one NSAID may respond to another.

melphalan (mel-fa-lan)

Alkeran, Evomela

Classification

Therapeutic: antineoplastics

Pharmacologic: alkylating agents

Indications

IV: High-dose conditioning treatment prior to hematopoietic stem cell transplantation (Evomela only). **IV and PO:** Palliative treatment of multiple myeloma when oral therapy is not appropriate (Alkeran and Evomela). **PO:** Palliative treatment of nonresectable epithelial ovarian carcinoma (Alkeran).

Action

Inhibits DNA and RNA synthesis by alkylation (cell-cycle phase–nonspecific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones. Also has immunosuppressive properties.

Pharmacokinetics

Absorption: Incompletely and variably absorbed following oral administration. IV administration results in complete bioavailability.

Distribution: Rapidly distributed throughout total body water.

Protein Binding: $\leq 30\%$.

Metabolism and Excretion: Rapidly metabolized in the bloodstream. Small amounts (10%) excreted unchanged by the kidneys.

Half-life: 1.5 hr.

TIME/ACTION PROFILE (effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	2–3 wk	4–5 wk
PO	5 days	2–3 wk	5–6 wk

Contraindications/Precautions

Contraindicated in: Hypersensitivity to melphalan; **OB, Lactation:** Pregnancy or lactation.

Use Cautiously in: Active infections; \downarrow bone marrow reserve; Renal impairment (dose \downarrow recommended for IV for palliative treatment only if BUN ≥ 30 mg/dL; dose \downarrow may be needed when using PO therapy); **Rep:** Women of reproductive potential and men with female sexual partners of reproductive potential; **Pedi:** Safety and effectiveness not established; **Geri:** Begin at lower end of dosing range due to potential for age-related \downarrow in renal, hepatic, or cardiac function.

Adverse Reactions/Side Effects

CNS: dizziness. **CV:** peripheral edema. **GI:** constipation, diarrhea, mucositis, nausea, vomiting, hepatotoxicity. **GU:** infertility. **Derm:** alopecia, pruritus, rash. **Endo:** menstrual irregularities. **F and E:** hypokalemia, hypophosphatemia. **Hemat:** leukopenia, thrombocytopenia, anemia. **Metab:** hyperuricemia. **Misc:** allergic reactions, including **ANAPHYLAXIS** (more common after IV use), **MALIGNANCY**, fever.

Interactions

Drug-Drug: \uparrow bone marrow depression with other **antineoplastics** or **radiation therapy**. May \downarrow anti-

body response to **live-virus vaccines** and \uparrow risk of adverse reactions. Concurrent IV use with **cyclosporine** may \uparrow risk of renal failure.

Route/Dosage

Multiple Myeloma (Palliative Treatment)

PO (Adults): 6 mg once daily for 2–3 wk followed by up to 4 wk rest, then 2 mg once daily or 10 mg once daily for 7–10 days, then 2 mg once daily once WBC $> 4000/\text{mm}^3$ and platelets $> 100,000/\text{mm}^3$ or 0.15 mg/kg/day for 7 days, followed by 2–6 wk rest, then 0.05 mg/kg/day maintenance dose or 0.25 mg/kg/day for 4 days every 4–6 wk or 0.2 mg/kg/day for 5 days every 4–6 wk.

IV (Adults): 16 mg/m² every 2 wk for 4 doses, then every 4 wk.

Renal Impairment

IV (Adults): BUN ≥ 30 mg/dL — \downarrow dose by up to 50%.

Multiple Myeloma (Conditioning Treatment)

IV (Adults): 100 mg/m²/day on Day –3 and Day –2 prior to autologous stem cell transplantation on Day 0.

Ovarian Carcinoma

PO (Adults): 0.2 mg/kg/day for 5 days every 4–5 wk.

Availability (generic available)

Tablets: 2 mg. **Powder for injection:** 50 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess for signs of infection (fever, chills, sore throat, cough, hoarseness, lower back or side pain, difficult or painful urination). Notify health care professional if these symptoms occur.
- Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis). Avoid IM injections and taking rectal temperatures. Apply pressure to venipuncture sites for 10 min.
- May cause nausea and vomiting. Monitor intake and output, appetite, and nutritional intake. Prophylactic antiemetics may be used. Adjust diet as tolerated.
- Monitor for symptoms of gout (increased uric acid, joint pain, edema). Encourage patient to drink at least 2 L of fluid per day. Allopurinol may be given to decrease uric acid levels.
- Anemia may occur. Monitor for increased fatigue and dyspnea.
- Assess patient for allergy to chlorambucil. Patients may have cross-sensitivity.
- **Lab Test Considerations:** Monitor CBC and differential weekly during therapy. The nadir of leukopenia occurs in 2–3 wk. Notify physician if leukocyte count is $< 3000/\text{mm}^3$. The nadir of thrombocytopenia occurs in 2–3 wk. Notify physi-

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

cian if platelet count is $<100,000/\text{mm}^3$. Recovery of leukopenia and thrombocytopenia occurs in 5–6 wk.

- Monitor liver function studies (AST, ALT, LDH, bilirubin) and renal function studies (BUN, creatinine) prior to and periodically during therapy to detect hepatotoxicity and nephrotoxicity.
- May cause \uparrow uric acid. Monitor periodically during therapy.
- May cause \uparrow 5-hydroxyindoleacetic acid (5-HIAA) concentrations as a result of tumor breakdown.

Potential Nursing Diagnoses

Risk for injury (Side Effects)

Risk for infection (Side Effects)

Implementation

- **Do not confuse Alkeran (melphalan) with Leukeran (chlorambucil) or Myleran (busulfan).**
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard IV equipment in specially designated container.
- If solution contacts skin or mucosa, immediately wash skin or mucosa with soap and water.
- **PO:** May be ordered in divided doses or as a single daily dose.

IV Administration

- **Intermittent Infusion:** Reconstitute with 10 mL of diluent supplied for a concentration of 5 mg/mL and shake vigorously until solution is clear. **Diluent:** Dilute dose immediately with 0.9% NaCl. **Concentration:** Not to exceed 2 mg/mL for central line or 0.45 mg/mL for a peripheral line. Administer within 60 min of reconstitution. **Rate:** Administer over at least 15 min (not to exceed 10 mg/min).
- **Y-Site Compatibility:** acyclovir, alemtuzumab, amikacin, aminophylline, amphotericin B lipid complex, ampicillin, anidulafungin, argatroban, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, ceftazidime, ceftriaxone, cefuroxime, cisplatin, clindamycin, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, daunorubicin, dexamethasone, dexrazoxane, diltiazem, diphenhydramine, doxorubicin, doxycycline, droperidol, enalaprilat, ertapenem, etoposide, famotidine, filgrastim, fluoxiridine, fluconazole, fludarabine, fluorouracil, furosemide, ganciclovir, gentamicin, granisetron, haloperidol, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, linezolid, lorazepam, manitol, mechlorethamine, meperidine, mesna, methotrexate, methylprednisolone, metoclopramide, metronidazole, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, nalbuphine, nesiritide, octreotide, ondansetron, palonosetron, pamidronate, pancuronium, pentostatin, piperacillin/tazobactam, potas-

sium acetate, potassium chloride, prochlorperazine, promethazine, ranitidine, sodium bicarbonate, streptozocin, teniposide, thiotepa, tigecycline, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** amiodarone, amphotericin B colloidal, chlorpromazine, pantoprazole.

Patient/Family Teaching

- Instruct patient to take melphalan as directed, even if nausea and vomiting occur. If vomiting occurs shortly after dose is taken, consult health care professional. If a dose is missed, do not take at all.
- Advise patient to notify health care professional if fever; chills; dyspnea; persistent cough; sore throat; signs of infection; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Caution patient not to drink alcoholic beverages or take products containing aspirin or other NSAIDs.
- Instruct patient to notify health care professional if skin rash, vasculitis, bleeding, fever, persistent cough, nausea, vomiting, amenorrhea, weight loss, or unusual lumps/masses occur.
- Instruct patient to inspect oral mucosa for redness and ulceration. If ulceration occurs, advise patient to use sponge brush and to rinse mouth with water after eating and drinking. Consult health care professional if pain interferes with eating. Stomatitis pain may require treatment with opioid analgesics.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Advise female and male patients that although fertility may be decreased, use effective contraception during and after melphalan therapy because of potential teratogenic effects on the fetus.
- Emphasize need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in size and spread of malignant tissue.

memantine (me-man-teen)

★ Ebixa, Namenda, Namenda XR

Classification

Therapeutic: anti-Alzheimer's agents

Pharmacologic: N-methyl-D-aspartate antagonist

Indications

Moderate to severe dementia/neurocognitive disorder associated with Alzheimer's disease.

Action

Binds to CNS N-methyl-D-aspartate (NMDA) receptor sites, preventing binding of glutamate, an excitatory

neurotransmitter. **Therapeutic Effects:** Decreased symptoms of dementia/cognitive decline. Does not slow progression. Cognitive enhancement. Does not cure disease.

Pharmacokinetics

Absorption: Well absorbed after oral administration.

Distribution: Unknown.

Metabolism and Excretion: 57–82% excreted unchanged in urine by active tubular secretion moderated by pH dependent tubular reabsorption. Remainder metabolized; metabolites are not pharmacologically active.

Half-life: 60–80 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	3–7 hr	12 hr
PO-ER	unknown	9–12 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Severe renal impairment (\downarrow dose); Severe hepatic impairment; Concurrent use of other NMDA antagonists (amantadine, rimantadine, ketamine, dextromethorphan); Concurrent use of drugs or diets that cause alkaline urine; Conditions that \uparrow urine pH including severe urinary tract infections or renal tubular acidosis (lead to \downarrow excretion and \uparrow levels); **OB, Lactation:** Safety not established; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: dizziness, fatigue, headache, sedation. **CV:** hypertension. **Derm:** rash. **GI:** diarrhea, weight gain.

GU: urinary frequency. **Hemat:** anemia.

Interactions

Drug-Drug: Medications that \uparrow urine pH (e.g. carbonic anhydrase inhibitors, sodium bicarbonate) may \downarrow excretion and \uparrow blood levels.

Route/Dosage

PO (Adults): Immediate-release—5 mg once daily initially, \uparrow at weekly intervals to 10 mg/day (5 mg twice daily), then 15 mg/day (5 mg once daily, 10 mg once daily as separate doses), then to target dose of 20 mg/day (10 mg twice daily); **Extended-release**—7 mg once daily, \uparrow at weekly intervals by 7 mg/day to target dose of 28 mg once daily.

Renal Impairment

(Adults): *CCr* 5–29 mL/min—**Immediate-release (solution):** Target dose is 10 mg/day (5 mg twice daily); **Extended-release:** Target dose is 14 mg once daily.

Availability (generic available)

Immediate-release tablets: 5 mg, 10 mg, titration package containing twenty-eight 5–mg tablets and twenty-one 10–mg tablets. **Cost:** 5 mg \$887.69/180.

Extended-release capsules: 7 mg, 14 mg, 21 mg, 28 mg. **Cost:** 7 mg \$302.62/30, 14 mg \$907.85/90, 21 mg \$302.62/30, 28 mg \$907.85/90.

Oral solution, sugar-free, alcohol-free (peppermint): 2 mg/mL.

Cost: \$668.50/360 mL. **In combination with:** donepezil (Namzaric). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) periodically during therapy.
- **Lab Test Considerations:** May cause anemia.

Potential Nursing Diagnoses

Disturbed thought process (Indications)

Risk for injury (Side Effects)

Impaired environmental interpretation syndrome

Implementation

- Dose increases should occur no more frequently than weekly.
- To switch from *Namenda* to Namenda XR, patients taking 10 mg twice daily of *Namenda* tablets may be switched to *Namenda XR* 28 mg once daily capsules the day following the last dose of a 10 mg *Namenda* tablet. Patients with renal impairment may use the same procedure to switch from *Namenda* 5 mg twice daily to *Namenda XR* 14 mg once daily.
- **PO:** May be administered without regard to food.
- Administer oral solution using syringe provided. Do not dilute or mix with other fluids.
- Swallow extended release capsules whole; do not crush, chew, or divide. Capsules may be opened, sprinkled on applesauce, and swallowed. Entire contents of each capsule should be consumed; do not divide dose.

Patient/Family Teaching

- Instruct patient and caregiver on how and when to administer memantine and how to titrate dose. Take missed doses as soon as remembered but not just before next dose; do not double doses. If several days doses are missed, may need to resume at a lower dose and re-titrate up to previous dose; consult health care professional. Advise patient and caregiver to read *Patient Instructions* before starting and with each Rx refill in case of changes.
- Caution patient and caregiver that memantine may cause dizziness. Monitor and assist with ambulation and caution patient to avoid driving and other activities requiring alertness until response to medication is known.

★ = Canadian drug name. ☒ = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Advise patient and caregiver to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Teach patient and caregivers that improvement in cognitive functioning may take months; degenerative process is not reversed.

Evaluation/Desired Outcomes

- Improvement in neurocognitive decline (memory, attention, reasoning, language, ability to perform simple tasks) in patients with Alzheimer's disease.

HIGH ALERT

meperidine (me-per-i-deen)

Demerol

Classification

Therapeutic: opioid analgesics

Pharmacologic: opioid agonists

Schedule II

Indications

Moderate or severe pain (alone or with nonopioid agents). Anesthesia adjunct. Analgesic during labor. Preoperative sedation. **Unlabeled Use:** Rigors.

Action

Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli, while producing generalized CNS depression. **Therapeutic Effects:** Decrease in severity of pain.

Pharmacokinetics

Absorption: 50% from the GI tract; well absorbed from IM sites. Oral doses are about half as effective as parenteral doses.

Distribution: Widely distributed. Crosses the placenta; enters breast milk.

Protein Binding: Neonates: 52%; Infants 3–18 mo: 85%; Adults: 60–80%.

Metabolism and Excretion: Mostly metabolized by the liver; some converted to normeperidine, which may accumulate and cause seizures. 5% excreted unchanged by the kidneys.

Half-life: Neonates: 12–39 hr; Infants 3–18 mo: 2.3 hr; Children 5–8 yr: 3 hr; Adults: 2.5–4 hr (↑ in impaired renal or hepatic function [7–11 hr]).

TIME/ACTION PROFILE (analgesia)

ROUTE	ONSET	PEAK	DURATION
PO	15 min	60 min	2–4 hr
IM	10–15 min	30–50 min	2–4 hr
Subcut	10–15 min	40–60 min	2–4 hr
IV	immediate	5–7 min	2–3 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity to bisulfites (some injectable products); Recent

(within 14 days) MAO inhibitor therapy; Severe respiratory insufficiency; **OB:** Labor and delivery; **Lactation:** Excreted in breast milk and can cause respiratory depression in the infant.

Use Cautiously in: Head trauma; ↑ intracranial pressure; Severe renal or hepatic impairment; Acute asthma attack, COPD, hypoxia, or hypercapnea; Hypothyroidism; Adrenal insufficiency; Alcoholism; Debilitated patients (dose ↓ suggested); Undiagnosed abdominal pain or prostatic hyperplasia; Patients with renal impairment, or extensive burns; High-dose or prolonged therapy (>600 mg/day or >2 days; ↑ risk of CNS stimulation and seizures due to accumulation of normeperidine); Sick cell anemia (may require ↓ initial doses); **OB:** Avoid chronic use during pregnancy as can result in neonatal opioid withdrawal syndrome; **Pedi:** Syrup contains benzyl alcohol, which can cause “gasping syndrome” in neonates. Children have ↑ risk of seizures due to accumulation of normeperidine; **Ger:** Appears on Beers list; morphine recommended.

Adverse Reactions/Side Effects

CNS: SEIZURES, confusion, sedation, dysphoria, euphoria, floating feeling, hallucinations, headache, unusual dreams. **EENT:** blurred vision, diplopia, miosis.

Resp: respiratory depression. **CV:** hypotension, bradycardia. **Endo:** adrenal insufficiency. **GI:** constipation, nausea, vomiting. **GU:** urinary retention.

Derm: flushing, sweating. **Misc:** allergic reactions including ANAPHYLAXIS, physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Do not use in patients receiving MAO inhibitors or procarbazine (may cause fatal reaction—contraindicated within 14 days of MAO inhibitor therapy). Use with benzodiazepines or other CNS depressants including other opioids, non-benzodiazepine sedative/hypnotics, anxiolytics, general anesthetics, muscle relaxants, antipsychotics, and alcohol may cause profound sedation, respiratory depression, coma, and death; reserve concurrent use for when alternative treatment options are inadequate. Administration of agonist/antagonist opioid analgesics may precipitate opioid withdrawal in physically dependent patients. Concurrent use of CYP3A4 inhibitors including ritonavir, ketoconazole, itraconazole, fluconazole clarithromycin, erythromycin, nefazodone, diltiazem, verapamil, nelfinavir, and fosamprenavir ↑ levels and risk of opioid toxicity; careful monitoring during initiation, dose changes, or discontinuation of the inhibitor is recommended. Concurrent use with CYP3A4 inducers including barbiturates, carbamazepine, efavirenz, corticosteroids, modafinil, nevirapine, oxcarbazepine, phenobarbital, phenytoin, rifabutin, or rifampin may ↓ levels and analgesia; if inducers are discontinued

or dosage ↓, patients should be monitored for signs of opioid toxicity and necessary dose adjustments should be made. **Nalbuphine** or **pentazocine** may ↓ analgesia. **Protease inhibitors** may ↑ effects and adverse reactions (concurrent use should be avoided). **Phenytoin** ↑ metabolism and may ↓ effects.

Chlorpromazine and **thioridazine** may ↑ the risk of adverse reactions (concurrent use should be avoided). May aggravate side effects of **isoniazid**. **Acyclovir** may ↑ plasma concentrations of meperidine and normeperidine. Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SSRIs**, **SNRIs**, **MAO inhibitors**, **TCA**s, **tramadol**, **trazodone**, **mirtazapine**, **5-HT₃ receptor antagonists**, **linezolid**, **methylene blue**, and **triptans** ↑ risk of serotonin syndrome.

Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, or **chamomile** can ↓ CNS depression. **St. John's wort** may ↑ serious side effects, concurrent use is not recommended.

Route/Dosage

PO, IM, Subcut (Adults): *Analgesia*—50 mg q 3–4 hr; may be ↑ as needed (not to exceed 600 mg/24 hr). *Analgesia during labor*—50–100 mg IM or subcut when contractions become regular; may repeat q 1–3 hr. *Preoperative sedation*—50–100 mg IM or subcut 30–90 min before anesthesia.

PO, IM, Subcut (Children): *Analgesia*—1–1.5 mg/kg q 3–4 hr (should not exceed 100 mg/dose). *Preoperative sedation*—1–2 mg/kg 30–90 min before anesthesia (not to exceed adult dose).

IV (Adults): 15–35 mg/hr as a continuous infusion; *PCA*—10 mg initially; with a range of 1–5 mg/incremental dose, recommended lockout interval is 6–10 min (minimum 5 min).

IV (Children): *Continuous infusion*—0.5–1 mg/kg loading dose followed by 0.3 mg/kg/hr, titrate to effect up to 0.5–0.7 mg/kg/hr.

Availability (generic available)

Tablets: 50 mg, 100 mg. **Oral solution (banana flavor):** 50 mg/5 mL. **Solution for injection:** 10 mg/mL, 25 mg/mL, 50 mg/mL, 75 mg/mL, 100 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess type, location, and intensity of pain prior to and 1 hr following PO, subcut, and IM doses and 5 min (peak) following IV administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at

the time of the peak if previous dose is ineffective and side effects are minimal.

- An equianalgesic chart (see Appendix J) should be used when changing routes or when changing from one opioid to another.
- Assess BP, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Dose may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use.
- Assess bowel function routinely. Prevention of constipation should be instituted with increased intake of fluids and bulk and with laxatives to minimize constipating effects. Stimulant laxatives should be administered routinely if opioid use exceeds 2–3 days, unless contraindicated.
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive meperidine for pain do not develop psychological dependence. Progressively higher doses may be required to relieve pain with long-term therapy.
- **Monitor patients on chronic or high-dose therapy for CNS stimulation (restlessness, irritability, seizures) due to accumulation of normeperidine metabolite. Risk of toxicity increases with doses >600 mg/24 hr, chronic administration (>2 days), and renal impairment.**
- **Assess risk for opioid addiction, abuse, or misuse prior to administration.**
- **Geri:** Meperidine has been reported to cause delirium in the elderly; older adults are at increased risk for normeperidine toxicity. Monitor frequently.
- **Pedi:** Assess pediatric patient frequently; neonates, infants, and children are more sensitive to the effects of opioid analgesics and may experience respiratory complications, excitability, and restlessness more frequently.
- **Lab Test Considerations:** May ↑ plasma amylase and lipase concentrations.
- **Toxicity and Overdose:** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain. **In patients receiving meperidine chronically, naloxone may precipitate seizures by eliminating the CNS depressant effects of meperidine, allowing the convulsant activity of normeperidine to predominate. Monitor patient closely.**

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Potential Nursing Diagnoses

Acute pain (Indications)

Disturbed sensory perception (visual, auditory) (Side Effects)

Risk for injury (Side Effects)

Implementation

- **High Alert:** Accidental overdose of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders; have second practitioner independently check original order, dose calculations, and infusion pump settings. **Pedi:** Medication errors with opioid analgesics are common in the pediatric population and include misinterpretation or miscalculation of doses and use of inappropriate measuring devices.
- Explain therapeutic value of medication prior to administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive analgesic effects and permit lower doses.
- Oral dose is <50% as effective as parenteral. When changing to oral administration, dose may need to be increased (see Appendix J).
- Medication should be discontinued gradually after long-term use to prevent withdrawal symptoms.
- May be administered via PCA pump.
- **PO:** Doses may be administered with food or milk to minimize GI irritation. Syrup should be diluted in half-full glass of water.
- **IM:** Administration of repeated subcut doses may cause local irritation.

IV Administration

- **IV Push:** **Diluent:** Dilute with sterile water or 0.9% NaCl for injection. **Concentration:** ≤ 10 mg/mL. **Rate:** **High Alert:** Administer slowly over at least 5 min. Rapid administration may lead to increased respiratory depression, hypotension, and circulatory collapse.
- **Intermittent Infusion:** **Diluent:** Dilute with D5W, D10W, dextrose/saline combinations, dextrose/Ringer's or lactated Ringer's injection combinations, 0.45% NaCl, 0.9% NaCl, or Ringer's or LR. Administer via infusion pump. **Concentration:** 1 mg/mL. **Rate:** Administer over 15–30 min.
- **Y-Site Compatibility:** acetaminophen, alemtuzumab, alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, azithromycin, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, busulfan, calcium chloride, calcium gluconate, carboplatin, cangrelor, carmustine, caspofungin, cefazolin, cefotaxime, cefoxitin, cefuroxime, cefazidime, ceftriaxone, cefuroxime, chlor-

promazine, ciprofloxacin, cisatracurium, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, daunorubicin, daunorubicin liposome, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxacurium, doxorubicin hydrochloride, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, epifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, flouxuridine, fluconazole, fludarabine, fluorouracil, folic acid, fosphenytoin, gemcitabine, gentamicin, glycopyrrolate, granisetron, hetastarch, hydrocortisone sodium phosphate, ifosfamide, insulin, irinotecan, isoproterenol, ketamine, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, mannitol, mechlorethamine, melphalan, mesna, metaraminol, methotrexate, methylodopate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, multivitamins, mycophenolate, naloxone, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxime, quinuapristin/dalfopristin, ranitidine, remifentanyl, rituximab, rocuronium, sargramostim, sodium acetate, streptokinase, streptozocin, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, tolazoline, topotecan, trastuzumab, trimetaphan, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** allopurinol, amphotericin B colloidal, amphotericin B liposome, azathioprine, cefepime, dantrolene, diazepam, diazoxide, ganciclovir, idarubicin, indomethacin, lorazepam, miconazole, nafcillin, pantoprazole, pentobarbital, phenobarbital, phenytoin, sodium bicarbonate, thiopental.

Patient/Family Teaching

- Instruct patient on how and when to ask for and take pain medication.
- Instruct patient to take meperidine as directed. If dose is less effective after a few weeks, do not increase dose without consulting health care professional. **Pedi:** Teach parents or caregivers how to accurately measure liquid medication and to use only the measuring device dispensed with the medication.
- May cause drowsiness or dizziness. Advise patient to call for assistance when ambulating or smoking.

Caution patient to avoid driving or other activities requiring alertness until response to medication is known.

- Advise patient that meperidine is a drug with known abuse potential. Protect it from theft, and never give to anyone other than the individual for whom it was prescribed.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Instruct patient to avoid concurrent use of alcohol or other CNS depressants.
- Advise ambulatory patients that nausea and vomiting may be decreased by lying down.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.

Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.

meropenem (mer-oh-pen-nem) Merrer

Classification

Therapeutic: anti-infectives

Pharmacologic: carbapenems

Indications

Treatment of: Intra-abdominal infections, Bacterial meningitis. Skin and skin structure infections. **Unlabeled Use:** Febrile neutropenia. Hospital-acquired pneumonia and sepsis.

Action

Binds to bacterial cell wall, resulting in cell death. Meropenem resists the actions of many enzymes that degrade most other penicillins and penicillin-like anti-infectives. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Active against the following gram-positive organisms: *Staphylococcus aureus*, *Streptococcus pneumoniae*, Viridans group streptococci, *Enterococcus faecalis*. Also active against the following gram-negative pathogens: *Escherichia coli*, *Haemophilus influenzae*, *Klebsiella pneumoniae*, *Neisseria meningitidis*, *Pseudomonas aeruginosa*, *Proteus mirabilis*. Active against the following anaerobes: *Bacteroides fragilis*, *Bacteroides fragilis* group, *Peptostreptococcus* species.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Widely distributed into body tissues and fluids; enters CSF when meninges are inflamed.

Metabolism and Excretion: 50–75% excreted unchanged by the kidneys.

Half-life: Premature neonates: 3 hr; Term neonates: 2 hr; Infants 3 mo–2 yr: 1.4 hr; Children >2 yr and Adults: 1 hr (↑ in renal impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to meropenem or imipenem; Serious hypersensitivity to other beta-lactams (penicillins or cephalosporins; cross-sensitivity may occur).

Use Cautiously in: Renal impairment (↑ risk of thrombocytopenia and seizures; dose reduction recommended if CCr <50 mL/min); History of seizures, brain lesions, or meningitis; **OB, Lactation:** Safety not established; **Pedi:** Children <3 mo (safety not established for skin/skin structure infections and meningitis).

Adverse Reactions/Side Effects

CNS: SEIZURES, dizziness, headache. **Resp:** APNEA. **GI:** CLOSTRIDIUM DIFFICILE-ASSOCIATED DIARRHEA (CDAD), constipation, diarrhea, glossitis (↑ in children), nausea, thrush (↑ in children), vomiting. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), moniliasis (children only), pruritus, rash.

Hemat: thrombocytopenia (↑ in renal impairment).

Local: inflammation at injection site, phlebitis.

Neuro: paresthesias. **Misc:** allergic reactions including ANAPHYLAXIS.

Interactions

Drug-Drug: Probenecid ↓ renal excretion and increases blood levels (coadministration not recommended). May ↓ serum valproate levels (↑ risk of seizures).

Route/Dosage

Skin/Skin Structure Infections

IV (Adults): 500 mg every 8 hr or 1 g every 8 hr (if caused by *Pseudomonas aeruginosa*).

IV (Children ≥3 mo–12 yr): 10 mg/kg (max of 500 mg) every 8 hr or 20 mg/kg (max of 1 g) every 8 hr (if caused by *Pseudomonas aeruginosa*).

Intra-abdominal Infections

IV (Adults): 1 g every 8 hr.

IV (Children ≥3 mo–12 yr): 20 mg/kg (max of 1 g) every 8 hr.

IV (Children <3 mo): <32 wk gestational age (GA) and postnatal age (PNA) <2 wk—20 mg/kg every 12 hr; <32 wk GA and PNA ≥2 wk—20 mg/kg every 8 hr; ≥32 wk GA and PNA <2 wk—20 mg/kg every 8 hr; ≥32 wk GA and PNA ≥2 wk—30 mg/kg every 8 hr.

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Meningitis

IV (Children ≥ 3 mo): 40 mg/kg (max of 2 g) every 8 hr.

Renal Impairment

IV (Adults): *CCr 26–50 mL/min*—Skin/skin structure infection: 500 mg every 12 hr; Intra-abdominal infection: 1 g every 12 hr; *CCr 10–25 mL/min*—Skin/skin structure infection: 250 mg every 12 hr; Intra-abdominal infection: 500 mg every 12 hr; *CCr <10 mL/min*—Skin/skin structure infection: 250 mg every 24 hr; Intra-abdominal infection: 500 mg every 24 hr.

Availability (generic available)

Powder for injection: 500 mg, 1 g.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain a history before initiating therapy to determine previous use of and reactions to penicillins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity prior to initiating therapy. First dose may be given before receiving results.
- **Monitor bowel function.** Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of *Clostridium difficile*-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- **Observe for signs and symptoms of anaphylaxis** (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify physician immediately if these symptoms occur. Have epinephrine, an antihistamine, and resuscitative equipment close by in the event of an anaphylactic reaction.
- **Assess injection site for phlebitis, pain, and swelling periodically during administration.**
- **Monitor for signs and symptoms of DRESS** (fever, rash, lymphadenopathy, and/or facial swelling, associated with involvement of other organ systems (hepatitis, nephritis, hematologic abnormalities, myocarditis, myositis) during therapy. May resemble an acute viral infection. Eosinophilia is often present. Discontinue therapy if signs occur.
- **Lab Test Considerations:** Monitor hematologic, hepatic, and renal functions periodically during therapy.
- BUN, AST, ALT, LDH, serum alkaline phosphatase, bilirubin, and creatinine may be transiently \uparrow .
- Hemoglobin and hematocrit concentrations may be \downarrow .
- May cause positive direct or indirect Coombs' test.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

IV Administration

- **IV Push:** Reconstitute 500-mg and 1-g vials with 10 mL and 20 mL, respectively, of sterile water for injection. **Concentration:** 50 mg/mL. **Rate:** Administer over 3–5 min.
- **Intermittent Infusion:** Reconstitute 500-mg and 1-g vials with 10 mL and 20 mL, respectively, of sterile water for injection, 0.9% NaCl, or D5W. Vials reconstituted with sterile water for injection are stable for 3 hr at room temperature and 13 hr if refrigerated; if reconstituted with 0.9% NaCl, stable for 1 hr at room temperature and 15 hr if refrigerated; if reconstituted with D5W, should be used immediately. **Diluent:** Further dilute in 0.9% NaCl or D5W to achieve concentration below. Infusions further diluted in 0.9% NaCl are stable for 4 hr at room temperature and 24 hr if refrigerated. Infusions further diluted in D5W are stable for 1 hr at room temperature and 4 hr if refrigerated. **Concentration:** 1–20 mg/mL. **Rate:** Infuse over 15–30 min.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, aminocaproic acid, aminophylline, anidulafungin, argatroban, atropine, azithromycin, bivalirudin, bleomycin, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, cisplatin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, docetaxel, doxorubicin liposomal, enalaprilat, eptifibatid, etoposide, etoposide phosphate, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, gemcitabine, gentamicin, granisetron, heparin, hetastarch, hydromorphone, ifosfamide, insulin, irinotecan, labetalol, leucovorin calcium, linezolid, lorazepam, mechlorethamine, mesna, methotrexate, metoclopramide, metronidazole, milrinone, mitomycin, mitoxantrone, morphine, naloxone, nesiritide, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, phenobarbital, potassium acetate, potassium chloride, rocuronium, tacrolimus, telavancin, teniposide, thiopeta, tigecycline, tirofiban, vancomycin, vasopressin, vecuronium, vinblastine, vincristine, vinorelbine, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** amiodarone, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, ciprofloxacin, dacarbazine, diazepam, doxorubicin hydrochloride, epirubicin, fenoldopam, idarubicin, ketamine, mycophenolate, nicardipine, pantoprazole, quinupristin/dalfopristin, topotecan.

Patient/Family Teaching

- Advise patient to report the signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools) and allergy.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to drug is known.
- **Caution patient to notify health care professional if fever and diarrhea occur, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional. May occur up to several wk after discontinuation of medication.**
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

meropenem/vaborbactam (mer-oh-pen-nem/va-bor-bak-tam)

Vabomere

Classification

Therapeutic: anti-infectives

Pharmacologic: carbapenems beta-lactamase inhibitors

Indications

Treatment of complicated urinary tract infections, including pyelonephritis.

Action

Binds to bacterial cell wall, resulting in cell death. Addition of vaborbactam protects meropenem from being degraded by certain serine beta-lactamases such as *Klebsiella pneumoniae* carbapenemase (KPC). **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Active against the following gram-negative pathogens: *Escherichia coli*, *Enterobacter cloacae*, *Klebsiella pneumoniae*.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Well distributed into body tissues and fluids.

Metabolism and Excretion: Meropenem undergoes hydrolysis; vaborbactam is not metabolized. Both meropenem and vaborbactam are primarily excreted by the kidneys (40–60% of meropenem and 75–95% of vaborbactam excreted unchanged in the urine).

Half-life: Meropenem: 1.22 hr; vaborbactam: 1.68 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to any of the carbapenems (ertapenem, imipenem, meropenem); Anaphylactic reactions to other beta-lactams (cross-sensitivity may occur); **OB:** May cause fetal harm.

Use Cautiously in: Renal impairment (↑ risk of thrombocytopenia and seizures; ↓ dose if eGFR <50 mL/min); History of seizures, brain lesions, or meningitis; **Lactation:** Consider benefits of breast feeding against possible risk to infant; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: SEIZURES, delirium, headache. **GI:** CLOSTRIDIUM DIFFICILE-ASSOCIATED DIARRHEA (CDAD), diarrhea.

Neuro: paresthesias. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), infusion site reactions, phlebitis.

Interactions

Drug-Drug: **Probenecid** ↓ renal excretion of meropenem and ↑ its blood levels; concurrent use not recommended. May ↓ **valproate** levels and ↑ risk of seizures; concurrent use not recommended.

Route/Dosage

IV (Adults): 4 g (meropenem 2 g/vaborbactam 2 g) every 8 hr for up to 14 days.

Renal Impairment

IV (Adults): eGFR 30–49 mL/min—2 g (meropenem 1 g/vaborbactam 1 g) every 8 hr for up to 14 days; eGFR 15–29 mL/min—2 g (meropenem 1 g/vaborbactam 1 g) every 12 hr for up to 14 days; eGFR <15 mL/min—1 g (meropenem 0.5 g/vaborbactam 0.5 g) every 12 hr for up to 14 days.

Availability

Powder for injection: 2 g/vial (1 g meropenem/1 g vaborbactam).

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain a history before initiating therapy to determine previous use of and reactions to penicillins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity prior to initiating therapy. First dose may be given before receiving results.
- **Monitor bowel function.** Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of Clostridium difficile-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- Observe for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify health care professional immediately if these symptoms occur. Have epinephrine, an antihistamine, and resuscitative equipment close by in the event of an anaphylactic reaction.
- **Lab Test Considerations:** May cause hyperkalemia, hyperglycemia, and hypoglycemia.

Potential Nursing Diagnoses

Risk for infection (Indications)

Implementation

- **Intermittent Infusion:** Reconstitute each vial with 20 mL 0.9% NaCl withdrawn from infusion bag. Mix gently to dissolve. **Diluent:** Dilute further in 250 mL to 1000 mL infusion bag of 0.9% NaCl. **Concentration:** 2 mg/mL to 8 mg/mL. Solution is clear to light yellow; do not infuse solutions that are discolored or contain particulate matter. Infusion must be completed within 4 hrs if stored at room temperature or 22 hrs if refrigerated. **Rate:** Infuse over 3 hrs.

Patient/Family Teaching

- Advise patient to report the signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools) and allergy.
- May cause seizures, delirium, headaches and/or paresthesias. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- **Caution patient to notify health care professional if fever and diarrhea occur, especially if stool contains blood, pus, or mucus.** Advise patient not to treat diarrhea without consulting health care professional. May occur up to several wk after discontinuation of medication.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products

being taken and to consult with health care professional before taking other medications.

- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

Therapeutic: gastrointestinal anti-inflammatories

Indications

Delzicol, **Lialda**, and **Pentasa**—Treatment and maintenance of remission of mildly-to-moderately-active ulcerative colitis. **Apriso**—Maintenance of remission of ulcerative colitis. **Asacol HD**—Treatment of moderately-active ulcerative colitis. **Canasa**—Treatment of active ulcerative proctitis. **Rowasa**—Treatment of active mild-to-moderate distal ulcerative colitis, proctosigmoiditis, or proctitis.

Action

Locally acting anti-inflammatory action in the colon, where activity is probably due to inhibition of prostaglandin synthesis. **Therapeutic Effects:** Reduction in the symptoms of ulcerative colitis, proctosigmoiditis, and proctitis.

Pharmacokinetics

Absorption: 28% absorbed following oral administration; 10–30% absorbed from the colon, depending on retention time, following rectal administration.

Distribution: Unknown.

Metabolism and Excretion: Some metabolism occurs, site unknown; mostly eliminated unchanged in the feces.

Half-life: *Oral*—12 hr (range 2–15 hr); *Rectal*—0.5–1.5 hr.

TIME/ACTION PROFILE (clinical improvement)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	6–8 hr
ER	2 hr	9–12 hr	24 hr
Rectal	3–21 days	unknown	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity reactions to sulfonamides, salicylates, mesalamine, or sulfasalazine; Cross-sensitivity with furosemide, sulfonyleurea hypoglycemic agents, or carbonic anhydrase inhibitors may exist; G6PD deficiency; Hypersensitivity to bisulfites (mesalamine enema only); Urinary tract or intestinal obstruction; Porphyria.

Use Cautiously in: Severe hepatic or renal impairment; **OB:** Safety not established; use tablets only if potential benefits outweigh risk to fetus (enteric coating contains dibutyl phthalate, which has been shown to cause congenital malformations in animals); **Lactation:** Has caused side effects in some infants; careful observation required.

Adverse Reactions/Side Effects

CNS: headache, dizziness, malaise, weakness. **EENT:** pharyngitis, rhinitis. **CV:** pericarditis. **GI:** diarrhea, eructation (PO), flatulence, nausea, vomiting. **GU:** interstitial nephritis, pancreatitis, renal failure. **Derm:** STEVENS-JOHNSON SYNDROME, hair loss, rash. **Local:** anal irritation (enema, suppository). **MS:** back pain, myalgia. **Misc:** ANAPHYLAXIS, ANGIOEDEMA, DRUG REACTION WITH EOSINOPHILIA AND SYSTEMATIC SYMPTOMS (DRESS), acute intolerance syndrome, fever.

Interactions

Drug-Drug: May ↓ metabolism and ↑ effects/toxicity of mercaptopurine or thioguanine.

Route/Dosage

One Asacol HD 800-mg tablet is NOT bioequivalent to two Delzicol 400-mg capsules.

Treatment of Ulcerative Colitis

PO (Adults): *Delzicol*—800 mg (two 400-mg capsules) 3 times daily for 6 wk; *Asacol HD*—1.6 g (two 800-mg tablets) 3 times daily for 6 wk; *Lialda*—2.4–4.8 g (two to four 1.2-g tablets) once daily for up to 8 wk; *Pentasa*—1 g (four 250-mg capsules or two 500-mg capsules) 4 times daily for up to 8 wk.

Rect (Adults): *Rowasa*—4-g enema (60 mL) at bedtime, retained for 8 hr for 3–6 wk.

PO (Children ≥12 yr and 54–90 kg): *Delzicol*—27–44 mg/kg/day in 2 divided doses (max dose = 2.4 g/day) for 6 wk.

PO (Children ≥12 yr and 33–53 kg): *Delzicol*—37–61 mg/kg/day in 2 divided doses (max dose = 2 g/day) for 6 wk.

PO (Children ≥12 yr and 17–32 kg): *Delzicol*—36–71 mg/kg/day in 2 divided doses (max dose = 1.2 g/day) for 6 wk.

Maintenance of Remission of Ulcerative Colitis

PO (Adults): *Apriso*—1.5 g (four 375-mg capsules) once daily in the morning; *Delzicol*—800 mg (two

400-mg capsules) 2 times daily; *Lialda*—2.4 g (two 1.2-g tablets) once daily; *Pentasa*—1 g (four 250-mg capsules or two 500-mg capsules) 4 times daily.

Treatment of Ulcerative Proctosigmoiditis

Rect (Adults): *Rowasa*—4-g enema (60 mL) at bedtime, retained for 8 hr (treatment duration = 3–6 wk).

Treatment of Ulcerative Proctitis

Rect (Adults): *Rowasa*—4-g enema (60 mL) at bedtime, retained for 8 hr (treatment duration = 3–6 wk); *Canasa*—Insert a 1-g suppository at bedtime, retain for at least 1–3 hr (treatment duration = 3–6 wk).

Availability (generic available)

Delayed-release tablets: * 400 mg, * 500 mg, 800 mg (Asacol HD), * 1 g, 1.2 g (Lialda). **Controlled-release capsules (Pentasa):** 250 mg, 500 mg. **Delayed-release capsules (Delzicol):** 400 mg. **Extended-release capsules (Apriso):** 375 mg. **Rectal suppository (Canasa):** * 500 mg, 1 g. **Rectal suspension (Rowasa):** * 1 g/100 mL, * 2 g/60 mL, 4 g/60 mL, * 4 g/100 mL.

NURSING IMPLICATIONS

Assessment

- Assess abdominal pain and frequency, quantity, and consistency of stools at the beginning of and during therapy.
- **Assess for allergy to sulfonamides and salicylates.** Patients allergic to sulfasalazine may take mesalamine or olsalazine without difficulty, but therapy should be discontinued if rash or fever occurs.
- Monitor intake and output ratios. Fluid intake should be sufficient to maintain a urine output of at least 1200–1500 mL daily to prevent crystalluria and stone formation.
- **Lab Test Considerations:** Monitor urinalysis, BUN, and serum creatinine prior to and periodically during therapy. Mesalamine may cause renal toxicity.
- Mesalamine may cause ↑ AST and ALT levels, serum alkaline phosphatase, GGTP, LDH, amylase, and lipase.

Potential Nursing Diagnoses

Acute pain (Indications)

Diarrhea (Indications)

Implementation

- **Do not confuse Asacol (mesalamine) with Os-Cal (calcium carbonate).**
- **PO:** Administer with a full glass of water. Tablets should be swallowed whole; do not break the outer coating, which is designed to remain intact. Take *Lialda* tablets with a meal. Take *Apriso* capsules in the

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

morning without regard to meals. Do not co-administer with antacids; may effect dissolution of the coating of the granules in *Apriso* capsules. Intact or partially intact tablets may occasionally be found in the stool. If this occurs repeatedly, advise patient to notify health care professional. Swallow *Delzicol* capsules whole; do not break, crush, or chew. Administer without regard to meals. Intact or partially intact tablets may occasionally be found in the stool. If this occurs repeatedly, advise patient to notify health care professional. Two *Delzicol* 400 mg capsules are not equal to one *Asacol HD* (mesalamine) delayed-release 800 mg tablet. *Pentasa* capsules may be swallowed whole or opened and sprinkled onto applesauce or yogurt. Consume entire contents immediately. Avoid crushing or chewing capsules and capsule contents.

- **Rect:** Patient should empty bowel prior to administration of rectal dose forms.
- Avoid excessive handling of *suppository*. Remove foil wrapper and insert pointed end first into rectum with gentle pressure. Suppository should be retained for 1–3 hr or more for maximum benefit.
- Administer 60-mL retention enema once daily at bedtime. Solution should be retained for approximately 8 hr. Prior to administration of *rectal suspension*, shake bottle well and remove the protective cap. Have patient lie on left side with the lower leg extended and the upper leg flexed for support or place the patient in knee-chest position. Gently insert the applicator tip into the rectum, pointing toward the umbilicus. Squeeze the bottle steadily to discharge most of the preparation.

Patient/Family Teaching

- Instruct patient on the correct method of administration. Advise patient to take medication as directed, even if feeling better. Take missed doses as soon as remembered unless almost time for next dose.
- Advise patient not to change brands of mesalamine without consulting health care professional.
- May cause dizziness. Caution patient to avoid driving or other activities that require alertness until response to medication is known.
- Advise patient to notify health care professional if skin rash, sore throat, fever, mouth sores, unusual bleeding or bruising, wheezing, fever, or hives occur.
- Instruct patient to notify health care professional if symptoms do not improve after 1–2 mo of therapy.
- Instruct patient to notify health care professional if symptoms worsen or do not improve. If symptoms of acute intolerance (cramping, acute abdominal pain, bloody diarrhea, fever, headache, rash) occur, discontinue therapy and notify health care professional immediately.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

- Inform patient that proctoscopy and sigmoidoscopy may be required periodically during treatment to determine response.
- **Rect:** Instruct patient to use *rectal suspension* at bedtime and retain suspension all night for best results.

Evaluation/Desired Outcomes

- Decrease in diarrhea and abdominal pain.
- Return to normal bowel pattern in patients with inflammatory bowel disease. Effects may be seen within 3–21 days. The usual course of therapy is 3–6 wk.
- Maintenance of remission in patients with inflammatory bowel disease.

mesna (mes-na)

Mesnex,  Uromitexan

Classification

Therapeutic: antidotes

Pharmacologic: ifosfamide detoxifying agents

Indications

Prevention of ifosfamide-induced hemorrhagic cystitis (see Ifosfamide monograph). **Unlabeled Use:** May also prevent hemorrhagic cystitis from cyclophosphamide.

Action

Binds to the toxic metabolites of ifosfamide in the kidneys. **Therapeutic Effects:** Prevents hemorrhagic cystitis from ifosfamide.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability; 45–79% absorbed after oral administration. Following IV with PO dosing ↑ systemic exposure.

Distribution: Unknown.

Metabolism and Excretion: Rapidly converted to mesna disulfide, then back to mesna in the kidneys, where it binds to toxic metabolites of ifosfamide (18–26% excreted as free mesna in urine after IV and PO dosing).

Half-life: *Mesna*—0.36 hr (IV); 1.2—8.3 hr (IV followed by PO); *mesna disulfide*—1.17 hr.

TIME/ACTION PROFILE (detoxifying action)

ROUTE	ONSET	PEAK	DURATION
PO, IV	rapid	unknown	4 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to mesna or other thiol (rubber) compounds.

Use Cautiously in: **OB, Lactation:** Safety not established.

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, headache. **GI:** anorexia, diarrhea, nausea, unpleasant taste, vomiting. **Derm:** flushing. **Local:** injection site reactions. **Misc:** flu-like symptoms.

Interactions

Drug-Drug: None significant.

Route/Dosage

IV (Adults): Give a dose of mesna equal to 20% of the ifosfamide dose at the same time as ifosfamide and 4 and 8 hr after.

PO, IV (Adults): Give a dose of IV mesna equal to 20% of the ifosfamide dose at the same time as ifosfamide; then give PO mesna equal to 40% of the ifosfamide dose 2 and 6 hr after ifosfamide (total mesna dose is 100% of ifosfamide dose).

Availability (generic available)

Tablets: 400 mg. **Injection:** 100 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor for development of hemorrhagic cystitis in patients receiving ifosfamide.
- **Lab Test Considerations:** Causes a false-positive result when testing urinary ketones.

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- Initial IV bolus is to be given at time of ifosfamide administration.
- **PO:** If second and third doses are given orally, administer 2 and 6 hr after IV dose.
- If PO mesna is vomited within 2 hr of administration, repeat dose or use IV mesna.

IV Administration

- **Intermittent Infusion:** 2nd IV dose is given 4 hr later, 3rd dose is given 8 hr after initial dose. This schedule must be repeated with each subsequent dose of ifosfamide. **Diluent:** Dilute 2-, 4-, and 10-mL ampules, containing a concentration of 100 mg/mL in 8 mL, 16 mL, or 50 mL, respectively, of D5W, 0.9% NaCl, D5/0.9% NaCl, D5/0.2% NaCl, D5/0.33% NaCl, or LR. **Concentration:** 20 mg/mL. Refrigerate to store. Use within 6 hr. Discard unused solution. **Rate:** Administer over 15–30 min or as a continuous infusion.
- **Syringe Compatibility:** ifosfamide.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amidodarone, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafun-

gin, argatroban, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium acetate, calcium chloride, calcium gluconate, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cladribine, clindamycin, cyclophosphamide, cytarabine, dactinomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, methotrexate, methylglucamine, methylprednisolone, metoclopramide, metoprolol, metronidazole, mifampridine, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, pentamidine, pentazocine, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, ranitidine, remifentanyl, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiotape, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, amphotericin B colloidal, amphotericin B lipid complex, dacarbazine, dantrolene, diazepam, fenoldopam, ganciclovir, nicardipine, nitroprusside, phenytoin, quinupristin/dalfopristin, thiopental.

Patient/Family Teaching

- Inform patient that unpleasant taste may occur during administration.
- Advise patient to notify health care professional if nausea, vomiting, or diarrhea persists or is severe.

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Advise female patient to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding.

Evaluation/Desired Outcomes

- Prevention of hemorrhagic cystitis associated with ifosfamide therapy.

mestranol/norethindrone, See CONTRACEPTIVES, HORMONAL.

metaxalone (me-tax -a-lone)

Skelaxin

Classification

Therapeutic: skeletal muscle relaxants (centrally acting)

Indications

Muscle spasm associated with acute painful musculoskeletal conditions (with rest and physical therapy).

Action

Skeletal muscle relaxation, probably as a result of CNS depression. **Therapeutic Effects:** Skeletal muscle relaxation.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Unknown.

Metabolism and Excretion: Mostly metabolized by the liver; metabolites excreted in urine.

Half-life: 2–3 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	1 hr	2 hr	4–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Significant hepatic/renal impairment; History of drug-induced hemolytic anemia or other anemia.

Use Cautiously in: Hepatic impairment; History of seizures; **OB, Lactation, Pedi:** Pregnancy, lactation or children ≤ 12 yr (safety not established); **Geri:** Appears on Beers list. Poorly tolerated due to anticholinergic effects.

Adverse Reactions/Side Effects

CNS: drowsiness, dizziness, confusion, headache, irritability, nervousness. **GI:** nausea, anorexia, dry mouth, GI upset, vomiting. **GU:** urinary retention.

Interactions

Drug-Drug: \uparrow CNS depression with other CNS depressants including alcohol, antihistamines, opioid analgesics, and sedative/hypnotics.

Drug-Natural Products: Concomitant use of kava-kava, valerian, or chamomile can \uparrow CNS depression.

Route/Dosage

PO (Adults): 800 mg 3–4 times daily.

Availability (generic available)

Tablets: 800 mg. **Cost:** *Generic*—\$409.39/100.

NURSING IMPLICATIONS

Assessment

- Assess for pain, muscle stiffness, and range of motion before and periodically during therapy.
- **Geri:** Assess geriatric patients for anticholinergic effects (sedation and weakness).
- **Lab Test Considerations:** Monitor hepatic function tests closely in patients with pre-existing liver damage.
- May cause false-positive Benedict's tests.

Potential Nursing Diagnoses

Acute pain (Indications)

Impaired bed mobility (Indications)

Risk for injury (Side Effects)

Implementation

- Provide safety measures as indicated. Supervise ambulation and transfer.
- **PO:** Administer 3–4 times daily.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses within 1 hr; if not, return to regular dosing schedule. Do not double doses.
- Encourage patient to comply with additional therapies prescribed for muscle spasm (rest, physical therapy, heat).
- Medication may cause dizziness, drowsiness, and blurred vision. Advise patient to avoid driving and other activities requiring alertness until response to drug is known.
- Instruct patient to make position changes slowly to minimize orthostatic hypotension.
- Advise patient to avoid concurrent use of alcohol and other CNS depressants while taking this medication.
- Instruct patient to notify health care professional if skin rash or yellowish discoloration of the skin or eyes occurs.
- Emphasize the importance of routine follow-up exams to monitor progress.

Evaluation/Desired Outcomes

- Decreased musculoskeletal pain and muscle spasticity.
- Increased range of motion.

metFORMIN (met-for-min)
Fortamet, Glucophage, Glucophage
XR, Glumetza,  Glycon, Riomet

Classification

Therapeutic: antidiabetics
Pharmacologic: biguanides

Indications

Management of type 2 diabetes mellitus; may be used with diet, insulin, or sulfonylurea oral hypoglycemics.

Action

Decreases hepatic glucose production. Decreases intestinal glucose absorption. Increases sensitivity to insulin.

Therapeutic Effects: Maintenance of blood glucose.

Pharmacokinetics

Absorption: 50–60% absorbed after oral administration.

Distribution: Enters breast milk in concentrations similar to plasma.

Metabolism and Excretion: Eliminated almost entirely unchanged by the kidneys.

Half-life: 17.6 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	12 hr
XR	unknown	4–8 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Metabolic acidosis (including diabetic ketoacidosis); Severe renal impairment (CCr <30 mL/min); Iodinated contrast imaging procedure in patients with CCr 30–60 mL/min, a history of liver disease, alcoholism or heart failure, or in those who will be administered intra-arterial iodinated contrast (discontinue metformin and reevaluate renal function 48 hr after imaging procedure; may restart therapy if renal function stable); Hepatic impairment.

Use Cautiously in: Mild to moderate renal impairment (initiation of therapy not recommended if CCr 30–45 mL/min; if CCr becomes <45 mL/min during therapy, assess risk-to-benefit of continuing therapy); Chronic alcohol use/abuse; Hypoxic states (acute HF, shock, MI, sepsis; discontinue metformin); Surgery (temporarily discontinue metformin when food and/or fluid intake is restricted); Pituitary deficiency or hyperthyroidism; **OB, Lactation, Pedi:** Pregnancy, lactation, or children <10 yr (safety not established; extended release for use in patients >17 yr only); **Geri:** May be at ↑ risk of lactic acidosis.

Adverse Reactions/Side Effects

GI: abdominal bloating, diarrhea, nausea, vomiting, unpleasant metallic taste. **F and E:** LACTIC ACIDOSIS.

Misc: decreased vitamin B₁₂ levels.

Interactions

Drug-Drug: Acute or chronic alcohol ingestion or iodinated contrast media ↑ risk of lactic acidosis. Amiloride, digoxin, morphine, procainamide, quinidine, ranitidine, triamterene, trimethoprim, calcium channel blockers, and vancomycin may compete for elimination pathways with metformin. Altered responses may occur. Cimetidine and furosemide may ↑ effects of metformin. Nifedipine ↑ absorption and effects.

Drug-Natural Products: Glucosamine may worsen blood glucose control. Chromium, and coenzyme Q-10 may produce ↑ hypoglycemic effects.

Route/Dosage

PO (Adults and children >17 yr): 500 mg twice daily; may ↑ by 500 mg at weekly intervals up to 2000 mg/day. If doses >2000 mg/day are required, give in 3 divided doses (not to exceed 2500 mg/day) or 850 mg once daily; may ↑ by 850 mg at 2-wk intervals (in divided doses) up to 2550 mg/day in divided doses (up to 850 mg 3 times daily); *Extended-release tablets*—500–1000 mg once daily with evening meal, may ↑ by 500 mg at weekly intervals up to 2000 mg once daily (Glucophage XR or Glumetza) or 2500 mg once daily (Fortamet). If 2000 mg once daily is inadequate, 1000 mg twice daily may be used.

PO (Children >10 yr): 500 mg twice daily, may be ↑ by 500 mg/day at 1-wk intervals, up to 2000 mg/day in 2 divided doses.

Availability (generic available)

Tablets: 500 mg, 850 mg, 1000 mg. **Cost:** *Generic*—500 mg \$6.99/100, 850 mg \$7.18/100, 1000 mg \$7.01/100. **Extended-release tablets (Fortamet, Glucophage XR, Glumetza):** 500 mg, 750 mg, 1000 mg. **Cost:** *Generic*—500 mg \$74.50/100, 750 mg \$119.70/100. **Oral solution (Riomet) (cherry flavor):** 500 mg/5 mL. **Cost:** \$59.30/118 mL. **In combination with:** alogliptin (Kazano); canagliflozin (Invokamet, Invokamet XR); dapagliflozin (Xigduo XR); empagliflozin (Synjardy); glipizide (Metaglip); glyburide (Glucovance); linagliptin (Jentaducto, Jentaducto XR); pioglitazone (Actoplus Met, Actoplus Met XR); repaglinide (PrandiMet); rosiglitazone (generic only); saxagliptin (Kombiglyze XR); and sitagliptin (Janumet, Janumet XR). See Appendix B.

NURSING IMPLICATIONS

Assessment

- When combined with oral sulfonylureas, observe for signs and symptoms of hypoglycemic reactions (ab-

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

dominal pain, sweating, hunger, weakness, dizziness, headache, tremor, tachycardia, anxiety).

- **Patients who have been well controlled on metformin who develop illness or laboratory abnormalities should be assessed for ketoacidosis or lactic acidosis.** Assess serum electrolytes, ketones, glucose, and, if indicated, blood pH, lactate, pyruvate, and metformin levels. If either form of acidosis is present, discontinue metformin immediately and treat acidosis. Patients with severe renal impairment are at greatest risk for lactic acidosis.
- **Lab Test Considerations:** Monitor serum glucose and glycosylated hemoglobin periodically during therapy to evaluate effectiveness of therapy. May cause false-positive results for urine ketones.
- Assess renal function before initiating and at least annually during therapy. Monitor patients at risk for renal impairment (eg, elderly) more frequently. Discontinue metformin if renal impairment occurs.
- Monitor serum folic acid and vitamin B₁₂ every 1–2 yr in long-term therapy. Metformin may interfere with absorption.

Potential Nursing Diagnoses

Imbalanced nutrition: more than body requirements (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- **Do not confuse metformin with metronidazole.**
- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin. Withhold metformin and reinstitute after resolution of acute episode.
- Metformin should be temporarily discontinued in patients requiring surgery involving restricted intake of food and fluids. Resume metformin when oral intake has resumed and renal function is normal.
- Withhold metformin before or at the time of studies requiring IV administration of iodinated contrast media and for 48 hr after study.
- **PO:** Administer metformin with meals to minimize GI effects.
- XR tablets must be swallowed whole; do not crush, dissolve, or chew. Administer *Glumetza* with the evening meal.

Patient/Family Teaching

- Instruct patient to take metformin at the same time each day, as directed. Take missed doses as soon as possible unless almost time for next dose. Do not double doses. Instruct parent/caregiver to read the *Medication Guide* prior to use and with each Rx refill; new information may be available.
- Explain to patient that metformin helps control hyperglycemia but does not cure diabetes. Therapy is usually long term.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hyperglycemic or hypoglycemic episodes.

- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water, and notify health care professional.
- Instruct patient in proper testing of blood glucose and urine ketones. These tests should be monitored closely during periods of stress or illness and health care professional notified if significant changes occur.
- **Explain to patient the risk of lactic acidosis and the potential need for discontinuation of metformin therapy if a severe infection, dehydration, or severe or continuing diarrhea occurs or if medical tests or surgery is required.** Symptoms of lactic acidosis (chills, diarrhea, dizziness, low BP, muscle pain, abdominal pain, sleepiness, slow heartbeat or pulse, dyspnea, or weakness) should be reported to health care professional immediately.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications or alcohol.
- Inform patient that metformin may cause an unpleasant or metallic taste that usually resolves spontaneously.
- Inform patients taking XR tablets that inactive ingredients resembling XR tablet may appear in stools.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to report the occurrence of diarrhea, nausea, vomiting, and stomach pain or fullness to health care professional.
- Insulin is the recommended method of controlling blood glucose during pregnancy. Counsel female patients to use a form of contraception other than oral contraceptives and to notify health care professional promptly if pregnancy is planned or suspected, or if breast feeding.
- Advise patient to carry a form of sugar (sugar packets, candy) and identification describing disease process and medication regimen at all times.
- Emphasize the importance of routine follow-up exams and regular testing of blood glucose, glycosylated hemoglobin, renal function, and hematologic parameters.

Evaluation/Desired Outcomes

- Control of blood glucose levels without the appearance of hypoglycemic or hyperglycemic episodes. Control may be achieved within a few days, but full effect of therapy may be delayed for up to 2 wk. If patient has not responded to metformin after 4 wk of maximum dose therapy, an oral sulfonylurea may be added. If satisfactory results are not obtained with 1–3 mo of concurrent therapy, oral agents may be discontinued and insulin therapy instituted.

REMS HIGH ALERT

methadone (meth-a-done)

Dolophine, *Metadol, *Metadol-D, Methadose

Classification

Therapeutic: opioid analgesics

Pharmacologic: opioid agonists

Schedule II**Indications**

Moderate to severe chronic pain in opioid-tolerant patients requiring use of daily, around-the-clock long-term opioid treatment and for which alternative treatment options are inadequate (extended-release).

Detoxification and maintenance therapy for opioid use disorder. **Unlabeled Use:** Neonatal abstinence syndrome.

Action

Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli, while producing generalized CNS depression. **Therapeutic Effects:** Decrease in severity of pain. Suppression of withdrawal symptoms during detoxification and maintenance from heroin and other opioids.

Pharmacokinetics

Absorption: Well absorbed from all sites (50% absorbed following oral administration).

Distribution: Widely distributed. Crosses the placenta; enters breast milk.

Protein Binding: High.

Metabolism and Excretion: Mostly metabolized by the liver; some metabolites are active and may accumulate with chronic administration.

Half-life: 15–25 hr; ↑ with chronic use.

TIME/ACTION PROFILE (analgesic effect)

ROUTE	ONSET	PEAK	DURATION
PO	30–60 min	90–120 min	4–12 hr
IM, subcut	10–20 min	60–120 min	4–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Significant respiratory depression; Acute or severe bronchial asthma; Paralytic ileus; Known alcohol intolerance (some oral solutions); Concurrent MAO inhibitor therapy.

Use Cautiously in: Structural heart disease, concomitant diuretic use, hypokalemia, hypomagnesemia, history of arrhythmia/syncope, or other risk factors for arrhythmias; Concurrent use of drugs that prolong the QTc interval or are CYP3A4 inhibitors; Head trauma; Seizure disorders; ↑ intracranial pressure; Severe re-

nal, hepatic, or pulmonary disease; Hypothyroidism; Adrenal insufficiency; Alcoholism; Undiagnosed abdominal pain; Prostatic hyperplasia or ureteral stricture; **OB:** Use with addiction control: weigh risk against potential for illicit drug use. Counsel mother about potential harm to fetus. Prolonged use of methadone during pregnancy can result in neonatal opioid withdrawal syndrome; **Lactation:** Appears in breast milk. Weigh risks against potential for illicit drug use. Counsel mother about potential harm to infant and to wean breast feeding slowly to prevent abstinence syndrome; **Ger:** ↑ risk of respiratory depression (dose ↓ suggested).

Adverse Reactions/Side Effects

CNS: confusion, sedation, dizziness, dysphoria, euphoria, floating feeling, hallucinations, headache, unusual dreams. **EENT:** blurred vision, diplopia, miosis.

Resp: **RESPIRATORY DEPRESSION.** **CV:** **TORSADES DE POINTES,** hypotension, bradycardia, QT interval prolongation. **Endo:** adrenal insufficiency. **GI:** constipation, nausea, vomiting. **GU:** urinary retention. **Derm:** flushing, sweating. **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Use with extreme caution in patients receiving **MAO inhibitors** (may result in severe, unpredictable reactions—↓ initial dose of methadone to 25% of usual dose). Use with extreme caution with any drug known to potentially prolong QT interval, including **class I and III antiarrhythmics**, some **neuroleptics** and **tricyclic antidepressants**, and **calcium channel blockers**. Use with extreme caution with CYP3A4 inhibitors, including **ketoconazole, itraconazole, erythromycin, clarithromycin, calcium channel blockers, or voriconazole**. Concurrent use with **laxatives, diuretics, or mineralocorticoids** may ↑ risk of hypomagnesemia or hypokalemia and ↑ risk of arrhythmias. Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants, SSRIs, SNRIs, MAO inhibitors, TCAs, tramadol, trazodone, mirtazapine, 5-HT₃ receptor antagonists, linezolid, methylene blue, and triptans** ↑ risk of serotonin syndrome. Concurrent use of **CYP3A4 inhibitors, CYP2C9 inhibitors, CYP2C19 inhibitors, or CYP2D6 inhibitors** including **ritonavir, ketoconazole, itraconazole, fluconazole, clarithromycin, erythromycin, nefazodone, diltiazem, verapamil, nelfinavir, fosamprenavir, and flvoxamine** ↑ levels and risk of opioid toxicity; careful monitoring during initiation, dose changes, or discontinuation of the inhibitor is recommended. Concurrent use with **CYP3A4 inducers, CYP2C9 inducers, or CYP2C19 inducers** including **barbiturates, carbamazepine, efavirenz, corticosteroids, modafinil, nevirapine, oxcarbazepine, phenobarbital,**

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

phenytoin, rifabutin, or rifampin may ↓ levels and analgesia; if inducers are discontinued or dosage ↓, patients should be monitored for signs of opioid toxicity and necessary dose adjustments should be made. Use with **benzodiazepines** or other **CNS depressants** including **other opioids, non-benzodiazepine sedative/hypnotics, anxiolytics, general anesthetics, muscle relaxants, antipsychotics, and alcohol** may cause profound sedation, respiratory depression, coma, and death; reserve concurrent use for when alternative treatment options are inadequate. Administration of **agonist/antagonist opioids** may precipitate opioid withdrawal in physically dependent patients.

Nalbuphine or **pentazocine** may ↓ analgesia. **Interferons (alpha)** may ↓ metabolism and ↑ effects. May ↑ blood levels and effects of **zidovudine** and **desipramine**. May ↓ level and effects of **didanosine** and **stavudine**. Concurrent abuse of methadone with **benzodiazepines** has resulted in death.

Drug-Natural Products: **St. John's wort** ↑ metabolism and ↓ blood levels, concurrent use may result in withdrawal. **Kava-kava, valerian, or chamomile**, can ↑ CNS depression.

Route/Dosage

Larger doses may be required for analgesia during chronic therapy; interval may be ↓/dose ↑ if pain recurs.

PO (Adults and Children ≥50 kg): *Usual starting dose for moderate to severe pain in opioid-naïve patients*—2.5 mg q 8–12 hr; *Opioid detoxification*—15–40 mg once daily or amount needed to prevent withdrawal. Dose may be ↓ q 1–2 days; maintenance dose is determined on an individual basis.

PO (Adults and Children <50 kg): *Analgesic*—0.1 mg/kg/dose q 4 hr for 2–3 doses then q 6–8 hr prn; maximum: 10 mg/dose. *Iatrogenic narcotic dependency*—0.05–0.1 mg/kg/dose q 6 hr; ↑ by 0.05 mg/kg/dose until withdrawal symptoms controlled; after 1–2 days lengthen dosing interval to q 12–24 hr; taper by ↓ dose by 0.05 mg/kg/day.

PO, IV (Neonates): Initial 0.05–0.2 mg/kg/dose q 12–24 hr or 0.5 mg/kg/day divided q 8 hr; taper dose by 10–20% per wk over 1–1 1/2 mo.

IV, IM, Subcut (Adults and Children ≥50 kg): *Analgesic*—10 mg q 6–8 hr. *Opioid detoxification*—15–40 mg once daily or amount needed to prevent withdrawal. Dose may be ↓ q 1–2 days; maintenance dose is determined on an individual basis.

IV, IM, Subcut (Adults and Children <50 kg): *Analgesic*—0.1 mg/kg q 6–8 hr; maximum: 10 mg/dose.

Availability (generic available)

Tablets: ⚡ 1 mg, 5 mg, 10 mg, ⚡ 25 mg. **Dispersible tablets (diskettes):** 40 mg (available only to licensed detoxification/maintenance programs). **Solution for injection:** 10 mg/mL. **Oral solution (contains alcohol) (citrus):** 5 mg/5 mL, 10 mg/5 mL. **Oral concentrate (cherry and unflavored):** 10 mg/mL.

NURSING IMPLICATIONS

Assessment

- **Pain:** Assess type, location, and intensity of pain prior to and 1–2 hr (peak) following administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numeric or visual analogue scale or the patient reports satisfactory pain relief. Dose increases should be made no more frequently than every 3–5 days because of variability in half-life between patients. Cumulative effects of this medication may require periodic dose adjustments.
- Doses of methadone for patients on methadone maintenance only prevent withdrawal symptoms; *no analgesia is provided*. Additional opioid doses are required for treatment of pain.
- An equianalgesic chart (see Appendix J) should be used when changing routes or when changing from one opioid to another.
- Assess BP, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Dose may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use.
- Assess bowel function routinely. Prevention of constipation should be instituted with increased intake of fluids and bulk and with laxatives to minimize constipating effects. Stimulant laxatives should be administered routinely if opioid use exceeds 2–3 days, unless contraindicated.
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive methadone for pain do not develop psychological dependence. Progressively higher doses may be required to relieve pain with long-term therapy.
- Assess for history of structural heart disease, arrhythmia, and syncope. Obtain a pretreatment ECG to measure QTc interval and follow-up ECG within 30 days and annually. Additional ECGs recommended if dose >100 mg/day or if patients have unexplained syncope or seizures. If QTc interval is >450 ms but <500 ms, discuss potential risks and benefits with patients and monitor more frequently. If the QTc interval >500 ms, consider discontinuing or reducing dose; eliminating contributing factors (drugs that promote hypokalemia) or using an alternative therapy.
- Assess risk for opioid addiction, abuse, or misuse prior to administration. Abuse or misuse by crushing, chewing, snorting, or injecting dissolved product will result in uncontrolled delivery of methadone and can result in overdose and death.
- **Opioid Detoxification:** Assess patient for signs of opioid withdrawal (irritability, runny nose and eyes, abdominal cramps, body aches, sweating, loss of ap-

petite, shivering, unusually large pupils, trouble sleeping, weakness, yawning). Methadone maintenance is undertaken only by federally approved treatment centers. This does not preclude maintenance for addicts hospitalized for other conditions and who require temporary maintenance during their care.

- **Lab Test Considerations:** May ↑ plasma amylase and lipase levels.
- **Toxicity and Overdose:** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

Potential Nursing Diagnoses

Acute pain (Indications)

Disturbed sensory perception (visual, auditory) (Side Effects)

Risk for injury (Side Effects)

Implementation

- **High Alert:** Do not confuse methadone with dexamethylphenidate, ketorolac, Mephyton (phytonadione), Metadate ER/CD (methylphenidate), or methylphenidate.
- Explain therapeutic value of medication prior to administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if administered before pain becomes severe. For patients in chronic severe pain, the oral solution containing 5 or 10 mg/5 mL is recommended on a fixed dose schedule.
- Coadministration with nonopioid analgesics may have additive analgesic effects and may permit lower doses.
- Medication should be discontinued gradually after long-term use to prevent withdrawal symptoms.
- **PO:** Doses may be administered with food or milk to minimize GI irritation.
- Dilute each dose of 10 mg/mL oral concentrate with at least 30 mL of water or other liquid prior to administration.
- Diskettes (dispersible tablets) are to be dissolved and used for detoxification and maintenance treatment only. Available only to licensed detoxification/maintenance programs.
- **Subcut, IM:** IM is the preferred parenteral route for repeated doses. Subcut administration may cause tissue irritation.

Patient/Family Teaching

- Instruct patient on how and when to ask for and take pain medication.
- Instruct patient to take methadone exactly as directed. If dose is less effective after a few weeks, do not increase dose without consulting health care professional.
- Advise patient that methadone is a drug with known abuse potential. Protect it from theft, and never give to anyone other than the individual for whom it was prescribed.
- May cause drowsiness or dizziness. Advise patient to call for assistance when ambulating or smoking and to avoid driving or other activities requiring alertness until response to medication is known.
- **Inform patient of the potential for arrhythmias and emphasize the importance of regular ECGs.**
- Caution patient to notify health care professional if signs of overdose (difficult or shallow breathing, extreme tiredness or sleepiness, blurred vision, inability to think, talk, or walk normally, and feelings of faintness, dizziness, or confusion) occur. Methadone has a prolonged action causing increased risk of overdose.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient to tell health care professional what medications they are taking and to avoid taking new Rx, OTC, vitamins, or herbal products without consulting health care professional. Caution patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.

Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.
- Prevention of withdrawal symptoms in detoxification from heroin and other opioid analgesics.

methIMazole (meth-im-a-zole)

Tapazole

Classification

Therapeutic: antithyroid agents

Indications

Palliative treatment of hyperthyroidism. Used as an adjunct to control hyperthyroidism in preparation for thyroidectomy or radioactive iodine therapy.

Action

Inhibits the synthesis of thyroid hormones. **Therapeutic Effects:** Decreased signs and symptoms of hyperthyroidism.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Pharmacokinetics

Absorption: Rapidly absorbed following oral administration.

Distribution: Crosses the placenta and enters breast milk in high concentrations.

Metabolism and Excretion: Mostly metabolized by the liver; <10% eliminated unchanged by the kidneys.

Half-life: 3–5 hr.

TIME/ACTION PROFILE (effect on thyroid function)

ROUTE	ONSET	PEAK	DURATION
PO	1 wk	4–10 wk	wk

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **Lactation:** Lactation.

Use Cautiously in: Patients with ↓ bone marrow reserve; Patients >40 yr (↑ risk of agranulocytosis); **OB:** May be used cautiously; however, thyroid problems may occur in the fetus.

Adverse Reactions/Side Effects

CNS: drowsiness, headache, vertigo. **GI:** HEPATOTOXICITY, diarrhea, loss of taste, nausea, parotitis, vomiting.

Derm: rash, skin discoloration, urticaria. **Hemat:** AGRANULOCYTOSIS, anemia, leukopenia, thrombocytopenia. **MS:** arthralgia. **Misc:** fever, lymphadenopathy.

Interactions

Drug-Drug: Additive bone marrow depression with antineoplastics or radiation therapy. Antithyroid effect may be ↓ by potassium iodide or amiodarone. ↑ risk of agranulocytosis with phenothiazines. May alter response to warfarin and digoxin.

Route/Dosage

PO (Adults): Thyrotoxic crisis—15–20 mg every 4 hr during the first 24 hr (with other interventions). Hypertthyroidism—15–60 mg/day as a single dose or divided doses for 6–8 wk. Maintenance—5–30 mg/kg as a single dose or 2 divided doses.

PO (Children): Initial—400 mcg (0.4 mg)/kg/day in single dose or 2 divided doses. Maintenance—200 mcg/kg/day in single dose or 2 divided doses.

Availability (generic available)

Tablets: 5 mg, 10 mg.

NURSING IMPLICATIONS

Assessment

- Monitor response for symptoms of hyperthyroidism or thyrotoxicosis (tachycardia, palpitations, nervousness, insomnia, fever, diaphoresis, heat intolerance, tremors, weight loss, diarrhea).
- Assess for development of hypothyroidism (intolerance to cold, constipation, dry skin, headache, listlessness, tiredness, or weakness). Dose adjustment may be required.

- Assess for skin rash or swelling of cervical lymph nodes. Treatment may be discontinued if this occurs.
- **Lab Test Considerations:** Monitor thyroid function studies prior to therapy, monthly during initial therapy, and every 2–3 mo during therapy.
- Monitor WBC and differential counts periodically during therapy. Agranulocytosis may develop rapidly; usually occurs during the first 2 mo and is more common in patients over 40 yr and those receiving >40 mg/day. This necessitates discontinuation of therapy.
- May cause ↑ AST, ALT, LDH, alkaline phosphatase, serum bilirubin, and prothrombin time.

Potential Nursing Diagnoses

Noncompliance (Patient/Family Teaching)

Implementation

- Do not confuse methimazole with metolazone or methazolamide.
- **PO:** Administer at same time in relation to meals every day. Food may either increase or decrease absorption.

Patient/Family Teaching

- Instruct patient to take medication as directed, around the clock. Take missed doses as soon as remembered; take both doses together if almost time for next dose; check with health care professional if more than 1 dose is missed. Consult health care professional prior to discontinuing medication.
- Instruct patient to monitor weight 2–3 times weekly. Notify health care professional of significant changes.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to consult health care professional regarding dietary sources of iodine (iodized salt, shellfish).
- Advise patient to report sore throat, fever, chills, headache, malaise, weakness, yellowing of eyes or skin, unusual bleeding or bruising, rash, or symptoms of hyperthyroidism or hypothyroidism promptly.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to carry identification describing medication regimen at all times.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Emphasize the importance of routine exams to monitor progress and to check for side effects.

Evaluation/Desired Outcomes

- Decrease in severity of symptoms of hyperthyroidism (lowered pulse rate and weight gain).
- Return of thyroid function studies to normal.

- May be used as short-term adjunctive therapy to prepare patient for thyroidectomy or radiation therapy or may be used in treatment of hyperthyroidism. Treatment from 6 mo to several yr may be necessary, usually averaging 1 yr.

methocarbamol (meth-oh-kar-ba-mole)

★ Robaximol, Robaxin

Classification

Therapeutic: skeletal muscle relaxants (centrally acting)

Indications

Adjunctive treatment of muscle spasm associated with acute painful musculoskeletal conditions (with rest and physical therapy).

Action

Skeletal muscle relaxation, probably as a result of CNS depression. **Therapeutic Effects:** Skeletal muscle relaxation.

Pharmacokinetics

Absorption: Rapidly absorbed from the GI tract.

Distribution: Widely distributed. Crosses the placenta; enters breast milk in small amounts.

Metabolism and Excretion: Metabolized by the liver.

Half-life: 1–2 hr.

TIME/ACTION PROFILE (skeletal muscle relaxation)

ROUTE	ONSET	PEAK	DURATION
PO	30 min	2 hr	unknown
IM	rapid	unknown	unknown
IV	immediate	end of infusion	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity to polyethylene glycol (parenteral form); Renal impairment (parenteral form).

Use Cautiously in: Seizure disorders (parenteral form); **OB, Pedi, Lactation:** Safety not established; **Ger:** Appears on Beers list. Poorly tolerated due to anticholinergic effects.

Adverse Reactions/Side Effects

CNS: **SEIZURES** (IV, IM only), dizziness, drowsiness, light-headedness. **EENT:** blurred vision, nasal congestion. **CV:** *IV*—bradycardia, hypotension. **GI:** anorexia, GI upset, nausea. **GU:** brown, black, or green urine. **Derm:** flushing (IV only), pruritus, rashes, urticaria. **Local:** pain at IM site, phlebitis at IV site. **Misc:**

allergic reactions including **ANAPHYLAXIS** (IM, IV use only), fever.

Interactions

Drug-Drug: Additive CNS depression with other CNS depressants, including alcohol, antihistamines, opioid analgesics, and sedative/hypnotics.

Drug-Natural Products: Concomitant use of kava-kava, valerian, chamomile, or hops can ↑ CNS depression.

Route/Dosage

PO (Adults): 1.5 g 4 times daily initially (up to 8 g/day) for 2–3 days, then 4–4.5 g/day in 3–6 divided doses; may be followed by maintenance dosing of 750 mg q 4 hr or 1 g 4 times daily or 1.5 g 3 times daily.

IM, IV (Adults): 1–3 g/day for not more than 3 days; course may be repeated after a 48-hr rest.

Availability (generic available)

Tablets: 500 mg, 750 mg. **Cost:** *Generic*—500 mg \$41.79/100, 750 mg \$60.28/100. **Injection:** 100 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess patient for pain, muscle stiffness, and range of motion before and periodically throughout therapy.
- Monitor pulse and BP every 15 min during parenteral administration.
- **Ger:** Assess geriatric patients for anticholinergic effects (sedation and weakness).
- **Assess patient for allergic reactions (skin rash, asthma, hives, wheezing, hypotension) after parenteral administration. Keep epinephrine and oxygen on hand in the event of a reaction.**
- Monitor IV site. Injection is hypertonic and may cause thrombophlebitis. Avoid extravasation.
- **Lab Test Considerations:** Monitor renal function periodically during prolonged parenteral therapy (>3 days), because polyethylene glycol 300 vehicle is nephrotoxic.
- May cause falsely increased urinary 5-hydroxyindoleacetic acid (5-HIAA) and vanillylmandelic acid (VMA) determinations.

Potential Nursing Diagnoses

Acute pain (Indications)

Impaired physical mobility (Indications)

Risk for injury (Side Effects)

Implementation

- Provide safety measures as indicated. Supervise ambulation and transfer of patients.
- **PO:** May be administered with food to minimize GI irritation. Tablets may be crushed and mixed with food or liquids to facilitate swallowing. For adminis-

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

tration via NG tube, crush tablet and suspend in water or saline.

- **IM:** Do not administer subcut. IM injections should contain no more than 5 mL (500 mg) at a time in the gluteal region.

IV Administration

- **IV Push:** **Diluent:** Administer undiluted. **Concentration:** 100 mg/mL. **Rate:** Administer at a maximum rate of 180 mg/m²/min but not >3 mL (300 mg)/min.
- **Intermittent Infusion:** **Diluent:** Dilute each dose in no more than 250 mL of 0.9% NaCl or D5W for injection. **Concentration:** 4 mg/mL for slower infusions. Do not refrigerate after dilution.
- Have patient remain recumbent during and for at least 10–15 min after infusion to avoid orthostatic hypotension.

Patient/Family Teaching

- Advise patient to take medication as directed. Take missed doses within 1 hr; if not, return to regular dosing schedule. Do not double doses.
- Encourage patient to comply with additional therapies prescribed for muscle spasm (rest, physical therapy, heat).
- May cause dizziness, drowsiness, and blurred vision. Advise patient to avoid driving and other activities requiring alertness until response to drug is known.
- Instruct patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient to avoid concurrent use of alcohol and other CNS depressants.
- Inform patient that urine may turn black, brown, or green, especially if left standing.
- Instruct patient to notify health care professional if skin rash, itching, fever, or nasal congestion occurs.
- Emphasize the importance of routine follow-up exams to monitor progress.

Evaluation/Desired Outcomes

- Decreased musculoskeletal pain and muscle spasticity.
- Increased range of motion.

HIGH ALERT

methotrexate (meth-o-trex-ate)

★ Metoject, Otrexup, Rasuvo, Rheumatrex, Trexall, Xatmep

Classification

Therapeutic: antineoplastics, antirheumatics (DMARDs), immunosuppressants
Pharmacologic: antimetabolites

Indications

Alone or with other treatment modalities in the treatment of: Trophoblastic neoplasms (choriocarcinoma, chorioadenoma destruens, hydatidiform mole), Leukemias, Breast carcinoma, Head carcinoma, Neck carci-

noma, Lung carcinoma. Severe psoriasis, rheumatoid arthritis, and polyarticular juvenile idiopathic arthritis unresponsive to conventional therapy. Treatment of mycosis fungoides (cutaneous T-cell lymphoma).

Action

Interferes with folic acid metabolism. Result is inhibition of DNA synthesis and cell reproduction (cell-cycle S-phase-specific). Also has immunosuppressive activity. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones, and immunosuppression.

Pharmacokinetics

Absorption: Small doses are well absorbed from the GI tract. Larger doses incompletely absorbed.

Distribution: Actively transported across cell membranes, widely distributed. Does not reach therapeutic concentrations in the CSF. Crosses placenta; enters breast milk in low concentrations. Absorption in children is variable (23–95%) and dose-dependent.

Metabolism and Excretion: Excreted mostly unchanged by the kidneys.

Half-life: *Low dose*—3–10 hr; *high dose*—8–15 hr (↑ in renal impairment).

TIME/ACTION PROFILE (effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
PO, IM, IV	4–7 days	7–14 days	21 days
Subcut	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Alcoholism or hepatic impairment; Immunosuppression; ↓ bone marrow reserve; **OB, Lactation:** Pregnancy or lactation; **Pedi:** Products containing benzyl alcohol should not be used in neonates.

Use Cautiously in: Renal impairment (CCr must be ≥60 mL/min prior to therapy); Patients with childbearing potential; Active infections; **Geri:** May be more sensitive to toxicity and adverse events.

Adverse Reactions/Side Effects

CNS: arachnoiditis (IT use only), dizziness, drowsiness, headache, malaise, seizures. **EENT:** blurred vision, dysarthriatransient blindness. **Resp:** **PULMONARY FIBROSIS**, interstitial pneumonitis. **GI:** **HEPATOTOXICITY**, anorexia, diarrhea, nausea, stomatitis, vomiting. **GU:** acute renal failure, infertility. **Derm:** **ERYTHEMA MULTIFORME**, **STEVENS-JOHNSON SYNDROME**, **TOXIC EPIDERMAL NECROLYSIS**, alopecia, painful plaque erosions (during psoriasis treatment), photosensitivity, pruritus, rashes, skin ulceration, urticaria. **Hemat:** **APLASTIC ANEMIA**, anemia, leukopenia, thrombocytopenia. **Metab:** hyperuricemia. **MS:** osteonecrosis, stress fracture. **Misc:** **nephropathy**, chills, fever, soft tissue necrosis.

Interactions

Drug-Drug: The following drugs may ↑ hematologic toxicity of methotrexate: high-dose **salicylates**,

NSAIDs, oral hypoglycemic agents (sulfonylureas), phenytoin, tetracyclines, probenecid, trimethoprim/sulfamethoxazole, pyrimethamine, proton pump inhibitors and chloramphenicol. ↑ hepatotoxicity with other **hepatotoxic drugs** including **azathioprine, sulfasalazine, and retinoids.** ↑ nephrotoxicity with other **nephrotoxic drugs.** ↑ bone marrow depression with other **antineoplastics or radiation therapy.** **Radiation therapy** ↑ risk of soft tissue necrosis and osteonecrosis. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions. ↑ risk of neurologic reactions with **acyclovir** (IT methotrexate only). **Asparaginase** may ↓ effects of methotrexate.

Drug-Natural Products: Concomitant use with **echinacea** and **melatonin** may interfere with immunosuppression. **Caffeine** may ↓ efficacy of methotrexate, similar effect may occur with **guarana.**

Route/Dosage

Trophoblastic Neoplasms

PO, IM (Adults): 15–30 mg/day for 5 days; repeat after 1 or more wk for 3–5 courses.

Breast Cancer

IV (Adults): 40 mg/m² on days 1 and 8 (with other agents; many regimens are used).

Leukemia

PO (Adults): Induction—3.3 mg/m²/day, usually with prednisone.

PO, IM (Adults): Maintenance—20–30 mg/m² twice weekly.

PO (Children): Oral solution—20 mg/m² once weekly.

IV (Adults): 2.5 mg/kg q 2 wk.

IT (Adults): 12 mg/m² or 15 mg.

IT (Children ≥3 yr): 12 mg.

IT (Children 2 yr): 10 mg.

IT (Children 1 yr): 8 mg.

IT (Children <1 yr): 6 mg.

Osteosarcoma

IV (Adults): 12 g/m² as a 4-hr infusion followed by leucovorin rescue, usually as part of a combination chemotherapeutic regimen (or increase dose until peak serum methotrexate level is 1×10^{-3} M/L but not to exceed 15 g/m²; 12 courses are given starting 4 wk after surgery and repeated at scheduled intervals.

Psoriasis

Therapy may be preceded by a 5–10-mg test dose.

PO, IM, Subcut, IV (Adults): 10–25 mg/weekly (not to exceed 30 mg/wk); Otrexup may be used when dose is 10–25 mg/wk.

Rheumatoid Arthritis

PO, Subcut (Adults): 7.5 mg weekly (not to exceed 20 mg/wk); when response is obtained, dose should be ↓ Otrexup may be used when dose is 10–20 mg/wk.

Polyarticular Juvenile Idiopathic Arthritis

PO (Children): 10 mg/m² once weekly initially, may be ↑ up to 20–30 mg/m², however response may be better if doses >20 mg/m² are given IM or subcut; Otrexup may be used when dose is 10–25 mg/wk.

Mycosis Fungoides

PO, IM, Subcut (Adults): 5–50 mg once weekly, if response is poor, dose may be changed to 15–37.5 mg twice weekly.

IM (Adults): 50 mg once weekly or 25 mg twice weekly.

Availability (generic available)

Tablets: 2.5 mg, 5 mg, 7.5 mg, 10 mg, 15 mg. **Cost:** 2.5 mg \$96.36/30, 5 mg \$352.75/30, 7.5 mg \$529.13/30, 10 mg \$705.50/30, 15 mg \$1,058.27/30. **Solution for injection:** 25 mg/mL. **Cost:** Generic—\$115.02/30 mL. **Oral solution:** 2.5 mg/mL. **Powder for injection:** 1 g/vial. **Preservative-free solution for injection:** 25 mg/mL. **Solution for subcutaneous injection (Otrexup):** 7.5 mg/0.4 mL, 10 mg/0.4 mL, 12.5 mg/0.4 mL, 15 mg/0.4 mL, 17.5 mg/0.4 mL, 20 mg/0.4 mL, 22.5 mg/0.4 mL, 25 mg/0.4 mL. **Solution for subcutaneous injection (Rasuvo):** 7.5 mg/0.15 mL, 10 mg/0.2 mL, 12.5 mg/0.25 mL, 15 mg/0.3 mL, 17.5 mg/0.35 mL, 20 mg/0.4 mL, 22.5 mg/0.45 mL, 25 mg/0.5 mL, 30 mg/0.6 mL.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs periodically during administration. Report significant changes.
- Monitor for abdominal pain, diarrhea, or stomatitis; therapy may need to be discontinued.
- **Monitor for bone marrow depression.** Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor intake and output ratios and daily weights. Report significant changes in totals.
- **Monitor for symptoms of pulmonary toxicity, which may manifest early as a dry, nonproductive cough.**
- Monitor for symptoms of gout (increased uric acid, joint pain, edema). Encourage patient to drink at least 2 L of fluid each day. Allopurinol and alkalinization of urine may be used to decrease uric acid levels.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Assess nutritional status. Administering an anti-emetic prior to and periodically during therapy and adjusting diet as tolerated may help maintain fluid and electrolyte balance and nutritional status.
- **Assess for rash periodically during therapy.** May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.
- **IT:** Assess for development of nuchal rigidity, headache, fever, confusion, drowsiness, dizziness, weakness, or seizures.
- **Rheumatoid Arthritis:** Assess patient for pain and range of motion prior to and periodically during therapy.
- **Psoriasis:** Assess skin lesions prior to and periodically during therapy.
- **Lab Test Considerations:** Monitor CBC and differential prior to and frequently during therapy. The nadir of leukopenia and thrombocytopenia occurs in 7–14 days. Leukocyte and thrombocyte counts usually recover 7 days after the nadirs. Notify health care professional of any sudden drop in values.
- Monitor renal (BUN and creatinine) and hepatic function (AST, ALT, bilirubin, and LDH) prior to and every 1–2 mo during therapy. Urine pH should be monitored prior to high-dose methotrexate therapy and every 6 hr during leucovorin rescue. Urine pH should be kept above 7.0 to prevent renal damage.
- May cause ↑ serum uric acid concentrations, especially during initial treatment of leukemia and lymphoma.
- **Toxicity and Overdose:** Monitor serum methotrexate levels every 12–24 hr during high-dose therapy until levels are $<5 \times 10$ M. This monitoring is essential to plan correct leucovorin dose and determine duration of rescue therapy.
- With high-dose therapy, patient must receive leucovorin rescue within 24–48 hr to prevent fatal toxicity. Glucarpidase may be used for patients with impaired renal function. In cases of massive overdose, hydration and urinary alkalization with sodium bicarbonate are required to prevent renal tubule damage. Monitor fluid and electrolyte status; patients must be well hydrated. Intermittent hemodialysis using a high-flux dialyzer may be used for clearance until levels are <0.05 micromolar. Methotrexate should be delayed until recovery if WBC <1500 /microliter, neutrophil count <200 /microliter, platelet count $<75,000$ /microliter, serum bilirubin level >1.2 mg/dL, AST level >450 U, mucositis is present, until evidence of healing, persistent pleural effusion is present, should be drained dry prior to infusion. Adequate renal function is required. Serum creatinine must be normal, creatinine clearance must be >60 mL/min, before initiation of therapy. Serum creatinine must be measured before each course of therapy. If ↑ by $\geq 50\%$ of a prior value, creatinine clear-

ance must be >60 mL/min, even if serum creatinine is within normal range.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)

Imbalanced nutrition: less than body requirements (Adverse Reactions)

Implementation

- **High Alert:** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations and infusion pump settings. Methotrexate for non-oncologic use is given at a much lower dose and frequency—often just once a week. Do not confuse non-oncologic dosing regimens with dosing regimens for cancer patients.
- Solutions for injection should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in specially designated containers.
- *Otrexup* and *Rasuvo* are not indicated for treatment of neoplastic diseases. Not for patients requiring oral, IM, IV, intra-arterial, or IT dosing, doses <10 mg/week, doses >25 mg/week, high-dose regimens, or dose adjustments of less than 5 mg increments.
- **Subcut:** *Otrexup* and *Rasuvo* are single-dose auto-injectors. Inject once weekly in abdomen or upper thigh. Avoid areas where skin is tender, bruised, red, scaly, hard, or has scars or stretch marks. Solution is clear and yellow; do not inject solutions that are discolored or contain particulate matter.

IV Administration

- **IV Push:** **Diluent:** Reconstitute each vial with 25 mL of 0.9% NaCl. Use sterile preservative-free diluents for high-dose regimens to prevent complications from large amounts of benzyl alcohol. Do not use preparations that are discolored or that contain a precipitate. Reconstitute immediately before use. Discard unused portion. **Concentration:** <25 mg/mL for IV push and intermittent/continuous infusions. **Rate:** Administer at a rate of 10 mg/min into Y-site of a free-flowing IV.
- **Intermittent/Continuous Infusion:** **Diluent:** Doses >100 – 300 mg/m² may also be diluted in D5W, D5/0.9% NaCl, or 0.9% NaCl and infused as intermittent or continuous infusion. **Rate:** Administration rates of 4–20 mg/hr have been used.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, cefazolin, cefepime, cefotaxime, cefotetan, ce-

- foxitin, ceftazidime, ceftriaxone, cefuroxime, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daunorubicin hydrochloride, dexmedetomidine, digoxin, diphenhydramine, docetaxel, doxorubicin hydrochloride, doxorubicin liposomal, enalaprilat, ephedrine, epinephrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, granisetron, heparin, hydrocortisone, hydromorphone, imipenem/cilastatin, insulin, isoproterenol, ketorolac, leucovorin, levorphanol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meprenolam, mesna, methohexital, methylprednisolone, metoclopramide, metoprolol, metronidazole, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, naloxone, nesiritide, nitroglycerin, norepinephrine, octreotide, ondansetron, oxacillin, paclitaxel, palonosetron, pamidronate, pancuronium, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphate, procainamide, prochlorperazine, propranolol, ranitidine, remifentanyl, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, sodium phosphate, succinylcholine, sufentanyl, tacrolimus, teniposide, theophylline, thio-pental, thiotepa, tigecycline, tirofiban, tobramycin, trastuzumab, trimethoprim/sulfamethoxazole, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** amiodarone, amphotericin B colloidal, caspofungin, chlorpromazine, dactarbazine, daptomycin, dexrazoxane, diazepam, diltiazem, dobutamine, dopamine, doxycycline, gemcitabine, gentamicin, idarubicin, ifosfamide, levofloxacin, midazolam, mycophenolate, nalbuphine, nicardipine, pantoprazole, pentamidine, phenytoin, propofol, quinupristin/dalfopristin.
 - **IT:** Reconstitute preservative-free methotrexate with preservative-free 0.9% NaCl, Elliot's B solution, or patient's CSF to a concentration not greater than 2 mg/mL. May be administered via lumbar puncture or Ommaya reservoir. To prevent bacterial contamination, use immediately.

Patient/Family Teaching

- Instruct patient to take medication as directed. If a dose is missed, it should be omitted. Consult health care professional if vomiting occurs shortly after a dose is taken.
- Instruct patient to notify health care professional promptly if rash, fever, chills, cough, hoarseness;

sore throat; signs of infection; lower back or side pain; painful or difficult urination; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or other NSAIDs; may precipitate gastric bleeding.

- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to use sponge brush and to rinse mouth with water after eating and drinking. Topical therapy may be used if mouth pain interferes with eating. Stomatitis pain may require treatment with opioid analgesics.
- Advise patient to tell health care professional what medications they are taking and to avoid taking new Rx, OTC, vitamins, or herbal products without consulting health care professional.
- Discuss the possibility of hair loss with patient. Explore methods of coping.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- **Rep:** Advise patient that this medication may have teratogenic effects. Contraception should be used during therapy and for at least 3 mo for men and 1 ovulatory cycle for women after completion of therapy. Avoid breast feeding during therapy. May impair fertility in both men and women.
- Emphasize the need for periodic lab tests to monitor for side effects.
- **Subcut:** Instruct patient on correct technique for injection and care and disposal of equipment.

Evaluation/Desired Outcomes

- Improvement of hematopoietic values in leukemia.
- Decrease in symptoms of meningeal involvement in leukemia.
- Decrease in size and spread of non-Hodgkin's lymphomas and other solid cancers.
- Resolution of skin lesions in severe psoriasis.
- Decreased joint pain and swelling.
- Improved mobility in patients with rheumatoid arthritis.
- Regression of lesions in mycosis fungoides.

methyldopa (meth-ill-doe-pa)

Aldomet

Classification

Therapeutic: antihypertensives
Pharmacologic: centrally acting antiadrenergics

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Indications

Management of moderate to severe hypertension (with other agents).

Action

Stimulates CNS alpha-adrenergic receptors, producing a decrease in sympathetic outflow to heart, kidneys, and blood vessels. Result is decreased BP and peripheral resistance, a slight decrease in heart rate, and no change in cardiac output. **Therapeutic Effects:** Lowering of BP.

Pharmacokinetics

Absorption: 50% absorbed from the GI tract. Parenteral form, methyldopate hydrochloride, is slowly converted to methyldopa.

Distribution: Crosses the blood-brain barrier.

Crosses the placenta; small amounts enter breast milk.

Metabolism and Excretion: Partially metabolized by the liver, partially excreted unchanged by the kidneys.

Half-life: 1.7 hr.

TIME/ACTION PROFILE (antihypertensive effect)

ROUTE	ONSET	PEAK	DURATION
PO	4–6 hr	12–24 hr	24–48 hr
IV	4–6 hr	unknown	10–16 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Active liver disease.

Use Cautiously in: Previous history of liver disease; **OB:** Has been used safely (may be used for treatment of hypertension in pregnancy); **Lactation:** Usually compatible with breast feeding; **Geri:** ↑ risk of adverse reactions; consider age-related impairment of hepatic, renal and cardiovascular function as well as other chronic illnesses. Appears on Beers list. May cause bradycardia and exacerbate depression.

Adverse Reactions/Side Effects

CNS: sedation, ↓ mental acuity, depression. **EENT:** nasal stuffiness. **CV:** MYOCARDITIS, bradycardia, edema, orthostatic hypotension. **GI:** DRUG-INDUCED HEPATITIS, diarrhea, dry mouth. **GU:** erectile dysfunction. **Hemat:** eosinophilia, hemolytic anemia. **Misc:** fever.

Interactions

Drug-Drug: Additive hypotension with other antihypertensives, acute ingestion of alcohol, anesthesia, and nitrates. Amphetamines, barbiturates, tricyclic antidepressants, NSAIDs, and phenothiazines may ↓ antihypertensive effect of methyldopa. ↑ effects and risk of psychoses with haloperidol. Excess sympathetic stimulation may occur with concurrent use of MAO inhibitors or other adrenergics. May ↑ lithium toxicity. Additive hypotension and CNS toxicity with levodopa. Additive CNS depression may occur with alcohol, antihistamines,

sedative/hypnotics, some antidepressants, and opioid analgesics. Concurrent use with nonselective beta blockers may rarely cause paradoxical hypertension.

Route/Dosage

PO (Adults): 250–500 mg 2–3 times daily (not to exceed 500 mg/day if used with other agents); may be ↑ every 2 days as needed; usual maintenance dose is 500 mg–2 g/day (not to exceed 3 g/day).

PO (Children): 10 mg/kg/day (300 mg/m²/day); may be ↑ every 2 days up to 65 mg/kg/day in divided doses (not to exceed 3 g/day).

IV (Adults): 250–500 mg q 6 hr (up to 1 g q 6 hr).

IV (Children): 5–10 mg/kg q 6 hr; up to 65 mg/kg/day in divided doses (not to exceed 3 g/day).

Availability (generic available)

Tablets: 250 mg, 500 mg. **Injection:** 50 mg/mL. **Combination with:** hydrochlorothiazide. See Appendix B.

NURSING IMPLICATIONS

Assessment

- Monitor BP and pulse frequently during initial dose adjustment and periodically during therapy. Report significant changes.
- Monitor frequency of prescription refills to determine compliance.
- Monitor intake and output ratios and weight and assess for edema daily, especially at beginning of therapy. Report weight gain or edema; sodium and water retention may be treated with diuretics.
- Assess patient for depression or other alterations in mental status. Notify health care professional promptly if these symptoms develop.
- **Monitor temperature during therapy.** Drug fever may occur shortly after initiation of therapy and may be accompanied by eosinophilia and hepatic function changes. Monitor hepatic function test if unexplained fever occurs.
- **Lab Test Considerations:** Monitor renal and hepatic function and CBC before and periodically during therapy.
- Monitor direct Coombs' test before and after 6 and 12 mo of therapy. May cause a positive direct Coombs' test, rarely associated with hemolytic anemia.
- **May cause ↑ BUN, serum creatinine, potassium, sodium, prolactin, uric acid, AST, ALT, alkaline phosphatase, and bilirubin concentrations.**
- May cause prolonged prothrombin times.
- May interfere with serum creatinine and AST measurements.

Potential Nursing Diagnoses

Risk for injury (Side Effects)

Noncompliance (Patient/Family Teaching)

Implementation

- Fluid retention and expanded volume may cause tolerance to develop within 2–3 mo after initiation of therapy. Diuretics may be added to regimen at this time to maintain control.
- Dose increases should be made with the evening dose to minimize drowsiness.
- When changing from IV to oral forms, dose should remain consistent.
- **PO:** Shake suspension before administration.

IV Administration

- **Intermittent Infusion:** **Diluent:** Dilute in 100 mL of D5W, 0.9% NaCl, D5/0.9% NaCl, 5% sodium bicarbonate, or Ringer's solution. **Concentration:** ≤10 mg/mL. **Rate:** Infuse slowly over 30–60 min.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, amikacin, aminophylline, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carmustine, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chlorpromazine, clindamycin, cyanocobalamin, cyclosporine, dactinomycin, daptomycin, dexamethasone, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxycycline, enalaprilat, ephedrine, epinephrine, epoetin alfa, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, insulin, irinotecan, isoproterenol, labetalol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, metaraminol, methoxamine, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, papaverine, pemetrexed, penicillin G, pentazocine, phenolamine, phenylephrine, phytonadione, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxime, ranitidine, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, tolazoline, trimetaphan, vancomycin, vasopressin, vecuronium, verapamil, vinorelbine, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** acyclovir, amphotericin B colloidal, amphotericin B lipid complex, azathi-

prine, chloramphenicol, dantrolene, diazepam, diazoxide, folic acid, furosemide, ganciclovir, imipenem/cilastatin, indomethacin, pentamidine, pentobarbital, phenobarbital, phenytoin, piperacillin/tazobactam, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Emphasize the importance of continuing to take this medication, even if feeling well. Instruct patient to take medication at the same time each day; last dose of the day should be taken at bedtime. Take missed doses as soon as remembered but not if almost time for next dose. Do not double doses.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, and stress management). Methyldopa controls but does not cure hypertension.
- Instruct patient and family on proper technique for monitoring BP. Advise them to check BP at least weekly and to report significant changes.
- **Instruct patient to notify health care professional if fever, muscle aches, or flu-like syndrome occurs.**
- Inform patient that urine may darken or turn red-black when left standing.
- May cause drowsiness. Advise patient to avoid driving or other activities requiring alertness until response to medication is known. Drowsiness usually subsides after 7–10 days of continuous use.
- Caution patient to avoid sudden changes in position to decrease orthostatic hypotension.
- Advise patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may minimize dry mouth. Notify health care professional if dry mouth continues for >2 wk.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially cough, cold, or allergy remedies.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.

Evaluation/Desired Outcomes

- Decrease in BP without appearance of side effects.

methylergonovine (meth-ill-er-goe-noe-veen) Methergine

Classification

Therapeutic: oxytocic

Pharmacologic: ergot alkaloids

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Indications

Prevention and treatment of postpartum or postabortion hemorrhage caused by uterine atony or subinvolution.

Action

Directly stimulates uterine and vascular smooth muscle.

Therapeutic Effects: Uterine contraction.

Pharmacokinetics

Absorption: Well absorbed following oral or IM administration.

Distribution: Unknown. Enters breast milk in small quantities.

Metabolism and Excretion: Probably metabolized by the liver.

Half-life: 30–120 min.

TIME/ACTION PROFILE (effects on uterine contractions)

ROUTE	ONSET	PEAK	DURATION
PO	5–15 min	unknown	3 hr
IM	2–5 min	unknown	3 hr
IV	immediate	unknown	45 min–3 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **OB:** Should not be used to induce labor; **Lactation:** Do not breast feed during treatment and for 12 hours after the last dose; Concurrent use of potent CYP3A4 inhibitors.

Use Cautiously in: Hypertensive or eclamptic patients (more susceptible to hypertensive and arrhythmogenic side effects); History of or risk factors for coronary artery disease; Severe hepatic or renal disease; Sepsis; Concurrent use of moderate CYP3A4 inhibitors.

Exercise Extreme Caution in: **OB:** Third stage of labor.

Adverse Reactions/Side Effects

CNS: **STROKE**, dizziness, headache. **EENT:** tinnitus.

Resp: dyspnea. **CV:** **HYPERTENSION**, arrhythmias, AV block, chest pain, palpitations. **GI:** nausea, vomiting.

GU: cramps. **Derm:** diaphoresis. **Neuro:** paresthesia. **Misc:** allergic reactions.

Interactions

Drug-Drug: Excessive vasoconstriction may result when used with heavy cigarette smoking (**nicotine**), other **vasopressors**, such as **dopamine**, or **beta-blockers**. Potent **CYP3A4 inhibitors**, including **erythromycin**, **clarithromycin**, **troleandomycin**, **ritonavir**, **indinavir**, **nelfinavir**, **delavirdine**, **ketoconazole**, **itraconazole**, or **voriconazole** may ↑ levels and ↑ risk of ischemia; concurrent use contraindicated. Moderate **CYP3A4 inhibitors** including **saquinavir**, **nefazodone**, **fluconazole**, **fluoxetine**, **fluvoxamine**, **zileuton**, or **clotrimazole** may ↑ levels; use with caution. **CYP3A4 inducers** including **nevirapine** and **rifampin** may ↓ levels. **Anesthetics** may

↓ its oxytocic properties. May ↓ the antianginal effects of **nitrates**.

Drug-Food: **Grapefruit juice** may ↑ levels; use with caution.

Route/Dosage

PO (Adults): 200–400 mcg (0.2–0.4 mg) q 6–12 hr for 2–7 days.

IM, IV (Adults): 200 mcg (0.2 mg) q 2–4 hr for up to 5 doses.

Availability (generic available)

Tablets: 200 mcg (0.2 mg). **Injection:** 200 mcg (0.2 mg)/mL.

NURSING IMPLICATIONS

Assessment

- **Monitor BP, heart rate, and uterine response frequently during medication administration. Notify health care professional promptly if uterine relaxation becomes prolonged or if character of vaginal bleeding changes.**
- Assess for signs of ergotism (cold, numb fingers and toes, chest pain, nausea, vomiting, headache, muscle pain, weakness).
- **Lab Test Considerations:** If no response to methylergonovine, calcium levels may need to be assessed. Effectiveness of medication is ↓ with hypocalcemia.
- May cause ↓ serum prolactin levels.

Potential Nursing Diagnoses

Acute pain (Side Effects)

Implementation

IV Administration

- **IV:** IV administration is used for emergencies only. Oral and IM routes are preferred.
- **IV Push:** **Diluent:** May be given undiluted or diluted in 5 mL of 0.9% NaCl and administered through Y site. Do not add to IV solutions. Do not mix in syringe with any other drug. Refrigerate; stable for storage at room temperature for 60 days; deteriorates with age. Use only solution that is clear and colorless and that contains no precipitate. **Concentration:** 0.2 mg/mL. **Rate:** Administer at a rate of 0.2 mg over at least 1 min.
- **Y-Site Compatibility:** heparin, hydrocortisone sodium succinate, potassium chloride, vitamin B complex with C.

Patient/Family Teaching

- Instruct patient to take medication as directed; do not skip or double up on missed doses. If a dose is missed, omit it and return to regular dose schedule.
- Advise patient that medication may cause menstrual-like cramps.
- Caution patient to avoid smoking, because nicotine constricts blood vessels.

- Instruct patient to notify health care professional if infection develops, as this may cause increased sensitivity to the medication.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.

Evaluation/Desired Outcomes

- Contractions that maintain uterine tone and prevent postpartum hemorrhage.

methylnaltrexone (me-thil-nal-trex-one) Relistor

Classification

Therapeutic: laxatives

Pharmacologic: opioid antagonists

Indications

Subcut: Treatment of constipation caused by opioid use in patients being treated palliatively, when laxative therapy has failed. **Subcut, PO:** Treatment of constipation caused by opioid use in patients with chronic, non-cancer pain.

Action

Acts peripherally as mu-opioid receptor antagonist, blocking opioid effects on the GI tract. **Therapeutic Effects:** Blocks constipating effects of opioids on the GI tract without loss of analgesia.

Pharmacokinetics

Absorption: Rapidly absorbed after subcutaneous and oral administration; oral absorption delayed by high-fat meal by 2 hr.

Distribution: Moderate tissue distribution, does not cross the blood-brain barrier.

Metabolism and Excretion: Some metabolism; 85% excreted unchanged in urine.

Half-life: 15 hr (oral).

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
Subcut	rapid	0.5 hr	24–48 hr
PO	rapid	1.5 hr	unknown

Contraindications/Precautions

Contraindicated in: Known/suspected mechanical GI obstruction.

Use Cautiously in: Known/suspected lesions of GI tract (↑ risk for GI perforation); Moderate-severe renal impairment (dose ↓ required); Moderate-severe he-

patric impairment (dose ↓ may be required); **OB, Lactation:** Use in pregnancy only if clearly needed; use cautiously during lactation; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: dizziness. **GI:** GI PERFORATION, abdominal pain, flatulence, nausea, diarrhea. **Derm:** hyperhidrosis.

Misc: opioid withdrawal.

Interactions

Drug-Drug: None noted.

Route/Dosage

Opioid-Induced Constipation in Patients with Advanced Illness

Subcut (Adults): 38– <62 kg—8 mg every other day, not to exceed every 24 hr; 62–114 kg—12 mg every other day, not to exceed every 24 hr; >114 kg—0.15 mg/kg every other day, not to exceed every 24 hr.

Renal Impairment

(Adults): *CCr* <60 mL/min—use 50% of recommended dose based on weight.

Opioid-Induced Constipation in Patients with Non-Cancer Pain

Subcut (Adults): 12 mg once daily.

Renal Impairment

Subcut (Adults): *CCr* <60 mL/min—6 mg once daily.

Hepatic Impairment

Subcut (Adults): *Severe hepatic impairment (Child–Pugh Class C)*—<38 kg: 0.075 mg/kg once daily; 38–<62 kg: 4 mg once daily; 62–114 kg: 6 mg once daily; >114 kg: 0.075 mg/kg once daily.

PO (Adults): 450 mg once daily.

Renal Impairment

PO (Adults): *CCr* <60 mL/min—150 mg once daily.

Hepatic Impairment

PO (Adults): *Moderate or severe hepatic impairment (Child–Pugh Class B or C)*—150 mg once daily.

Availability

Solution for subcutaneous injection (prefilled syringes): 8 mg/0.4 mL, 12 mg/0.6 mL. **Cost:** All strengths \$71.46/syringe. **Tablets:** 150 mg.

NURSING IMPLICATIONS

Assessment

- Assess bowel sounds and frequency, quantity, and consistency of stools periodically during therapy.
- Monitor pain intensity during therapy. Methylnaltrexone does not affect pain or effects of opioid analgesics on pain control.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Potential Nursing Diagnoses

Constipation (Indications)
Diarrhea (Adverse Reactions)

Implementation

- Maintenance laxative must be stopped prior to administration of methylphenidate. If response is not sufficient after 3 days, laxatives may be restarted.
- **PO:** Administer with water on an empty stomach at least 30 min before first meal of the day.
- **Subcut:** Pinch skin and administer in upper arm, abdomen, or thigh at a 45° angle using a 1-mL syringe with a 27-gauge needle inserted the full length of the needle. Do not rub the injection site. Solution is clear and colorless to pale yellow. Do not administer solutions that are discolored or contain a precipitate. Solution is stable for 24 hr at room temperature. Protect vials from light. Do not freeze. Do not use single-use vials for more than 1 dose.

Patient/Family Teaching

- Instruct patient to take methylphenidate as directed and on correct technique for administration of methylphenidate and disposal of supplies. Usual schedule is one dose every other day, as needed, but no more than one dose in a 24-hr period. Advise patient to read the *Patient Information* prior to starting therapy and with each Rx refill.
- Advise patient that laxation may occur within 30 min of subcut injection, so toilet facilities should be available following administration.
- Advise patient to discontinue all maintenance laxatives; can be added if inadequate response to methylphenidate.
- May cause dizziness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional and discontinue therapy if severe or persistent diarrhea occurs or if abdominal pain, nausea, or vomiting persists or worsens.
- Instruct patient to stop taking methylphenidate if they stop taking opioid medications.
- Advise patient to consult health care professional prior to taking other Rx, OTC, or herbal products.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Laxation and relief of opioid-induced constipation.

methylphenidate (oral)

(meth-ill-fen-i-date)

Aptensio XR,  Biphentin, Concerta, Metadate CD, Metadate ER, Methylin, Methylin ER, Quillichew ER, Quillivant XR, Ritalin, Ritalin LA, Ritalin SR

methylphenidate (transdermal)

Daytrana

Classification

Therapeutic: central nervous system stimulants

Schedule II**Indications**

Treatment of ADHD (adjunct). **Oral:** Symptomatic treatment of narcolepsy. **Unlabeled Use:** Management of some forms of refractory depression.

Action

Produces CNS and respiratory stimulation with weak sympathomimetic activity. **Therapeutic Effects:** Increased attention span in ADHD. Increased motor activity, mental alertness, and diminished fatigue in narcoleptic patients.

Pharmacokinetics

Absorption: Slow and incomplete after oral administration; absorption of sustained or extended-release tablet (SR) is delayed and provides continuous release; well absorbed from skin. *Aptensio XR, Metadate CD, Concerta, Ritalin LA*—provides initial rapid release followed by a second continuous release (biphasic release).

Distribution: Unknown.

Metabolism and Excretion: Mostly metabolized (80%) by the liver.

Half-life: 2–4 hr.

TIME/ACTION PROFILE (CNS stimulation)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–3 hr	4–6 hr
PO-ER	unknown	4–7 hr	3–12 hr†
Transdermal	unknown	unknown	12 hr

†Depends on formulation.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hyperexcitable states; Hyperthyroidism; Patients with psychotic personalities or suicidal or homicidal tendencies; Personal or family history of Tourette's syndrome; Glaucoma; Motor tics; Concurrent use or use within 14 days of MAO inhibitors or MAO-like drugs (linezolid or methyl-ene blue); Fructose intolerance, glucose-galactose malabsorption, or sucrose-isomaltase insufficiency; Surgery.

Use Cautiously in: History of cardiovascular disease (sudden death has occurred in children with structural cardiac abnormalities or other serious heart problems); Hypertension; Diabetes mellitus; History of contact sensitization with transdermal product (may be at ↑ risk for systemic sensitization reactions with oral products); History or family history of vitiligo (may be at ↑ risk for loss of skin pigmentation with transdermal

product); Continual use (may result in psychological or physical dependence); Seizure disorders (may lower seizure threshold); Concerta product should be used cautiously in patients with esophageal motility disorders or severe GI narrowing (may ↑ the risk of obstruction); **OB:** Safety not established; **Lactation:** Present in human milk; no reports of adverse effects in breast-fed infant (monitor for agitation, insomnia, anorexia, and lack of weight gain); **Geri:** Geriatric or debilitated patients; **Pedi:** Growth suppression may occur in children with long-term use; children <6 yr (transdermal only).

Adverse Reactions/Side Effects

CNS: hyperactivity, insomnia, restlessness, tremor, behavioral disturbances, dizziness, hallucinations, headache, irritability, mania, thought disorder. **EENT:** blurred vision, teeth grinding. **CV:** **SUDDEN DEATH**, hypertension, palpitations, tachycardia, hypotension, peripheral vasculopathy. **GI:** anorexia, constipation, cramps, diarrhea, dry mouth, metallic taste, nausea, vomiting. **Derm:** contact sensitization (erythema, edema, papules, vesicles) (transdermal), erythema, loss of skin pigmentation (transdermal), rash. **Metab:** growth suppression, weight loss (may occur with prolonged use). **Neuro:** akathisia, dyskinesia, tics. **GU:** priapism. **MS:** **RHABDOMYOLYSIS**. **Misc:** **ANAPHYLAXIS**, **ANGIOEDEMA**, fever, physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Concurrent use with **MAO inhibitors** or **MAO-inhibitor-like drugs**, such as **linezolid** or **methylene blue** may result in serious, potentially fatal reactions; wait at least 14 days following discontinuation of MAO inhibitor before initiation of amphetamine mixtures. Drugs that affect serotonergic neurotransmitter systems, including **MAO inhibitors**, **tricyclic antidepressants**, **SSRIs**, **SNRIs**, **fentanyl**, **bupropion**, **tramadol**, **lithium**, and **triptans** ↑ risk of serotonin syndrome. ↑ sympathomimetic effects with other **adrenergics**, including **vasoconstrictors**, **decongestants**, and **halogenated anesthetics**. Metabolism of **warfarin**, **phenytoin**, **phenobarbital**, **primidone**, **phenylbutazone**, **selective serotonin reuptake inhibitors**, and **tricyclic antidepressants** may be ↓ and effects ↑. Avoid concurrent use with **pimozide** (may mask cause of tics). May ↓ the effectiveness of **antihypertensives**. **Alcohol** may ↑ rate of release of drug from some methylphenidate formulations (Metadate CD, Ritalin LA).

Drug-Natural Products: Use with caffeine-containing herbs (**guarana**, **tea**, **coffee**) ↑ stimulant effect. **St. John's wort** may ↑ risk of serotonin syndrome.

Drug-Food: Excessive use of **caffeine**-containing foods or beverages (**coffee**, **cola**, **tea**) may cause ↑ CNS stimulation.

Route/Dosage

PO (Adults): **ADHD**—5–20 mg 2–3 times daily as prompt-release tablets. When maintenance dose is determined, may change to extended-release formulation. **Narcolepsy**—10 mg 2–3 times/day; maximum dose 60 mg/day.

PO (Children >6 yr): **Prompt release tablets**—0.3 mg/kg/dose or 2.5–5 mg before breakfast and lunch; ↑ by 0.1 mg/kg/dose or by 5–10 mg/day at weekly intervals (not to exceed 60 mg/day or 2 mg/kg/day). When maintenance dose is determined, may change to extended-release formulation. **Ritalin SR**, **Metadate ER**—may be used in place of the prompt-release tablets when the 8-hour dose corresponds to the titrated 8-hour dosage of the prompt-release tablets; **Ritalin LA**—can be used in place of twice daily regimen given once daily at same total dose, or in place of SR product at same dose; **Concerta** (*patients who have not taken methylphenidate previously*)—18 mg once daily in the morning initially, may be titrated as needed up to 54 mg/day. **Concerta** (*patients are currently taking other forms of methylphenidate*)—18 mg once daily in the morning if previous dose was 5 mg 2–3 times daily or 20 mg daily as SR product, 36 mg once daily in the morning if previous dose was 10 mg 2–3 times daily or 40 mg daily as SR product, 54 mg once daily in the morning if previous dose was 15 mg 2–3 times daily or 60 mg once daily as SR product. **Aptensio XR**—10 mg once daily. Dose may be adjusted in weekly 10-mg increments to a maximum of 60 mg/day taken once daily in the morning. **Metadate CD**—20 mg once daily. Dose may be adjusted in weekly 20-mg increments to a maximum of 60 mg/day taken once daily in the morning. **Quilivant XR** and **Quillichev ER**—20 mg once daily. Dose may be adjusted in weekly 10–20-mg increments to a maximum of 60 mg/day taken once daily in the morning.

Transdermal (Children 6–17 yr): Apply one 10-mg patch initially (should be applied 2 hr before desired effect and removed 9 hr after application); may be titrated based on response and tolerability; may ↑ to 15-mg patch after 1 wk, and then to 20-mg patch after another week, and then to 30-mg patch after another week.

Availability (generic available)

Immediate-release tablets (Ritalin): 5 mg, 10 mg, 20 mg. **Cost:** *Generic*—5 mg \$73.08/100, 10 mg \$104.19/100, 20 mg \$149.81/100. **Extended-release tablets (Metadate ER):** 20 mg. **Extended-release tablets (Methylin ER):** 10 mg, 20 mg. **Cost:** *Generic*—10 mg \$171.91/100, 20 mg \$247.21/100. **Extended-release tablets (Concerta):** 18 mg, 27 mg, 36 mg, 54 mg. **Cost:** *Generic*—18 mg \$622.18/100, 27 mg \$637.78/100, 36 mg \$657.86/100, 54 mg \$715.83/100. **Sustained-release tablets (Ritalin**

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

SR): 20 mg. **Cost:** \$266.65/100. **Extended-release capsules (Aptensio XR):** 10 mg, 15 mg, 20 mg, 30 mg, 40 mg, 50 mg, 60 mg. **Extended-release capsules (Metadate CD):** 10 mg, 20 mg, 30 mg, 40 mg, 50 mg, 60 mg. **Cost:** *Generic*—10 mg \$560.21/100, 20 mg \$560.21/100, 30 mg \$560.21/100, 40 mg \$711.52/100, 50 mg \$944.19/100, 60 mg \$944.19/100. **Extended-release capsules (Ritalin LA):** 10 mg, 20 mg, 30 mg, 40 mg, 60 mg. **Cost:** *Generic*—10 mg \$630.47/100, 20 mg \$630.47/100, 30 mg \$644.82/100, 40 mg \$66.274/100. **Extended-release oral suspension (Quillivant XR):** 25 mg/5 mL. **Chewable tablets (Methylin) (grape flavor):** 2.5 mg, 5 mg, 10 mg. **Cost:** 2.5 mg \$351.16/100, 5 mg \$501.16/100, 10 mg \$715.09/100. **Extended-release chewable tablets (Quillichew ER):** 20 mg, 30 mg, 40 mg. **Oral solution (Methylin) (grape flavor):** 5 mg/5 mL, 10 mg/5 mL. **Cost:** *Generic*—5 mg/5 mL \$451.61/500 mL, 10 mg/5 mL \$643.82/500 mL. **Transdermal patch:** 10 mg/9 hr, 15 mg/9 hr, 20 mg/9 hr, 30 mg/9 hr. **Cost:** All strengths \$249.35/30.

NURSING IMPLICATIONS

Assessment

- **Monitor BP, pulse, and respiration before administering and periodically during therapy.** Obtain a history (including assessment of family history of sudden death or ventricular arrhythmia), physical exam to assess for cardiac disease, and further evaluation (ECG and echocardiogram), if indicated. If exertional chest pain, unexplained syncope, or other cardiac symptoms occur, evaluate promptly.
- Monitor closely for behavior change.
- Assess risk of abuse prior to prescribing. After prescribing, keep accurate prescription records, educate patient and family about risk of abuse, monitor for signs of abuse and overdose, and evaluate need for use periodically during therapy.
- Screen patients with bipolar disorder for risk of manic episode (comorbid or history of depressive symptoms or a family history of suicide, bipolar disorder, depression) prior to starting therapy.
- Monitor for signs and symptoms of peripheral vasculopathy (numbness and burning in fingers, digital changes). May require reduction in dose or discontinuation.
- **Pedi:** Monitor growth, both height and weight, in children on long-term therapy.
- May produce a false sense of euphoria and well-being. Provide frequent rest periods and observe patient for rebound depression after the effects of the medication have worn off.
- **ADHD:** Assess children for attention span, impulse control, and interactions with others. Therapy may be interrupted at intervals to determine whether symptoms are sufficient to continue therapy.
- **Narcolepsy:** Observe and document frequency of episodes.

- **Transdermal:** Assess skin for signs of contact sensitization (erythema with edema, papules, or vesicles that does not improve within 48 hr or spreads beyond patch site) during therapy. May lead to systemic sensitization to other forms of methylphenidate (flare-up of previous dermatitis or prior positive patch-test sites, generalized skin eruptions, headache, fever, malaise, arthralgia, diarrhea, vomiting). If contact sensitization develops and oral methylphenidate is instituted, monitor closely.
- Monitor for signs of skin depigmentation. May cause persistent loss of skin pigmentation at and around the application site and at other sites distant from application site. Discontinue transdermal if depigmentation occurs.
- **Lab Test Considerations:** Monitor CBC, differential, and platelet count periodically in patients receiving prolonged therapy.

Potential Nursing Diagnoses

Disturbed thought process (Side Effects)

Implementation

- **Do not confuse Metadate ER/CD (methylphenidate), or methylphenidate with methadone. Do not confuse Metadate CD with Metadate ER. Do not confuse Ritalin LA with Ritalin SR.**
- **PO:** Administer immediate and sustained-release tablets on an empty stomach (30–45 min before a meal). Sustained-release tablets should be swallowed whole; do not break, crush, or chew. *Quillichew ER* chewable tablets may be broken in half. *Aptensio XL*, *Metadate CD* and *Ritalin LA* capsules may be opened and sprinkled on cool applesauce; entire mixture should be ingested immediately and followed by a drink of water. Do not store for future use. *Concerta* may be administered without regard to food, but must be taken with water, milk, or juice.
- Shake extended-release oral suspension for 10 seconds before administering. May be given with or without food.
- **Transdermal:** Apply patch to a clean, dry site on the hip which is not oily, damaged, or irritated; do not apply to waistline where tight clothing may rub it. Press firmly in place with palm of hand for 30 seconds to make sure of good contact with skin, especially around edges. Alternate site daily. Apply patch 2 hr before desired effect and remove 9 hr after applied; effects last several more hours. Do not apply or reapply with dressings, tape, or other adhesives. Do not cut patches.
- If difficulty in separating patch from release liner, tearing, or other damage occurs during removal from liner, discard patch and apply a new patch. Inspect release liner to ensure no adhesive containing medication has transferred to liner; if transfer has occurred, discard patch. Avoid touching adhesive during application; wash hands immediately after application.

- If patch does not fully adhere or partially detaches, remove and replace with another patch. Wear patched for a total of 9 hr, regardless of number used. Exposure to water during bathing, swimming, or showering may affect patch adherence.
- Patches may be removed earlier before decreasing dose if an unacceptable loss of appetite or insomnia occurs.
- Store patches at room temperature in a safe place to prevent abuse and misuse; do not refrigerate or freeze.
- To remove patch, peel off slowly. An oil-based product (petroleum jelly, olive oil, mineral oil) may be applied gently to facilitate removal. Upon removal, fold so that adhesive side of patch adheres to itself and flush down toilet or dispose of in an appropriate lidded container.

Patient/Family Teaching

- Instruct patient to take medication as directed. If an oral dose is missed, take the remaining doses for that day at regularly spaced intervals; do not double doses. Take the last dose before 6 PM to minimize the risk of insomnia. Instruct patient not to alter dose without consulting health care professional. Abrupt cessation of high doses may cause extreme fatigue and mental depression. Instruct parent/caregiver to read the *Medication Guide* prior to use and with each Rx refill; new information may be available.
- Advise patient to check weight 2–3 times weekly and report weight loss to health care professional.
- May cause dizziness or blurred vision. Caution patient to avoid driving or activities requiring alertness until response to medication is known.
- Inform patient and/or parents that shell of *Concerta* tablet may appear in the stool. This is no cause for concern.
- Advise patient to avoid using caffeine-containing beverages concurrently with this therapy.
- Advise patient to notify health care professional if nervousness, insomnia, palpitations, vomiting, skin rash, or fever occurs.
- Advise patient and/or parents to notify health care professional of behavioral changes.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Inform patient that health care professional may order periodic holidays from the drug to assess progress and to decrease dependence.
- Emphasize the importance of routine follow-up exams to monitor progress.
- **Transdermal:** Encourage parent or caregiver to use the administration chart included in package to

monitor application and removal time and disposal method.

- Caution patient to avoid exposing patch to direct external heat sources (hair dryers, heating pads, electric blankets, heated water beds, etc.). May increase rate and extent of absorption.
- Inform parent/caregiver that skin redness, itching and small bumps on the skin are common. If swelling or blistering occurs, the patch should not be worn and health care professional notified. Caution parent/caregiver not to apply hydrocortisone or other solutions, creams, ointments, or emollients prior to application.
- Advise patient referred for MRI test to discuss patch with referring health care professional and MRI facility to determine if removal of patch is necessary prior to test and for directions for replacing patch.
- **Home Care Issues:** **Pedi:** Advise parents to notify school nurse of medication regimen.

Evaluation/Desired Outcomes

- Improved attention span and social interactions in ADHD.
- Decreased frequency of narcoleptic symptoms.

methyLPREDNISolone, See CORTICOSTEROIDS (SYSTEMIC).

metoclopramide

(met-oh-kloe-pra-mide)

✳ Metonia, Metzolv ODT, Reglan

Classification

Therapeutic: antiemetics

Indications

Prevention of chemotherapy-induced emesis. Treatment of postsurgical and diabetic gastric stasis. Facilitation of small bowel intubation in radiographic procedures. Management of gastroesophageal reflux. Treatment and prevention of postoperative nausea and vomiting when nasogastric suctioning is undesirable.

Unlabeled Use: Treatment of hiccups. Adjunct management of migraine headaches.

Action

Blocks dopamine receptors in chemoreceptor trigger zone of the CNS. Stimulates motility of the upper GI tract and accelerates gastric emptying. **Therapeutic Effects:** Decreased nausea and vomiting. Decreased symptoms of gastric stasis. Easier passage of nasogastric tube into small bowel.

✳ = Canadian drug name. ~~⊗~~ = Genetic implication. ~~⊗~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Pharmacokinetics

Absorption: Well absorbed from the GI tract, from rectal mucosa, and from IM sites.

Distribution: Widely distributed into body tissues and fluids. Crosses blood-brain barrier and placenta. Enters breast milk in concentrations greater than plasma.

Metabolism and Excretion: Partially metabolized by the liver; 25% eliminated unchanged in the urine.

Half-life: 2.5–6 hr.

TIME/ACTION PROFILE (effects on peristalsis)

ROUTE	ONSET	PEAK	DURATION
PO	30–60 min	unknown	1–2 hr
IM	10–15 min	unknown	1–2 hr
IV	1–3 min	immediate	1–2 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Possible GI obstruction or hemorrhage; History of seizure disorders; Pheochromocytoma; Parkinson's disease.

Use Cautiously in: History of depression; Diabetes (may alter response to insulin); Renal impairment (↓ dose in CCr <50 mL/min); Chronic use >3 mo (↑ risk for tardive dyskinesia); **OB, Lactation:** Safety not established; **Pedi:** Prolonged clearance in neonates can result in high serum concentrations and ↑ the risk for methemoglobinemia. Side effects are more common in children, especially extrapyramidal reactions; **Geri:** More susceptible to oversedation, extrapyramidal reactions, and tardive dyskinesia.

Adverse Reactions/Side Effects

CNS: drowsiness, extrapyramidal reactions, restlessness, **NEUROLEPTIC MALIGNANT SYNDROME**, anxiety, depression, irritability, tardive dyskinesia. **CV:** arrhythmias (supraventricular tachycardia, bradycardia), hypertension, hypotension. **GI:** constipation, diarrhea, dry mouth, nausea. **Endo:** gynecomastia. **Hemat:** methemoglobinemia, neutropenia, leukopenia, agranulocytosis.

Interactions

Drug-Drug: Additive CNS depression with other CNS depressants, including alcohol, antidepressants, antihistamines, opioid analgesics, and sedative/hypnotics. May ↑ absorption and risk of toxicity from cyclosporine. May affect the GI absorption of other orally administered drugs as a result of effect on GI motility. May exaggerate hypotension during general anesthesia. ↑ risk of extrapyramidal reactions with agents such as haloperidol or phenothiazines. Opioids and anticholinergics may antagonize the GI effects of metoclopramide. Use cautiously with MAO inhibitors (causes release of catecholamines). May ↑ neuromuscular blockade from succinylcholine. May ↓ effectiveness of levodopa. May ↑ tacrolimus serum levels.

Route/Dosage

Prevention of Chemotherapy-Induced Vomiting

PO, IV (Adults and Children): 1–2 mg/kg 30 min before chemotherapy. Additional doses of 1–2 mg/kg may be given q 2–4 hr, pretreatment with diphenhydramine will ↓ the risk of extrapyramidal reactions to this dose.

Facilitation of Small Bowel Intubation

IV (Adults and Children >14 yr): 10 mg over 1–2 min.

IV (Children 6–14 yr): 2.5–5 mg (dose should not exceed 0.5 mg/kg) over 1–2 min.

IV (Children <6 yr): 0.1 mg/kg over 1–2 min.

Diabetic Gastroparesis

PO, IV (Adults): 10 mg 30 min before meals and at bedtime for 2–8 weeks.

Gastroesophageal Reflux

PO, IM, IV (Adults): 10–15 mg 30 min before meals and at bedtime (not to exceed 0.5 mg/kg/day). A single dose of 20 mg may be given preventively. Some patients may respond to doses as small as 5 mg.

PO, IM, IV (Neonates, Infants, and Children): 0.4–0.8 mg/kg/day in 4 divided doses.

Postoperative Nausea/Vomiting

IM, IV (Adults and Children >14 yr): 10 mg at the end of surgical procedure, repeat in 6–8 hr if needed.

IM, IV (Children <14 yr): 0.1–0.2 mg/kg/dose, repeat in 6–8 hr if needed.

Treatment of Hiccups

PO, IM (Adults): 10–20 mg 4 times daily PO; may be preceded by a single 10-mg dose IM (unlabeled).

Availability (generic available)

Tablets: 5 mg, 10 mg. **Cost:** *Generic*—5 mg \$11.04/100, 10 mg \$7.18/100. **Orally disintegrating tablets:** 5 mg, 10 mg. **Cost:** \$26.40/10. **Oral solution (apricot-peach flavor):** 5 mg/5 mL. **Solution for injection:** 5 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess for nausea, vomiting, abdominal distention, and bowel sounds before and after administration.
- Assess for extrapyramidal side effects (*parkinsonian*—difficulty speaking or swallowing, loss of balance control, pill rolling, mask-like face, shuffling gait, rigidity, tremors; and *dystonic*—muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs) periodically throughout course of therapy. May occur wk to mo after initiation of therapy and are reversible on discontinuation. Dystonic reactions may occur within minutes of IV infusion and stop within 24 hr of discontinuation of metoclopramide. May be treated

with 50 mg of IM diphenhydramine or diphenhydramine 1 mg/kg IV may be administered prophylactically 15 min before metoclopramide IV infusion.

- Monitor for tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or worm-like movements of tongue). Usually occurs after a year or more of continued therapy; risk of tardive dyskinesia increases with total cumulative dose. Report immediately and discontinue metoclopramide; may be irreversible.
- **Monitor for neuroleptic malignant syndrome (hyperthermia, muscle rigidity, altered consciousness, irregular pulse or BP, tachycardia, and diaphoresis).**
- Assess for signs of depression periodically throughout therapy.
- **Lab Test Considerations:** May alter hepatic function test results.
- May cause ↑ serum prolactin and aldosterone concentrations.

Potential Nursing Diagnoses

Imbalanced nutrition: less than body requirements (Indications)

Risk for injury (Side Effects)

Implementation

- **PO:** Administer doses 30 min before meals and at bedtime.
- Do not to remove *orally disintegrating tablets* from the bottle until just prior to dosing. Remove tablet from bottle with dry hands and immediately place on tongue to disintegrate and swallow with saliva. Tablet typically disintegrates in 1–1.5 minutes. Administration with liquid is not necessary.
- **IM:** For prevention of postoperative nausea and vomiting, inject IM near the end of surgery.

IV Administration

- **IV Push:** Administer IV dose 30 min before administration of chemotherapeutic agent. **Rate:** Doses may be given slowly over 1–2 min. Rapid administration causes a transient but intense feeling of anxiety and restlessness followed by drowsiness.
- **Intermittent Infusion:** **Diluent:** May be diluted for IV infusion in 50 mL of D5W, 0.9% NaCl, D5/0.45% NaCl, Ringer's solution, or LR. Diluted solution is stable for 48 hr if protected from light or 24 hr under normal light. **Concentration:** May dilute to 0.2 mg/mL or give undiluted at 5 mg/mL. **Rate:** Infuse slowly (maximum rate 5 mg/min) over at least 15–30 min.
- **Y-Site Compatibility:** aldesleukin, alemtuzumab, alfentanil, amifostine, amikacin, aminophylline, amphotericin B lipid complex, anidulafungin, argatroban, ascorbic acid, atropine, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide,

buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexmethasone, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatid, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludara-bine, folic acid, foscarnet, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, indomethacin, insulin, irinotecan, isoproterenol, ketamine, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, methadone, methotrexate, methylodopate, methylprednisolone, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, multiple vitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, papaverine, pemetrexed, penicillin G, pentamidine, pentazocine, pentobarbital, phenobarbital, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, ranitidine, remifentanyl, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, telavancin, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** amphotericin B cholesteryl, amphotericin B colloidal, amphotericin B liposome, carmustine, cefepime, dantrolene, diazepam, doxorubicin liposome, ganciclovir, phenytoin, propofol, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Instruct patient to take metoclopramide as directed. Take missed doses as soon as remembered if not almost time for next dose. Advise patient to read the

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Medication Guide before starting therapy and with each Rx refill in case of changes.

- **Pedi:** Unintentional overdose has been reported in infants and children with the use of metoclopramide oral solution. Teach parents how to accurately read labels and administer medication.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid concurrent use of alcohol and other CNS depressants while taking this medication.
- Inform patient of risk of extrapyramidal symptoms, tardive dyskinesia, and neuroleptic malignant syndrome. Advise patient to notify health care professional immediately if involuntary or repetitive movements of eyes, face, or limbs occur.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Prevention or relief of nausea and vomiting.
- Decreased symptoms of gastric stasis.
- Facilitation of small bowel intubation.
- Decreased symptoms of esophageal reflux.
- Metoclopramide should not be used for more than 12 wk due to risk of tardive dyskinesia.

metOlazone (me-tole-a-zone)

Zaroxolyn

Classification

Therapeutic: antihypertensives, diuretics
Pharmacologic: thiazide-like diuretics

Indications

Mild to moderate hypertension. Edema associated with HF or the nephrotic syndrome.

Action

Increases excretion of sodium and water by inhibiting sodium reabsorption in the distal tubule. Promotes excretion of chloride, potassium, magnesium, and bicarbonate. May produce arteriolar dilation. **Therapeutic Effects:** Lowering of BP in hypertensive patients. Diuresis with subsequent mobilization of edema. Effect may continue in renal impairment.

Pharmacokinetics

Absorption: Absorption is variable.

Distribution: Unknown.

Protein Binding: 95%.

Metabolism and Excretion: Excreted mainly unchanged by the kidneys.

Half-life: 6–20 hr.

TIME/ACTION PROFILE (diuretic effect†)

ROUTE	ONSET	PEAK	DURATION
PO	1 hr	2 hr	12–24 hr

†Full antihypertensive effect may take days–weeks.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with other sulfonamides may exist; Anuria; **Lactation:** Avoid breast feeding.

Use Cautiously in: Severe hepatic impairment; **OB:** Safety not established; **Geri:** ↑ sensitivity to drug effects.

Adverse Reactions/Side Effects

CNS: drowsiness, lethargy. **CV:** chest pain, hypotension, palpitations. **GI:** anorexia, bloating, cramping, drug-induced hepatitis, nausea, pancreatitis, vomiting.

Derm: photosensitivity, rashes. **Endo:** hyperglycemia. **F and E:** hypokalemia, dehydration, hypercalcemia, hypochloremic alkalosis, hypomagnesemia, hyponatremia, hypophosphatemia, hypovolemia.

Hemat: blood dyscrasias. **Metab:** hyperuricemia.

MS: muscle cramps.

Interactions

Drug-Drug: ↑ risk of hypotension with nitrates, acute ingestion of alcohol, or other anti-hypertensives. ↑ risk of hypokalemia with corticosteroids, amphotericin B, or piperacillin/tazobactam. May ↑ the risk of digoxin toxicity. ↓ the excretion of lithium; may cause toxicity. May ↓ the effectiveness of methenamine. **Stimulant laxatives** (including aloe, senna) may ↑ risk of potassium depletion.

Drug-Food: Food may ↑ extent of absorption.

Route/Dosage

PO (Adults): Hypertension—2.5–5 mg/day; edema—5–20 mg/day.

PO (Children): 0.2–0.4 mg/kg/day divided every 12–24 hr.

Availability (generic available)

Tablets: 2.5 mg, 5 mg, 10 mg.

NURSING IMPLICATIONS

Assessment

- Monitor BP, intake and output, and daily weight, and assess feet, legs, and sacral area for edema daily.
- Assess patient, especially if taking digoxin, for anorexia, nausea, vomiting, muscle cramps, paresthesia, and confusion. Notify health care professional if these signs of electrolyte imbalance occur. Patients taking digoxin are at risk of digoxin toxicity because of the potassium-depleting effect of the diuretic.
- Assess patient for allergy to sulfonamides.
- **Hypertension:** Monitor BP before and periodically during therapy.
- Monitor frequency of prescription refills to determine compliance.

- **Lab Test Considerations:** Monitor electrolytes (especially potassium), blood glucose, BUN, and serum creatinine and uric acid levels before and periodically during therapy.
- May cause ↑ in serum and urine glucose in diabetic patients.
- May cause an ↑ in serum bilirubin, calcium, creatinine, and uric acid, and a ↓ in serum magnesium, potassium, and sodium and urinary calcium concentrations.
- May cause ↓ serum protein-bound iodine (PBI) concentrations.
- May cause ↑ serum cholesterol, low-density lipoprotein, and triglyceride concentrations.

Potential Nursing Diagnoses

Excess fluid volume (Indications)

Risk for deficient fluid volume (Side Effects)

Implementation

- Do not confuse metolazone with methimazole, methazolamide, or methadone.
- Administer in the morning to prevent disruption of sleep cycle.
- Intermittent dose schedule may be used for continued control of edema.
- **PO:** May give with food or milk to minimize GI irritation.

Patient/Family Teaching

- Instruct patient to take metolazone at the same time each day. Take missed doses as soon as remembered but not just before next dose is due. Do not double doses.
- Instruct patient to monitor weight biweekly and notify health care professional of significant changes.
- Caution patient to change positions slowly to minimize orthostatic hypotension; may be potentiated by alcohol.
- Advise patient to use sunscreen and protective clothing in the sun to prevent photosensitivity reactions.
- Instruct patient to discuss dietary potassium requirements with health care professional (see Appendix K).
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Advise patient to report muscle weakness, cramps, nausea, vomiting, diarrhea, or dizziness to health care professional.
- Emphasize the importance of routine follow-up exams.
- **Hypertension:** Advise patient to continue taking the medication even if feeling better. Medication controls but does not cure hypertension.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, regular exercise, smoking cessation,

moderation of alcohol consumption, and stress management).

- Instruct patient and family in correct technique for monitoring weekly BP.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially cough or cold preparations, concurrently with this therapy.

Evaluation/Desired Outcomes

- Decrease in BP.
- Increase in urine output.
- Decrease in edema.

HIGH ALERT

metoprolol (me-toe-proe-lole)
 * Betaloc, * Lopresor, * Lopresor SR,
 Lopressor, Toprol-XL

Classification

Therapeutic: antianginals, antihypertensives
 Pharmacologic: beta blockers

Indications

Hypertension. Angina pectoris. Prevention of MI and decreased mortality in patients with recent MI. Management of stable, symptomatic (class II or III) heart failure due to ischemic, hypertensive or cardiomyopathic origin (may be used with ACE inhibitors, diuretics and/or digoxin; Toprol XL only). **Unlabeled Use:** Ventricular arrhythmias/tachycardia. Migraine prophylaxis. Tremors. Aggressive behavior. Drug-induced akathisia. Anxiety.

Action

Blocks stimulation of beta, (myocardial)-adrenergic receptors. Does not usually affect beta₂ (pulmonary, vascular, uterine)-adrenergic receptor sites. **Therapeutic Effects:** Decreased BP and heart rate. Decreased frequency of attacks of angina pectoris. Decreased rate of cardiovascular mortality and hospitalization in patients with heart failure.

Pharmacokinetics

Absorption: Well absorbed after oral administration.

Distribution: Crosses the blood-brain barrier, crosses the placenta; small amounts enter breast milk.

Metabolism and Excretion: Mostly metabolized by the liver (primarily by CYP2D6; the CYP2D6 enzyme system exhibits genetic polymorphism); \approx 7% of population may be poor metabolizers and may have significantly ↑ metoprolol concentrations and an ↑ risk of adverse effects.

Half-life: 3–7 hr.

* = Canadian drug name. H = Genetic implication. = Discontinued.

*CAPITALS indicates life-threatening; indicates most frequent.

TIME/ACTION PROFILE (cardiovascular effects)

ROUTE	ONSET	PEAK	DURATION
PO†	15 min	unknown	6–12 hr
PO–ER	unknown	6–12 hr	24 hr
IV	immediate	20 min	5–8 hr

†Maximal effects on BP (chronic therapy) may not occur for 1 wk. Hypotensive effects may persist for up to 4 wk after discontinuation.

Contraindications/Precautions

Contraindicated in: Uncompensated HF; Pulmonary edema; Cardiogenic shock; Bradycardia, heart block, or sick sinus syndrome (in absence of a pacemaker).

Use Cautiously in: Renal impairment; Hepatic impairment; **Geriatric:** ↑ sensitivity to beta blockers; initial dose reduction recommended; Pulmonary disease (including asthma; beta, selectivity may be lost at higher doses); Diabetes mellitus (may mask signs of hypoglycemia); Thyrotoxicosis (may mask symptoms); Patients with a history of severe allergic reactions (intensity of reactions may be increased); Untreated pheochromocytoma (initiate only after alpha blocker therapy started); **OB, Lactation, Pediatric:** Safety not established; all agents cross the placenta and may cause fetal/neonatal bradycardia, hypotension, hypoglycemia, or respiratory depression.

Adverse Reactions/Side Effects

CNS: fatigue, weakness, anxiety, depression, dizziness, drowsiness, insomnia, memory loss, mental status changes, nervousness, nightmares. **EENT:** blurred vision, stuffy nose. **Resp:** bronchospasm, wheezing. **CV: BRADYCARDIA, HF, PULMONARY EDEMA,** hypotension, peripheral vasoconstriction. **GI:** constipation, diarrhea, drug-induced hepatitis, dry mouth, flatulence, gastric pain, heartburn, ↑ liver enzymes, nausea, vomiting. **GU:** erectile dysfunction, ↓ libido, urinary frequency. **Derm:** rash. **Endo:** hyperglycemia, hypoglycemia. **MS:** arthralgia, back pain, joint pain. **Misc:** drug-induced lupus syndrome.

Interactions

Drug-Drug: General anesthesia, IV phenytoin, and verapamil may cause ↑ myocardial depression. ↑ risk of bradycardia when used with digoxin, verapamil, diltiazem, or clonidine. ↑ hypotension may occur with other antihypertensives, acute ingestion of alcohol, or nitrates. Concurrent use with amphetamines, cocaine, ephedrine, epinephrine, norepinephrine, phenylephrine, or pseudoephedrine may result in unopposed alpha-adrenergic stimulation (excessive hypertension, bradycardia). Concurrent administration of thyroid administration may ↓ effectiveness. May alter the effectiveness of insulins or oral hypoglycemic agents (dose adjustments may be necessary). May ↓ the effectiveness of theophylline. May ↓ the beneficial beta₁-cardiovascular effects of dopa-

mine or dobutamine. Use cautiously within 14 days of MAO inhibitor therapy (may result in hypertension).

Route/Dosage

When switching from immediate-release to extended-release product, the same total daily dose can be used

PO (Adults): Antihypertensive/antianginal—25–100 mg/day as a single dose initially or 2 divided doses; may be ↑ q 7 days as needed up to 450 mg/day (immediate-release) or 400 mg/day (extended-release) (for angina, give in divided doses). Extended-release products are given once daily. *MI*—25–50 mg (starting 15 min after last IV dose) q 6 hr for 48 hr, then 100 mg twice daily. *Heart failure*—12.5–25 mg once daily (of extended-release), can be doubled every 2 wk up to 200 mg/day. *Migraine prevention*—50–100 mg 2–4 times daily (unlabeled).

IV (Adults): *MI*—5 mg q 2 min for 3 doses, followed by oral dosing.

Availability (generic available)

Tablets (tartrate): 25 mg, 50 mg, 100 mg. **Cost:** *Generic*—All strengths \$7.18/100. **Extended-release tablets (succinate; Toprol XL):** 25 mg, 50 mg, 100 mg, 200 mg. **Cost:** *Generic*—25 mg \$35.68/100, 50 mg \$41.93/100, 100 mg \$53.95/100, 200 mg \$84.54/100. **Solution for injection:** 1 mg/mL. **In combination with:** hydrochlorothiazide (Dutoprol, Lopressor HCT). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Monitor BP, ECG, and pulse frequently during dose adjustment and periodically during therapy.
- Monitor frequency of prescription refills to determine compliance.
- Monitor vital signs and ECG every 5–15 min during and for several hours after parenteral administration. If heart rate <40 bpm, especially if cardiac output is also decreased, administer atropine 0.25–0.5 mg IV.
- Monitor intake and output ratios and daily weights. Assess routinely for signs and symptoms of HF (dyspnea, rales/crackles, weight gain, peripheral edema, jugular venous distention).
- **Angina:** Assess frequency and characteristics of anginal attacks periodically during therapy.
- **Lab Test Considerations:** May cause ↑ BUN, serum lipoprotein, potassium, triglyceride, and uric acid levels.
 - May cause ↑ ANA titers.
 - May cause ↑ in blood glucose levels.
 - May cause ↑ serum alkaline phosphatase, LDH, AST, and ALT levels.

Potential Nursing Diagnoses

Decreased cardiac output (Side Effects)
Noncompliance (Patient/Family Teaching)

Implementation

- **High Alert:** IV vasoactive medications are inherently dangerous. Before administering intravenously, have second practitioner independently check original order and dose calculations.
- **High Alert:** Do not confuse Toprol-XL (metoprolol) with Topamax (topiramate). Do not confuse Lopressor with Lyrica. Do not confuse metoprolol tartrate with metoprolol succinate.
- **PO:** Take apical pulse before administering. If <50 bpm or if arrhythmia occurs, withhold medication and notify health care professional.
- Administer metoprolol with meals or directly after eating.
- Extended-release tablets should be swallowed whole; do not break, crush, or chew.

IV Administration

- **IV Push:** **Diluent:** Administer undiluted. **Concentration:** 1 mg/mL. **Rate:** Administer over 1 min.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, alteplase, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B liposome, amiodulafungin, argatroban, ascorbic acid, atropine, aztreonam, benztrapine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, cefazolin, cefonocid, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatid, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, indomethacin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, methotrexate, methylodopate, methylprednisolone, metoclopramide, metronidazole, midazolam, milrinone, mitoxantrone, morphine, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pentamexed, penicillin G, pentamidine, pentazocine, pentobarbital, phenobarbital,

phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, ranitidine, rocuronium, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, voriconazole, zoledronic acid.

Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day, even if feeling well; do not skip or double up on missed doses. Take missed doses as soon as possible up to 8 hr before next dose. **Abrupt withdrawal may precipitate life-threatening arrhythmias, hypertension, or myocardial ischemia.**
- Teach patient and family how to check pulse daily and BP biweekly and to report significant changes to health care professional.
- May cause drowsiness. Caution patient to avoid driving or other activities that require alertness until response to the drug is known.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Caution patient that this medication may increase sensitivity to cold.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any Rx, OTC, or herbal products, especially cold preparations, concurrently with this medication. Patients on antihypertensive therapy should also avoid excessive amounts of coffee, tea, and cola.
- Diabetics should closely monitor blood glucose, especially if weakness, malaise, irritability, or fatigue occurs. Medication does not block sweating as a sign of hypoglycemia.
- **Advise patient to notify health care professional if slow pulse, difficulty breathing, wheezing, cold hands and feet, dizziness, light-headedness, confusion, depression, rash, fever, sore throat, unusual bleeding, or bruising occurs.**
- Instruct patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- **Hypertension:** Reinforce the need to continue additional therapies for hypertension (weight loss, sodium restriction, stress reduction, regular exercise,

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

moderation of alcohol consumption, and smoking cessation). Medication controls but does not cure hypertension.

Evaluation/Desired Outcomes

- Decrease in BP.
- Reduction in frequency of anginal attacks.
- Increase in activity tolerance.
- Prevention of MI.

metroNIDAZOLE

(me-troe-ni-da-zole)

Flagyl, Flagyl ER, MetroCream, MetroGel, MetroGel-Vaginal, Metro-Lotion, Metro IV,  Nidagel, Noritate, Nuessa, Vandazole

Classification

Therapeutic: anti-infectives, antiprotozoals, antiulcer agents

Indications

PO, IV: Treatment of the following anaerobic infections: Intra-abdominal infections (may be used with a cephalosporin), Gynecologic infections, Skin and skin structure infections, Lower respiratory tract infections, Bone and joint infections, CNS infections, Septicemia, Endocarditis. **IV:** Perioperative prophylactic agent in colorectal surgery. **PO:** Amebicide in the management of amebic dysentery, amebic liver abscess, and trichomoniasis: Treatment of peptic ulcer disease caused by *Helicobacter pylori*. **Topical:** Treatment of acne rosacea. **Vag:** Management of bacterial vaginosis. **Unlabeled Use:** Treatment of giardiasis. Treatment of anti-infective associated *Clostridium difficile*-associated diarrhea (CDAD).

Action

Disrupts DNA and protein synthesis in susceptible organisms. **Therapeutic Effects:** Bactericidal, trichomonocidal, or amebicidal action. **Spectrum:** Most notable for activity against anaerobic bacteria, including: *Bacteroides*, *Clostridium*. In addition, is active against: *Trichomonas vaginalis*, *Entamoeba histolytica*, *Giardia lamblia*, *H. pylori*, *Clostridium difficile*.

Pharmacokinetics

Absorption: 80% absorbed after oral administration. Minimal absorption after topical or vaginal application.

Distribution: Widely distributed into most tissues and fluids, including CSF. Crosses the placenta and enters fetal circulation rapidly; enters breast milk in concentrations equal to plasma levels.

Metabolism and Excretion: Partially metabolized by the liver (30–60%), partially excreted unchanged in the urine, 6–15% eliminated in the feces.

Half-life: Neonates: 25–75 hr; Children and adults: 6–12 hr.

TIME/ACTION PROFILE (PO, IV = blood levels; topical = improvement in rosacea)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1–3 hr	8 hr
PO-ER	rapid	unknown	up to 24 hr
IV	rapid	end of infusion	6–8 hr
Topical	3 wk	9 wk	12 hr
Vaginal	unknown	6–12 hr	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity to parabens (topical only); **OB:** First trimester of pregnancy.

Use Cautiously in: History of blood dyscrasias; History of seizures or neurologic problems; Severe hepatic impairment (dose ↓ suggested); **OB:** Although safety not established, has been used to treat trichomoniasis in 2nd- and 3rd-trimester pregnancy—but not as single-dose regimen; **Lactation:** If needed, use single dose and interrupt nursing for 24 hr thereafter; Patients receiving corticosteroids or predisposed to edema (injection contains 28 mEq sodium/g metronidazole).

Adverse Reactions/Side Effects

CNS: SEIZURES, dizziness, headache, aseptic meningitis (IV), encephalopathy (IV), psychosis. **EENT:** optic neuropathy, tearing (topical only). **GI:** abdominal pain, anorexia, nausea, diarrhea, dry mouth, furry tongue, glossitis, unpleasant taste, vomiting. **Derm:** STEVENS-JOHNSON SYNDROME, rash, urticaria; topical only, burning, mild dryness, skin irritation, transient redness. **Hemat:** leukopenia. **Local:** phlebitis at IV site. **Neuro:** peripheral neuropathy. **Misc:** superinfection.

Interactions

Drug-Drug: Cimetidine may ↓ metabolism. Phenobarbital and rifampin ↑ metabolism and may ↓ effectiveness. Metronidazole ↑ the effects of phenytoin, lithium, and warfarin. Disulfiram-like reaction may occur with alcohol ingestion. May cause acute psychosis and confusion with disulfiram. ↑ risk of leukopenia with fluorouracil or azathioprine.

Route/Dosage

PO (Adults): Anaerobic infections—7.5 mg/kg q 6 hr (not to exceed 4 g/day). Trichomoniasis—250 mg q 8 hr for 7 days or single 2-g dose or 1 g twice daily for 1 day. Amebiasis—500–750 mg q 8 hr for 5–10 days. *H. pylori*—250 mg 4 times daily or 500 mg twice daily for 1–2 wk (with other agents). Bacterial vaginosis—750 mg once daily as ER tablets for 7 days. Antibiotic associated *Clostridium difficile*-associated diarrhea (CDAD)—250–500 mg 3–4 times/day for 10–14 days.

PO (Infants and Children): Anaerobic infections—30 mg/kg/day divided q 6 hr, maximum dose: 4 g/day Trichomoniasis—15–30 mg/kg/day divided q 8 hr for 7–10 days. Amebiasis—35–50 mg/kg/day

divided q 8 hr for 5–10 days (not to exceed 750 mg/dose). *Antibiotic associated Clostridium difficile-associated diarrhea (CDAD)*—30 mg/kg/day divided q 6 hr for 7–10 days. *H. pylori*—15–20 mg/kg/day divided twice daily for 4 wk.

IV, PO (Neonates 0–4 weeks, <1200 g): 7.5 mg/kg q 48 hr. *Postnatal age <7 days, 1200–2000 g*—7.5 mg/kg/day q 24 hr. *Postnatal age <7 days, >2000 g*—15 mg/kg/day divided q 12 hr. *Postnatal age >7 days, 1200–2000 g*—15 mg/kg/day divided q 12 hr. *Postnatal age >7 days, >2000 g*—30 mg/kg/day divided q 12 hr.

IV (Adults): *Anaerobic infections*—Initial dose 15 mg/kg, then 7.5 mg/kg q 6–8 hr or 500 mg q 6–8 hr (not to exceed 4 g/day). *Perioperative prophylaxis*—Initial dose 15 mg/kg 1 hr before surgery, then 7.5 mg/kg 6 and 12 hr later. *Amebiasis*—500–750 mg q 8 hr for 5–10 days.

IV (Children): *Anaerobic infections*—30 mg/kg/day divided q 6 hr, maximum dose: 4 g/day.

Topical (Adults): *Acne rosacea*—Apply thin film to affected area bid.

Vag (Adults): *Bacterial vaginosis*—*MetroGel Vaginal*—One applicatorful (37.5 mg) of 0.75% gel 1–2 times daily for 5 days; *Nuessa*—One applicatorful (65 mg) of 1.3% gel as a single dose at bedtime; *Vandazole*—One applicatorful (37.5 mg) of 0.75% gel once daily for 5 days.

Availability (generic available)

Tablets: 250 mg, 500 mg. **Extended-release tablets:** 750 mg. **Capsules:** 375 mg, *500 mg. **Pre-mixed injection:** 500 mg/100 mL. **Topical gel:** 0.75%, 1%. **Topical cream:** 0.75%, 1%. **Topical lotion:** 0.75%. **Vaginal gel:** 0.75% (37.5 mg/5 g applicatorful), 1.3% (65 mg/5 g applicatorful). **In combination with:** bismuth subcitrate potassium and tetracycline (Pylera). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Monitor neurologic status during and after IV infusions. Inform health care professional if numbness, paresthesia, weakness, ataxia, or seizures occur.
- Monitor intake and output and daily weight, especially for patients on sodium restriction. Each 500 mg of premixed injection for dilution contains 14 mEq of sodium.
- **Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.**

applied if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.

- **Giardiasis:** Monitor three stool samples taken several days apart, beginning 3–4 wk after treatment.
- **Lab Test Considerations:** May alter results of several AST, ALT, and LDH tests.

Potential Nursing Diagnoses

Risk for infection (Indications)

Diarrhea (Indications)

Implementation

- **Do not confuse metronidazole with metformin.**
- **PO:** Administer on an empty stomach, or may administer with food or milk to minimize GI irritation. Tablets may be crushed for patients with difficulty swallowing. Swallow extended-release tablets whole; do not break, crush, or chew.

IV Administration

- **Intermittent Infusion: Diluent:** Administer premixed injection (500 mg/100 mL) undiluted. Do not refrigerate. Once taken out of overwrap, premixed infusion stable for 30 days at room temperature. **Concentration:** 5 mg/mL. **Rate:** Infuse over 30–60 min.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, azithromycin, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium acetate, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftriaxone, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, dimenhydrinate, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, eftifibatid, etrapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludara-bine, fluorouracil, foscarnet, fosphenytoin, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketamine, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna,

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

methotrexate, methylodopate, methylprednisolone, metoclopramide, metoprolol, midazolam, milrinone, mitoxantrone, morphine, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pentamidine, pentazocine, pentobarbital, pentobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, prochlorperazine, promethazine, propranolol, ranitidine, remifentanyl, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, toptecan, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** acetaminophen, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, aztreonam, dantrolene, daptomycin, diazepam, filgrastim, ganciclovir, pantoprazole, pemetrexed, phenytoin, procainamide, quinupristin/dalfopristin.
- **Topical:** Cleanse affected area before application. Apply and rub in a thin film twice daily, morning and evening. Avoid contact with eyes.
- **Vag:** Administer once daily dosing at bedtime.

Patient/Family Teaching

- Instruct patient to take medication as directed with evenly spaced times between doses, even if feeling better. Do not skip doses or double up on missed doses. Take missed doses as soon as remembered if not almost time for next dose.
- Advise patients treated for trichomoniasis that sexual partners may be asymptomatic sources of reinfection and should be treated concurrently. Patient should also refrain from intercourse or use a condom to prevent reinfection.
- Caution patient to avoid intake of alcoholic beverages or preparations containing alcohol during and for at least 3 days after treatment with metronidazole, including vaginal gel. May cause a disulfiram-like reaction (flushing, nausea, vomiting, headache, abdominal cramps).
- May cause dizziness or light-headedness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- **Instruct patient to notify health care professional promptly if rash occurs.**
- Inform patient that medication may cause an unpleasant metallic taste.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.

- Advise patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may minimize dry mouth. Notify health care professional if dry mouth persists for more than 2 wk.
- Inform patient that medication may cause urine to turn dark.
- Advise patient to consult health care professional if no improvement in a few days or if signs and symptoms of superinfection (black, furry overgrowth on tongue; vaginal itching or discharge; loose or foul-smelling stools) develop.
- Advise patient to inform health care professional if pregnancy is planned or suspected or if breast feeding.
- **Vag:** Instruct patient in correct technique for intravaginal instillation. Advise patient to avoid intercourse during treatment with vaginal gel.
- **Topical:** Instruct patient on correct technique for application of topical gel. Cosmetics may be used after application of gel.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on organism and site of infection.
- Significant results should be seen within 3 wk of application of topical gel. Application may be continued for 9 wk.

micafungin (my-ka-fun-jin)

Mycamine

Classification

Therapeutic: antifungals
Pharmacologic: echinocandins

Indications

Esophageal candidiasis. Candidemia/acute disseminated candidiasis/Candidal peritonitis and abscesses. Prophylaxis of *Candida* infections during hematopoietic stem cell transplantation.

Action

Inhibits synthesis of glucan required for the formation of fungal cell wall. **Therapeutic Effects:** Death of susceptible fungi. **Spectrum:** Active against the following *Candida* spp.: *C. albicans*, *C. glabrata*, *C. krusei*, *C. parapsilosis*, *C. tropicalis*.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Protein Binding: >99%.

Metabolism and Excretion: Mostly metabolized; 71% fecal elimination.

Half-life: 15 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Severe hepatic impairment; **OB:** Use only if clearly needed; **Lactation, Pedi:** Children <4 mo (safety not established).

Adverse Reactions/Side Effects

GI: worsening hepatic function/hepatitis. **GU:** renal impairment. **Hemat:** hemolysis/hemolytic anemia.

Local: injection site reactions. **Misc:** allergic reactions including **ANAPHYLAXIS** (rare).

Interactions

Drug-Drug: ↑ blood levels and risk of toxicity with **sirolimus** and **nifedipine** (dose adjustments may be necessary).

Route/Dosage

IV (Adults): *Esophageal candidiasis*—150 mg daily for 15 days (range 10–30 days); *Candidemia/acute disseminated candidiasis/Candida peritonitis and abscesses*—100 mg daily for 15 days (range 10–47 days); *Prevention of Candida infections in stem cell transplantation*—50 mg daily (duration range 6–51 days).

IV (Children ≥4 mo and >30 kg): *Esophageal candidiasis*—2.5 mg/kg daily (maximum daily dose = 150 mg); *Candidemia/acute disseminated candidiasis/Candida peritonitis and abscesses*—2 mg/kg daily (maximum daily dose = 100 mg); *Prevention of Candida infections in stem cell transplantation*—1 mg/kg daily (maximum daily dose = 50 mg).

IV (Children ≥4 mo and ≤30 kg): *Esophageal candidiasis*—3 mg/kg daily; *Candidemia/acute disseminated candidiasis/Candida peritonitis and abscesses*—2 mg/kg daily; *Prevention of Candida infections in stem cell transplantation*—1 mg/kg daily.

IV (Neonates): 7–10 mg/kg daily. Higher dose should be used in neonates <27 wk gestation and those with meningitis.

Availability

Lyophilized powder for injection: 50 mg/vial, 100 mg/vial.

NURSING IMPLICATIONS**Assessment**

- Assess symptoms of esophageal candidiasis (dysphagia, odynophagia, retrosternal pain) prior to and during therapy.

- Monitor for signs of anaphylaxis (rash, pruritus, wheezing, laryngeal edema, abdominal pain). Discontinue micafungin and notify health care professional immediately if these occur.
- Assess for injection site reactions (phlebitis, thrombophlebitis) during therapy. These occur more frequently in patients receiving micafungin via peripheral IV infusion.
- Lab Test Considerations:** May cause ↑ serum alkaline phosphatase, bilirubin, ALT, AST, and LDH levels. If elevations occur, monitor for worsening liver function; may require discontinuation of therapy.
- May cause ↑ BUN and serum creatinine.
- May cause leukopenia, neutropenia, thrombocytopenia, and anemia. Monitor for worsening levels; may require discontinuation of therapy.
- May cause hypokalemia, hypocalcemia, and hypomagnesemia.

Potential Nursing Diagnoses

Risk for infection (Indications)

Implementation**IV Administration**

- Intermittent Infusion:** **Diluent:** For Adults: Reconstitute each 50-mg vial with 5 mL of 0.9% NaCl or D5W to achieve concentration of 10 mg/mL. Reconstitute each 100-mg vial with 5 mL of 0.9% NaCl or D5W to achieve concentration of 20 mg/mL. Dissolve by gently swirling vial; do not shake vigorously. Directions for further dilution based on indication for use. For prophylaxis of *Candida* infections, add 50 mg of micafungin to 100 mL of 0.9% NaCl or D5W. For treatment of esophageal candidiasis, add 150 mg of micafungin to 100 mL of 0.9% NaCl or D5W. Reconstituted vials and infusion are stable for 24 hr at room temperature. Protect diluted solution from light. **Concentration:** 0.5–1.5 mg/mL.
- For Children: Determine dose and divide by final concentration (10 or 20 mg/mL). Add withdrawn volume to 0.9% NaCl or D5W in IV bag or syringe. **Concentration:** 0.5 mg/mL–4 mg/mL. Concentrations >1.5 mg/mL should be administered via central venous catheter to minimize infusion reactions. Discard unused vials. **Rate:** Flush line with 0.9% NaCl prior to administration. Infuse over 1 hr. More rapid infusions may result in more frequent histamine mediated reactions.
- Y-Site Compatibility:** aminophylline, bumetanide, calcium chloride, calcium gluconate, carboplatin, cyclosporine, dopamine, eptifibatid, esmolol, etoposide, fenoldopam, furosemide, heparin, hydro-morphone, lidocaine, lorazepam, magnesium sulfate, mesna, milrinone, nitroglycerin, nitroprusside, norepinephrine, phenylephrine, potassium chloride,

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

potassium phosphates, sodium phosphates, tacrolimus, theophylline, vasopressin.

- **Y-Site Incompatibility:** amiodarone, cisatracurium, diltiazem, dobutamine, epinephrine, insulin, labetalol, levofloxacin, meperidine, midazolam, morphine, mycophenolate mofetil, nesiritide, nicardipine, octreotide, ondansetron, phenytoin, rocuronium, telavancin, vecuronium.

Patient/Family Teaching

- Inform patient of the purpose of micafungin.
- Advise patient to notify health care professional immediately if signs of anaphylaxis occur.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of esophageal candidiasis, candidemia, acute disseminated candidiasis, candidal peritonitis, and abscesses.
- Prevention of *Candida* infections during hematopoietic stem cell transplantation.

miconazole, See ANTIFUNGALS (TOPICAL) and ANTIFUNGALS (VAGINAL).

HIGH ALERT

midazolam (mid-ay-zoe-lam)

Versed

Classification

Therapeutic: antianxiety agents, sedative/hypnotics

Pharmacologic: benzodiazepines

Schedule IV

Indications

PO: Preprocedural sedation and anxiolysis in pediatric patients. **IM, IV:** Preoperative sedation/anxiolysis/amnesia. **IV:** Provides sedation/anxiolysis/amnesia during therapeutic, diagnostic, or radiographic procedures (conscious sedation): Aids in the induction of anesthesia and as part of balanced anesthesia. As a continuous infusion, provides sedation of mechanically ventilated patients during anesthesia or in a critical care setting, Status epilepticus.

Action

Acts at many levels of the CNS to produce generalized CNS depression. Effects may be mediated by GABA, an inhibitory neurotransmitter. **Therapeutic Effects:** Short-term sedation. Postoperative amnesia.

Pharmacokinetics

Absorption: Rapidly absorbed following oral and nasal administration; undergoes substantial intestinal and first-pass hepatic metabolism. Well absorbed following IM administration; IV administration results in complete bioavailability.

Distribution: Crosses the blood-brain barrier and placenta; excreted in breast milk.

Protein Binding: 97%.

Metabolism and Excretion: Almost exclusively metabolized by the liver, resulting in conversion to hydroxymidazolam, an active metabolite, and 2 other inactive metabolites (metabolized by cytochrome P450 3A4 enzyme system); metabolites are excreted in urine.

Half-life: Preterm neonates: 2.6–17.7 hr; Neonates: 4–12 hr; Children: 3–7 hr; Adults: 2–6 hr (increased in renal impairment, HF, or cirrhosis).

TIME/ACTION PROFILE (sedation)

ROUTE	ONSET	PEAK	DURATION
IN	5 min	10 min	30–60 min
IM	15 min	30–60 min	2–6 hr
IV	1.5–5 min	rapid	2–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with other benzodiazepines may occur; Shock; Comatose patients or those with pre-existing CNS depression; Uncontrolled severe pain; Acute angle-closure glaucoma; **OB:** Benzodiazepine drugs may ↑ risk of congenital malformations; use in the last wk of pregnancy has caused CNS depression in the neonate; may affect child's brain development when used during 3rd trimester; **Lactation:** Lactation; **Pedi:** Products containing benzyl alcohol should not be used in neonates.

Use Cautiously in: Pulmonary disease; HF; Renal impairment; Severe hepatic impairment; Obese pediatric patients (calculate dose on the basis of ideal body weight); **Pedi:** Rapid injection in neonates has caused severe hypotension and seizures, especially when used with fentanyl; may affect brain development in children <3 yr; **Geri:** Older patients (especially >70 yr) are more susceptible to cardiorespiratory depressant effects; dosage ↓ required.

Adverse Reactions/Side Effects

CNS: agitation, drowsiness, excess sedation, headache.

EENT: blurred vision. **Resp:** APNEA, LARYNGOSPASM, RESPIRATORY DEPRESSION, bronchospasm, coughing.

CV: CARDIAC ARREST, arrhythmias. **GI:** hiccups, nausea, vomiting. **Derm:** rashes. **Local:** phlebitis at IV site, pain at IM site.

Interactions

Drug-Drug: ↑ CNS depression with alcohol, antihistamines, opioid analgesics, and other sedative/hypnotics (↓ midazolam dose by 30–50% if used concurrently). ↑ risk of hypotension with antihypertensives, opioid analgesics, acute ingestion of alcohol, or nitrates. Midazolam is metabolized by the cytochrome P450 3A4 enzyme system; drugs that induce or inhibit this system may be expected to alter the effects of midazolam. **Carbamazepine, phenytoin, rifampin, rifabutin, and phenobarbital** ↓ levels. **Erythromycin, cimetidine, ranitidine, diltiazem,**

verapamil, fluconazole, itraconazole, and ketoconazole ↓ metabolism and may ↑ risk of toxicity.

Drug-Natural Products: Concomitant use of kava-kava, valerian, or chamomile can ↑ CNS depression. Long-term use of **St. John's wort** may significantly ↓ levels.

Drug-Food: Grapefruit juice ↓ metabolism and may ↑ risk of toxicity.

Route/Dosage

Dose must be individualized, taking caution to reduce dose in geriatric patients and in those who are already sedated.

Preoperative Sedation/Anxiolysis/Amnesia

PO (Children 6 mo–16 yr): 0.25–0.5 mg/kg, may require up to 1 mg/kg (dose should not exceed 20 mg); *patients with cardiac/respiratory compromise or concurrent CNS depressants*—0.25 mg/kg.

IM (Adults Otherwise Healthy and <60 yr): 0.07–0.08 mg/kg 1 hr before surgery (usual dose 5 mg).

IM (Adults ≥60 yr, Debilitated or Chronically Ill): 0.02–0.03 mg/kg 1 hr before surgery (usual dose 1–3 mg).

IM (Children): 0.1–0.15 mg/kg up to 0.5 mg/kg 30–60 min prior to procedure; not to exceed 10 mg/dose.

Conscious Sedation for Short Procedures

IV (Adults and Children Otherwise Healthy >12 yr and <60 yr): 1–2.5 mg initially; dosage may be ↑ further as needed. Total doses >5 mg are rarely needed (↓ dose by 50% if other CNS depressants are used).

Maintenance doses of 25% of the dose required for initial sedation may be given as necessary.

IV (Children 6–12 yr): 0.025–0.05 mg/kg initially, then titrate dose carefully, may need up to 0.4 mg/kg total, maximum dose 10 mg.

IV (Children 6 mo–5 yr): 0.05 mg/kg initially, then titrate dose carefully, may need up to 0.6 mg/kg total, maximum dose 6 mg.

IV (Geriatric Patients ≥60 yr, Debilitated or Chronically Ill): 1–1.5 mg initially; dose may be ↑ further as needed. Total doses >3.5 mg are rarely needed (↓ dose by 30% if other CNS depressants are used). Maintenance doses of 25% of the dose required for initial sedation may be given as necessary.

Intranasal (Children): 0.2–0.3 mg/kg, may repeat in 5–15 min.

Status Epilepticus

IV (Children >2 mo): 0.15 mg/kg load followed by a continuous infusion of 1 mcg/kg/min. Titrate dose upward q 5 min until seizure controlled, range: 1–18 mcg/kg/min.

Induction of Anesthesia (Adjunct)

May give additional dose of 25% of initial dose if needed.

IV (Adults Otherwise Healthy and <55 yr): 300–350 mcg/kg initially (up to 600 mcg/kg total). If patient is premedicated, initial dose should be further ↓.

IV (Geriatric Patients >55 yr): 150–300 mcg/kg as initial dose. If patient is premedicated, initial dose should be further ↓.

IV (Adults — Debilitated): 150–250 mcg/kg initial dose. If patient is premedicated, initial dose should be further ↓.

Sedation in Critical Care Settings

IV (Adults): 0.01–0.05 mg/kg (0.5–4 mg in most adults) initially if a loading dose is required; may repeat q 10–15 min until desired effect is obtained; may be followed by infusion at 0.02–0.1 mg/kg/hr (1–7 mg/hr in most adults).

IV (Children): *Intubated patients only*—0.05–0.2 mg/kg initially as a loading dose; follow with infusion at 0.06–0.12 mg/kg/hr (1–2 mcg/kg/min), titrate to effect, range: 0.4–6 mcg/kg/min.

IV (Neonates >32 wk): *Intubated patients only*—0.06 mg/kg/hr (1 mcg/kg/min).

IV (Neonates <32 wk): *Intubated patients only*—0.03 mg/kg/hr (0.5 mcg/kg/min).

Availability (generic available)

Solution for injection: 1 mg/mL, 5 mg/mL. **Oral syrup (cherry flavor):** 2 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess level of sedation and level of consciousness throughout and for 2–6 hr following administration.
- **Monitor BP, pulse, and respiration continuously during IV administration.** Oxygen and resuscitative equipment should be immediately available.
- **Toxicity and Overdose:** If overdose occurs, monitor pulse, respiration, and BP continuously. Maintain patent airway and assist ventilation as needed. If hypotension occurs, treatment includes IV fluids, repositioning, and vasopressors.
- The effects of midazolam can be reversed with flumazenil (Romazicon).

Potential Nursing Diagnoses

Ineffective breathing pattern (Adverse Reactions)
Risk for injury (Side Effects)

Implementation

- **High Alert:** Accidental overdose of oral midazolam syrup in children has resulted in serious harm or death. Do not accept orders prescribed by volume (5 mL or 1 tsp); instead, request dose be expressed in milligrams. Have second practitioner indepen-

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

dently check original order and dose calculations. Midazolam syrup should only be administered by health care professionals authorized to administer conscious sedation.

- **PO:** To use the *Press-in Bottle Adaptor (PIBA)*, remove the cap and push bottle adaptor into neck of bottle. Close bottle tightly with cap. Solution is a clear red to purplish-red cherry-flavored syrup. Then remove cap and insert tip of oral dispenser in bottle adaptor. Push the plunger completely down toward tip of oral dispenser and insert firmly into bottle adaptor. Turn entire unit (bottle and oral dispenser) upside down. Pull plunger out slowly until desired amount of medication is withdrawn into oral dispenser. Turn entire unit right side up and slowly remove oral dispenser from the bottle. Tip of dispenser may be covered with tip of cap until time of use. Close bottle with cap after each use.
- Dispense directly into mouth. Do not mix with any liquid prior to dispensing.
- **Intranasal:** Administer using a 1 mL needleless syringe into the nares over 15 sec. Using the 5 mg/mL injection, administer half dose into each nare.
- **IM:** Administer IM doses deep into muscle mass, maximum concentration 1 mg/mL.

IV Administration

- **IV Push:** **Diluent:** Administer undiluted or diluted with D5W or 0.9% NaCl. **Concentration:** Undiluted: 1 mg/mL or 5 mg/mL. Diluted: 0.03–3 mg/mL. **Rate:** Administer slowly over at least 2–5 min. Titrate dose to patient response. Rapid injection, especially in neonates, has caused severe hypotension.
- **Continuous Infusion:** **Diluent:** Dilute with 0.9% NaCl or D5W. **Concentration:** 0.5–1 mg/mL. **Rate:** Based on patient's weight (see Route/Dosage section). Titrate to desired level of sedation. Assess sedation at regular intervals and adjust rate up or down by 25–50% as needed. Dose should also be decreased by 10–25% every few hours to find minimum effective infusion rate, which prevents accumulation of midazolam and provides more rapid recovery upon termination.
- **Y-Site Compatibility:** acetaminophen, alentuzumab, alfentanil, amikacin, amiodarone, anidulafungin, argatroban, atracurium, atropine, aztreonam, benzotropine, bivalirudin, bleomycin, buprenorphine, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, ceftazolin, cefotaxime, ceftioxin, ceftriaxone, ceftriaxone, ciprofloxacin, cisatracurium, cisplatin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexmedetomidine, dezazoxane, digoxin, diltiazem, diphenhydramine, docetaxel, dopamine, doxacurium, doxorubicin hydrochloride, doxycycline, enalaprilat, epinephrine, epirubicin, eptifibatid, erythromycin lactobionate, esmolol, etomidate, etoposide, etoposide phosphate, famoti-

dine, fenoldopam, fentanyl, fluconazole, fludara-bine, folic acid, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydromorphone, idarubicin, ifosfamide, irinotecan, isoproterenol, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, mesna, metaraminol, methadone, methoxamine, methylodopate, metoclopramide, metoprolol, metronidazole, milrinone, mitoxantrone, morphine, mycophenolate, multivitamins, mycophenolate, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G potassium, pentamidine, pentazocine, phenolamine, phenylephrine, phytonadione, potassium chloride, procainamide, promethazine, propofol, protriptyline, pyridoxime, quinupristin/dalfopristin, ranitidine, remifentanyl, rifampin, rocuronium, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, tolazoline, trimetaphan, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, aminocaproic acid, aminophylline, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, ascorbic acid, azathioprine, cefepime, ceftazidime, cefuroxime, chloramphenicol, dantrolene, dexamethasone, diazepam, diazoxide, epoetin alfa, ertapenem, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, hydrocortisone, ibuprofen, indomethacin, ketorolac, methotrexate, micafungin, omeprazole, pantoprazole, pentobarbital, phenobarbital, phenytoin, piperacillin/tazobactam, potassium acetate, prochlorperazine, sodium bicarbonate, thiopental, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Inform patient that this medication will decrease mental recall of the procedure.
- May cause drowsiness or dizziness. Advise patient to request assistance prior to ambulation and transfer and to avoid driving or other activities requiring alertness for 24 hr following administration.
- Instruct patient to inform health care professional prior to administration if pregnancy is suspected.
- Advise patient to avoid alcohol or other CNS depressants for 24 hr following administration of midazolam.

Evaluation/Desired Outcomes

- Sedation during and amnesia following surgical, diagnostic, and radiologic procedures.
- Sedation and amnesia for mechanically ventilated patients in a critical care setting.

midostaurin (mye-doe-staw-rin) Rydapt

Classification

Therapeutic: antineoplastics
Pharmacologic: kinase inhibitors

Indications

⚠ Newly diagnosed acute myeloid leukemia (AML) that is FLT3 mutation positive (in combination with cytarabine and daunorubicin induction and cytarabine consolidation chemotherapy). Aggressive systemic mastocytosis (ASM), systemic mastocytosis with associated hematological neoplasm (SM-AHN), or mast cell leukemia (MCL).

Action

Inhibits FLT3 receptor signaling and cell proliferation, and induces apoptosis in ITD- and TKD-mutant expressing leukemic cells, as well as in cells overexpressing wild type FLT3 and PDGFR. It also may inhibit KIT signaling, cell proliferation, and histamine release (and induces apoptosis) in mast cells. **Therapeutic Effects:** Improved survival in AML. Improved complete or incomplete remission rates in systemic mastocytosis.

Pharmacokinetics

Absorption: Absorption increased with food (especially a high-fat meal).

Distribution: Extensively distributed to tissues.

Protein Binding: >99%.

Metabolism and Excretion: Primarily metabolized via the liver by CYP3A4 into 2 active metabolites (CGP62221 and CGP52421). Primarily excreted in the feces (4% as unchanged drug).

Half-life: Midostaurin: 21 hr; CGP62221: 32 hr; CHP52421: 482 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–3 hr	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **OB:** May cause fetal harm; **Lactation:** Avoid breast feeding.

Use Cautiously in: **Rep:** Women of reproductive potential and men with female partners of reproductive potential; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: dizziness, fatigue, headache, insomnia, attention disturbance, mental status changes. **CV:** QT INTERVAL PROLONGATION, edema, hypertension, hypotension, pericardial effusion. **Derm:** ↑ sweating, petechiae, rash, dry skin. **EENT:** epistaxis, eyelid edema, vertigo.

Endo: hyperglycemia. **F and E:** hypercalcemia, hyperkalemia, hypernatremia, hypocalcemia, hypokalemia, hypomagnesemia, hyponatremia, hyperphosphatemia. **GI:** GI HEMORRHAGE, abdominal pain, constipation, diarrhea, hemorrhoids, hyperbilirubinemia, hypoalbuminemia, ↑ amylase, ↑ lipase, ↑ liver enzymes, mucositis, nausea, vomiting, dyspepsia. **GU:** renal impairment, ↓ fertility. **Hemat:** ANEMIA, NEUTROPENIA, THROMBOCYTOPENIA, lymphopenia. **Me-tab:** hyperuricemia, ↑ weight. **MS:** arthralgia.

Neuro: tremor. **Resp:** INTERSTITIAL LUNG DISEASE/PNEUMONITIS, cough, dyspnea, pleural effusion. **Misc:** INFECTION, HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema), fever.

Interactions

Drug-Drug: **Strong CYP3A inhibitors**, including clarithromycin, cobicistat, conivaptan, diltiazem, elvitegravir, idelalisib, indinavir, itraconazole, ketoconazole, lopinavir, nefazodone, nelfinavir, paritaprevir, posaconazole, ritonavir, saquinavir, tipranavir, or voriconazole may ↑ midostaurin levels and risk of toxicity; avoid concurrent use. **Strong CYP3A inducers**, including carbamazepine, enzalutamide, mitotane, phenytoin, or rifampin may ↓ midostaurin levels and its effectiveness; avoid concurrent use.

Drug-Natural Products: **St. John's wort** may ↓ midostaurin levels and its effectiveness; avoid concurrent use.

Drug-Food: **Grapefruit juice** may ↑ midostaurin levels and risk of toxicity; avoid concurrent use.

Route/Dosage

AML

PO (Adults): 50 mg twice daily on Days 8–21 of each cycle of induction with cytarabine and daunorubicin and on Days 8–21 of each cycle of consolidation with high-dose cytarabine.

ASM, SM-AHN, and MCL

PO (Adults): 100 mg twice daily. Continue until disease progression or unacceptable toxicity.

Availability

Capsules: 25 mg.

NURSING IMPLICATIONS

Assessment

- Assess for signs and symptoms of pulmonary toxicity (new cough, chest discomfort, or shortness of breath) periodically during therapy. Discontinue therapy if symptoms occur.
- Monitor for signs and symptoms of hypersensitivity reaction (trouble breathing, flushing, chest pain, throat tightness, swelling of lips, mouth, or throat)

* = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

during therapy. Discontinue therapy and provide supportive care.

- **Lab Test Considerations:** Ξ Determine presence of FLT3 mutation positivity with FDA approved test before starting therapy.
- Verify negative pregnancy test within 7 days before starting therapy.
- May cause leukopenia, anemia, thrombocytopenia, neutropenia.
- May cause hyperglycemia, hypocalcemia, lipase increase, hyperuricemia, hyponatremia, hypokalemia, hyperkalemia, hypophosphatemia, and hypomagnesemia.
- May cause \uparrow alkaline phosphatase, AST, ALT, creatinine, hyperbilirubinemia, and hypoalbuminemia.

Potential Nursing Diagnoses

Impaired gas exchange (Adverse Reactions)
Nausea (Adverse Reactions)

Implementation

- Administer antiemetics prior to therapy to reduce nausea and vomiting.
- **PO:** Administer twice daily, at 12 hr intervals, with food. Swallow capsules whole; do not open, crush, or chew.

Patient/Family Teaching

- Instruct patient to take midostaurin as directed. If a dose is missed or vomited, omit and take next dose at scheduled time; do not double doses. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Advise patient to avoid taking grapefruit or grapefruit juice during therapy.
- **Advise patient to notify health care professional if signs and symptoms of pulmonary toxicity, hypersensitivity reactions, or nausea and vomiting occur.**
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort.
- **Rep:** May be teratogenic. Advise male and female patients to use effective contraception during and for at least 4 mo after lost dose of therapy. Advise women to avoid breast feeding during and for at least 4 mo after last dose of midostaurin. Inform patients midostaurin may impair fertility in males and females.

Evaluation/Desired Outcomes

- Improved survival in AML.
- Improved complete or incomplete remission rates in systemic mastocytosis.

miFEPRiStone (mi-fe-priss-tone) Korlym, Mifeprex

Classification

Therapeutic: abortifacients, antidiabetics
Pharmacologic: antiprogestational agents

Indications

Mifeprex: Medical termination of intrauterine pregnancy up to day 70 of pregnancy (in combination with misoprostol). **Korlym:** Hyperglycemia secondary to hypercortisolism in patients with endogenous Cushing's syndrome who have type 2 diabetes or glucose intolerance and have failed or are not candidates for surgery.

Action

Antagonizes endometrial and myometrial effects of progesterone. Sensitizes the myometrium to contraction-inducing activity of prostaglandins. Antagonizes the glucocorticoid receptor. **Therapeutic Effects:** Termination of pregnancy. Improved control of blood glucose.

Pharmacokinetics

Absorption: Rapidly absorbed following oral administration (69% bioavailability); absorption enhanced with food.

Distribution: Unknown.

Protein Binding: 98%.

Metabolism and Excretion: Mostly metabolized by the liver (CYP3A4 enzyme system); primarily excreted in the feces.

Half-life: 18 hr.

TIME/ACTION PROFILE (termination of pregnancy)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	within 2 days	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Presence of an intrauterine device (IUD) (Mifeprex); **OB:** Confirmed or suspected ectopic pregnancy (Mifeprex); Undiagnosed adnexal mass (Mifeprex); Chronic adrenal failure (Mifeprex); Concurrent long-term corticosteroid therapy; Bleeding disorders or concurrent anticoagulant therapy (Mifeprex); Inherited porphyrias (Mifeprex); Severe hepatic impairment (Korlym); **OB:** Pregnancy (Korlym); Concurrent use with simvastatin, lovastatin, cyclosporine, dihydroergotamine, ergotamine, fentanyl, pimozide, quinidine, sirolimus, or tacrolimus (Korlym); Vaginal bleeding; Endometrial hyperplasia with atypia or endometrial carcinoma (Korlym).

Use Cautiously in: Chronic medical conditions such as cardiovascular, hypertensive, hepatic, renal, or

respiratory disease (safety and efficacy not established) (Mifeprex); Women >35 yrs old or who smoke ≥ 10 cigarettes/day (Mifeprex); Concurrent use with moderate CYP3A4 inhibitors; Bleeding disorders or concurrent anticoagulant therapy (Korlym).

Exercise Extreme Caution in: Concurrent use with strong CYP3A4 inhibitors (Korlym).

Adverse Reactions/Side Effects

CNS: anxiety (Korlym), headache, dizziness, fainting (Mifeprex), fatigue (Korlym), weakness (Mifeprex).

CV: peripheral edema (Korlym), hypertension (Korlym), QT interval prolongation (Korlym). **GI:** abdominal pain (Mifeprex), anorexia (Korlym), constipation (Korlym), diarrhea, dry mouth (Korlym), nausea, vomiting. **Resp:** dyspnea (Korlym), *Pneumocystis jirovecii* pneumonia. **Endo:** hypothyroidism (Korlym), adrenal insufficiency (Korlym), \downarrow HDL cholesterol (Korlym). **F and E:** hypokalemia (Korlym). **MS:** arthralgia (Korlym), myalgia (Korlym). **Derm:** rash (Korlym). **GU:** uterine bleeding, uterine cramping (Mifeprex), ruptured ectopic pregnancy (Mifeprex), pelvic pain (Mifeprex). **Misc:** ANGIOEDEMA.

Interactions

Drug-Drug: Mifepristone is a substrate and inhibitor of the CYP3A4 enzyme system. \uparrow blood levels and risk of toxicity from **dihydroergotamine, ergotamine, lovastatin, simvastatin, cyclosporine, fentanyl, pimozide, quinidine, sirolimus, or tacrolimus**; concurrent use with Korlym is contraindicated. **Strong CYP3A4 inhibitors**, including ketoconazole, itraconazole, nefazodone, ritonavir, nelfinavir, indinavir, atazanavir, fosamprenavir, clarithromycin, conivaptan, lopinavir/ritonavir, posaconazole, saquinavir, or voriconazole may \uparrow levels; adjust dose of Korlym. **Moderate CYP3A4 inhibitors**, including aprepitant, diltiazem, fluconazole, imatinib, or verapamil may \uparrow levels; caution with concurrent use of Korlym. Blood levels and effects may be \downarrow by rifampin, rifabutin dexamethasone, phenytoin, phenobarbital, and carbamazepine; avoid concurrent use with Korlym.

Drug-Natural Products: Blood levels and effects may be \downarrow by **St. John's wort**; avoid concurrent use with Korlym.

Drug-Food: Blood levels and effects may be \uparrow by **grapefruit juice**; caution with concurrent use of Korlym.

Route/Dosage

Mifeprex

PO (Adults): Day 1—200 mg as a single dose, followed on Day 2 or Day 3 (within 24–48 hr of taking Mifeprex) by misoprostol 800 mcg (given as four 200-mcg tablets) given buccally.

Korlym

PO (Adults): 300 mg once daily; may \uparrow by 300 mg/day every 2–4 wk (maximum dose = 1200 mg/day or 20 mg/kg/day); *Initiation of Korlym in patients already being treated with strong CYP3A4 inhibitor*—300 mg once daily; may titrate up to 600 mg once daily, if needed; *Initiation of strong CYP3A4 inhibitor in patients already being treated with Korlym*—Current dose of Korlym = 300 mg once daily; No change; Current dose of Korlym = 600 mg once daily; \downarrow dose to 300 mg once daily (may titrate up to 600 mg once daily, if needed); Current dose of Korlym = 900 mg or 1200 mg once daily; \downarrow dose to 600 mg once daily.

Renal Impairment

PO (Adults): 300 mg once daily; may \uparrow by 300 mg/day every 2–4 wk (maximum dose = 600 mg/day).

Hepatic Impairment

PO (Adults): 300 mg once daily; may \uparrow by 300 mg/day every 2–4 wk (maximum dose = 600 mg/day).

Availability

Tablets (Mifeprex): 200 mg. **Tablets (Korlym):** 300 mg.

NURSING IMPLICATIONS

Assessment

- **Mifeprex:** Determine duration of pregnancy. Pregnancy is dated from the first day of the last menstrual period in a presumed 28-day cycle with ovulation occurring at mid-cycle and can be determined by menstrual history and clinical examination; use ultrasound if duration is uncertain or if ectopic pregnancy is suspected. Assess women who became pregnant with an IUD in place for ectopic pregnancy.
- Assess amount of bleeding and cramping during treatment. Determine if termination is complete on day 14.
- **Korlym:** Monitor for changes in cushingoid appearance (acne, hirsutism, striae, body weight) during therapy.
- Monitor for signs and symptoms of adrenal insufficiency (weakness, nausea, increased fatigue, hypotension, hypoglycemia) during therapy. If adrenal insufficiency is suspected, discontinue Korlym and administer glucocorticoids immediately.
- **Lab Test Considerations: Mifeprex:** \downarrow hemoglobin, hematocrit, and RBCs may occur in women who bleed heavily.
- Changes in quantitative human chorionic gonadotropin (hCG) levels are not accurate until at least 10 days after mifepristone administration; complete termination of pregnancy must be confirmed by clinical examination.
- **Korlym:** Correct hypokalemia prior to initiating therapy. Assess serum potassium 1–2 wk after start-

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

ing or increasing dose of Korlym and periodically thereafter.

- Obtain a negative pregnancy test in women prior to starting therapy or before restarting therapy if stopped for more than 14 days.
- Monitor Hemoglobin A_{1c} periodically during therapy.

Potential Nursing Diagnoses

Acute pain (Side Effects)

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- **Do not confuse mifepristone with misoprostol.**
- Mifepristone is only available through a restricted program, Mifeprex REMS program. Prescribers must be certified by the program, patients must sign an agreement form, and mifepristone is dispensed to patients only in certain healthcare settings.
- **Mifeprex:** Mifepristone should be administered only by health care professionals who have read and understood the prescribing information, are able to assess gestational age of an embryo and diagnose ectopic pregnancies, and who are able to provide surgical intervention in cases of incomplete abortion or severe bleeding.
- Any IUD should be removed prior to mifepristone administration.
- Measures to prevent rhesus immunization, similar to those of surgical abortion, should be taken.
- **PO:** On *day 1*, after the patient has read the *Medication Guide* and signed the Patient Agreement, administer one 200 mg tablets of mifepristone as a single dose. On *day 2 or 3*, unless abortion has occurred and been confirmed by clinical examination or ultrasound, administer four 200-mcg tablets of misoprostol buccally between 24 and 48 hrs after taking mifepristone. Expulsion of pregnancy usually happens within 2–24 hrs of taking misoprostil. On *day 7–14*, confirm that termination of pregnancy has occurred by clinical examination or ultrasound. If complete expulsion has not occurred, administer another dose of misoprostil 800 mcg buccally.
- **Korlym:** Administer with a meal. Swallow tablet whole; do not crush, break, or chew.
- If Korlym therapy is interrupted, reinstate at lowest dose (300 mg).

Patient/Family Teaching

- **Mifeprex:** Advise patient of the treatment and its effects. Patients must be given a copy of the *Medication Guide and Patient Agreement*. Patient must understand the necessity of completing the treatment schedule of three office visits (day 1, day 2–3, and day 7–14).
- Inform patient that vaginal bleeding and uterine cramping will probably occur and that prolonged or heavy vaginal bleeding is not proof of complete expulsion. Bleeding or spotting occurs for an average of 9–16 days; but may continue for more than 30

days. Advise patient that if the treatment fails, there is a risk of fetal malformation; medical abortion failures are managed by surgical termination.

- **Caution patient to notify health care professional immediately if she develops weakness, nausea, vomiting, diarrhea, with or without abdominal pain or fever more than 24 hr after taking mifepristone; may indicate life-threatening sepsis.**
- Instruct patient in the steps to take in an emergency situation, including precise instructions and a telephone number to call if she has problems or concerns.
- May cause dizziness or fainting. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient that pregnancy can occur following termination of pregnancy and before resumption of normal menses. Contraception can be initiated as soon as pregnancy termination is confirmed, or before sexual intercourse is resumed.
- Advise patient to notify health care professional if she smokes at least 10 cigarettes a day.
- **Korlym:** Instruct patient to take Korlym as directed. Advise patient to read *Medication Guide* prior to starting therapy and with each refill in case of changes.
- Caution patient to avoid drinking grapefruit juice during therapy; may increase risk of side effects.
- Instruct patient to notify health care professional if signs and symptoms of adrenal insufficiency, abnormal vaginal bleeding, or low potassium (muscle weakness, aches, cramps, palpitations) occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise female patient to use a nonhormonal form of contraception during and for at least 1 mo after therapy. Notify health care professional immediately if pregnancy is suspected; Korlym is teratogenic. Advise female patient to avoid breast feeding during therapy.

Evaluation/Desired Outcomes

- **Mifeprex:** Termination of an intrauterine pregnancy of less than 49 days' duration.
- **Korlym:** Improved control of blood glucose.

milnacipran (mil-na-sip-ran)
Savella

Classification

Therapeutic: antifibromyalgia agents
Pharmacologic: selective norepinephrine reuptake inhibitors

Indications

Management of fibromyalgia.

Action

Inhibits neuronal reuptake of norepinephrine and serotonin. **Therapeutic Effects:** Decreased pain associated with fibromyalgia.

Pharmacokinetics

Absorption: 85–90% absorbed following oral administration.

Distribution: Unknown.

Metabolism and Excretion: Mostly excreted urine as unchanged drug (55%) and inactive metabolites.

Half-life: *D*— isomer 8–10 hr; *L*— isomer 4–6 hr.

TIME/ACTION PROFILE (↓ in pain)

ROUTE	ONSET	PEAK	DURATION
PO	1 wk	unknown	unknown

Contraindications/Precautions

Contraindicated in: Concurrent use of MAO inhibitors or MAO-like drugs (linezolid or methylene blue); End-stage renal disease; Significant history of alcohol use/abuse; Chronic liver disease.

Use Cautiously in: History of suicide risk or attempt; History of seizures; Moderate-to-severe renal impairment (↓ dose if $CCr < 30$ mL/min); Hypertension; Severe hepatic impairment; Obstructive uropathy (↑ risk of adverse genitourinary effects); Angle-closure glaucoma;

Ger: Consider age-related ↓ in renal function, chronic disease state and concurrent drug therapy; **OB:** Use only if clearly required during pregnancy weighing benefit to mother versus potential harm to fetus; **Lactation:** Potential for serious adverse reactions in infant; discontinue drug or discontinue breast feeding; **Pedi:** ↑ risk of suicidal thinking and behavior (suicidality) in adolescents and young adults up to 24 yr with Major Depressive Disorder (MDD) and other psychiatric disorders.

Adverse Reactions/Side Effects

CNS: NEUROLEPTIC MALIGNANT SYNDROME, SUICIDAL THOUGHTS, dizziness, headache, insomnia. **CV:** hypertension, tachycardia. **F and E:** hyponatremia. **GI:**

PANCREATITIS, constipation, dry mouth, ↑ liver enzymes, nausea, vomiting. **Derm:** hot flushes, hyperhidrosis.

Misc: SEROTONIN SYNDROME.

Interactions

Drug-Drug: Concurrent use with **MAO inhibitors** may result in serious, potentially fatal reactions; wait at least 14 days following discontinuation of MAO inhibitor before initiation of milnacipran. Wait at least 5 days after discontinuing milnacipran before initiation of MAO inhibitor. Concurrent use with **MAO-inhibitor-like drugs**, such as **linezolid** or **methylene blue** may ↑ risk of serotonin syndrome; concurrent use contraindicated; do not start therapy in patients receiving **linezolid** or **methylene blue**; if **linezolid** or **methylene blue** need to be started in a patient receiving

milnacipran, immediately discontinue milnacipran and monitor for signs/symptoms of serotonin syndrome for 5 days or until 24 hr after last dose of linezolid or methylene blue, whichever comes first (may resume milnacipran therapy 24 hr after last dose of linezolid or methylene blue). Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SSRIs**, **fentanyl**, **bupirone**, **tramadol**, **amphetamines**, and **triptans** ↑ risk of serotonin syndrome. Concurrent use of **NSAIDs**, **aspirin**, or other **drugs that affect coagulation** may ↑ the risk of bleeding. May ↓ antihypertensive effectiveness of **clonidine**. ↑ risk of hypertension and arrhythmias with **epinephrine** or **norepinephrine**. ↑ risk of euphoria and hypotension when switching from **clomipramine**. Concurrent use with **digoxin** may result in adverse hemodynamics, including hypotension and tachycardia; avoid concurrent use with IV digoxin.

Drug-Natural Products: Use with **St. John's wort** ↑ serotonin syndrome.

Route/Dosage

PO (Adults): *Day 1*— 12.5 mg; *Day 2–3*— 12.5 mg twice daily; *Day 4–7*— 25 mg twice daily; *After Day 7*— 50 mg twice daily. Some patients may require up to 100 mg twice daily depending on response.

Renal Impairment

PO (Adults): *CCr 5–29 mL/min*— maintenance dose is 25 mg twice daily; some patients may require up to 50 mg twice daily depending on response.

Availability (generic available)

Tablets (contain tartrazine): 12.5 mg, 25 mg, 50 mg, 100 mg.

NURSING IMPLICATIONS

Assessment

- Assess intensity, quality, and location of pain periodically during therapy. May require several wk for effects to be seen.
- Monitor BP and heart rate before and periodically during therapy. Treat pre-existing hypertension and cardiac disease prior to therapy. Sustained hypertension may be dose related; decrease dose or discontinue therapy if this occurs.
- Monitor closely for changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, convulsions, diaphoresis, hypertension or hypotension, pallor, tiredness, severe muscle stiffness, loss of bladder control). Report symptoms immediately.
- **Lab Test Considerations:** May cause ↑ ALT, AST, and bilirubin.
- May cause hyponatremia.

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Potential Nursing Diagnoses

Chronic pain (Indications)

Risk for suicide (Adverse Reactions)

Implementation

- **PO:** May be administered without regard to meals; may be more tolerable if taken with food.

Patient/Family Teaching

- Instruct patient to take milnacipran as directed at the same time each day. Take missed doses as soon as possible unless time for next dose. Do not stop abruptly; must be decreased gradually. Advise patient to read the *Medication Guide* prior to therapy and with each Rx refill.
- **Encourage patient and family to be alert for emergence of anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, mania, worsening of depression and suicidal ideation, especially during early antidepressant therapy. Assess symptoms on a day-to-day basis as changes may be abrupt. If these symptoms occur, notify health care professional.**
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort. Avoid use of aspirin, NSAIDs, and warfarin due to increased risk for bleeding.
- Instruct patient to notify health care professional if signs of liver damage (pruritus, dark urine, jaundice, right upper quadrant tenderness, unexplained "flu-like" symptoms) or hyponatremia (headache, difficulty concentrating, memory impairment, confusion, weakness, unsteadiness), hyponatremia (headache, difficulty concentrating, memory impairment, confusion, weakness, unsteadiness, falls), **rash, or serotonin syndrome (mental status changes: agitation, hallucinations, coma; autonomic instability: tachycardia, labile BP, hyperthermia; neuromuscular aberrations: hyperreflexia, incoordination; and/or gastrointestinal symptoms: nausea, vomiting, diarrhea)** occur.
- Advise patient to avoid taking alcohol during milnacipran therapy.
- **Rep:** Instruct patient to notify health care professional if pregnancy is planned or suspected or if breast feeding. Encourage patients who become pregnant while taking milnacipran to enroll in the pregnancy registry by calling 1-800-643-3010 or at www.savellapregnancyregistry.com.
- Encourage patient to maintain routine follow-up visits with health care provider to determine effectiveness.

Evaluation/Desired Outcomes

- Reduction in pain and soreness associated with fibromyalgia.

HIGH ALERT

milrinone (mill-ri-none)

Primacor

Classification

Therapeutic: inotropics

Indications

Short-term treatment of HF unresponsive to conventional therapy with digoxin, diuretics, and vasodilators.

Action

Increases myocardial contractility. Decreases preload and afterload by a direct dilating effect on vascular smooth muscle. **Therapeutic Effects:** Increased cardiac output (inotropic effect).

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: 80–90% excreted unchanged by the kidneys.

Half-life: 2.3 hr (↑ in renal impairment).

TIME/ACTION PROFILE (hemodynamic effects)

ROUTE	ONSET	PEAK	DURATION
IV	5–15 min	unknown	3–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Severe aortic or pulmonic valvular heart disease; Hypertrophic subaortic stenosis (may ↑ outflow tract obstruction).

Use Cautiously in: History of arrhythmias, electrolyte abnormalities, abnormal digoxin levels, or insertion of vascular catheters (↑ risk of ventricular arrhythmias); Renal impairment (↓ infusion rate if CCr is <50 mL/min); **OB, Lactation:** Pregnancy or lactation.

Adverse Reactions/Side Effects

CNS: headache, tremor. **CV:** VENTRICULAR ARRHYTHMIAS, angina pectoris, chest pain, hypotension, supraventricular arrhythmias. **CV:** skin rash. **GI:** ↑ liver enzymes. **F and E:** hypokalemia. **Hemat:** thrombocytopenia.

Interactions

Drug-Drug: None significant.

Route/Dosage

IV (Adults): Loading dose—50 mcg/kg followed by continuous infusion at 0.5 mcg/kg/min (range 0.375–0.75 mcg/kg/min).

IV (Infants and Children): Loading dose—50 mcg/kg over 10 min followed by continuous infusion at 0.5 mcg/kg/min (range 0.25–0.75 mcg/kg/min).

Availability (generic available)

Injection: 1 mg/mL. **Premixed infusion:** 20 mg/100 mL, 40 mg/200 mL.

NURSING IMPLICATIONS

Assessment

- Monitor heart rate and BP continuously during administration. Slow or discontinue if BP drops excessively.
- Monitor intake and output and daily weight. Assess patient for resolution of signs and symptoms of HF (peripheral edema, dyspnea, rales/crackles, weight gain) and improvement in hemodynamic parameters (increase in cardiac output and cardiac index, decrease in pulmonary capillary wedge pressure). Correct effects of previous aggressive diuretic therapy to allow for optimal filling pressure.
- **Monitor ECG continuously during infusion. Arrhythmias are common and may be life threatening. The risk of ventricular arrhythmias is increased in patients with a history of arrhythmias, electrolyte abnormalities, abnormal digoxin levels, or insertion of vascular catheters.**
- **Lab Test Considerations:** Monitor electrolytes and renal function frequently during administration. Correct hypokalemia prior to administration to decrease the risk of arrhythmias.
- Monitor platelet count during therapy.
- **Toxicity and Overdose: High Alert:** Overdose manifests as hypotension. Dose should be decreased or discontinued. Supportive measures may be necessary.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)

Implementation

- **High Alert:** Accidental overdose of milrinone can cause patient harm or death. Have second practitioner independently check original order, dose calculations, and infusion pump settings.

IV Administration

- **IV Push: Diluent:** Loading dose may be administered undiluted. May also be diluted in 0.9% NaCl, 0.45% NaCl, or D5W for ease of administration. **Concentration:** 1 mg/mL. **Rate:** Administer the loading dose over 10 min.
- **Continuous Infusion: Diluent:** Milrinone drawn from vials must be diluted. Dilute 10 mg (10 mL) of milrinone in 40 mL of diluent or 20 mg (20 mL) of milrinone in 80 mL of diluent. Compatible diluents include 0.45% NaCl, 0.9% NaCl, and D5W. Premixed infusions are already diluted and ready to use. Admixed solutions are stable for 72 hr at room temperature. Stability of premixed infusions based on manufacturer's expiration date. Do not use solutions that are discolored or contain particulate matter. **Concentration:** 200 mcg/mL. **Rate:** Based on patient's weight (see Route/Dosage section). Titrate according to hemodynamic and clinical response.

- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amiodarone, amphotericin B liposome, ampicillin, anidulafungin, argatroban, atracurium, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, ceftazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone sodium phosphate, dexmedetomidine, digoxin, diltiazem, dobutamine, docetaxel, dopamine, doxacurium, doxorubicin, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, eftifibatide, ertapenem, erythromycin, etoposide, etoposide phosphate, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, insulin, irinotecan, isoproterenol, ketamine, ketorolac, labetalol, levofloxacin, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, methohexital, methotrexate, methylglucate, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, mitoxantrone, morphine, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, prochlorperazine, promethazine, propofol, propranolol, quinupristin/dalfopristin, ranitidine, remifentanyl, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, telavancin, teniposide, theophylline, thiopental, thiotape, tige-cycline, tirofiban, tobramycin, torsemide, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** amphotericin B colloidal, amphotericin B lipid complex, dantrolene, diazepam, diphenhydramine, esmolol, furosemide, hydroxyzine, imipenem/cilastatin, lidocaine, ondansetron, pantoprazole, phenytoin, procainamide.

Patient/Family Teaching

- Inform patient and family of reasons for administration. Milrinone is not a cure but is a temporary measure to control the symptoms of HF.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Evaluation/Desired Outcomes

- Decrease in the signs and symptoms of HF.
- Improvement in hemodynamic parameters.

minocycline, See TETRACYCLINES.

mirabegron (mye-ra-beg-ron)

Myrbetriq

Classification

Therapeutic: urinary tract antispasmodics
Pharmacologic: beta-adrenergic agonists

Indications

Treatment of symptoms of overactive bladder (OAB) including urge urinary incontinence, urgency, and frequency.

Action

Acts as a selective beta-3 adrenergic agonist. Increases bladder capacity by relaxing detrusor smooth muscle during storage phase of bladder fill-void cycle. **Therapeutic Effects:** Decreased symptoms of OAB.

Pharmacokinetics

Absorption: 29–35% absorbed following oral administration.

Distribution: Widely distributed.

Metabolism and Excretion: Extensively metabolized, 6% excreted unchanged in urine (25 mg dose), remainder excreted in urine and feces as metabolites.

Half-life: 50 hr.

TIME/ACTION PROFILE (effects on bladder)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	3.5 hr†	24 hr

†Blood level.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Severe uncontrolled hypertension; End-stage renal disease or severe hepatic impairment (Child-Pugh Class C); **Lactation:** Probably enters breast milk and may cause adverse reactions in infant.

Use Cautiously in: Hypertension; Bladder outlet obstruction/concurrent antimuscarinics (↑ risk of urinary retention); Concurrent use of antimuscarinics used to treat OAB; **OB:** Use only if potential maternal benefit outweighs risk to fetus; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: dizziness, headache. **EENT:** nasopharyngitis.

CV: ↑ BP, tachycardia. **GI:** constipation, diarrhea, nausea.

GU: urinary tract infection. **Misc:** ANGIOEDEMA.

Interactions

Drug-Drug: Acts as a moderate inhibitor of the CYP2D6 enzyme system. May ↑ levels and risk of adverse reactions of **drugs metabolized by the CYP2D6 enzyme system** including **desipramine, flecainide, metoprolol, propafenone, and thioridazine**. May ↑ levels and risk of toxicity with **digoxin**; use lowest effective level of digoxin/monitor serum levels).

Route/Dosage

PO (Adults): 25 mg once daily; may be ↑ to 50 mg once daily based on need/tolerance after 8 wk.

Renal Impairment

PO (Adults): *CCr 15–20 mL/min*—Dose should not exceed 25 mg/day.

Hepatic Impairment

PO (Adults): *Moderate hepatic impairment (Child-Pugh Class B)*—Dose should not exceed 25 mg/day.

Availability

Extended-release tablets: 25 mg, 50 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for urinary urgency, frequency, and urge incontinence periodically during therapy.
- Monitor BP prior to starting and periodically during therapy; may cause ↑ BP.
- **Monitor for signs and symptoms of angioedema (swelling of face, lips, tongue and/or larynx).** **Discontinue mirabegron and treat symptomatically.**

Potential Nursing Diagnoses

Impaired urinary elimination (Indications)

Urinary retention (Indications)

Implementation

- **PO:** Administer without regard to food.
- Swallow tablets whole with water; do not break, crush, or chew.

Patient/Family Teaching

- Instruct patient to take mirabegron as directed. If a dose is missed, omit dose and begin taking next day; do not take 2 doses on the same day. Advise patient to read *Patient Information* sheet prior to starting and with each Rx refill in case of changes.
- Inform patient that mirabegron may cause an increase in BP. Advise patient to have BP checked periodically during therapy.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional if difficulty emptying bladder occurs.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.

- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decreased urinary frequency, urgency, and urge incontinence.

mirtazapine (meer-taz-a-peen)
Remeron,  Remeron RD, Remeron SolTab

Classification

Therapeutic: antidepressants

Pharmacologic: tetracyclic antidepressants

Indications

Major depressive disorder. **Unlabeled Use:** Panic disorder. Generalized anxiety disorder (GAD). Post-traumatic stress disorder (PTSD).

Action

Potentiates the effects of norepinephrine and serotonin.

Therapeutic Effects: Antidepressant action, which may develop only after several weeks.

Pharmacokinetics

Absorption: Well absorbed but rapidly metabolized, resulting in 50% bioavailability.

Distribution: Unknown.

Protein Binding: 85%.

Metabolism and Excretion: Extensively metabolized by the liver (P450 2D6, 1A2 and 3A enzymes involved); metabolites excreted in urine (75%) and feces (15%).

Half-life: 20–40 hr.

TIME/ACTION PROFILE (antidepressant effect)

ROUTE	ONSET	PEAK	DURATION
PO	1–2 wk	6 wk or more	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of MAO inhibitors or MAO-like drugs (linezolid or methylene blue).

Use Cautiously in: History of seizures; History of suicide attempt; May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; History of mania/hypomania; Patients with hepatic or renal impairment; Angle-closure glaucoma; **OB:** Safety not established; **Lactation:** Discontinue drug or bottle-feed; **Pedi:** Safety not established. Suicide risk may be greater in children or adolescents; **Geri:** ↑ sensitivity to CNS effects and oversedation. Begin at lower doses and titrate carefully.

Adverse Reactions/Side Effects

CNS: **NEUROLEPTIC MALIGNANT SYNDROME, SUICIDAL THOUGHTS, drowsiness, abnormal dreams, abnormal thinking, agitation, akathisia, anxiety, apathy, confusion, dizziness, malaise, weakness. EENT:** sinusitis. **Resp:** dyspnea, cough. **CV:** edema, hypotension, vasodilation. **GI:** constipation, dry mouth, ↑ appetite, abdominal pain, anorexia, ↑ liver enzymes, nausea, vomiting. **GU:** urinary frequency. **Derm:** pruritus, rash. **F and E:** ↑ thirst. **Hemat:** **AGRANULOCYTOSIS. Metab:** weight gain, hypercholesterolemia, hyponatremia, ↑ triglycerides. **MS:** arthralgia, back pain, myalgia. **Neuro:** hyperkinesia, hypesthesia, twitching. **Misc:** **SEROTONIN SYNDROME, flu-like syndrome.**

Interactions

Drug-Drug: May cause hypertension, seizures, and death when used with **MAO inhibitors**; do not use within 14 days of MAO inhibitor therapy. Concurrent use with **MAO-inhibitor like drugs**, such as **linezolid** or **methylene blue** may ↑ risk of serotonin syndrome; concurrent use contraindicated; do not start therapy in patients receiving **linezolid** or **methylene blue**; if **linezolid** or **methylene blue** need to be started in a patient receiving mirtazapine, immediately discontinue mirtazapine and monitor for signs/symptoms of serotonin syndrome for 2 wk or until 24 hr after last dose of linezolid or methylene blue, whichever comes first (may resume mirtazapine therapy 24 hr after last dose of linezolid or methylene blue). Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants, SNRIs, fenflans, buspirone, tramadol, and triptans** ↑ risk of serotonin syndrome. ↑ CNS depression with other **CNS depressants**, including **alcohol** and **benzodiazepines. Ketoconazole, cimetidine, clarithromycin, erythromycin, indinavir, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, or saquinavir** may ↑ levels. **Phenobarbital, phenytoin, carbamazepine, rifampin, or rifabutin** may ↓ levels; may need to ↑ mirtazapine dose. May ↑ the effects and risk of bleeding from **warfarin.**

Drug-Natural Products: Concomitant use of **kava-kava, valerian, skullcap, chamomile, or hops** can ↑ CNS depression. ↑ risk of serotonin syndrome with **St. John's wort** and **SAME.**

Route/Dosage

PO (Adults): 15 mg/day as a single bedtime dose initially; may be ↑ q 1–2 wk up to 45 mg/day.

Availability (generic available)

Tablets: 7.5 mg, 15 mg, 30 mg, 45 mg. **Cost:** *Generic*—7.5 mg \$158.00/60, 15 mg \$81.40/30, 30 mg \$83.00/30, 45 mg \$85.50/30. **Orally disintegrating tablets (orange flavor):** 15 mg, 30 mg, 45 mg. **Cost:**

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Generic—15 mg \$77.90/30, 30 mg \$80.27/30, 45 mg \$85.53/30.

NURSING IMPLICATIONS

Assessment

- Assess mental status (orientation, mood, behavior) frequently. Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- Monitor closely for changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- Assess weight and BMI initially and throughout therapy. For overweight/obese individuals, obtain fasting blood glucose and cholesterol levels. Refer as appropriate for nutritional/weight management and medical management.
- Monitor BP and pulse rate periodically during initial therapy. Report significant changes.
- Monitor for seizure activity in patients with a history of seizures or alcohol abuse. Institute seizure precautions.
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyperreflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness). Discontinue mirtazapine and notify health care professional immediately if these symptoms occur.
- **Lab Test Considerations:** Assess CBC and hepatic function before and periodically during therapy.

Potential Nursing Diagnoses

Ineffective coping (Indications)

Anxiety (Indications)

Imbalanced nutrition: risk for more than body requirements (Side Effects)

Implementation

- May be given as a single dose at bedtime to minimize excessive drowsiness or dizziness.
- May be taken without regard to food.
- For orally disintegrating tablets, do not attempt to push through foil backing; with dry hands, peel back backing and remove tablet. Immediately place tablet on tongue; tablet will dissolve in seconds, then swallow with saliva. Administration with liquid is not necessary.

Patient/Family Teaching

- Instruct patient to take mirtazapine as directed. Take missed doses as soon as remembered; if almost time for next dose, skip missed dose and return to regular

schedule. If single bedtime dose regimen is used, do not take missed dose in morning, but consult health care professional. Do not discontinue abruptly; gradual dose reduction may be required.

- May cause drowsiness and dizziness. Caution patient to avoid driving and other activities requiring alertness until response to drug is known.
- Encourage patient and family to be alert for emergence of anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, mania, worsening of depression and suicidal ideation, especially during early antidepressant therapy. Assess symptoms on a day-to-day basis as changes may be abrupt. If these symptoms occur, notify health care professional.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient to avoid alcohol or other CNS depressant drugs during and for at least 3–7 days after therapy has been discontinued.
- Instruct patient to notify health care professional of signs and symptoms of serotonin syndrome (mental status changes: agitation, hallucinations, coma; autonomic instability: tachycardia, labile BP, hyperthermia; neuromuscular aberrations: hyperreflexia, incoordination; and/or gastrointestinal symptoms: nausea, vomiting, diarrhea) occur.
- Advise patient to notify health care professional if dry mouth, urinary retention, or constipation occurs. Frequent rinses, good oral hygiene, and sugarless candy or gum may diminish dry mouth. An increase in fluid intake, fiber, and exercise may prevent constipation.
- Inform patient of need to monitor dietary intake. Increase in appetite may lead to undesired weight gain.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Therapy for depression may be prolonged. Emphasize the importance of follow-up exam to monitor effectiveness and side effects.

Evaluation/Desired Outcomes

- Resolution of the symptoms of depression.
- Increased sense of well-being.
- Renewed interest in surroundings.
- Increased appetite.
- Improved energy level.
- Improved sleep.
- Therapeutic effects may be seen within 1 wk, although several wk are usually necessary before improvement is observed.

miSOPROStol

(mye-soe-prost-ole)
Cytotec

Classification

Therapeutic: antiulcer agents, cytoprotective agents

Pharmacologic: prostaglandins

Indications

Prevention of gastric mucosal injury from NSAIDs, including aspirin, in high-risk patients (geriatric patients, debilitated patients, or those with a history of ulcers). With mifepristone for termination of pregnancy. **Unlabeled Use:** Treatment of duodenal ulcers. Cervical ripening and labor induction.

Action

Acts as a prostaglandin analogue, decreasing gastric acid secretion (antisecretory effect) and increasing the production of protective mucus (cytoprotective effect). Causes uterine contractions. **Therapeutic Effects:** Prevention of gastric ulceration from NSAIDs. With mifepristone terminates pregnancy of less than 49 days.

Pharmacokinetics

Absorption: Well absorbed following oral administration and rapidly converted to its active form (misoprostol acid).

Distribution: Unknown.

Protein Binding: 85%.

Metabolism and Excretion: Undergoes some metabolism and is then excreted by the kidneys.

Half-life: 20–40 min.

TIME/ACTION PROFILE (effect on gastric acid secretion)

ROUTE	ONSET	PEAK	DURATION
PO	30 min	unknown	3–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to prostaglandins; **OB:** Should not be used to prevent NSAID-induced gastric injury due to potential for fetal harm or death; **Lactation:** May cause severe diarrhea in the nursing infant.

Use Cautiously in: **OB:** Patients with childbearing potential should be counseled to avoid pregnancy during misoprostol therapy for prevention of NSAID-induced gastric injury. Pregnancy status should be determined before initiating therapy; **Pedi:** Safety not established.

Exercise Extreme Caution in: When used for cervical ripening (unlabeled use) or to induce abortion, may cause uterine rupture (risk factors are late

trimester pregnancy, previous Cesarean section or uterine surgery, advanced gestational age, or ≥ 3 previous pregnancies).

Adverse Reactions/Side Effects

CNS: headache. **GI:** abdominal pain, diarrhea, constipation, dyspepsia, flatulence, nausea, vomiting. **GU:** miscarriage, menstrual disorders.

Interactions

Drug-Drug: ↑ risk of diarrhea with magnesium-containing antacids.

Route/Dosage

PO (Adults): *Antiulcer*—200 mcg 4 times daily with or after meals and at bedtime, or 400 mcg twice daily, with the last dose at bedtime. If intolerance occurs, dose may be ↓ to 100 mcg 4 times daily. *Termination of pregnancy*—400 mcg single dose 2 days after mifepristone if abortion has not occurred.

Intravaginally (Adults): 25 mcg (1/4 of 100-mcg tablet); may repeat q 3–6 hr, if needed.

Availability (generic available)

Tablets: 100 mcg, 200 mcg. **In combination with:** diclofenac (Arthrotec). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess patient routinely for epigastric or abdominal pain and for frank or occult blood in the stool, emesis, or gastric aspirate.
- Assess women of childbearing age for pregnancy. Misoprostol is usually begun on 2nd or 3rd day of menstrual period following a negative pregnancy test result.
- **Termination of pregnancy:** Monitor uterine cramping and bleeding during therapy.
- **Cervical Ripening:** Assess dilation of cervix periodically during therapy.

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- **Do not confuse misoprostol with mifepristone.**
- Misoprostol therapy should be started at the onset of treatment with NSAIDs.
- **PO:** Administer medication with meals and at bedtime to reduce severity of diarrhea.
- Antacids may be administered before or after misoprostol for relief of pain. Avoid those containing magnesium, because of increased diarrhea with misoprostol.

Patient/Family Teaching

- Instruct patient to take medication as directed for the full course of therapy, even if feeling better. Take missed doses as soon as possible unless next dose is

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

due within 2 hr; do not double doses. Emphasize that sharing of this medication may be dangerous.

- Advise patient not to share misoprostol with others, even if they have similar symptoms; may be dangerous.
- Inform patient that misoprostol will cause spontaneous abortion. Women of childbearing age must be informed of this effect through verbal and written information and must use contraception throughout therapy. If pregnancy is suspected, the woman should stop taking misoprostol and immediately notify her health care professional.
- Inform patient that diarrhea may occur. Health care professional should be notified if diarrhea persists for more than 1 wk. Also advise patient to report onset of black, tarry stools or severe abdominal pain.
- Advise patient to avoid alcohol and foods that may cause an increase in GI irritation.

Evaluation/Desired Outcomes

- The prevention of gastric ulcers in patients receiving chronic NSAID therapy.
- Termination of pregnancy.
- Cervical ripening and induction of labor.

mitoMYcin (mye-toe-mye-sin)

Mutamyacin

Classification

Therapeutic: antineoplastics

Pharmacologic: antitumor antibiotics

Indications

Used with other agents in the management of disseminated adenocarcinoma of the stomach or pancreas.

Unlabeled Use: Palliative treatment of: Carcinoma of the colon or breast, Head and neck tumors, Advanced biliary, lung, and cervical squamous cell carcinomas.

Action

Primarily inhibits DNA synthesis by causing cross-linking; also inhibits RNA and protein synthesis (cell-cycle phase—nonspecific but is most active in S and G phases). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Widely distributed, concentrates in tumor tissue. Does not enter CSF.

Metabolism and Excretion: Mostly metabolized by the liver. Small amounts (<10%) excreted unchanged by the kidneys and in bile.

Half-life: 50 min.

TIME/ACTION PROFILE (effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
IV	3–8 wk	4–8 wk	up to 3 mo

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Pregnancy or lactation.

Use Cautiously in: Active infections; ↓ bone marrow reserve; Hepatic dysfunction; History of pulmonary problems; **OB:** Patients with childbearing potential should be counseled to avoid pregnancy during treatment; **Geriatrics:** May have ↑ sensitivity to drug effects.

Adverse Reactions/Side Effects

Resp: PULMONARY TOXICITY. **CV:** edema. **GI:** nausea, vomiting, anorexia, stomatitis. **GU:** infertility, renal failure. **Derm:** alopecia, desquamation. **Hemat:** leukopenia, thrombocytopenia, anemia. **Local:** phlebitis at IV site. **Misc:** HEMOLYTIC UREMIC SYNDROME, fever, prolonged malaise.

Interactions

Drug-Drug: Additive bone marrow depression with other antineoplastics or radiation therapy. May ↓ antibody response to live-virus vaccines and ↑ risk of adverse reactions. Concurrent or sequential use with vinca alkaloids may result in respiratory toxicity.

Route/Dosage

IV (Adults): 20 mg/m² every 6–8 wk.

Availability (generic available)

Powder for injection (requires reconstitution): 5 mg/vial, 20 mg/vial, 40 mg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs periodically during administration.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor intake and output, appetite, and nutritional intake. Nausea and vomiting usually occur within 1–2 hr. Vomiting may stop within 3–4 hr; nausea may persist for 2–3 days. Antiemetics may be administered prophylactically. Adjust diet as tolerated to help maintain fluid and electrolyte balance and nutritional status.
- Assess respiratory status and chest x-ray examination prior to and periodically throughout course of therapy. Cough, bronchospasm, hemoptysis, or dyspnea usually occurs after several doses and may

be indicative of pulmonary toxicity, which may be life threatening.

- **Monitor for potentially fatal hemolytic uremic syndrome in patients receiving long-term therapy.** Symptoms include microangiopathic hemolytic anemia, thrombocytopenia, renal failure, and hypertension.
- **Lab Test Considerations:** Monitor CBC with differential, platelet count, and observation for fragmented RBCs on peripheral blood smears prior to and periodically throughout therapy and for several mo following therapy.
- The nadirs of leukopenia and thrombocytopenia occur in 4–8 wk. Notify health care professional if leukocyte count is $<4000/\text{mm}^3$ or if platelet count is $<150,000/\text{mm}^3$ or is progressively declining. Recovery from leukopenia and thrombocytopenia occurs within 10 wk after cessation of therapy. Myelosuppression is cumulative and may be irreversible. Repeat courses of therapy are held until leukocyte count is $>4000/\text{mm}^3$ and platelet count is $>100,000/\text{mm}^3$.
- **Monitor liver function studies (AST, ALT, LDH, bilirubin) and renal function studies (BUN, creatinine) prior to and periodically throughout therapy to detect hepatotoxicity and nephrotoxicity.** Notify health care professional if creatinine is $>1.7 \text{ mg/dL}$.

Potential Nursing Diagnoses

Risk for injury (Side Effects)

Risk for infection (Side Effects)

Disturbed body image (Side Effects)

Implementation

- **Do not confuse mitomycin with mitoxantrone.**
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in designated containers.
- Ensure patency of IV. Extravasation may cause severe tissue necrosis. If patient complains of discomfort at IV site, discontinue immediately and restart infusion at another site. Promptly notify physician of extravasation.

IV Administration

- **IV Push:** Reconstitute 5-mg vial with 10 mL and 10-mg vial with 40 mL of sterile water for injection. Shake the vial; may need to stand at room temperature for additional time to dissolve. Final solution is blue-gray. Reconstituted solution is stable for 7 days at room temperature, 14 days if refrigerated. **Diluent:** 0.9% NaCl. **Concentration:** 20–40 mcg/mL for administration. **Rate:** May be administered IV push over 5–10 min through free-flowing IV of 0.9% NaCl or D5W.
- **Y-Site Compatibility:** alfentanil, amifostine, amphotericin B lipid complex, amphotericin B lipo-

some, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, bivalirudin, bleomycin, bumetamide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, caspofungin, cefoxitin, ceftazidime, ceftriaxone, chloramphenicol, chlorpromazine, ciprofloxacin, cisplatin, cyclophosphamide, cyclophosphamide, cyclosporine, dactinomycin, dexamethasone, dexmedetomidine, doxorubicin hydrochloride, droperidol, epirubicin, ertapenem, fentanyl, fluconazole, fludarabine, fluorouracil, fosfarnet, fosphenytoin, furosemide, granisetron, heparin, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, ketorolac, leucovorin calcium, levofloxacin, linezolid, magnesium sulfate, mannitol, melphalan, meperidine, methotrexate, methylprednisolone, metoclopramide, metronidazole, moxifloxacin, nesiritide, nitroglycerin, octreotide, ondansetron, ondansetron, oxaliplatin, paclitaxel, palonosetron, pemetrexed, potassium chloride, procainamide, quinupristin/dalfopristin, ranitidine, rituximab, sodium bicarbonate, tacrolimus, teniposide, thiotepa, tigecycline, tirofiban, tobramycin, trastuzumab, vasopressin, verapamil, vinblastine, vincristine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, allopurinol, amikacin, aminophylline, amiodarone, amphotericin B colloidal, aztreonam, cefepime, cefotaxime, cefotetan, cefuroxime, clindamycin, dacarbazine, daptomycin, dexrazoxane, diazepam, dobutamine, docetaxel, dopamine, doxycycline, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, filgrastim, gencitabine, gentamicin, glycopyrrolate, haloperidol, idarubicin, insulin, irinotecan, isoproterenol, labetalol, lorazepam, midazolam, milrinone, morphine, naloxone, pantoprazole, phenytoin, piperacillin/tazobactam, promethazine, propranolol, sargramostim, succinylcholine, topotecan, vancomycin, vecuronium, vinorelbine.

Patient/Family Teaching

- Instruct patient to notify health care professional promptly if fever; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; painful or difficult urination; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDs; may precipitate gastric bleeding.
- **Instruct patient to notify health care professional if decreased urine output, edema in lower extremities, shortness of breath, skin ulceration, or persistent nausea occurs.**

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Instruct patient to inspect oral mucosa for redness and ulceration. If ulceration occurs, advise patient to use sponge brush and rinse mouth with water after eating and drinking. Topical agents may be used if pain interferes with eating. Stomatitis pain may require treatment with opioid analgesics.
- Discuss with patient the possibility of hair loss. Explore coping strategies.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- **Rep:** Advise patient that, although mitomycin may cause infertility, contraception during therapy is necessary because of teratogenic effects.
- Emphasize need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in size and spread of malignant tissue.

mitoXANTRONE

(mye-toe-zan-trone)

Novantrone

Classification

Therapeutic: antineoplastics, immune modifiers

Pharmacologic: antitumor antibiotics

Indications

Acute nonlymphocytic leukemia (ANLL) in adults (with other antineoplastics). Initial chemotherapy for patients with pain associated with advanced hormone-refractory prostate cancer. Secondary (chronic) progressive, progressive relapsing, or worsening relapsing-remitting multiple sclerosis (MS). **Unlabeled Use:** Breast cancer, liver cancer, and non-Hodgkin's lymphoma.

Action

Inhibits DNA synthesis (cell-cycle phase—nonspecific).

Therapeutic Effects: Death of rapidly replicating cells, particularly malignant ones. Decreased pain in patients with advanced prostate cancer. Decreased disability and slowed progression of MS.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Widely distributed; limited penetration of CSF.

Metabolism and Excretion: Mostly eliminated by hepatobiliary clearance; <10% excreted unchanged by the kidneys.

Half-life: 5.8 days.

TIME/ACTION PROFILE (effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	10 days	21 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **OB, Lactation:** Pregnancy or lactation.

Use Cautiously in: Presence or history of cardiovascular disease (↑ risk of heart failure); Active infection; ↓ bone marrow reserve; Previous mediastinal radiation or use of anthracyclines (↑ risk of heart failure); Impaired hepatobiliary function; **Rep:** Women of reproductive potential; **Ger:** May have ↑ sensitivity to drug effects; **Pedi:** Safety not established.

Adverse Reactions/Side Effects

CNS: SEIZURES, headache. **EENT:** blue-green sclera, conjunctivitis. **Resp:** cough, dyspnea. **CV:** CARDIOTOXICITY, arrhythmias, ECG changes. **GI:** HEPATOTOXICITY, abdominal pain, diarrhea, nausea, stomatitis, vomiting. **GU:** blue-green urine, gonadal suppression, renal failure. **Derm:** alopecia, rash. **Hemat:** anemia, leukopenia, secondary leukemia, thrombocytopenia. **Metab:** hyperuricemia. **Misc:** HYPERSENSITIVITY REACTIONS, fever.

Interactions

Drug-Drug: ↑ bone marrow depression with other antineoplastics or radiation therapy. Risk of cardiomyopathy ↑ by previous anthracycline antineoplastics (daunorubicin, doxorubicin, idarubicin) or mediastinal radiation. May ↓ antibody response to live-virus vaccines and ↑ risk of adverse reactions.

Route/Dosage

Acute Nonlymphatic Leukemia

IV (Adults): Induction—12 mg/m²/day for 3 days (usually given with cytosine arabinoside 100 mg/m²/day for 7 days); if incomplete remission occurs, a 2nd induction may be given. **Consolidation**—12 mg/m²/day for 2 days (usually given with cytosine arabinoside 100 mg/m²/day for 5 days), given 6 wk after induction with another course 4 wk later.

Advanced Prostate Cancer

IV (Adults): 12–14 mg/m² single dose as a short infusion (with corticosteroids).

Multiple Sclerosis

IV (Adults): 12 mg/m² every 3 mo.

Availability (generic available)

Solution for injection: 2 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor for hypersensitivity reaction (rash, urticaria, bronchospasm, tachycardia, hypotension). If these occur, stop infusion and notify physician. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae,

- guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor intake and output, appetite, and nutritional intake. Assess patient for nausea and vomiting. Antiemetics may be administered prophylactically. Adjust diet as tolerated to help maintain fluid and electrolyte balance and nutritional status.
 - **Monitor chest x-ray, ECG, echocardiography or MUGA, and radionuclide angiography to determine ejection fraction prior to and periodically during therapy.** Multiple sclerosis patients with baseline left ventricular ejection fraction (LVEF) <50% should not receive mitoxantrone. May cause cardiotoxicity, especially in patients who have received daunorubicin or doxorubicin. Assess for rales/crackles, dyspnea, edema, jugular vein distention, ECG changes, arrhythmias, and chest pain. Monitor LVEF with echocardiogram or MUGA if signs of HF occur, prior to each dose, and yearly after stopping therapy in patients with multiple sclerosis. Potentially fatal HF may occur during or for mo or years after therapy. Risk is greater in patients receiving a cumulative dose >140m g/m².
 - Monitor for symptoms of gout (↑ uric acid levels and joint pain and swelling). Encourage patient to drink at least 2 L of fluid per day. Allopurinol may be given to decrease serum uric acid levels.
 - **Multiple sclerosis:** Asses frequency of exacerbations of symptoms of multiple sclerosis periodically during therapy.
 - **Lab Test Considerations:** Monitor CBC with differential and platelet count prior to and periodically during therapy. The nadir of leukopenia usually occurs within 10 days, and recovery usually occurs within 21 days.
 - **Monitor liver function studies (AST, ALT, LDH, bilirubin) and renal function studies (BUN, creatinine) prior to and periodically during therapy to detect hepatotoxicity and nephrotoxicity.**
 - May cause ↑ uric acid concentrations. Monitor periodically during therapy.

Potential Nursing Diagnoses

Risk for injury (Side Effects)

Risk for infection (Side Effects)

Disturbed body image (Side Effects)

Implementation

- **Do not confuse mitoxantrone with mitomycin.**
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in designated containers.

- Avoid contact with skin. Use Luer-Lok tubing to prevent accidental leakage. If contact with skin occurs, immediately wash skin with soap and water.
- Clean all spills with an aqueous solution of calcium hypochlorite. Mix solution by adding 5.5 parts (per weight) of calcium hypochlorite to 13 parts water.

IV Administration

- **IV:** Monitor IV site. If extravasation occurs, discontinue IV and restart at another site. Elevate extremity with extravasation and place ice packs over area. Monitor closely and obtain surgical consultation if local reaction occurs. Mitoxantrone is not a vesicant.
- **IV Push:** **Diluent:** Dilute dark blue mitoxantrone solution in at least 50 mL of 0.9% NaCl or D5W. Discard unused solution appropriately. **Rate:** Administer slowly over at least 3 min into the tubing of a free-flowing IV of 0.9% NaCl or D5W.
- **Intermittent Infusion:** May be further diluted in D5W, 0.9% NaCl, or D5/0.9% NaCl and used immediately. **Concentration:** 0.02–0.5 mg/mL. **Rate:** Administer over 15–30 min.
- **Continuous Infusion:** May also be administered over 24 hr.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amikacin, aminophylline, amindarone, anidulafungin, argatroban, atracurium, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, chloramphenicol, chlropromazine, ciprofloxacin, cisatracurium, cisplatin, cladribine, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexmedetomidine, dexrazoxane, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxacurium, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, hydralazine, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, metaraminol, methohexital, methotrexate, methyldopate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, morphine, moxifloxacin, nalbuphine, naloxone, nesiritide, nifedipine, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, palonosetron, pamidronate, pancuronium, pantamidine, pentazocine, pentobarbital, phenobarbital, phenoltamine, phenylephrine, potassium acetate, potassium chloride,

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, ranitidine, remifentanyl, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, tolazoline, topotecan, trastuzumab, trimethiprom/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, azithromycin, aztreonam, cefazolin, cefepime, cefotaxime, ceftioxin, ceftazidime, ceftriaxone, cefuroxime, clindamycin, dantrolene, dexamethasone, diazepam, digoxin, doxorubicin liposome, ertapenem, foscarnet, fosphenytoin, furosemide, heparin, idarubicin, methylprednisolone, nafcillin, nitroprusside, paclitaxel, pantoprazole, pemetrexed, phenytoin, piperacillin/tazobactam, potassium phosphates, propofol, sodium phosphates, voriconazole.

Patient/Family Teaching

- Advise patient to read the *Patient Package Insert* before starting therapy and before each dose in case of changes.
- Instruct patient to notify health care professional promptly if fever; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; painful or difficult urination; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDs; may precipitate gastric bleeding.
- **Instruct patient to notify health care professional if abdominal pain, yellow skin, cough, diarrhea, or decreased urine output occurs.**
- Inform patient that medication may cause the urine and sclera to turn blue-green.
- Instruct patient to inspect oral mucosa for redness and ulceration. If mouth sores occur, advise patient to use sponge brush and rinse mouth with water after eating and drinking. Topical agents may be used if pain interferes with eating. Stomatitis pain may require treatment with opioid analgesics.
- Discuss with patient the possibility of hair loss. Explore coping strategies.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Advise patient that, although mitoxantrone may cause infertility, contraception during therapy is necessary because of possible teratogenic effects.
- Emphasize need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in the production and spread of leukemic cells.
- Decreased pain in patients with prostate cancer.
- Decrease in the frequency of relapse (neurologic dysfunction) in patients with relapsing-remitting multiple sclerosis.

modafinil (mo-daf-i-nil)

★Alertec, Provigil

Classification

Therapeutic: central nervous system stimulants

Indications

To improve wakefulness in patients with excessive daytime drowsiness due to narcolepsy, obstructive sleep apnea, or shift work sleep disorder.

Action

Produces CNS stimulation. **Therapeutic Effects:**

Decreased daytime drowsiness in patients with narcolepsy and obstructive sleep apnea. Decreased drowsiness during work in patients with shift work sleep disorder.

Pharmacokinetics

Absorption: Rapidly absorbed; bioavailability unknown.

Distribution: Well distributed; moderately (60%) bound to plasma proteins.

Metabolism and Excretion: Highly (90%) metabolized by the liver; <10% eliminated unchanged.

Half-life: 15 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	2–4 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; History of left ventricular hypertrophy or ischemic ECG changes, chest pain, arrhythmia, or other significant manifestations of mitral valve prolapse in association with CNS stimulant use.

Use Cautiously in: History of MI or unstable angina; Severe hepatic impairment with or without cirrhosis (dosage ↓ recommended); Concurrent use of MAO inhibitors; **OB, Lactation, Pedi:** Safety not established; **Geri:** Lower doses may be necessary due to ↑ sensitivity to drug effects.

Adverse Reactions/Side Effects

CNS: **SUICIDAL IDEATION**, headache, aggression, amnesia, anxiety, cataplexy, confusion, delusions, depression, dizziness, hallucinations, insomnia, mania, nervousness, seizures. **EENT:** rhinitis, abnormal vision, amblyopia, epistaxis, pharyngitis. **Resp:** dyspnea, lung

disorder. **CV:** arrhythmias, chest pain, hypertension, hypotension, syncope, vasodilation. **GI:** ↑ liver enzymes, nausea, anorexia, diarrhea, gingivitis, mouth ulcers, thirst, vomiting. **GU:** abnormal ejaculation, albuminuria, urinary retention. **Derm:** STEVENS-JOHNSON SYNDROME, dry skin, herpes simplex, rash. **Endo:** hyperglycemia. **Hemat:** eosinophilia. **MS:** joint disorder, neck pain. **Neuro:** ataxia, dyskinesia, hypertonia, paresthesia, tremor. **Misc:** infection.

Interactions

Drug-Drug: May ↓ the metabolism and ↑ the effects of diazepam, phenytoin, propranolol, or tricyclic antidepressants (dosage adjustments may be necessary). May ↑ the metabolism and ↓ the effects of hormonal contraceptives, cyclosporine, and theophylline (dosage adjustments or additional methods of contraception may be necessary).

Drug-Natural Products: Use with caffeine-containing herbs (cola nut, guarana, mate, tea, coffee) may ↑ stimulant effect.

Route/Dosage

PO (Adults): 200 mg/day as a single dose.

Hepatic Impairment

PO (Adults): Severe hepatic impairment — 100 mg/day as a single dose.

Availability (generic available)

Tablets: 100 mg, 200 mg.

NURSING IMPLICATIONS

Assessment

- Observe and document frequency of narcoleptic episodes.
- Monitor closely for changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.
- Monitor for signs and symptoms of angioedema or anaphylaxis (rash, swelling of face, eyes, lips, tongue or larynx; difficulty in swallowing or breathing; hoarseness).
- **Lab Test Considerations:** May cause elevated liver enzymes.

Potential Nursing Diagnoses

Disturbed thought process (Side Effects)
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- **PO:** Administer as a single dose in the morning for patients with narcolepsy or obstructive sleep apnea.

Administer 1 hr before the start of work shift for patients with shift work sleep disorder.

Patient/Family Teaching

- Instruct patient to take medication as directed. Advise patient to read the *Medication Guide* prior to starting therapy and with each Rx refill, in case of changes.
- Medication may impair judgment. Advise patient to use caution when driving or during other activities requiring alertness.
- Encourage patient and family to be alert for emergence of anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, mania, worsening of depression and suicidal ideation, especially during early antidepressant therapy. Assess symptoms on a day-to-day basis as changes may be abrupt. If these symptoms occur, notify health care professional.
- Advise patient to notify health care professional immediately if rash or symptoms of anaphylaxis occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications. If alcohol is used during therapy, intake should be limited to moderate amounts.
- Nonhormonal methods of contraception should be used during and for 1 mo following discontinuation of therapy. Instruct patient to notify health care professional promptly if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in narcoleptic symptoms and an enhanced ability to stay awake.

moexipril, See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.

mometasone, See CORTICOSTEROIDS (INHALATION), CORTICOSTEROIDS (NASAL), and CORTICOSTEROIDS (TOPICAL/LOCAL).

montelukast (mon-te-loo-kast) Singulair

Classification

Therapeutic: allergy, cold, and cough remedies, bronchodilators
Pharmacologic: leukotriene antagonists

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Indications

Prevention and chronic treatment of asthma. Management of seasonal allergic rhinitis. Prevention of exercise-induced bronchoconstriction in patients 6 yr and older.

Action

Antagonizes the effects of leukotrienes, which mediate the following: Airway edema, Smooth muscle constriction, Altered cellular activity. Result is decreased inflammatory process, which is part of asthma and allergic rhinitis. **Therapeutic Effects:** Decreased frequency and severity of acute asthma attacks. Decreased severity of allergic rhinitis. Decreased attacks of exercise-induced bronchoconstriction.

Pharmacokinetics

Absorption: Rapidly absorbed (63–73%) following oral administration.

Distribution: Unknown.

Protein Binding: 99%.

Metabolism and Excretion: Mostly metabolized by the liver (by P450 3A4 and 2C9 enzyme systems); metabolites eliminated in feces via bile; negligible renal excretion.

Half-life: 2.7–5.5 hr.

TIME/ACTION PROFILE (improved symptoms of asthma)

ROUTE	ONSET	PEAK†	DURATION
PO (swallow)	within 24 hr	3–4 hr	24 hr
PO (chew)	within 24 hr	2–2.5 hr	24 hr

†Blood levels.

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Acute attacks of asthma; Phenylketonuria (chewable tablets contain aspartame); Hepatic impairment (may need ↓ doses); Reduction of corticosteroid therapy (may ↑ the risk of eosinophilic conditions); **OB, Lactation, PEDI:** Pregnancy, lactation, or children <1 yr (safety not established).

Adverse Reactions/Side Effects

CNS: SUICIDAL BEHAVIORS/THOUGHTS, agitation, aggression, anxiety, attention disturbance, depression, disorientation, dream abnormalities, fatigue, hallucinations, headache, insomnia, irritability, memory impairment, restlessness, sleep walking, weakness. **EENT:** nosebleed, otitis (children), sinusitis (children). **Resp:** cough, rhinorrhea. **GI:** abdominal pain, diarrhea (children), dyspepsia, nausea (children), ↑ liver enzymes. **Neuro:** tics, tremor. **Derm:** STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, rash. **Misc:** eosinophilic conditions (including CHURG-STRAUSS SYNDROME), fever.

Interactions

Drug-Drug: Drugs which induce the CYP450 enzyme system (phenobarbital and rifampin) may ↓ the effects of montelukast.

Route/Dosage

Asthma and Allergic Rhinitis

PO (Adults and Children ≥14 yr): 10 mg once daily.

PO (Children 6–14 yr): 5 mg once daily (as chewable tablet).

PO (Children 2–5 yr): 4 mg once daily (as chewable tablet or granules).

PO (Children 6–23 months): 4 mg once daily (as oral granules).

Exercise-Induced Bronchoconstriction (EIB)

PO (Adults and Children ≥6 yrs): 10 mg at least 2 hr before exercise. Do not take within 24 hr of another dose; if taking daily doses, do not take dose for EIB.

Availability (generic available)

Tablets: 10 mg. **Cost:** Generic—\$169.72/30. **Chewable tablets (cherry flavor):** 4 mg, 5 mg. **Cost:** Generic—All strengths \$169.72/30. **Oral granules:** 4 mg/pkt. **Cost:** Generic—\$169.72/30 pkts.

NURSING IMPLICATIONS

Assessment

- Assess lung sounds and respiratory function prior to and periodically during therapy.
- Assess allergy symptoms (rhinitis, conjunctivitis, hives) before and periodically during therapy.
- **Monitor closely for changes in behavior that could indicate the emergence or worsening of depression or suicidal thoughts.**
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.
- **Lab Test Considerations:** May cause ↑ AST and ALT concentrations.

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)

Implementation

- Do not confuse Singulair with Sinequan.
- Doses of inhaled corticosteroids may be gradually decreased with supervision of health care professional; do not discontinue abruptly.
- **PO:** For asthma, administer once daily in the evening. For allergic rhinitis, may be administered at any time of day.
- Administer granules directly into mouth or mixed in a spoonful of cold or room temperature foods (use only applesauce, mashed carrots, rice, or ice cream). Do not open packet until ready to use. After opening packet, administer full dose within 15 min. Do not store mixture. Discard unused portion. Do not dissolve granules in fluid, but fluid may be taken following administration. Granules may be administered without regard to meals.

- **For Exercise Induced Bronchoconstriction:** Administer one tablet at least 2 hrs before exercise; do not take within 24 hr of another dose.

Patient/Family Teaching

- Instruct patient to take medication daily in the evening or at least 2 hr before exercise, even if not experiencing symptoms of asthma. Do not double doses. Do not discontinue therapy without consulting health care professional.
- Instruct patient not to discontinue or reduce other asthma medications without consulting health care professional.
- Advise patient that montelukast is not used to treat acute asthma attacks, but may be continued during an acute exacerbation. Patient should carry rapid-acting therapy for bronchospasm at all times. Advise patient to notify health care professional if more than the maximum number of short-acting bronchodilator treatments prescribed for a 24-hr period are needed.
- **Encourage patient and family to be alert for emergence of anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, mania, worsening of depression and suicidal ideation, especially during early antidepressant therapy. Assess symptoms on a day-to-day basis as changes may be abrupt. If these symptoms or rash occurs, notify health care professional.**

Evaluation/Desired Outcomes

- Prevention of and reduction in symptoms of asthma.
- Decrease in severity of allergic rhinitis.
- Prevention of exercise-induced bronchoconstriction.

Classification

Therapeutic: opioid analgesics

Pharmacologic: opioid agonists

Schedule II

Indications

Severe pain (the 20 mg/mL oral solution concentration should only be used in opioid-tolerant patients). Pain

severe enough to require daily, around-the-clock long-term opioid treatment and for which alternative treatment options are inadequate (extended-release). Pulmonary edema. Pain associated with MI.

Action

Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli while producing generalized CNS depression. **Therapeutic Effects:** Decrease in severity of pain. Addition of naltrexone in *Embeda* product is designed to prevent abuse or misuse by altering the formulation. Naltrexone has no effect unless the capsule is crushed or chewed.

Pharmacokinetics

Absorption: Variably absorbed (about 30%) following oral administration. More reliably absorbed from rectal, subcut, and IM sites. Following epidural administration, systemic absorption and absorption into the intrathecal space via the meninges occurs.

Distribution: Widely distributed. Crosses the placenta; enters breast milk in small amounts.

Protein Binding: Premature infants: <20%; Adults: 35%.

Metabolism and Excretion: Mostly metabolized by the liver. Active metabolites excreted renally.

Half-life: Premature neonates: 10–20 hr; Neonates: 7.6 hr; Infants 1–3 mo: 6.2 hr; Children 6 mo–2.5 yr: 2.9 hr; Children 3–6 yr: 1–2 hr; Children 6–19 yr with sickle cell disease: 1.3 hr; Adults: 2–4 hr.

TIME/ACTION PROFILE (analgesia)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	60 min	4–5 hr
PO-ER	unknown	3–4 hr	8–24 hr
IM	10–30 min	30–60 min	4–5 hr
Subcut	20 min	50–90 min	4–5 hr
Rect	unknown	20–60 min	3–7 hr
IV	rapid	20 min	4–5 hr
Epidural	6–30 min	1 hr	up to 24 hr
IT	rapid (min)	unknown	up to 24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Some products contain tartrazine, bisulfites, or alcohol and should be avoided in patients with known hypersensitivity; Acute, mild, intermittent, or postoperative pain (extended/sustained-release); Significant respiratory depression (extended-release); Acute or severe bronchial asthma (extended-release); Paralytic ileus (extended-release).

Use Cautiously in: Head trauma; ↑ intracranial pressure; Severe renal, hepatic, or pulmonary disease; Hypothyroidism; Seizure disorder; Adrenal insufficiency; History of substance abuse; Undiagnosed abdominal pain; Prostatic hyperplasia; Patients undergoing procedures that rapidly ↓ pain (cordotomy,

★ = Canadian drug name. ⚡ = Genetic implication. ~~Staxet~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

radiation); long-acting agents should be discontinued 24 hr before and replaced with short-acting agents; **Geriatric**: Geriatric or debilitated patients (\uparrow risk of respiratory depression; dose \downarrow suggested); **OB, Lactation**: Avoid chronic use; has been used during labor but may cause respiratory depression in the newborn; prolonged use of extended-release morphine during pregnancy can result in neonatal opioid withdrawal syndrome; **Pedi**: Neonates and infants <3 mo (more susceptible to respiratory depression); **Pedi**: Neonates (oral solution contains sodium benzoate which can cause potentially fatal gasping syndrome).

Adverse Reactions/Side Effects

CNS: confusion, sedation, dizziness, dysphoria, euphoria, floating feeling, hallucinations, headache, unusual dreams. **EENT**: blurred vision, diplopia, miosis.

Resp: **RESPIRATORY DEPRESSION**. **CV**: hypotension, bradycardia. **Endo**: adrenal insufficiency. **GI**: constipation, nausea, vomiting. **GU**: urinary retention.

Derm: flushing, itching, sweating. **Misc**: physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Use with **extreme caution** in patients receiving **MAO inhibitors** within 14 days prior (may result in unpredictable, severe reactions— \downarrow initial dose of morphine to 25% of usual dose). Use with **benzodiazepines** or other **CNS depressants** including **other opioids**, **non-benzodiazepine sedative/hypnotics**, **anxiolytics**, **general anesthetics**, **muscle relaxants**, **antipsychotics**, and **alcohol** may cause profound sedation, respiratory depression, coma, and death; reserve concurrent use for when alternative treatment options are inadequate. Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SSRIs**, **SNRIs**, **MAO inhibitors**, **TCAs**, **tramadol**, **trazodone**, **mirtazapine**, **5-HT₂ receptor antagonists**, **linezolid**, **methylene blue**, and **triptans** \uparrow risk of serotonin syndrome. Administration of **partial-antagonist opioid analgesics** may precipitate opioid withdrawal in physically dependent patients. **Buprenorphine**, **nalbuphine**, **butorphanol**, or **pentazocine** may \downarrow analgesia. May \uparrow the anticoagulant effect of **warfarin**. **Cimetidine** \downarrow metabolism and may \uparrow effects.

Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, or **chamomile** can \uparrow CNS depression.

Route/Dosage

Larger doses may be required during chronic therapy.

PO, Rect (Adults ≥ 50 kg): *Usual starting dose for moderate to severe pain in opioid-naïve patients*—30 mg q 3–4 hr initially or once 24-hr opioid requirement is determined, convert to extended-release morphine by administering total daily oral morphine dose every 24 hr (as **Kadian** or other ER capsules), 50% of the total daily oral morphine dose every 12 hr (as **Arymo ER**, **Kadian**, **Morphabond**, **MS Contin**), or 33%

of the total daily oral morphine dose every 8 hr (as **Arymo ER**, **MS Contin**). See equianalgesic chart, Appendix J. Dose of ER capsules (not **Kadian**) should not exceed 1600 mg/day because of fumaric acid in formulation.

PO, Rect (Adults and Children <50 kg): *Usual starting dose for moderate to severe pain in opioid-naïve patients*—0.3 mg/kg q 3–4 hr initially.

PO (Children >1 mo): *Prompt-release tablets and solution*—0.2–0.5 mg/kg/dose q 4–6 hr as needed. *Controlled-release tablet*—0.3–0.6 mg/kg/dose q 12 hr.

IM, IV, Subcut (Adults ≥ 50 kg): *Usual starting dose for moderate to severe pain in opioid-naïve patients*—4–10 mg q 3–4 hr. *MI*—8–15 mg, for very severe pain additional smaller doses may be given every 3–4 hr.

IM, IV, Subcut (Adults and Children <50 kg): *Usual starting dose for moderate to severe pain in opioid-naïve patients*—0.05–0.2 mg/kg q 3–4 hr, maximum: 15 mg/dose.

IM, IV, Subcut (Neonates): 0.05 mg/kg q 4–8 hr, maximum dose: 0.1 mg/kg. Use preservative-free formulation.

IV, Subcut (Adults): *Continuous infusion*—0.8–10 mg/hr; may be preceded by a bolus of 15 mg (infusion rates vary greatly; up to 80 mg/hr have been used).

IV, Subcut (Children >1 mo): *Continuous infusion, postoperative pain*—0.01–0.04 mg/kg/hr. *Continuous infusion, sickle cell or cancer pain*—0.02–2.6 mg/kg/hr.

IV (Neonates): *Continuous infusion*—0.01–0.03 mg/kg/hr.

Epidural (Adults): *Intermittent injection*—5 mg/day (initially); if relief is not obtained at 60 min, 1–2 mg increments may be made (total dose not to exceed 10 mg/day. *Continuous infusion*—2–4 mg/24 hr; may \uparrow by 1–2 mg/day (up to 30 mg/day).

Epidural (Children >1 mo): 0.03–0.05 mg/kg, maximum dose: 0.1 mg/kg or 5 mg/24 hr. Use preservative-free formulation.

IT (Adults): 0.2–1 mg. Use preservative-free formulation.

Availability (generic available)

Immediate-release tablets: 15 mg, 30 mg. **Cost**: *Generic*—15 mg \$22.17/100, 30 mg \$37.77/100. **Extended-release tablets (Arymo ER, abuse deterrent)**: 15 mg, 30 mg, 60 mg. **Extended-release tablets (MS Contin)**: 15 mg, 30 mg, 60 mg, 100 mg, 200 mg. **Cost**: *Generic*—15 mg \$167.57/100, 30 mg \$317.19/100, 60 mg \$532.39/100, 100 mg \$763.63/100, 200 mg \$1,838.19/100. **Extended-release tablets (Morphabond ER, abuse deterrent)**: 15 mg, 30 mg, 60 mg, 100 mg. **Extended-release capsules (Kadian)**: 10 mg, 20 mg, 30 mg, 40 mg, 50 mg, 60 mg, 70 mg, 80 mg, 100 mg, 130 mg, 150 mg, 200 mg. **Cost**: 10 mg \$609.60/100, 20 mg \$673.20/100, 30 mg \$732.00/100, 40 mg \$976.80/100, 50 mg \$1,224.00/

100, 60 mg \$1,465.20/100, 70 mg \$1,708.80/100, 80 mg \$1,951.20/100, 100 mg \$2,407.20/100, 130 mg \$3,182.40/100, 150 mg \$3,672.00/100, 200 mg \$4,946.40/100. **Extended-release capsules:** 30 mg, 45 mg, 60 mg, 75 mg, 90 mg, 120 mg. **Cost:** 30 mg \$606.31/100, 45 mg \$898.99/100, 60 mg \$1,177.88/100, 75 mg \$1,498.31/100, 90 mg \$1,770.29/100, 120 mg \$2,088.66/100. **Oral solution:** * 1 mg/mL, 2 mg/mL, 4 mg/mL, * 5 mg/mL, 20 mg/mL (concentrated). **Cost:** *Generic*—4 mg/mL \$17.51/100 mL, 20 mg/mL \$25.20/30 mL. **Rectal suppositories:** 5 mg, 10 mg, 20 mg, 30 mg. **Cost:** *Generic*—5 mg \$60.00/12, 10 mg \$75.00/12, 20 mg \$90.00/12, 30 mg \$112.50/12. **Solution for IM, subcut, IV injection:** 1 mg/mL, 2 mg/mL, 4 mg/mL, 5 mg/mL, 8 mg/mL, 10 mg/mL, 15 mg/mL, 25 mg/mL, 50 mg/mL. **Solution for epidural, IV injection (preservative-free):** 0.5 mg/mL, 1 mg/mL. **Solution for epidural or IT use (continuous microinfusion device; preservative-free):** 10 mg/mL, 25 mg/mL. **Solution for IV injection (PCA device):** 1 mg/mL, 2 mg/mL, 3 mg/mL, 5 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess type, location, and intensity of pain prior and 1 hr following PO, subcut, IM, and 20 min (peak) following IV administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief. When titrating doses of short-acting morphine, a repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal.
- Patients on a continuous infusion should have additional bolus doses provided every 15–30 min, as needed, for breakthrough pain. The bolus dose is usually set to the amount of drug infused each hour by continuous infusion.
- Patients taking extended-release morphine may require additional short-acting opioid doses for breakthrough pain. Doses of short-acting opioids should be equivalent to 10–20% of 24 hr total and given every 2 hr as needed.
- An equianalgesic chart (see Appendix J) should be used when changing routes or when changing from one opioid to another.
- **High Alert:** Assess level of consciousness, BP, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Physical stimulation may be sufficient to prevent significant hypoventilation. Subsequent doses may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use. **Ger:** Assess geriatric patients frequently; older

adults are more sensitive to the effects of opioid analgesics and may experience side effects and respiratory complications more frequently. **Pedi:** Assess pediatric patient frequently; children are more sensitive to the effects of opioid analgesics and may experience respiratory complications, excitability and restlessness more frequently.

- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive morphine for pain do not develop psychological dependence. Progressively higher doses may be required to relieve pain with long-term therapy.
- Assess bowel function routinely. Institute prevention of constipation with increased intake of fluids and bulk and with laxatives to minimize constipating effects. Administer stimulant laxatives routinely if opioid use exceeds 2–3 days, unless contraindicated.
- **Assess risk for opioid addiction, abuse, or misuse prior to administration. Abuse or misuse of extended-release preparations by crushing, chewing, snorting, or injecting dissolved product will result in uncontrolled delivery of morphine and can result in overdose and death.**
- **Lab Test Considerations:** May ↑ plasma amylase and lipase levels.
- **Toxicity and Overdose:** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by IV push every 2 min. For children and adults weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

Potential Nursing Diagnoses

Acute pain (Indications)
Chronic pain (Indications)
Risk for injury (Side Effects)

Implementation

- **High Alert:** Do not confuse MS Contin (morphine sulfate) with Oxycontin (oxycodone). Do not confuse morphine (non-concentrated oral liquid) with morphine (concentrated oral liquid).
- **High Alert:** Do not confuse morphine with hydromorphone—errors have resulted in death. Use only preservative-free formulations for neonates, and for epidural and intrathecal routes in all patients.
- Abuse deterrent: *Embeda* is an abuse deterrent formulation that contains naltrexone which remains inactive unless the product is crushed or diluted. *Morphabond ER* and *Arymo ER* are abuse deterrent

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

formulations that are difficult to crush and, if crushed result in a gel.

- Explain therapeutic value of medication prior to administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive analgesic effects and may permit lower doses.
- When transferring from other opioids or other forms of morphine to extended-release tablets, administer a total daily dose of oral morphine equivalent to previous daily dose (see Appendix J) and divided every 8 hr (MS Contin), every 12 hr (Embeda, Kadian, MS Contin), every 24 hr (Kadian).
- Morphine should be discontinued gradually to prevent withdrawal symptoms after long-term use.
- **PO:** Doses may be administered with food or milk to minimize GI irritation.
- Administer oral solution with properly calibrated measuring device; may be diluted in a glass of fruit juice just prior to administration to improve taste. Verify correct dose (mg) and correct volume (mL) prior to administration. Use an oral syringe when using 20 mg/mL concentration of oral solution.
- Swallow extended-release tablets whole; do not break, crush, dissolve, or chew (could result in rapid release and absorption of a potentially toxic dose).
- *Embeda* and *Kadian* capsules may be opened and the pellets sprinkled onto applesauce immediately prior to administration. Patients should rinse mouth and swallow to assure ingestion of entire dose. Pellets should not be chewed, crushed, or dissolved. *Kadian* capsules may also be opened and sprinkled on approximately 10 mL of water and flushed while swirling through a pre-wetted 16 French gastrostomy tube fitted with a funnel at the port end. Additional water should be used to transfer and flush any remaining pellets. *Kadian* should not be administered via a nasogastric tube.
- **Rect:** *MS Contin* has been administered rectally.
- **IM, Subcut:** Use IM route for repeated doses, because morphine is irritating to subcut tissues.

IV Administration

- **IV:** Solution is colorless; do not administer discolored solution.
- **IV Push:** **Diluent:** Dilute with at least 5 mL of sterile water or 0.9% NaCl for injection. **Concentration:** 0.5–5 mg/mL. **Rate:** **High Alert:** Administer 2.5–15 mg over 5 min. Rapid administration may lead to increased respiratory depression, hypotension, and circulatory collapse.
- **Continuous Infusion:** **Diluent:** May be added to D5W, D10W, 0.9% NaCl, 0.45% NaCl, Ringer's or LR, dextrose/saline solution, or dextrose/Ringer's or LR. **Concentration:** 0.1–1 mg/mL or greater for

continuous infusion. **Rate:** Administer via infusion pump to control the rate. Dose should be titrated to ensure adequate pain relief without excessive sedation, respiratory depression, or hypotension. May be administered via patient-controlled analgesia (PCA) pump.

- **Y-Site Compatibility:** acetaminophen, aldesleukin, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amsacrine, anakinra, anidulafungin, argatroban, ascorbic acid, atropine, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cisraccurium, cladrifene, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, epitifibatide, etapenem, erythromycin, esmolol, etomidate, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin calcium, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, methclorethamine, melfalan, meperidine, meprenem, mesna, methotrexate, methylodopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, phenobarbital, phenoltamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quinuapristin/dalfopristin, ranitidine, remifentanyl, rituximab, rocuronium, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vincorelline, vitamin B complex with C, voriconazole, warfarin, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** alemtuzumab, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, azathioprine, dantrolene,

doxorubicin liposomal, folic acid, ganciclovir, indomethacin, micafungin, mitomycin, pentamidine, pentobarbital, phenytoin, sargramostim, trastuzumab.

- **Epidural:** Administer undiluted. Do not use an in-line filter. Do not admix or administer other medications in epidural space for 48 hr after administration. Administer within 4 hr after removing from vial. Store in refrigerator; do not freeze.

Patient/Family Teaching

- Instruct patient how and when to ask for pain medication.
- May cause drowsiness or dizziness. Caution patient to call for assistance when ambulating or smoking and to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient that morphine is a drug with known abuse potential. Protect it from theft, and never give to anyone other than the individual for whom it was prescribed.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Encourage patients who are immobilized or on prolonged bedrest to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.
- Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- **Home Care Issues:** **High Alert:** Explain to patient and family how and when to administer morphine and how to care for infusion equipment properly. **Pedi:** Teach parents or caregivers how to accurately measure liquid medication and to use only the measuring device dispensed with the medication.
- Emphasize the importance of aggressive prevention of constipation with the use of morphine.

Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.
- Decrease in symptoms of pulmonary edema.

mupirocin (myoo-peer-oh-sin)

Bactroban, Bactroban Nasal, Centany

Classification

Therapeutic: anti-infectives

Indications

Topical: Treatment of: Impetigo, Secondarily infected traumatic skin lesions (up to 10 cm in length or 100 cm² area) caused by *Staphylococcus aureus* and

Streptococcus pyogenes. **Intranasal:** Eradicates nasal colonization with methicillin-resistant *S. aureus*.

Action

Inhibits bacterial protein synthesis. **Therapeutic Effects:** Inhibition of bacterial growth and reproduction.

Spectrum: Greatest activity against gram-positive organisms, including: *S. aureus*, Beta-hemolytic streptococci. Resolution of impetigo. Eradication of *S. aureus* carrier state.

Pharmacokinetics

Absorption: Minimal systemic absorption.

Distribution: Remains in the stratum corneum after topical use for prolonged periods of time (72 hr).

Metabolism and Excretion: Metabolized in the skin, removed by desquamation.

Half-life: 17–36 min.

TIME/ACTION PROFILE (anti-infective effect)

ROUTE	ONSET	PEAK	DURATION
Nasal	unknown	unknown	12 hr
Topical†	unknown	3–5 days	72 hr

†Resolution of lesions.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to mupirocin or polyethylene glycol.

Use Cautiously in: Renal impairment; Burn patients; **OB, Lactation:** Safety not established.

Adverse Reactions/Side Effects

CNS: *nasal only*—headache. **EENT:** *nasal only*—cough, itching, pharyngitis, rhinitis, upper respiratory tract congestion. **GI:** nausea; *nasal only*, altered taste.

Derm: *topical only*—burning, itching, pain, stinging.

Interactions

Drug-Drug: Nasal mupirocin should not be used concurrently with other **nasal products**.

Route/Dosage

Topical (Adults and Children ≥2 mo): Ointment: Apply 3–5 times daily for 5–14 days.

Topical (Adults and Children ≥3 mo): Cream: Apply small amount 3 times/day for 10 days.

Intranasal (Adults and Children ≥1 yr): Apply small amount nasal ointment to each nostril 2–4 times/day for 5–14 days.

Availability (generic available)

Ointment: 2%. **Cost:** *Generic*—\$17.20/22 g.

Cream: 2%. **Cost:** *Generic*—\$69.25/15 g. **Nasal**

ointment: 2%. **Cost:** \$14.14/1 g.

NURSING IMPLICATIONS

Assessment

- Assess lesions before and daily during therapy.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Potential Nursing Diagnoses

Impaired skin integrity (Indications)

Risk for infection (Indications, Patient/Family Teaching)

Implementation

- **Topical:** Wash affected area with soap and water and dry thoroughly. Apply a small amount of mupirocin to the affected area 3 times daily and rub in gently. Treated area may be covered with gauze if desired.
- **Nasal:** Apply one half of the ointment from the single-use tube to each nostril twice daily (morning and evening) for 5 days. After application, close nostrils by pressing together and releasing sides of the nose repeatedly for 1 min.

Patient/Family Teaching

- Instruct patient on the correct application of mupirocin. Advise patient to apply medication exactly as directed for the full course of therapy. If a dose is missed, apply as soon as possible unless almost time for next dose. Avoid contact with eyes.
- **Topical:** Teach patient and family appropriate hygienic measures to prevent spread of impetigo.
- Instruct parents to notify school nurse for screening and prevention of transmission.
- Patient should consult health care professional if symptoms have not improved in 3–5 days.

Evaluation/Desired Outcomes

- Healing of skin lesions. If no clinical response is seen in 3–5 days, condition should be re-evaluated.
- Eradication of methicillin-resistant *S. aureus* carrier state in patients and health care workers during institutional outbreaks.

REMS

mycophenolate mofetil
(mye-koe-fee-noe-late moe-fe-til)
CellCept

mycophenolic acid
(mye-koe-fee-noe-lik)
Myfortic

Classification

Therapeutic: immunosuppressants

Indications

Mycophenolate mofetil: Prevention of rejection in allogenic renal, hepatic, and cardiac transplantation (used concurrently with cyclosporine and corticosteroids). **Mycophenolic acid:** Prevention of rejection in allogenic renal transplantation (used concurrently with cyclosporine and corticosteroids). **Unlabeled Use:** Nephrotic syndrome.

Action

Inhibits the enzyme inosine monophosphate dehydrogenase, which is involved in purine synthesis. This inhibition

results in suppression of T- and B-lymphocyte proliferation. **Therapeutic Effects:** Prevention of heart, kidney, or liver transplant rejection.

Pharmacokinetics

Absorption: Following oral and IV administration, mycophenolate mofetil is rapidly hydrolyzed to mycophenolic acid (MPA), the active metabolite. Absorption of enteric-coated mycophenolic acid (Myfortic) is delayed compared with mycophenolate mofetil (CellCept).

Distribution: Cross the placenta and enter breast milk.

Protein Binding: MPA—97%.

Metabolism and Excretion: MPA is extensively metabolized; <1% excreted unchanged in urine. Some enterohepatic recirculation of MPA occurs.

Half-life: MPA—8–18 hr.

TIME/ACTION PROFILE (blood levels of MPA)

ROUTE	ONSET	PEAK	DURATION
mycophenolate mofetil-PO	rapid	0.25–1.25 hr	NA
mycophenolic acid	rapid	1.5–2.75 hr	NA

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity to polysorbate 80 (for IV mycophenolate mofetil); **OB, Lactation:** ↑ risk of congenital anomalies or spontaneous abortion.

Use Cautiously in: Active serious pathology of the GI tract (including history of ulcer disease or GI bleeding); Phenylketonuria (oral suspension contains aspartame); Severe chronic renal impairment (dose not to exceed 1 g twice daily (CellCept) if $\text{CCr} < 25 \text{ mL/min/1.73 m}^2$); careful monitoring recommended; Delayed graft function following transplantation (observe for ↑ toxicity); **Geri:** ↑ risk of adverse reactions related to immunosuppression; **Rep:** Women with childbearing potential; **Pedi:** Mycophenolate mofetil approved in children ≥ 3 mo for renal transplant; mycophenolic acid approved in children ≥ 5 yr for renal transplant; safety not established for other age groups.

Adverse Reactions/Side Effects

CNS: PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY (PML), anxiety, dizziness, headache, insomnia, paresthesia, tremor. **CV:** edema, hypertension, hypotension, tachycardia. **Derm:** rashes. **Endo:** hypercholesterolemia, hyperglycemia, hyperkalemia, hypocalcemia, hypokalemia, hypomagnesemia. **GI:** GI BLEEDING, anorexia, constipation, diarrhea, nausea, vomiting, abdominal pain. **GU:** renal dysfunction. **Hemat:** leukocytosis, leukopenia, thrombocytopenia, anemia, pure red cell aplasia. **Resp:** cough, dyspnea. **Misc:** fever, infection (including activation of latent viral infections)

such as Polyomavirus-associated nephropathy or Hepatitis B/C), ↑ risk of malignancy.

Interactions

Drug-Drug: Combined use with **azathioprine** is not recommended (effects unknown). **Acyclovir** and **ganciclovir** compete with MPA for renal excretion and, in patients with renal dysfunction, may ↑ each other's toxicity. **Magnesium and aluminum hydroxide** antacids ↓ the absorption of MPA (avoid simultaneous administration). **Proton pump inhibitors**, including **dexlansoprazole**, **esomeprazole**, **lansoprazole**, **omeprazole**, **pantoprazole**, and **rabeprazole** may ↓ levels. **Cholestyramine** and **colestipol** ↓ the absorption of MPA (avoid concurrent use). May ↓ the effectiveness of **oral contraceptives** (additional contraceptive method should be used). May ↓ the antibody response to and ↑ risk of adverse reactions from **live-virus vaccines**, although influenza vaccine may be useful. **Amoxicillin/clavulanic acid** or **ciprofloxacin** may ↓ MPA trough levels. **Cyclosporine** may ↓ levels; use caution when discontinuing cyclosporine (may ↑ mycophenolate levels) or when switching from cyclosporine to another immunosuppressant, such as tacrolimus or belatacept. **Telmisartan** may ↓ levels.

Drug-Food: When administered with food, peak blood levels of MPA are significantly ↓ (should be administered on an empty stomach).

Route/Dosage

Mycophenolate Mofetil

Renal Transplantation

PO, IV (Adults): 1 g twice daily; IV should be started ≤ 24 hr after transplantation and switched to PO as soon as possible (IV not recommended for ≥ 14 days).
PO (Children 3 mo–18 yr): 600 mg/m² twice daily (not to exceed 2 g/day).

Hepatic Transplantation

PO, IV (Adults): 1 g twice daily IV, or 1.5 g twice daily PO. IV should be started ≤ 24 hr after transplantation and switched to PO as soon as possible (IV not recommended for ≥ 14 days).

Cardiac Transplantation

PO, IV (Adults): 1.5 g twice daily; IV should be started ≤ 24 hr after transplantation and switched to PO as soon as possible (IV not recommended for ≥ 14 days).

Nephrotic syndrome

PO (Children): *Frequent relapses*—12.5–18 mg/kg/dose twice daily; maximum: 2 g/day. *Steroid-dependent*—12–18 mg/kg/dose or 600 mg/m² twice daily; maximum: 2 g/day.

Renal Impairment

PO, IV (Adults): *CCr <25 mL/min*—daily dose should not exceed 2 g.

Mycophenolic Acid

Mycophenolate mofetil and mycophenolic acid should not be used interchangeably without the advice of a health care professional.

Renal Transplantation

PO (Adults): 720 mg twice daily.

PO (Children 5–16 yr and ≥ 1.19 m²): 400–450 mg/m² twice daily (not to exceed 720 mg twice daily).

Availability (generic available)

Mycophenolate Mofetil

Capsules: 250 mg. **Tablets:** 500 mg. **Oral suspension (fruit flavor):** 200 mg/mL. **Powder for injection (requires reconstitution):** 500 mg/vial.

Mycophenolic Acid

Delayed-release tablets: 180 mg, 360 mg.

NURSING IMPLICATIONS

Assessment

- Assess for symptoms of organ rejection throughout therapy.
- Assess for signs of PML (hemiparesis, apathy, confusion, cognitive deficiencies, and ataxia) periodically during therapy.
- **Lab Test Considerations:** Obtain a urine pregnancy test with a specificity of 25 mIU/mL immediately prior to beginning therapy and again 8–10 days later. Repeat pregnancy tests should be performed during routine follow-up visits.
- Monitor CBC with differential weekly during the 1st month, twice monthly for the 2nd and 3rd mo of therapy, and then monthly during the 1st yr. Neutropenia occurs most frequently from 31–180 days post-transplant. If ANC is $<1000/\text{mm}^3$, dose should be reduced or discontinued.
- Monitor hepatic and renal status and electrolytes periodically during therapy. May cause ↑ serum alkaline phosphatase, AST, ALT, LDH, BUN, and creatinine. May also cause hyperkalemia, hypokalemia, hypocalcemia, hypomagnesemia, hyperglycemia, and hyperlipidemia.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)

Implementation

- The initial dose of mycophenolate (usually IV) should be given within 24 hr of transplant.
- Women of childbearing yr should have a negative serum or urine pregnancy test within 1 wk prior to initiation of therapy.
- Mycophenolate mofetil (Cellcept) and mycophenolic acid (Myfortic) are not interchangeable; rate of absorption is different.
- **PO:** Administer on an empty stomach, 1 hr before or 2 hr after meals. Capsules and delayed-release tab-

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

lets should be swallowed whole; do not open, crush, or chew. Mycophenolate may be teratogenic; contents of capsules should not be inhaled or come in contact with skin or mucous membranes.

- Do not administer mycophenolate concurrently with antacids containing magnesium or aluminum.

IV Administration

- **IV:** IV route should only be used for patients unable to take oral medication and should be switched to oral dose form as soon as patient can tolerate capsules or tablets.
- **Intermittent Infusion:** **Diluent:** Reconstitute each vial with 14 mL of D5W. Shake gently to dissolve. Solution is slightly yellow; discard if solution is discolored or contains particulate matter. Dilute contents of 2 vials (1-g dose) further with 140 mL of D5W or 3 vials (1.5-g dose) with 210 mL of D5W. **Concentration:** 6 mg/mL. Solution is stable for 4 hr. **Rate:** Administer via slow IV infusion over 2 hr. Do not administer as a bolus or via rapid infusion.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, amikacin, amiodarone, anidulafungin, argatroban, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride, caspofungin, chlorpromazine, ciprofloxacin, cisatracurium, daptomycin, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, dolasetron, dopamine, doxorubicin liposomal, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, erythromycin, esmolol, famotidine, fenoldopam, fentanyl, fluconazole, gentamicin, glycopyrrolate, granisetron, haloperidol, hydralazine, hydromorphone, insulin, isoproterenol, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, mesna, methyldopate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, morphine, moxifloxacin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nor-epinephrine, octreotide, ondansetron, oxytocin, pamidronate, pancuronium, pentamidine, phenylephrine, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, ranitidine, remifentanyl, rocuronium, succinylcholine, sufentanil, tacrolimus, theophylline, tigecycline, tirofiban, tobramycin, vancomycin, vasopressin, vecuronium, verapamil, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** acyclovir, allopurinol, amifostine, aminophylline, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, azithromycin, aztreonam, calcium gluconate, cangrelor, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, clindamycin, dantrolene, dexamethasone, diazepam, etipibatid, foscarnet, fosphenytoin, furosemide, ganciclovir, heparin, hydrocortisone, imipenem/

cilastatin, ketorolac, meropenem, methotrexate, methylprednisolone, micafungin, nafcilin, nitroprusside, pantoprazole, pentobarbital, phenobarbital, phenytoin, piperacillin/tazobactam, potassium acetate, potassium phosphates, sodium acetate, sodium phosphates, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day. Take missed dose as soon as remembered, but not if almost time for next dose. Do not skip or double up on missed doses. Do not discontinue without consulting health care professional.
- Reinforce the need for lifelong therapy to prevent transplant rejection. Review symptoms of rejection for the transplanted organ, and stress need to notify health care professional immediately if signs of rejection or infection occur.
- Instruct patient to notify health care professional immediately if signs and symptoms of infection (temperature $\geq 100.5^{\circ}\text{F}$, cold symptoms [runny nose, sore throat], flu symptoms [upset stomach, stomach pain, vomiting, diarrhea], earache or headache, pain during urination, frequent urination, white patches in mouth or throat, unexpected bruising or bleeding, cuts, scrapes, or incisions that are red, warm, and oozing pus) or PML.
- Advise patient to avoid contact with persons with contagious diseases.
- Advise patient to avoid vaccinations with live attenuated virus during therapy.
- Inform patient of the increased risk of lymphoma and other malignancies. Advise patient to use sunscreen and wear protective clothing to decrease risk of skin cancer.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- **Rep:** Inform female patients of the importance of simultaneously using two reliable forms of contraception, unless abstinence is the chosen method, prior to beginning, during, and for 6 wk following discontinuation of therapy and to avoid breast feeding. Discuss acceptable forms of contraception with health care professional. Encourage patients who become pregnant during or within 6 wk after therapy to enroll in the Pregnancy Registry by calling 1–800–617–8191 to help the Health Care Community better understand the effects of mycophenolate during pregnancy.
- Emphasize the importance of routine follow-up laboratory tests.

Evaluation/Desired Outcomes

- Prevention of rejection of transplanted organs.

nadolol (nay-doe-lole)Corgard,  Syn-Nadolol**Classification**Therapeutic: antihypertensives
Pharmacologic: beta blockers**Indications**

Management of hypertension. Management of angina pectoris. **Unlabeled Use:** Arrhythmias. Migraine prophylaxis. Tremors (essential, lithium-induced, parkinsonian). Aggressive behavior. Antipsychotic-associated akathisia. Situational anxiety. Esophageal varices. Reduction of intraocular pressure.

Action

Blocks stimulation of beta₁ (myocardial) and beta₂ (pulmonary, vascular, and uterine) receptor sites.

Therapeutic Effects: Decreased heart rate and BP.

Pharmacokinetics

Absorption: 30% absorbed after oral administration.

Distribution: Minimal penetration of the CNS. Crosses the placenta and enters breast milk.

Metabolism and Excretion: 70% excreted unchanged by the kidneys.

Half-life: 10–24 hr (↑ in renal impairment).

TIME/ACTION PROFILE (antihypertensive effects)

ROUTE	ONSET	PEAK	DURATION
PO†	up to 5 days	6–9 days	24 hr

†With chronic dosing.

Contraindications/Precautions

Contraindicated in: Uncompensated HF; Pulmonary edema; Cardiogenic shock; Bradycardia or heart block.

Use Cautiously in: Renal impairment (CCr <50 mL/min); Hepatic impairment; Pulmonary disease (including asthma); Diabetes mellitus (may mask signs of hypoglycemia); Thyrotoxicosis (may mask symptoms); Patients with a history of severe allergic reactions (intensity of reactions may be ↑); **OB:** Crosses the placenta and may cause fetal/neonatal bradycardia, hypotension, hypoglycemia, or respiratory depression; **Lactation, Pedi:** Safety not established; **Geri:** ↑ sensitivity to beta blockers; initial dose ↓ recommended.

Adverse Reactions/Side Effects

CNS: fatigue, weakness, anxiety, depression, dizziness, drowsiness, insomnia, memory loss, mental status changes, nightmares. **EENT:** blurred vision, dry eyes, nasal stuffiness. **Resp:** bronchospasm, wheezing. **CV:** **ARRHYTHMIAS, BRADYCARDIA, HF, PULMONARY EDEMA, or-**

thostatic hypotension, peripheral vasoconstriction. **GI:** constipation, diarrhea, nausea. **GU:** erectile dysfunction, ↓ libido. **Derm:** itching, rashes. **Endo:** hyperglycemia, hypoglycemia. **MS:** arthralgia, back pain, muscle cramps. **Neuro:** paresthesia. **Misc:** drug-induced lupus syndrome.

Interactions

Drug-Drug: **General anesthesia, IV phenytoin, diltiazem, and verapamil** may cause additive myocardial depression. Additive bradycardia may occur with **digoxin**. Additive hypotension may occur with other **antihypertensives**, acute ingestion of **alcohol**, or **nitrates**. Concurrent use with **amphetamines, cocaine, ephedrine, epinephrine, norepinephrine, phenylephrine, or pseudoephedrine** may result in unopposed alpha-adrenergic stimulation (excessive hypertension, bradycardia). Concurrent use with **clonidine** ↑ hypotension and bradycardia. Concurrent **thyroid** administration may ↓ effectiveness. May alter the effectiveness of **insulins** or **oral hypoglycemic agents** (dosage adjustments may be necessary). May ↓ the effectiveness of **theophylline**. May ↓ the effects of **dopamine** or **dobutamine**. Use cautiously within 14 days of **MAO inhibitor therapy** (may result in hypertension). Concurrent **NSAIDs** may ↓ anti-hypertensive action.

Route/Dosage

PO (Adults): *Antianginal*—40 mg once daily initially; may ↑ by 40–80 mg/day q 3–7 days as needed (up to 240 mg/day). *Antihypertensive*—40 mg once daily initially; may ↑ by 40–80 mg/day q 7 days as needed (up to 320 mg/day).

Renal Impairment

PO (Adults): *CCr 31–50 mL/min*—↑ dosing interval to 24–36 hr; *CCr 10–30 mL/min*—↑ dosing interval to 24–48 hr; *CCr <10 mL/min*—↑ dosing interval to 40–60 hr.

Availability (generic available)

Tablets: 20 mg, 40 mg, 80 mg. **In combination with:** bendroflumethiazide (Corzide). See Appendix B.

NURSING IMPLICATIONS**Assessment**

- Monitor BP and pulse frequently during dose adjustment and periodically during therapy. Assess for orthostatic hypotension when assisting patient up from supine position.
- Monitor intake and output ratios and daily weight. Assess patient routinely for evidence of fluid overload (peripheral edema, dyspnea, rales/crackles, fatigue, weight gain, jugular venous distention).
- **Hypertension:** Check frequency of refills to determine compliance.

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- **Angina:** Assess frequency and characteristics of angina periodically during therapy.
- **Lab Test Considerations:** May cause increased BUN, serum lipoprotein, potassium, triglyceride, and uric acid levels.
- May cause increased ANA titers.
- May cause increase in blood glucose levels.
- **Toxicity and Overdose:** Monitor patients receiving beta blockers for signs of overdose (bradycardia, severe dizziness or fainting, severe drowsiness, dyspnea, bluish fingernails or palms, seizures). Notify physician or other health care professional immediately if these signs occur.

Potential Nursing Diagnoses

Decreased cardiac output (Side Effects)

Noncompliance (Patient/Family Teaching)

Implementation

- Discontinuation of concurrent clonidine should be done gradually, with beta blocker discontinued first; then, after several days, discontinue clonidine.
- **PO:** Take apical pulse before administering. If <50 bpm or if arrhythmia occurs, withhold medication and notify physician or other health care professional.
- May be administered with food or on an empty stomach.
- Tablets may be crushed and mixed with food.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed, at the same time each day, even if feeling well; do not skip or double up on missed doses. Take missed doses as soon as possible up to 8 hr before next dose. **Abrupt withdrawal may precipitate life-threatening arrhythmias, hypertension, or myocardial ischemia.**
- Advise patient to ensure that enough medication is available for weekends, holidays, and vacations. A written prescription may be kept in wallet for emergencies.
- **Teach patient and family how to check pulse and BP. Instruct them to check pulse daily and BP biweekly. Advise patient to hold dose and contact health care professional if pulse is <50 bpm or if BP changes significantly.**
- May cause drowsiness or dizziness. Caution patients to avoid driving or other activities that require alertness until response to the drug is known.
- Advise patients to make position changes slowly to minimize orthostatic hypotension, especially during initiation of therapy or when dose is increased.
- Caution patient that this medication may increase sensitivity to cold.
- Instruct patient to consult health care professional before taking any OTC medications, especially cold preparations, concurrently with this medication.
- Patients with diabetes should closely monitor blood glucose, especially if weakness, malaise, irritability,

or fatigue occurs. Medication may mask some signs of hypoglycemia, but dizziness and sweating may still occur.

- Advise patient to notify health care professional if slow pulse, difficulty breathing, wheezing, cold hands and feet, dizziness, confusion, depression, rash, fever, sore throat, unusual bleeding, or bruising occurs.
- Instruct patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- **Hypertension:** Reinforce the need to continue additional therapies for hypertension (weight loss, sodium restriction, stress reduction, regular exercise, moderation of alcohol consumption, and smoking cessation). Medication controls but does not cure hypertension.
- **Angina:** Caution patient to avoid overexertion with decrease in chest pain.

Evaluation/Desired Outcomes

- Decrease in BP.
- Reduction in frequency of angina.
- Increase in activity tolerance. May require up to 5 days before therapeutic effects are seen.

nafarelin (na-fare-e-lin)

Synarel

Classification

Therapeutic: hormones

Pharmacologic: gonadotropin-releasing hormones

Indications

Endometriosis. Central precocious puberty (gonadotropin-dependent) in children.

Action

Acts as a synthetic analogue of gonadotropin-releasing hormone (GnRH). Initially increases pituitary production of luteinizing hormone (LH) and follicle-stimulating hormone (FSH), which cause ovarian steroid production. Chronic administration leads to decreased production of gonadotropins. Endometriotic lesions are sensitive to ovarian hormones. **Therapeutic Effects:** Reduction in lesions and associated pain in endometriosis. Arrest and regression of puberty in children with central precocious puberty.

Pharmacokinetics

Absorption: Well absorbed following intranasal administration.

Distribution: Unknown.

Metabolism and Excretion: 20–40% excreted in feces; 3% excreted unchanged by the kidneys.

Half-life: 3 hr.

TIME/ACTION PROFILE (↓ ovarian steroid production)

ROUTE	ONSET	PEAK	DURATION
Intranasal	within 4 wk	3–4 wk	3–6 mo†

†Relief of symptoms of endometriosis following discontinuation.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to GnRH, its analogues, or sorbitol; **OB, Lactation:** Pregnancy or lactation.

Use Cautiously in: Rhinitis; Seizures, cerebrovascular disorders, CNS tumor, or concurrent use of bupropion or selective serotonin reuptake inhibitors.

Adverse Reactions/Side Effects

CNS: SEIZURES, STROKE, headaches, aggression, anger, depression, impatience, irritability, insomnia. **EENT:** nasal irritation. **CV:** MYOCARDIAL INFARCTION, edema.

GU: vaginal dryness. **Derm:** acne, hirsutism, seborrhea. **Endo:** cessation of menses, impaired fertility, ↓ breast size. **Metab:** hyperglycemia. **MS:** ↓ bone density, myalgia. **Misc:** ↓ libido, hot flashes, hypersensitivity reactions, weight gain.

Interactions

Drug-Drug: Concurrent topical nasal decongestants may ↓ absorption of nafarelin (administer decongestant at least 2 hr after nafarelin). Concurrent use with bupropion or SSRIs may ↑ risk of seizures.

Route/Dosage

Intranasal (Adults): Endometriosis—1 spray (200 mcg) in 1 nostril in the morning and 1 spray in the other nostril in the evening (400 mcg/day). May ↑ to 1 spray in each nostril in the morning and evening (800 mcg/day).

Intranasal (Children): Central precocious puberty—2 sprays in each nostril in the morning and in the evening (1600 mcg/day); may ↑ up to 1800 mcg/day (3 sprays in alternating nostrils 3 times daily).

Availability

Nasal spray: 2 mg/mL (200 mcg/spray).

NURSING IMPLICATIONS

Assessment

- **Endometriosis:** Assess patient for endometriotic pain periodically during therapy.
- **Central Precocious Puberty:** Prior to therapy, a complete physical and endocrinologic examination including height, weight, hand and wrist x-ray, total sex steroid level (estradiol or testosterone), adrenal steroid level, beta human chorionic gonadotropin level, GnRH stimulation test, pelvic/adrenal/testicular ultrasound, and CT of the head must be per-

formed. These parameters are monitored after 6–8 wk and every 3–6 mo during therapy.

- Assess patient for signs of precocious puberty (menses, breast development, testicular growth) periodically during therapy.
- Nafarelin is discontinued when the onset of normal puberty is desired. Monitor the onset of normal puberty and assess menstrual cycle, reproductive function, and final adult height.

Potential Nursing Diagnoses

Acute pain (Indications)

Sexual dysfunction (Indications, Side Effects)

Implementation

- **Endometriosis:** Treatment should be started between days 2 and 4 of the menstrual cycle and continued for up to 6 mo.

Patient/Family Teaching

- Instruct patient on the correct technique for nasal spray: The head should be tilted back slightly; wait 30 sec between sprays.
- Advise patient to consult health care professional if rhinitis occurs during therapy. If a topical decongestant is needed, do not use decongestant until 2 hr after nafarelin dosing. If possible, avoid sneezing during and immediately after nafarelin dose.
- **Endometriosis:** Inform patient that 1 spray should be administered into 1 nostril in the morning and 1 spray into the other nostril in the evening for the 400 mcg/day dose. If dose is increased to 800 mcg/day, administer 1 spray to each nostril (2 sprays) morning and evening; 1 bottle should provide a 30-day supply at the 400 mcg/day dose.
- Advise patient to use a form of contraception other than oral contraceptives during therapy. Inform patient that amenorrhea is expected. Instruct patient to notify health care professional if regular menstruation persists or if successive doses are missed.
- Advise patient that medication may cause hot flashes. Notify health care professional if these become bothersome.
- **Central Precocious Puberty:** Instruct patient on correct timing and number of sprays. The 1600 mcg/day dose is achieved by 2 sprays to each nostril in the morning (4 sprays) and 2 sprays to each nostril in the evening (4 sprays), for a total of 8 sprays. The 1800 mcg/day dose is achieved by 3 sprays into alternating nostrils 3 times per day, for a total of 9 sprays. Inform patient and parents that if doses are not taken as directed pubertal process may be reactivated. One bottle should provide a 7-day supply at the 1600 mcg/day dose.
- Advise patient and parents that during 1st mo of therapy some signs of puberty (vaginal bleeding, breast enlargement) may occur. These should re-

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

solve after the 1st mo of therapy. If these signs persist after the 2nd mo of therapy, notify health care professional.

Evaluation/Desired Outcomes

- Reduction in lesions and associated pain in endometriosis.
- Resolution of the signs of precocious puberty.

nalbuphine, See PENICILLINS, PENICILLINASE RESISTANT.

naftifine, See ANTIFUNGALS (TOPICAL).

HIGH ALERT

nalbuphine (nal-byoo-feen)

★ Nubain

Classification

Therapeutic: opioid analgesics

Pharmacologic: opioid agonists/analgesics

Indications

Moderate to severe pain. Also provides: Analgesia during labor, Sedation before surgery, Supplement to balanced anesthesia.

Action

Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli while producing generalized CNS depression. In addition, has partial antagonist properties, which may result in opioid withdrawal in physically dependent patients. **Therapeutic Effects:** Decreased pain.

Pharmacokinetics

Absorption: Well absorbed after IM and subcut administration.

Distribution: Probably crosses the placenta and enters breast milk.

Protein Binding: 50%.

Metabolism and Excretion: Mostly metabolized by the liver and eliminated in the feces via biliary excretion. Minimal amounts excreted unchanged by the kidneys.

Half-life: Children 1–8 yrs: 0.9 hr; Adults: 3.5–5 hr.

TIME/ACTION PROFILE (analgesia)

ROUTE	ONSET	PEAK	DURATION
IM	<15 min	60 min	3–6 hr
Subcut	<15 min	unknown	3–6 hr
IV	2–3 min	30 min	3–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to nalbuphine or bisulfites; Patients physically dependent on opioids

and who have not been detoxified (may precipitate withdrawal).

Use Cautiously in: Head trauma; ↑ intracranial pressure; Severe renal, hepatic, or pulmonary disease; Hypothyroidism; Adrenal insufficiency; Alcoholism; Undiagnosed abdominal pain; Prostatic hyperplasia; Patients who have recently received opioid agonists; **OB:** Has been used during labor but may cause respiratory depression in the newborn; prolonged use of opioids during pregnancy can result in neonatal opioid withdrawal syndrome; **Lactation:** May cause respiratory depression and excessive sedation in infant; **Geri:** Dose ↓ suggested; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: dizziness, headache, sedation, confusion, dysphoria, euphoria, floating feeling, hallucinations, unusual dreams. **Endo:** adrenal insufficiency. **EENT:** blurred vision, diplopia, miosis (high doses). **Resp:** respiratory depression. **CV:** hypertension, orthostatic hypotension, palpitations. **GI:** dry mouth, nausea, vomiting, constipation, ileus. **GU:** urinary urgency. **Derm:** clammy feeling, sweating. **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Use with extreme caution in patients receiving **MAO inhibitors** (may result in unpredictable, severe reactions—↓ initial dose of nalbuphine to 25% of usual dose). Use with **benzodiazepines** or other **CNS depressants** including other **opioids, non-benzodiazepine sedative/hypnotics, anxiolytics, general anesthetics, muscle relaxants, antipsychotics, and alcohol** may cause profound sedation, respiratory depression, coma, and death; reserve concurrent use for when alternative treatment options are inadequate. May precipitate withdrawal in patients who are physically dependent on **opioid agonists**. Avoid concurrent use with other **opioid analgesic agonists** (may diminish analgesic effect). Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants, SSRIs, SNRIs, MAO inhibitors, TCAs, tramadol, trazodone, mirtazapine, 5-HT₃ receptor antagonists, linezolid, methylene blue, and triptans** ↑ risk of serotonin syndrome.

Drug-Natural Products: Concomitant use of **kava-kava, valerian, skullcap, chamomile, or hops** can ↑ CNS depression.

Route/Dosage

Analgesia

IM, Subcut, IV (Adults): Usual dose is 10 mg q 3–6 hr (maximum: 20 mg/dose or 160 mg/day).

IM, Subcut, IV (Children): 0.1–0.15 mg/kg q 3–6 hr (maximum: 20 mg/dose or 160 mg/day).

Supplement to Balanced Anesthesia

IV (Adults): *Initial*—0.3–3 mg/kg over 10–15 min. *Maintenance*—0.25–0.5 mg/kg as needed.

Availability (generic available)

Solution for injection: 10 mg/mL, 20 mg/mL.

NURSING IMPLICATIONS**Assessment**

- Assess type, location, and intensity of pain before and 1 hr after IM or 30 min (peak) after IV administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numeric or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal. Patients requiring doses higher than 20 mg should be converted to an opioid agonist. Nalbuphine is not recommended for prolonged use or as first-line therapy for acute or cancer pain.
- An equianalgesic chart (see Appendix J) should be used when changing routes or when changing from one opioid to another.
- Assess BP, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Physical stimulation may be sufficient to prevent significant hypoventilation. Dose may need to be decreased by 25–50%. Nalbuphine produces respiratory depression, but this does not markedly increase with increased doses.
- Assess previous analgesic history. Antagonistic properties may induce withdrawal symptoms (vomiting, restlessness, abdominal cramps, and increased BP and temperature) in patients physically dependent on opioids.
- Although this drug has a low potential for dependence, prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive nalbuphine for pain do not develop psychological dependence. If tolerance develops, changing to an opioid agonist may be required to relieve pain.
- **Assess risk for opioid addiction, abuse, or misuse prior to administration.**
- **Lab Test Considerations:** May cause ↑ serum amylase and lipase concentrations.
- **Toxicity and Overdose:** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

Potential Nursing Diagnoses

Acute pain (Indications)

Risk for injury (Side Effects)

Disturbed sensory perception (visual, auditory) (Side Effects)

Implementation

- **High Alert:** Do not confuse nalbuphine with naloxone.
- Explain therapeutic value of medication before administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if administered before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive effects and permit lower opioid doses.
- **IM:** Administer deep into well-developed muscle. Rotate sites of injections.

IV Administration

- **IV Push:** May give IV undiluted.
- **Concentration:** 10–20 mg/mL. **Rate:** Administer slowly, each 10 mg over 3–5 min.
- **Y-Site Compatibility:** acetaminophen, alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, argatroban, atropine, azithromycin, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, cefazolin, cefotaxime, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chlorpromazine, cisatracurium, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, dolasetron, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, epifibatidate, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, idarubicin, ifosfamide, insulin, irinotecan, isoproterenol, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, mesna, methylodopate, metoclopramide, metoprolol, midazolam, milrinone, mitoxantrone, morphine, multivitamins, mycophenolate, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palosetron, pamidronate, pancuronium, papaverine, penicillin G, phentolamine, phenylephrine, phytonadione, potassium acetate, potassium chloride, procainamide, prochlor-

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

perazine, promethazine, propofol, propranolol, protamine, pyridoxine, ranitidine, remifentanyl, rituximab, rocuronium, sodium acetate, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zoledronic acid.

- **Y-Site Incompatibility:** alemtuzumab, allopurinol, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, cefepime, chloramphenicol, cyclosporine, dantrolene, diazepam, docetaxel, folic acid, furosemide, ganciclovir, hydrocortisone, imipenem/cilastatin, indomethacin, ketorolac, methotrexate, methylprednisolone, mitomycin, pantoprazole, pemetrexed, pentamidine, pentobarbital, phenobarbital, phenytoin, piperacillin/tazobactam, sargramostim, sodium bicarbonate, streptokinase, trastuzumab, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Instruct patient on how and when to ask for pain medication.
- May cause drowsiness or dizziness. Advise patient to call for assistance when ambulating and to avoid driving or other activities requiring alertness until response to the medication is known.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may decrease dry mouth.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.
- Advise patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in severity of pain without significant alteration in level of consciousness or respiratory status.

naldemedine (nal-dem-e-deen)

Symproic

Classification

Therapeutic: laxatives

Pharmacologic: opioid antagonists

Schedule II

Indications

Treatment of opioid-induced constipation (OIC) in patients with chronic non-cancer pain, including those with chronic pain related to prior cancer or its treatment who do not require frequent (e.g., weekly) opioid dosage escalation.

Action

Acts peripherally as a mu-opioid receptor antagonist, blocking opioid effects on the GI tract. **Therapeutic Effects:** Blocks constipating effects of opioids on the GI tract without loss of analgesia.

Pharmacokinetics

Absorption: Rapidly absorbed; absorption delayed by high-fat meal by 2 hr.

Distribution: Moderate tissue distribution, does not cross the blood-brain barrier.

Protein Binding: 93–94%.

Metabolism and Excretion: Primarily metabolized by CYP3A to an active metabolite (nor-naldemedine); 57% excreted in urine (16–18% as unchanged drug), 35% excreted in feces.

Half-life: 11 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	0.75 hr	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Known/suspected mechanical GI obstruction; ↑ risk of recurrent GI obstruction; Severe hepatic impairment; **Lactation:** Discontinue breast feeding or the naldemedine.

Use Cautiously in: Known/suspected lesions of GI tract (↑ risk for GI perforation); Receiving opioids for <4 wk (may be less responsive to naldemedine); **OB:** Use only if potential benefit outweighs potential risk to fetus; may cause opioid withdrawal in fetus; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

GI: GI PERFORATION, abdominal pain, diarrhea, nausea, vomiting. **Misc:** opioid withdrawal.

Interactions

Drug-Drug: Strong CYP3A inducers, including carbamazepine, phenytoin, or rifampin, may ↓ naldemedine levels and its effectiveness; avoid concurrent use. Other opioid antagonists may cause additive effects and ↑ risk of opioid withdrawal. Moderate CYP3A inhibitors and strong CYP3A inhibitors, including aprepitant, atazanavir, clarithromycin, diltiazem, erythromycin, fluconazole, itraconazole, ketoconazole, ritonavir, or saquinavir may ↑ naldemedine levels and risk of toxicity; monitor for potential adverse effects. P-glycoprotein inhibitors, including amiodarone, captopril, cyclosporine, quinidine, or verapamil may ↑ naldemedine levels and risk of toxicity; monitor for potential adverse effects.

Drug-Natural Products: St. John's wort may ↓ naldemedine levels and its effectiveness; avoid concurrent use.

Route/Dosage

PO (Adults): 0.2 mg once daily.

Availability

Tablets: 0.2 mg.

NURSING IMPLICATIONS**Assessment**

- Assess bowel sounds and frequency, quantity, and consistency of stools periodically during therapy.
- Monitor pain intensity during therapy. Naldemedine does not affect pain or effects of opioid analgesics on pain control. Discontinue naldemedine if opioid analgesic is discontinued. Patients receiving opioids for <4 wk may be less responsive to naldemedine.
- **Monitor for signs and symptoms of gastrointestinal perforation (severe, persistent or worsening abdominal pain) periodically during therapy. Discontinue naldemedine if symptoms occur.**

Potential Nursing Diagnoses

Constipation (Indications)

Diarrhea (Adverse Reactions)

Implementation

- **PO:** Administer once daily without regard to food.

Patient/Family Teaching

- Instruct patient to take naldemedine as directed. Advise patient to read *Medication Guide* prior to starting therapy and with each refill in case of changes.
- **Advise patient to notify health care professional immediately if stomach pain that does not go away occurs.**
- Advise patient to notify health care professional if signs and symptoms of opioid withdrawal (sweating, chills, diarrhea, stomach pain, anxiety, irritability, yawning) occur. Patients taking methadone for pain are at increased risk for stomach pain and diarrhea.
- Instruct patient to stop taking naldemedine if they stop taking opioid medications.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise female patients to notify health care professional if pregnancy is planned or suspected and avoid breast feeding during and for 3 days after last dose of therapy.

Evaluation/Desired Outcomes

- Relief of opioid induced constipation, especially if opioid therapy has been for 4 wk or more.

 **naloxegol** (nal-ox-ee-gol)
Movantik

Classification

Therapeutic: laxatives

Pharmacologic: opioid antagonists

Indications

Treatment of opioid-induced constipation (OIC) in patients receiving chronic opioids for chronic non-cancer pain when traditional laxatives have failed.

Action

Acts peripherally as a mu receptor antagonist, blocking opioid receptors in the GI tract. **Therapeutic Effects:** Blocks constipating effects of opioids on the GI tract without loss of analgesia.

Pharmacokinetics

Absorption: Systemic absorption follows oral administration. A high-fat meal ↑ absorption.

Distribution: Does not cross the blood-brain barrier.

Metabolism and Excretion: Metabolized primarily by the CYP3A4 enzyme system; 68% excreted in feces, 16% in urine mostly as metabolites.

Half-life: 6–11 hr.

TIME/ACTION PROFILE (spontaneous bowel movement)

ROUTE	ONSET	PEAK	DURATION
PO	within 24 hr	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Known/suspected/history of gastrointestinal obstruction; Severe hepatic impairment; Concurrent use of strong CYP3A4 inhibitors, strong CYP3A4 inducers, other opioid antagonists, or grapefruit/grapefruit juice; Severe hepatic impairment; **Lactation:** May precipitate opioid withdrawal in infant.

Use Cautiously in: Patients with disruption of the blood-brain barrier (may precipitate opioid withdrawal); **Ger:**  Blood levels are ↑ in elderly Japanese patients; **OB:** May precipitate fetal opioid withdrawal (use only if potential benefit justifies potential risk to fetus); **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: headache. **GI:** **GASTROINTESTINAL PERFORATION, abdominal pain, diarrhea, flatulence, nausea, vomiting.**

Derm: sweating. **Misc:** opioid withdrawal.

Interactions

Drug-Drug: Concurrent use of **strong CYP3A4 inhibitors** including clarithromycin and ketoconazole ↑ risk of toxicity/adverse reactions and is contraindicated. Concurrent use of **moderate CYP3A4 inhibitors** including diltiazem, erythromycin, and verapamil may also ↑ risk of toxicity/adverse reactions; dose reduction and careful monitoring recommended. Concurrent use of **strong CYP3A4 inducers** including rifampin may ↓ blood levels/effectiveness and is contraindicated. Concurrent use of other **opioid**

* = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

antagonists may precipitate opioid withdrawal and is contraindicated. Concurrent use of **methadone** for pain ↑ risk of stomach pain and diarrhea.

Drug-Food: Grapefruit/grapefruit juice may ↑ blood levels and the risk of toxicity/adverse reactions and should be avoided.

Route/Dosage

PO (Adults): 25 mg once daily, if poorly tolerated ↓ dose to 12.5 mg once daily; *Concurrent use of moderate CYP3A4 inhibitors*—12.5 mg once daily (careful monitoring recommended).

Renal Impairment

PO (Adults): *CCR <60 mL/min*—12.5 mg once daily initially, may be cautiously ↑ to 25 mg once daily if necessary with careful monitoring.

Availability

Tablets: 12.5 mg, 25 mg.

NURSING IMPLICATIONS

Assessment

- Assess bowel sounds and frequency, quantity, and consistency of stools periodically during therapy.
- Monitor pain intensity during therapy. Naloxegol does not affect pain or effects of opioid analgesics on pain control. Discontinue naloxegol if opioid analgesic is discontinued.
- **Monitor for signs and symptoms of gastrointestinal perforation (severe, persistent or worsening abdominal pain) periodically during therapy. Discontinue naloxegol if symptoms occur.**

Potential Nursing Diagnoses

Constipation (Indications)

Diarrhea (Adverse Reactions)

Implementation

- Discontinue all maintenance laxative therapy before starting naloxegol. If a suboptimal response occurs with naloxegol, laxatives may be used after 3 days.
- **PO:** Administer on an empty stomach at least 1 hr before first meal in morning or 2 hrs after meal. Tablet may be crushed to a powder, mixed with 4 ounces of water (120 mL) for patients with difficulty swallowing. Drink mixture immediately; refill glass with 120 mL water, stir and drink contents.
- May be administered by NG tube. Flush the NG tube with 1 ounce (30 mL) of water using a 60 mL syringe. Crush tablet to a powder and mix with 2 ounces (60 mL) of water. Draw up mixture using the 60 mL syringe and administer through the NG tube. Add 2 ounces (60 mL) of water to rinse container and administer to flush NG tube and any remaining medicine from NG tube into stomach.
- Avoid grapefruit and grapefruit juice during therapy.

Patient/Family Teaching

- Instruct patient to take naloxegol on an empty stomach as directed. Laxatives should be stopped before

starting naloxegol, but may be restarted after 3 days if needed. Advise patient to read *Medication Guide* prior to starting therapy and with each refill in case of changes.

- Caution patient to avoid grapefruit and grapefruit juice during therapy.
- **Advise patient to notify health care professional immediately if stomach pain that does not go away occurs.**
- Advise patient to notify health care professional if signs and symptoms of opioid withdrawal (sweating, chills, diarrhea, stomach pain, anxiety, irritability, yawning) occur. Patients taking methadone for pain are at increased risk for stomach pain and diarrhea.
- Instruct patient to stop taking naloxegol if they stop taking opioid medications.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise female patients to notify health care professional if pregnancy is planned or suspected and avoid breast feeding during therapy.

Evaluation/Desired Outcomes

- Relief of opioid induced constipation, especially if opioid therapy has been for 4 wks or more.

naloxone (nal-ox-one)

Evzio, Narcan

Classification

Therapeutic: antidotes (for opioids)

Pharmacologic: opioid antagonists

Indications

Reversal of CNS depression and respiratory depression because of suspected opioid overdose. **Unlabeled Use:** Opioid-induced pruritus (low-dose IV infusion). Management of refractory circulatory shock.

Action

Competitively blocks the effects of opioids, including CNS and respiratory depression, without producing any agonist (opioid-like) effects. **Therapeutic Effects:** Reversal of signs of opioid excess.

Pharmacokinetics

Absorption: Well absorbed after IM or subcut administration. Rapidly absorbed from nasal mucosa.

Distribution: Rapidly distributed to tissues. Crosses the placenta.

Metabolism and Excretion: Metabolized by the liver.

Half-life: 30–90 min (IM, IV, subcut) (up to 3 hr in neonates); 2 hr (intranasal).

TIME/ACTION PROFILE (reversal of opioid effects)

ROUTE	ONSET	PEAK	DURATION
IV	1–2 min	unknown	45 min
IM, Subcut	2–5 min	unknown	>45 min
Intranasal	8–13 min	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Cardiovascular disease; Patients physically dependent on opioids (may precipitate severe withdrawal); **OB:** May cause acute withdrawal syndrome in mother and fetus if mother is opioid dependent; **Lactation:** Safety not established; **Pedi:** May cause acute withdrawal syndrome in neonates of opioid-dependent mothers.

Adverse Reactions/Side Effects

CV: VENTRICULAR ARRHYTHMIAS, hypertension, hypotension. **GI:** nausea, vomiting.

Interactions

Drug-Drug: Can precipitate withdrawal in patients physically dependent on **opioid analgesics**. Larger doses may be required to reverse the effects of **buprenorphine, butorphanol, nalbuphine, or pentazocine**. Antagonizes postoperative **opioid analgesics**.

Route/Dosage

Postoperative Opioid-Induced Respiratory Depression

IV (Adults): 0.02–0.2 mg q 2–3 min until response obtained; repeat q 1–2 hr if needed.

IV (Children): 0.01 mg/kg; may repeat q 2–3 min until response obtained. Additional doses may be given q 1–2 hr if needed.

IM, IV, Subcut (Neonates): 0.01 mg/kg; may repeat q 2–3 min until response obtained. Additional doses may be given q 1–2 hr if needed.

Opioid-Induced Respiratory Depression During Chronic (>1 wk) Opioid Use

IV, IM, Subcut (Adults >40 kg): 20–40 mcg (0.02–0.04 mg) given as small, frequent (q min) boluses or as an infusion titrated to improve respiratory function without reversing analgesia.

IV, IM, Subcut (Adults and Children <40 kg): 0.005–0.02 mg/dose given as small, frequent (q min) boluses or as an infusion titrated to improve respiratory function without reversing analgesia.

Overdose of Opioids

IV, IM, Subcut (Adults): *Patients not suspected of being opioid dependent*—0.4 mg (10 mcg/kg); may repeat q 2–3 min (IV route is preferred). Some pa-

tients may require up to 2 mg. *Patients suspected to be opioid dependent*—Initial dose should be ↓ to 0.1–0.2 mg q 2–3 min. May also be given by IV infusion at rate adjusted to patient's response.

IM, Subcut (Adults and Children): *Evizio*—0.4 mg; may repeat q 2–3 min until emergency medical assistance arrives.

IV, IM, Subcut (Children >5 yr or >20 kg): 2 mg/dose, may repeat q 2–3 min.

IV, IM, Subcut (Infants up to 5 yr or 20 kg): 0.1 mg/kg, may repeat q 2–3 min.

Intranasal (Adults and Children): 1 spray (2 mg or 4 mg) in one nostril; may repeat dose q 2–3 min (with each subsequent dose being administered in alternate nostril).

Opioid-Induced Pruritus

IV (Children): 2 mcg/kg/hr continuous infusion, may ↑ by 0.5 mcg/kg/hr every few hours if pruritus continues.

Availability (generic available)

Injection: 0.4 mg/0.4 mL auto-injector, 0.4 mg/mL, 2 mg/0.4 mL auto-injector, 2 mg/2 mL prefilled syringe.

Nasal spray: 2 mg/0.1 mL, 4 mg/0.1 mL. **In combination with:** buprenorphine (Suboxone, Zubsolv).

See Appendix B.

NURSING IMPLICATIONS

Assessment

- **Monitor respiratory rate, rhythm, and depth; pulse, ECG, BP; and level of consciousness frequently for 3–4 hr after the expected peak of blood concentrations.** After a moderate overdose of a short half-life opioid, physical stimulation may be enough to prevent significant hypoventilation. The effects of some opioids may last longer than the effects of naloxone, and repeat doses may be necessary.
- Patients who have been receiving opioids for >1 wk are extremely sensitive to the effects of naloxone. Dilute and administer in slow increments.
- Assess patient for level of pain after administration when used to treat postoperative respiratory depression. Naloxone decreases respiratory depression but also reverses analgesia.
- Assess patient for signs and symptoms of opioid withdrawal (vomiting, restlessness, abdominal cramps, increased BP, and temperature). Symptoms may occur within a few minutes to 2 hr. Severity depends on dose of naloxone, the opioid involved, and degree of physical dependence.
- Lack of significant improvement indicates that symptoms are caused by a disease process or other non-opioid CNS depressants not affected by naloxone.
- **Toxicity and Overdose:** Naloxone is a pure antagonist with no agonist properties and minimal toxicity.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Potential Nursing Diagnoses

Ineffective breathing pattern (Indications)

Ineffective coping (Indications)

Acute pain

Implementation

- **Do not confuse naloxone with Lanoxin (digoxin). Do not confuse Narcan (naloxone) with Norcuron (vecuronium).**
- Larger doses of naloxone may be necessary when used to antagonize the effects of buprenorphine, butorphanol, nalbuphine, and pentazocine.
- Resuscitation equipment, oxygen, vasopressors, and mechanical ventilation should be available to supplement naloxone therapy as needed.
- Doses should be titrated carefully in postoperative patients to avoid interference with control of postoperative pain.
- **Evzio:** A take-home naloxone auto-injector that patients, family members, and other caregivers can have close by in case an opioid overdose occurs. Has visual and voice instructions.
- Inject into upper outer thigh.
- **Intranasal:** Administer a single spray into 1 nostril. If patient does not respond or responds and relapses into respiratory depression, additional doses may be given every 2–3 min in alternating nostrils until emergency medical assistance arrives. Naloxone is not a substitute for emergency medical care.

IV Administration

- **IV Push:** **Diluent:** Administer undiluted for *suspected opioid overdose*. For *opioid-induced respiratory depression*, dilute with sterile water for injection. For children or adults weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of sterile water or 0.9% NaCl for injection. **Concentration:** 0.4 mg/mL, 1 mg/mL, or 10 mcg/mL (depending on preparation used). **Rate:** Administer over 30 seconds for patients with a *suspected opioid overdose*. For patients who develop *opioid-induced respiratory depression*, administer dilute solution of 0.4 mg/10 mL at a rate of 0.5 mL (0.02 mg) IV push every 2 min. Titrate to avoid withdrawal and severe pain. **Excessive dose in postoperative patients may cause excitement, pain, hypotension, hypertention, pulmonary edema, ventricular tachycardia and fibrillation, and seizures.** For children and adults weighing <40 kg, administer 10 mcg/mL solution at a rate of 0.5 mcg/kg every 1–2 min.
- **Continuous Infusion:** **Diluent:** Dilute 2 mg of naloxone in 500 mL of 0.9% NaCl or D5W. Infusion is stable for 24 hr. **Concentration:** 4 mcg/mL. **Rate:** Titrate dose according to patient response.
- **Y-Site Compatibility:** alfentanil, amikacin, aminocaproic acid, amiodarone, anidulafungin, argatroban, ascorbic acid, atropine, azithromycin, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, daunorubicin hydrochloride, desmopressin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, dimenhydrinate, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatid, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludara-bine, fluorouracil, folic acid, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, indomethacin, insulin, irinotecan, isoproterenol, ketamine, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, mannitol, mechlorethamine, meperidine, meropenem, mesna, methotrexate, methyl-dopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, multivitamins, mycophenolate, nafcillin, nalbuphine, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, pentazocine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, ranitidine, rocuro-nium, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, tigecycline, tirofiban, tobramycin, topotecan, vancomycin, vaso-pressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** alemtuzumab, amphotericin B lipid complex, amphotericin B liposome, dantrolene, diazepam, leucovorin, mitomycin, pantoprazole, phenytoin, thiotepa.
- **Additive Incompatibility:** Incompatible with preparations containing bisulfite, sulfite, and solutions with an alkaline pH.

Patient/Family Teaching

- As medication becomes effective, explain purpose and effects of naloxone to patient.
- **Intranasal:** Instruct parents and caregivers in the correct technique for use.
- **Evzio:** Explain purpose and instructions for use to caregiver. Advise to continue monitoring patient af-

ter injection and notify emergency medical assistance. Repeated doses may be required due to duration of naloxone.

Evaluation/Desired Outcomes

- Adequate ventilation following opioid excess.
- Alertness without significant pain or withdrawal symptoms.

naproxen (na-prox-en)

Aleve, Anaprox, Anaprox DS,

★ Maxidol, EC-Naprosyn, Naprelan, Naprosyn

Classification

Therapeutic: nonopioid analgesics, nonsteroidal anti-inflammatory agents, antipyretics

Indications

Mild to moderate pain. Dysmenorrhea. Fever. Inflammatory disorders, including: Rheumatoid arthritis (adults and children), Osteoarthritis.

Action

Inhibits prostaglandin synthesis. **Therapeutic Effects:** Decreased pain. Reduction of fever. Suppression of inflammation.

Pharmacokinetics

Absorption: Completely absorbed from the GI tract. Sodium salt is more rapidly absorbed.

Distribution: Crosses the placenta; enters breast milk in low concentrations.

Protein Binding: >99%.

Metabolism and Excretion: Mostly metabolized by the liver.

Half-life: Children <8 yr: 8–17 hr; Children 8–14 yr: 8–10 hr; Adults: 10–20 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO (analgesic)	1 hr	unknown	8–12 hr
PO (anti-inflammatory)	14 days	2–4 wk	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity may occur with other NSAIDs, including aspirin; Active GI bleeding; Ulcer disease; Coronary artery bypass graft (CABG) surgery; **Lactation:** Passes into breast milk and should not be used by nursing mothers.

Use Cautiously in: Severe renal or hepatic disease; Cardiovascular disease or risk factors for cardiovascular disease (may ↑ risk of serious cardiovascular

thrombotic events, myocardial infarction, and stroke, especially with prolonged use or use of higher doses); avoid use in patients with recent MI or HF; History of ulcer disease or any other history of gastrointestinal bleeding (may ↑ risk of GI bleeding); Chronic alcohol use/abuse; **Ger:** ↑ risk of adverse reactions; **OB:** Avoid using during third trimester; may cause premature closure of the ductus arteriosus; **Pedi:** Children <2 yr (safety not established).

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, headache. **EENT:** tinnitus, visual disturbances. **Resp:** dyspnea. **CV:** HF, MYOCARDIAL INFARCTION, STROKE, edema, hypertension, palpitations, tachycardia. **F and E:** hyperkalemia. **GI:** DRUG-INDUCED HEPATITIS, GI BLEEDING, constipation, dyspepsia, nausea, anorexia, diarrhea, discomfort, flatulence, vomiting. **GU:** cystitis, hematuria, renal failure.

Derm: photosensitivity, rashes, sweating, pseudoporphyria (12% incidence in children with juvenile rheumatoid arthritis—discontinue therapy if this occurs).

Hemat: blood dyscrasias, prolonged bleeding time.

Misc: allergic reactions including ANAPHYLAXIS and STEVENS-JOHNSON SYNDROME.

Interactions

Drug-Drug: Concurrent use with aspirin ↓ levels and may ↓ effectiveness. ↑ risk of bleeding with anticoagulants, aspirin, clopidogrel, ticagrelor, prasugrel, corticosteroids, fibrinolytics, SNRIs, or SSRIs. Additive adverse GI side effects with aspirin, corticosteroids, alcohol, and other NSAIDs. **Probenecid** ↑ blood levels and may ↑ toxicity. May ↑ risk of toxicity from methotrexate, antineoplastics, or radiation therapy. May ↑ serum levels and risk of toxicity from lithium. ↑ risk of adverse renal effects with cyclosporine, ACE inhibitors, angiotensin II antagonists, or chronic use of acetaminophen. May ↓ response to antihypertensives or diuretics. May ↑ risk of hypoglycemia with insulin or oral hypoglycemic agents. Oral potassium supplements may ↑ GI adverse effects.

Drug-Natural Products: ↑ anticoagulant effect and bleeding risk with anise, arnica, chamomile, clove, dong quai, feverfew, garlic, ginger, ginkgo, Panax ginseng, licorice, and others.

Route/Dosage

275 mg naproxen sodium is equivalent to 250 mg naproxen.

Anti-Inflammatory/Analgesic/Antidysmenorrheal

PO (Adults): Naproxen—250–500 mg twice daily (up to 1.5 g/day). Delayed-release naproxen—375–500 mg twice daily. Naproxen sodium—275–550 mg twice daily (up to 1.65 g/day).

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

PO (Children >2 yr): *Analgesia:* 5–7 mg/kg/dose q 8–12 hr. *Inflammatory disease:* 10–15 mg/kg/day divided q 12 hr, maximum: 1000 mg/day.

Antigout

PO (Adults): *Naproxen*—750 mg naproxen initially, then 250 mg q 8 hr. *Naproxen sodium*—825 mg initially, then 275 mg q 8 hr.

OTC Use (naproxen sodium)

PO (Adults): 200 mg q 8–12 hr or 400 mg followed by 200 mg q 12 hr (not to exceed 600 mg/24 hr).

PO (Geriatric Patients >65 yr): Not to exceed 200 mg q 12 hr.

Availability

Naproxen (generic available)

Tablets (Naprosyn): ★ 125 mg, 250 mg, 375 mg, 500 mg. **Delayed-release tablets (EC-Naprosyn):** 375 mg, 500 mg. **Extended-release tablets:** ★ 750 mg. **Oral suspension (Naprosyn):** 125 mg/5 mL. **Rectal suppositories :** ★ 500 mg. **In combination with:** esomeprazole (Vimovo).

Naproxen Sodium (generic available)

Capsules (Maxidol): ★ 220 mg^{OTC}. **Tablets (Aleve, Anaprox, Anaprox DS):** 220 mg^{OTC}, 275 mg, 550 mg. **Extended-release tablets (Naprelan):** 375 mg, 500 mg, 750 mg. **In combination with:** pseudoephedrine (Aleve-D Sinus and Cold), sumatriptan (Treximet). See Appendix B.

NURSING IMPLICATIONS

Assessment

- **Patients who have asthma, aspirin-induced allergy, and nasal polyps are at increased risk for developing hypersensitivity reactions. Assess for rhinitis, asthma, and urticaria.**
- Monitor BP during initiation and periodically during therapy. May cause fluid retention and edema leading to new onset or worsening hypertension.
- **Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.**
- **Pain:** Assess pain (note type, location, and intensity) prior to and 1–2 hr following administration.
- **Arthritis:** Assess pain and range of motion prior to and 1–2 hr following administration.
- **Fever:** Monitor temperature; note signs associated with fever (diaphoresis, tachycardia, malaise).
- **Lab Test Considerations:** Evaluate BUN, serum creatinine, CBC, and liver function tests periodically in patients receiving prolonged therapy.
- May ↑ serum potassium, BUN, serum creatinine, alkaline phosphatase, LDH, AST, and ALT tests levels. May ↓ blood glucose, hemoglobin, and hematocrit concentrations, leukocyte and platelet counts, and CCr.

- Bleeding time may be prolonged up to 4 days following discontinuation of therapy.
- May alter test results for urine 5-HIAA and urine steroid determinations.

Potential Nursing Diagnoses

Acute pain (Indications)

Chronic pain (Indications)

Impaired physical mobility (Indications)

Implementation

- Administration in higher than recommended doses does not provide increased effectiveness but may cause increased side effects. Use lowest effective dose for the shortest duration possible to minimize risk of cardiovascular thrombotic events.
- Coadministration with opioid analgesics may have additive analgesic effects and may permit lower opioid doses.
- Analgesic is more effective if given before pain becomes severe.
- **PO:** For rapid initial effect, administer 30 min before or 2 hr after meals. May be administered with food, milk, or antacids to decrease GI irritation. Food slows but does not reduce the extent of absorption. Do not mix suspension with antacid or other liquid prior to administration. Swallow extended-release, delayed-release, and controlled-release tablets whole; do not break, crush, or chew.
- **Dysmenorrhea:** Administer as soon as possible after the onset of menses. Prophylactic treatment has not been shown to be effective.

Patient/Family Teaching

- Advise patient to take this medication with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Instruct patient to take medication as directed. Take missed doses as soon as remembered but not if almost time for the next dose. Do not double doses.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- **Caution patient to avoid the concurrent use of alcohol, aspirin, acetaminophen, or other OTC medications without consulting health care professional. Use of naproxen with 3 or more glasses of alcohol per day may increase risk of GI bleeding.**
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Caution patient to wear sunscreen and protective clothing to prevent photosensitivity reactions (especially in children with JRA).
- Instruct patients not to take OTC naproxen preparations for more than 3 days for fever and to consult health care professional if symptoms persist or worsen.
- Advise patient to consult health care professional if rash, itching, visual disturbances, tinnitus, weight gain, edema, black stools, persistent headache, or

influenza-like syndrome (chills, fever, muscle aches, pain) occurs.

- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Relief of pain.
- Improved joint mobility. Partial arthritic relief is usually seen within 2 wk, but maximum effectiveness may require 2–4 wk of continuous therapy. Patients who do not respond to one NSAID may respond to another.
- Reduction of fever.

naratriptan (nar-a-trip-tan)

Amerge

Classification

Therapeutic: vascular headache suppressants

Pharmacologic: 5-HT₁ agonists

Indications

Acute treatment of migraine headache.

Action

Acts as an agonist at specific 5-HT₁ receptor sites in intracranial blood vessels and sensory trigeminal nerves.

Therapeutic Effects: Cranial vessel vasoconstriction with resultant decrease in migraine headache.

Pharmacokinetics

Absorption: Well absorbed (70%) following oral administration.

Distribution: Unknown.

Metabolism and Excretion: 60% excreted unchanged in urine; 30% metabolized by the liver.

Half-life: 6 hr (↑ in renal impairment).

TIME/ACTION PROFILE (↓ migraine pain)

ROUTE	ONSET	PEAK	DURATION
PO	30–60 min	2–3 hr†	up to 24 hr

†3–4 hr during migraine attack.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Ischemic heart disease or Prinzmetal's angina; Uncontrolled hypertension; Wolff-Parkinson-White syndrome, or other arrhythmias involving conduction pathways; Hemiplegic or basilar migraine; Stroke or transient ischemic attack; Peripheral vascular disease; Ischemic bowel disease; Severe renal impairment (CCr <15 mL/min); Severe hepatic impairment; Should not be used within 24 hr of other 5-HT₁ agonists or ergot-type compounds (dihydroergotamine); **Geri:** Age-related ↓ in renal func-

tion and ↑ likelihood of CAD greatly ↑ risk of fatal adverse events.

Use Cautiously in: Mild to moderate renal or hepatic impairment (dose should not exceed 2.5 mg/24 hr; initial dose should be ↓); **OB, Lactation, Pedi:** Safety not established.

Exercise Extreme Caution in: Cardiovascular risk factors (hypertension, hypercholesterolemia, cigarette smoking, obesity, diabetes, strong family history, menopausal women or men >40 yr); use only if cardiovascular status has been evaluated and determined to be safe and 1st dose is administered under supervision.

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, malaise/fatigue. **CV:** CORONARY ARTERY VASOSPASM, MI, VENTRICULAR FIBRILLATION, VENTRICULAR TACHYCARDIA, myocardial ischemia. **GI:** nausea. **Neuro:** paresthesia. **Misc:** pain/pressure sensation in throat/neck.

Interactions

Drug-Drug: ↑ risk of serotonin syndrome when used with **SSRI** or **SNRI antidepressants**. **Cigarette smoking** ↑ the metabolism of naratriptan. Blood levels and effects are ↑ by **hormonal contraceptives**. Avoid concurrent use (within 24 hr of each other) with **ergot-containing drugs (dihydroergotamine)** may result in prolonged vasospastic reactions. Avoid concurrent (within 2 wk) use with **MAO inhibitors**; produces ↑ systemic exposure and risk of adverse reactions to naratriptan.

Drug-Natural Products: ↑ risk of serotonergic side effects including serotonin syndrome with **St. John's wort** and **SAME**.

Route/Dosage

PO (Adults): 1 or 2.5 mg; dose may be repeated in 4 hr if response is inadequate (not to exceed 5 mg/24 hr or treatment of more than 4 headaches/mo).

Availability (generic available)

Tablets: 1 mg, 2.5 mg.

NURSING IMPLICATIONS

Assessment

- Assess pain location, character, intensity, and duration and associated symptoms (photophobia, phonophobia, nausea, vomiting) during migraine attack.
- Monitor for serotonin syndrome in patients taking SSRIs or SNRIs concurrently with naratriptan.

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- **PO:** Tablets may be administered at any time after the headache starts.
